5205 and yard expense, uses the tons of freight as shown by Exhibit 26, which are determined from the auditor's figures, which would be subject to the criticism of the inaccuracies caused by the lap-overs from September into October, October into November, or even a longer period as those lap-overs extended over; whereas the distribution as made by us of both those items is based upon the reports, the actual yard engine mileage shown by the reports during the month.

In other words, the physical operations as compared with the auditor's figures.

If you ask my opinion as to what the effect would be, I would say I do not think those lap-overs would affect Exhibit 26 materially, if all worked out.

Q. If they are as horrible as they have been painted in this testimony—our friends on the other side are using them this time—is that a fact?

A. The tons as shown by Exhibit 26 are used in distributing these two items of expense to which we have referred in Exhibit 56.

Q. I do not suppose they are as horrible as some of their people might imagine, or I am satisfied Mr. Johnson would not have used them.

A. If you want my opinion, I would say that somewhat overworked word "negligible" would apply more specifically to the variation that would exist between the physical movement and the movement as shown by Exhibit 26, than to any other quan-
5206 tity to which it has been applied in this case.

Q. In section 3 "Transportation expenses," subdivision (*b*) in Exhibit 56, to which I wish to call your attention, is what I

understand to be the yard and terminal expenses divided upon the ton basis.

I believe you discussed that in connection with this other item: what do you say of its use there?

A. I think I have already covered that. I think it is wrong to distribute the same yard and terminal expense to a ton of freight that moves 70 miles, as you would distribute to a ton of freight that moves 222 miles.

Q. In other words, this applies to the matter you are discussing now, as well as to the one you discussed heretofore?

A. Yes, sir. It is also based on the tons as shown by Exhibit 26.

Q. What is the practical effect of that swelling of the division of expense there over against the state, in those two items when you consider this "Maintenance of Way" expense in Exhibit 56, which is switched from your basis on to the other head in the Railroad exhibit?

A. The effect of distributing the "Maintenance of Way" expense as an overhead expense against the direct expenses, and then charging your direct expenses so that you apportion as much expense for maintenance of yard locomotives and for terminal and yard expenses, to a ton of freight that moves 70 miles as you
5207 apportion to a ton of freight that moves 222 miles, is to improperly and excessively load the cost of the ton of freight that moves 70 miles.

I am speaking now of the effect of doing that, not as to the propriety of so distributing the "maintenance of way" expenses.

Q. While we are on that subject, I want you to discuss that question and I will ask your opinion of it now.

In Exhibit 56, made up by the Railroads—which I have somewhat facetiously called a "caricature" of the State's exhibit—they adopt many of the bases of the state, but in "Maintenance of Way" they have added that, as I understand it, to the general expenses, and distributed that item of expense all through the other:

I wish you would express your opinion on that.

A. I think it is wrong in principle; that there is no accounting practice or procedure that would justify it. It is a well known rule of accounting that you should distribute those expenses that are specific against the use which is had from the expenses incurred.

In the case of the "Maintenance of Way" expense, they should be distributed, in my judgment, both the proportion which is direct and the proportion which is indirect—which has been referred to as being from 75% to 90%—against the use which is made of the "Maintenance of Way," and the use which is made of "Maintenance of Way" is to run trains.

5208 If it is true that only 10 or 25% of the "Maintenance of Way" expenses apply specifically to the operation of the trains over the track, then that 10 or 25%, if it could be determined, should be apportioned specifically against those trains that cause the damage, and the remainder of the "Maintenance of Way" expense—which would be the indirect expense of "Maintenance of Way"—

should be apportioned over the direct expenses of "Maintenance of Way".

Q. And that was done?

A. The result of our distribution approximately does that.

Q. I believe you have heretofore testified that in your accounting experience you have had a great deal of experience in auditing railroads; did you ever come across a proposition like this that distributed things like "maintenance of way" through all these various accounts?

A. No, sir, the "maintenance of way" is a specific expense and that would be one of the elements used to distribute "general expenses".

There is a certain element of your "general expenses" that applies to your "maintenance of way" expenses. A certain proportion of your President's and Vice President's salaries, the clerks in the auditor's office, all apply to the "maintenance of way" expenses, and the "general expenses" would be distributed over all the elements of expense, which, as I stated, would include the "main-
5209 tenance of way" expenses, as well as the "maintenance of equipment"; "traffic" expenses; and "conducting transportation" expense, but there is absolutely, as I see it, no possible reason for adding your "maintenance of way" expenses to your "general expenses" and then attempting to distribute those over the balance.

In that way you do not apportion any of your "general expenses" to your "maintenance of way" expense.

Q. Why is that?

A. Because if you add your "maintenance of way" expense to your "general expense", then you apportion them all over "maintenance of equipment"; "traffic expenses"; and your "conducting transportation expenses", which are all that are left of your operating expenses.

I am sure no man who is familiar with railroad procedure, would claim that the officers of a company—and by "officers" I mean the general officers, higher executive officers—have nothing to do with the "maintenance of way".

I can imagine, for instance, in the case of the panic in October, 1907, the President of this Company wiring from New York to reduce the expenses, and probably the first men that were laid off were some of the section hands, who would be charged to "maintenance of way".

I am sure the records of the Company, if carefully searched, would show very explicit instructions from the higher executives during October, November and December of 1907, affecting the "main-
tenance of way" department.

5210 Q. Take the other items in "general expense" outside of the higher executive officers; take your legal department—claim department, auditor's department, and various items going to make up "general expenses": do not all of them have more or less relation or duties to perform in regard to the way and maintenance?

A. Yes, they all have something to do with the "maintenance of

way" expense and it is proper that those expenses should be distributed over the "maintenance of way".

Q. As I understand you, under this "grand, gloomy and peculiar method" that our friends have invented, the "maintenance of way" would escape all of that—all portions of that?

A. Under their method the "maintenance of way" would all be distributed against the other operating expenses.

Q. Now, coming to the practical end of that proposition on this matter: what is the effect when you come to carry out such an abnormal method—as we view it—to distribute it in connection with such abnormalities—as we view them—as is done in "terminal expenses": what is the practical effect of that?

A. On the basis followed by Exhibit 56?

Q. Yes.

A. The practical effect is to increase the cost of the state freight, as shown by Exhibit 56.

In the first place, you improperly apply certain of so-called direct expenses—specifically illustrated in the case of repairs of yard locomotives; in the case of handling and in the case of ex-
5211 pense of yard and terminal—by apportioning, as I have said before, as much of that expense to a ton of freight that moves only seventy miles, as you apportion to another ton of freight that moves two hundred and twenty-two miles.

If you take all of your "maintenance of way" expenses and distribute them over your direct expenses, the proportion that would apply to those specific items, you are also—in the case of your "maintenance of way"—charging as much to a ton that moves 70 miles as you are to a ton that moves 222 miles. That is, to the extent that the repairs of yard locomotives and the expense of yard terminals represent the total expense over which you distribute your "maintenance of way" expenses; you are claiming it costs as much to maintain your property to move a ton of freight 70 miles at it does to maintain your property to move a ton of freight 222 miles.

Q. Are there any other matters in that connection which I have not called your attention to? I want to go into it thoroughly and then pass on to something else.

A. I think that explains the inaccuracy of the principle.

Q. Take another illustration of that: in your exhibit you use 35% for stopping and starting——

A. Not 35%.

Q. 21½% for starting and stopping and 13½% for terminal. Under some testimony introduced by the railroads in rebuttal, the evidence tended to show that that ought to be very much
5212 increased, up to something like 58 or 60%: I believe Exhibit 56 is based on that——

A. Fifty-five per cent, Exhibit 56.

Q. The testimony in sur-rebuttal tends to show that the 21½% and 13½% used by you, is much too high:

I will ask you, assuming now that your 35%, for the two, is correct, as against 55%, what effect would that have on swelling

an item like that and then using the overhead method of apportioning the "maintenance of way expense"?

A. In our apportionment of the expense any variation between the percentage of 21½% allowed by us for starting and stopping, or any variation in the percentage of 13½% allowed by us for terminal handling, between those figures and the actual, would affect only the distribution of this item of expense to the extent that the per cent as used by us might be proven to be inaccurate, but under the method adopted in Exhibit 56, it would not only increase that specific item of expense, but it would correspondingly erroneously distribute the proportion of the "maintenance of way" expenses that are distributed over such items as are applied direct. That is to say, if they charged under their distribution twice as much to local trains on account of starting and stopping and terminal handling, then they would correspondingly, under their method, charge twice as much "maintenance of way expense" as they should charge.

Q. If you had any error in that your error would affect only "general expenses"?

5213 A. Our error would only affect the specific item and "general expenses".

Col. MOORE:

Q. How about supervision?

A. And supervision which was distributed over the direct charges—supervision of "maintenance of equipment" department.

Q. It would affect everything distributed over direct charges?

A. Yes. Consequently, it is apparent that if the total of your indirect which you distribute is $50,000, there is not a chance for as large a mistake to occur through such distribution as where the indirect that you distribute is half a million dollars, because the effect under our method, as you will see, of an error of one per cent. would result in a very small erroneous charge; whereas an error of one per cent, under your method, would result in a very much larger ultimate discrepancy—when I say "you" I mean the railroad.

Judge HILL:

Q. In that connection, there is another item of "maintenance of way" itself that there has been a diversity of testimony about:

In your exhibit you allowed 2½ for a locomotive as against a freight car:

The railroad put in testimony here tending to prove that that was too small and should have been five or six, if I remember their testimony correctly.

A. Three to five is the highest I saw in the testimony.

5214 Q. In the testimony of the state, in rebuttal, I think one of the witnesses testified it ought not to be more and others testified that 2 or 2½ would be sufficient. That is a subject that the "learned doctors" disagreed about.

What effect would an error like that have—suppose you had made an error in that, either way?

A. Inasmuch as we estimated that all engine miles are equal to

2½ car miles and applied that to both local and through trains, whatever element of difference there may be between 2½ times and the actual times, and the actual excess of the locomotive over the car, would affect our distribution only to the proportion that each of those items—the local and through—bore to the total.

For the purpose of running that out in the case of this "Maintenance of way and structures" I made a calculation estimating the one engine mile as being equal to five car miles, and I found that the ultimate return on the property as a result of doing that—in the case of intrastate freight— was reduced from the figure of 1093 per cent, as shown by Exhibit "O", to 1085 per cent.

Q. A difference of what?

A. 8/100 of one per cent.

Q. There is another item in the case that there has been much evidence upon and a wide diversity of opinion:

You use four stops for the local against the through and there has been a great deal of testimony that that is excessive; probably the weight of the testimony would indicate two times:

5215 Assuming for the sake of the illustration that that would be two times and also that the switching would be 25, 30 or 40 percent instead of 50 percent: that would cut quite a wide swath in those figures, would it not?

A. It would reduce the proportion of the expenses charged to the local trains.

Q. And consequently to the state, ultimately?

A. And ultimately it would tend to reduce the cost of doing the state business worked out to its final conclusion. I have not made any figures, however.

Q. Under your system if there has been any error in your statistics against the state there in using four to one, instead of two to one, and using 50% for switching instead of 25%, that error would be confined, as I understand it, to "Maintenance of equipment" and to a small percentage of "general expenses":

Now, what would be the effect of that, under this peculiar method that these gentlemen have devised, of adding the "maintenance of way" to the "general expenses"? I do not mean in dollars and cents.

A. Any inaccuracies between the assumed basis in determining expense of maintenance of equipment and the actual basis would carry not only the mistake in expense of "maintenance of equipment" resulting from such inaccuracies but also the corresponding proportion for "maintenance of way" expense.

5216 Q. What is the percentage of "general expenses" in this case? As I recall it, it is about 4%.

A. "General expenses" for the six months ending December 31, 1907, charged to the freight account, amount to $132,218.24 against——

Q. What percent is that of the whole? I just want the percent?

Mr. JOHNSON: About four and one-half percent.

A. —total expenses of $3,073,843.40. That would make the "general expenses" about four per cent of the total operating expenses.

Q. That is on the freight side?

A. That is on the freight only.

Q. Mr. Johnson has figured it out and says it is about four and one-half percent.

A. That would be about right.

Q. Now, to sum up that: if you made an error on this starting and stopping and switching, and what has been called the "arbitraries" that error would, to that extent, disturb the true relation of "maintenance of equipment" and to a certain extent of 4½% of "general expenes" and no more.

A. Other than the "Supervision and general" of the different specific departments.

Q. I understand that is included in your exhibit in that "Maintenance of equipment" account, is it not?

A. Yes, but that in turn is distributed over the direct expenses of that particular department.

5217 Q. But that is all confined in that department?

A. Yes, sir. The "Maintenance of way" expenses charged to freight for the six months ended December 31, amounts to $553,395.11 as compared to the total operating expenses charged to freight of $3,073,843.40. Approximately 18% of the total operating expenses applicable to the freight are for "Maintenance of way and structure."

Q. Now, turn to the passenger side of that: I believe they follow that same method in the passenger side of it, don't they?

A. Yes. The total "general expenses" for the six months ended December 31, 1907, charged to the passenger amounts to $160,767.19 and the total passenger operating expenses for the same period amounts to $1,678,039.98, making the "General expenses" approximately 10% of the total operating expenses.

Q. What is the "Maintenance of way"?

A. The "Maintenance of way" expense—the expense of "Maintenance of way and structures" charged to passenger service during the six months ended December 31, 1907, amounted to $501,281.40, as compared to total passenger operating expenses of $1,678,039.98, which would make the proportion of the "Maintenance of way and structures" expenses to the total operating expenses about 30%.

Q. About 18% of the freight and about 30% of the passenger for maintenance of way expense?

5218 A. Yes, sir, of the total operating expenses, applicable to the freight and passenger.

Q. And about 4½% on "General expenses" for freight and about 10% for passenger?

A. Yes, sir.

Q. What particular significance would that have upon this method of apportioning that "Maintenance of way"?

A. To my mind they illustrate very forcibly the inaccuracy of that method. I might say that they illustrate that under that method any mistakes that were made in the direct expenses would affect a much larger proportion of the total expenses than if the distribution of "Maintenance of way and structures" had been made in the man-

ner that I consider proper, that is, on the basis of the use made of the property.

Q. Then in this case, as we see it, there are a great many errors in this Exhibit 56 as to the various charges—conceding for the sake of the argument that we are right on that, how far reaching would this method of accentuating those errors go? I do not mean in dollars and cents, but just as a general proposition?

A. I think the Exhibit is altogether unreliable for obtaining any valuable information or reaching any conclusion that would be of value.

Q. You have illustrated these applications on the unreliability of it dependent on variable factors: now, suppose it was alright, that these various arbitraries were right: Is that a method that
5219 gets at the true result, aside from these matters that you have called attention to, when you come to a method of getting as near as the actual results as possible in distributing railroad costs?

A. I think the methods followed in Exhibit 56 are wrong.

Q. What are your reasons for that, leaving aside these illustrations that you have taken: are they so full of manifest errors as we take it——

A. I think the principle of attempting to distribute your "Maintenance of way" expense over these other expenses is entirely wrong wrong in principle and wrong in results, and the results, as I have already stated, are—the errors in the final results as I have already stated, are increased by any inaccuracies in the division that is made in the other items of expenses.

Q. Mr. Ward says on page 622:

"It seems to be the case that up to this point in this exhibit the endeavor of the state's accountants has been to determine what is a proper method of distributing train and car costs between local and through trains. And when they have done that according to the method adopted, they undertook by taking into account the tonnage of state freight handled on local and through trains respectively, to ascertain the ton mile cost of handling such freight; and have assumed that the cost of handling a ton mile of state freight on a local and on a through train is the same as that of handling a toin mile of interstate freight on the same train."

Is that a correct statement of your exhibit?

A. Yes, we assume that after we have gotten your train costs so far as the train costs themselves go, the cost of handling the
5220 ton mile of state freight is the same as the cost of handling a ton mile of interstate freight.

Q. At page 639 of Mr. Ward's testimony, in discussing the passenger side of your exhibit, he states this:

"The inclusion of those items of yard service, wages of train and engine men, fuel and other supplies, on a car mileage basis, is wrong. It is unfair, and charges too much to the through service, and not enough to the local service, and to the local trains on which are carried the state passengers."

In various other places in the testimony of Mr. Ward—I will

not take the time to give you the page—he criticises your passenger exhibit on the basis of the through and the local service.

I wish you would explain that.

A. We make no segregation of the passenger business between through and local trains. Our passenger expenses are divided between the coach, Pullman, mail and express service.

Q. Mr. Nay has made a statement here—you can get it more quickly than I can give it to you by looking it over, page 443—as if you had used a car mile there: I wish you would explain that. It seems to be a misapprehension as to the factor which you have used.

A. (After examining record.) Mr. Nay says: "They have divided the expenses of terminal handling of cars on a car mile basis." He thinks we should have used the same basis for dividing the repairs due to terminal handling that would be used in dividing repairs of yard locomotives.

5221 We attempted to divide it on the basis set forth in our exhibit very fully, that we thought was fairest and most equitable, and I will just say in answer to Mr. Nay's criticism that if we had used the basis he suggests that we would have charged local trains, in the case of that specific expense, with only 19.46%; whereas, under the method we had adopted—and we adopted it because we thought it more equitable—we did charge the local with 26.46. The method we adopted was more unfavorable to the state than the method that Mr. Nay says he should have thought we would have adopted.

5222 Judge HULL: Mr. Ludlam, we were discussing Mr. Nay's statement wherein he criticised your use of the car mile in the yard and terminal expense, was it not?

A. It was the charge we made to the local trains for terminal expense. He said instead of having made it on the car mile basis we should have made it on the car basis, the same as we did the yard and terminal expenses.

In that connection I might say the same result is accomplished by our method of multiplying the car mileage by two to get the number of terminal handlings that the cars in the local trains would have.

In other words, we use the car mile only as a factor to determine the actual terminal handling or the approximate terminal handling.

Q. He seems to misapprehend the way in which you have handled it?

A. Yes, sir, he apparently does not understand the use we have made of the car mile.

Mr. MOORE:

Q. You mean the same result in money would be obtained?

A. No, sir, I mean to say the same principle would be obtained. It is reduced to the basis of car handling, taking the car mileage and switching each car in the local train has two handlings to one handling of the cars in the through train.

5223 Q. You do not mean your method would be equivalent in respect of result of a division on the basis of the number of cars, do you? Or that it is the same in principle?

A. It is the same in principle but as your total expenses are different the rate per car would not be the same.

Q. Would the percentage be the same?

A. Not quite. There is a slight difference.

Q. Is it not more than a slight difference, Mr. Ludlam?

A. 26.43% of the total terminal handling is assigned to the local train under the method adopted by us. Whereas, in the case of the cars handled in the terminals the proportion assigned to the local trains is 19.46%. Of course, we are dealing with two different elements, you understand?

Q. I understand that.

Judge HILL (resuming):

Q. Which plan reaches most nearly, in your opinion, the actual facts: that suggested by Mr. Nay or the way you have followed in that exhibit?

A. The plan followed by us in our exhibit is the plan that Mr. Nay suggests would be the proper way to do it. The trouble is that Mr. Nay assumes that we have not done it on a car mileage basis and he says it should be done on a car mileage basis.

We have equalized our car mileage basis to a car basis; so we have done it on the plan Mr. Nay says would be the better plan but he does not give us credit for having done it that way.

5224 Col. MOORE:

Q. Would it not be a simpler method of arriving at that result to take the car miles, instead of doubling in order to equalize what the cars would produce?

A. You have no way of determining the method of handling the cars on local trains except as you determine it on a car mile basis.

Q. Don't you think this exhibit is plain enough, that a man of Mr. Nay's intelligence could understand the basis of your division?

A. Yes, sir, we think the basis is clear enough for any man of ordinary intelligence to understand it.

Q. So it is something else than want of understanding on Mr. Nay's part, do you think?

A. I think he simply got mixed on it. I think he could easily have been straightened out. Sometimes even the brightest men get twisted on the simplest and plainest things.

Judge HILL:

Q. On page 467 I wish to read an excerpt from Mr. Nay's testimony. It reads as follows:

"My judgment would be, based on a good many years' experience with Arkansas conditions, that the proportion of intrastate tonnage to interstate tonnage in October would be less than during the entire six months, or during an entire year, for the reason that there is an excess of interstate tonnage or shipments handled during that month."

I wish to call your attention to Exhibit 26 and Exhibit 5 and ask you to state whether Mr. Nay's statement there is correct, as shown by the exhibits of the railroad in this case.

5225 A. Exhibit 26 shows that on the ton mile basis the state freight in the month of October amounted to 8.15% of the total ton miles; whereas, Exhibit 5 shows that the state ton miles for the six months ended December 31st, amounted to 7.25% of the total ton miles.

When considered on a ton basis Exhibit 26 shows that October amounted to 21.15% on the state business and Exhibit 5 shows that for six months ending December 31st, the state per cent was 19.98%. Showing that both in the case of ton miles and in the case of tons, the state proportion of the total business was larger in the month of October than it was for six months.

In other words, just exactly the reverse of what Mr. Nay's many years' experience in the state of Arkansas led him to believe.

Q. That is the opinion against railroad statistics?

A. Yes, sir.

Q. On page 483 and also on page 490 of Mr. Nay's testimony, he makes certain statements about the passenger division of expenses between local and through trains: I wish you would explain that?

A. The remarks of Mr. Nay referred to on pages 483-484 are based on his proposition that it would have been more correct for us to have divided the passenger business between the local and the through trains as we did in the case of the freight business. I think Mr. Nay's comments, however, were answered fully when we
5226 referred him to the passenger train exhibit.

Q. Of Mr. McPherson?

A. Yes, sir, Mr. McPherson's exhibit 46.

Q. Now, what are you going to do with the Cotton Belt?

A. In the case of the Cotton Belt, the trains were all local. Not even a small proportion of them were through trains, as in the case of the Iron Mountain. So, of course, his remarks do not apply at all to the Cotton Belt?

Q. Mr. Johnson at page 884 says:

"Q. I notice in ascertaining the engine miles for the purpose of making the division under that heading, they have assumed 270,564 engine miles and on the next sheet speaking of maintenance of locomotives under "Maintenance of equipment" there is an enumeration of 130,150 engine miles for yard locomotives:

Is that omitted from the figures to which I first called your attention under the head of "Maintenance of way".

A. The item of 270,564 engine miles as shown in the state exhibit K under the heading of "maintenance of way and structures" is road engine miles. While under "Maintenance of equipment" yard locomotive mileage is shown to be 130,150.

This 130,150 miles has been omitted from the engine miles or wheels taken into account under "maintenance of way and structures."

The yard engines are incurring an expense in maintenance of way, maintenance of tracks, and the use of structures to at least the same extent as the road engine mileage is; and if the wheelage basis is to be considered a reasonable basis for dividing maintenance

of way and structures expense, I do not understand why the switch engine mileage should not be included in it."

I wish you would explain why it is your understanding it is not included in it?

A. Because the switch engine mileage was merely a feature
5227 of the transportation of the freight.

Consequently when we distributed all the expense of maintenance of way to the movement of the freight, there was no object in first apportioning it to the switch engine and then reapportioning it to the movement of the freight.

And, furthermore, there are no statistics and no way of determining the proportion of maintenance of way expenses that are attributable to the switching.

Q. Is there any significance to be attached to the omission of that engine mileage? Have you omitted any expense or items that should be included, by omitting to include that engine mileage in there?

A. No, sir.

Q. That is all taken care of on the other basis?

A. Yes, sir, and we think taken care of more correctly than if we had attempted to include a proportion of those expenses applicable to switching engines, and then in turn distributed that on the same basis as you attempt to distribute the other expenses.

Q. There is a simpler and better way to get at the same apportionment?

A. We think so.

Q. In Exhibit 56, passenger accounts, in a note on sub-division 8 there is this statement:

5228 "The company records also show that in October, 1907, there were 2,188,495 passenger miles carried in Pullman cars and on the state's assumption that 25% of the passenger miles is intrastate traffic the division of passenger miles for October, 1907, may be made as follows:"

And then follows a calculation based upon that theory.

Mr. Johnson in his testimony has explained that and claims that substantial injury has been done to the interstate business by the omission of those passenger mile statistics, and applying the same to the intrastate and interstate passengers carried in Pullman coaches.

I wish you would explain, first how your exhibit was made and what investigation you have made since to see whether his contention is correct?

A. When we made our exhibit in this case we did not have the proportion of passenger miles which were carried in the Pullman cars during the month of October, 1907, or for any other of the six months under review.

The company's records did not permit of the ascertainment of that information divided between intrastate and interstate passengers. The only way that information could be made up was from the tickets themselves, which we were advised had been destroyed and undoubtedly they had been.

Consequently, after giving the matter considerable thought we decided to apportion all of the baggage car expenses and the dining car expenses and a proportion of the observation part of the café car expenses, which would be accessible to the Pullman
5229 passengers as against coach passengers, and then divide the total coach expenses so ascertained against the total passenger mileage, between the state and interstate.

On that basis the coach expense in the case of the Iron Mountain was found to be $896,378.78.

This was represented by a total coach mileage proper on the basis stated of 751,229 miles.

In view of the figures produced by the company in this case, 2,188,495 passenger miles carried in Pullmans during the month of October (and I use this figure with the understanding it will be corrected) and a division made in Exhibit 56 between Pullman expense and the coach expense, but we have referred back to our figures and found that of 751,221 miles made by the coaches, there are 139,696 miles represented by baggage cars; 27,057 miles represented by diners; and there are 10,168 miles represented by café-observation cars; making a total of 176,921 car miles which would apply to the Pullman passengers as well as the coach passengers. The Pullman passenger, of course, using the baggage, dining cars and café cars equally with the coach passengers.

That leaves of the 751,221 coach miles shown by our exhibit, a total of only 574,308 coach miles which are applicable to the passengers carried in the coaches, plus their proportion of the baggage, diner and café-observation car.

5230 Apportioning those passengers on the basis of the state passengers and the interstate passengers carried in Pullman cars, I estimate that 18% of the total passengers carried in the Pullmans are state passengers and 82% are interstate passengers——

Q. If that does not interrupt your thought, I would like to ask you a question there.

A. All right, go ahead.

Q. You say your exhibit is 25% and 75%: why do you use 18%? Have you some basis for that?

A. We have made some figures from current operations of passenger trains in Arkansas, which would indicate that a percentage of 18% would be more nearly correct than the percentage of 25%.

In that connection I might say that in making our original exhibit we used 25% with the intention of not understating the state passengers carried in Pullman cars. We thought at the time that was a liberal estimate. But on examination we have made recently of the current operations it shows about 18% of state and 82% of interstate passengers——

Mr. MOORE:

Q. May I ask what period of time was covered by that recent investigation of which you speak?

By Mr. HAMILTON:

A. 94% of the trains for eight days for some twelve trains the reports had not come in.

Judge HILL:

Q. As I understand it, that is all that was possible. The custom of the company is to destroy the tickets as soon as they
5231 come in and they are properly listed.

A. Yes, sir. It is absolutely impossible to ascertain what proportion of passengers carried in Pullman cars during any part of the year 1907 were state and what proportion were interstate.

Q. One other matter in that connection: Do you recall Mr. Wright's testimony on that subject—and I think he is the only one who testified on that subject, for the state?

A. Yes, sir, Mr. Wright testified in his opinion the proportion of interstate passengers carried in Pullman cars would be somewhere between eighty and eighty-five per cent of the total. Of course, I mean passenger miles.

Q. You have taken 18%?

A. Yes, sir, in these figures we have taken 18%.

Taking both the average of Mr. Wright's estimate and the figures actually indicated by tests we have made of a few trains this month, as Mr. Hamilton stated 94% of all the trains for eight days.

Q. Proceed.

A. The result of this compilation would be to increase the charges applicable to the state passengers $16,968.83 over the figures shown by our exhibit in the case of the Iron Mountain.

And $3.597.00 in the case of the Cotton Belt.

That is for the six months.

5232 Q. There is one other thing you did not explain, but I interrupted you.

That is, what figures you have used for the total passengers carried in Pullmans for the month of October 2,188,495?

A. On the basis of our estimate made somewhat roughly that the figure given in Exhibit 56, 2,188,495 passenger miles carried in Pullmans during the month of October, is in error 33 1/3%. We have reduced that to 75% of that figure and based our estimate for the six months on that basis.

Q. Do you remember what percentage they actually showed on the Cotton Belt?

A. What percentage of what?

Q. Of the passenger miles in Pullman, in lieu of those 2,188,495? They have actual figures, as I understand it.

Q. The result of reducing the figures shown on Exhibit 56 in the case of the Iron Mountain from 2,188,495 miles one-third results in the figure I have just presented, being 12% of the passenger mileage carried in Pullman cars.

In the case of the Cotton Belt it is stated in Exhibit 60 that no record of the passenger miles made in Pullman cars during any of the months of July to December, 1907, is available; but for the month of June, 1910, which month is about an average of the six

months ending Dec. 31, 1907, the records of the company show passenger miles in coaches 2,574,781 or 90.26%. And passenger miles in Pullmans 277,764 or 9.74%.

5233 Q. You used 12% in the case of the Iron Mountain?

A. In the case of the Iron Mountain we used 12% and in the case of the Cotton Belt we used 9.74%.

Q. That is already in evidence in the statement and showing that these 2,188,495 is erroneous.

Just how great the error is, is to be determined by agreement later on and you have made a rough estimate from the data before you that it would be one-third, as I understand it.

A. Yes, sir, that the correct figures would reduce the figures shown here by one-third.

Q. And if that is more or less your calculations will change proportionately?

A. Yes, sir.

Q. The net result of that is that by this information you have obtained since your exhibit was made, there is an error here against interstate of $17,000 in round numbers, in the case of the Iron Mountain; and $3500 in round numbers, in the case of the Cotton Belt.

A. Yes, sir.

Q. That is favor of the interstate?

A. Yes, sir. Our exhibit was originally in favor of the intrastate.

Q. And now this error redounds in favor of the interstate to that extent?

A. Yes, sir.

5234–5236 Q. Have you figured out what effect that would have upon the returns on the property as made in your exhibits?

A. Yes, sir.

Q. What would that be?

A. In the case of the Iron Mountain it would reduce the intrastate return on the passenger valuation alone of .66%; and in the case of both freight and passenger it would reduce the intrastate return .4%.

Q. And now take the Cotton Belt?

A. On the Cotton Belt it would reduce the return from intrastate business on the passenger valuation alone .467%; and in the case of freight and passenger business both it would reduce the return from intrastate business alone .275%.

No cross-examination.

The defendants here rest.

And this was all the testimony offered in the case.

LEED THRU

## EXHIBIT No. 3.

### St. Louis, Iron Mountain & Southern Railway Company.

*Statement of the Earnings and Expenses of the St. Louis, Iron Mountain & Southern Railway Company in the State of Arkansas for Six Months Ending December 31st, 1907.*

A. The Gross Revenue of the St. Louis, Iron Mountain & Southern Railway in the State of Arkansas, for the period mentioned above, as shown in Statement No. 1 is as follows:

| | Amount. | Per cent of Freight revenue. | Per cent of All revenue. |
|---|---|---|---|
| Intra-State Freight | $640,248.17 | 13.08% | 9.59% |
| Inter-State Freight | 4,133,210.33 | 84.41 | 61.92 |
| Miscellaneous Freight | 122,814.41 | 2.51 | 1.84 |
| Total | $4,896,272.91 | 100.00 | 73.35 |
| | | Per cent of Passenger revenue. | |
| Intra-State Passenger | $836,542.20 | 47.03% | 12.53% |
| Inter-State Passenger | 568,476.21 | 31.96 | 8.52 |
| Misc'l. Passenger | 373,785.47 | 21.01 | 5.60 |
| Total | $1,778,803.88 | 100.00 | 26.65 |
| Grand Total | $6,675,076.79 | | 100.00 |

DARK PAGE BL

The methods used in apportioning revenue to the State of Arkansas are fully set forth in Statement No. 2. Miscellaneous revenue has not been divided between Intra-State and Inter-State for reasons given in Statement No. 2.

That the methods used in apportioning revenue to the State are fair and equitable is shown by a comparison of the revenue assigned to the State with the revenue of the entire line and a comparison of various statistics relating to revenue, all of which is shown in Statement No. 3.

5241 EXHIBIT No. —.

B. The total Operating Expenses and Fixed Charges of the St. Louis, Iron Mountain & Southern Railway Company in the State of Arkansas for the period mentioned, as shown in Statement No. 4, are as follows:

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Maint. of Way & Struct | $553,395.11 | $501,281.40 | $1,054,676.51 |
| Maint. of Equipment | 723,431.33 | 312,134.74 | 1,035,566.07 |
| Traffic Expenses | 88,734.42 | 53,276.08 | 142,010.50 |
| Transportation Expenses | 1,576,064.30 | 650,580.57 | 2,226,644.87 |
| General Expenses | 132,218.24 | 160,767.19 | 292,985.43 |
| Hire of Equipment—Bal | 179,191.46 | Cr. 1,033.99 | 178,157.47 |
| Dining Car Service—Bal | ..... | 1,183.90 | 1,183.90 |
| | $3,253,034.86 | $1,678,189.89 | $4,931,224.75 |
| Taxes | 162,945.69 | 59,202.49 | 222,148.18 |
| Rentals | 16,084.56 | 5,843.95 | 21,928.51 |
| Grand Total | $3,432,065.11 | $1,743,236.33 | $5,175,301.44 |

The basis used in apportioning expenses to the State of Arkansas and dividing same between the Freight and Passenger service *are* fully set forth in Statement No. 5.

Statement No. 4 shows the total Operating Expenses for the entire line and the percentage of the entire line expense charged to the State; and a comparison of these percentages with the percentage of traffic handled in the State, as shown in Statement No. 3, shows that the division of expense is fair and equitable when compared with the amount of business handled.

C. The assessment of the State Board of Equalization, for the purpose of taxation, is $20,156,022.00, and if multiplied by two and divided between the freight and passenger traffic in proportion to the gross earnings of each class of traffic, would be as follows:

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| One-half of total Assessed Valuation being for six months | $14,784,442.14 | $5,371,579.86 | $20,156,022.00 |
| Six per cent interest on above | 887,066.53 | 322,294.79 | 1,209,361.32 |
| Seven per cent interest | 1,034,910.95 | 376,010.59 | 1,410,921.54 |
| Eight per cent interest | 1,182,755.37 | 429,726.39 | 1,612,481.76 |

D. Recapitulation—Total Business, State of Arkansas.

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Gross Revenue | $4,896,272.91 | $1,778,803.88 | $6,675,076.79 |
| Operating Expenses | 3,253,034.86 | 1,678,189.89 | 4,931,224.75 |
| Net Operating Revenue | $1,643,238.05 | $100,613.99 | $1,743,852.04 |
| Less, Taxes and Rentals | 179,030.25 | 65,046.44 | 244,076.69 |
| Balance | $1,464,207.80 | $35,567.55 | $1,499,775.35 |
| Return on the assessed value of the property after deducting Taxes and Rentals | 9.90% | 0.66% | 7.44% |

DARK PAGE B

E. The Intra-State gross freight and passenger revenue, as shown in Statement No. 1, is:

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Gross Revenue | $640,248.17 | $836,542.20 | $1,476,790.37 |

The intra-state proportion of the total operating expenses, divided on per cents based upon the gross revenue of each class of traffic (Freight 13.08%, Passenger 47.03%), is,

| | | | |
|---|---|---|---|
| Operating Expenses | $425,496.96 | $789,252.70 | $1,214,749.66 |
| Leaving | $214,751.21 | $47,289.50 | $262,040.71 |

From these amounts there should be deducted a proportion of the taxes and rentals; divided on a revenue basis, (per cents shown above) the charge is as follows:

| | | | |
|---|---|---|---|
| Taxes and Rentals | $23,417.16 | $30,591.34 | $54,008.50 |
| Leaving | $191,334.05 | $16,698.16 | $208,032.21 |

F. From the sums thus left there should be deducted such sums as the Court may find to represent the extra cost of handling Intra-State traffic. This extra cost is shown under various percentages in statements No. 6 and 7, and the result of applying any of the percentages is as follows:

| | Freight. | | Passenger. |
|---|---|---|---|
| Amount left after deducting Taxes and Rentals | $191,334.05 | | $16,698.16 |
| Extra Cost @ 50% | 173,386.76 | Extra cost @ 15% | 58,568.83 |
| Surplus | $17,947.29 | Deficit | $41,870.67 |
| Extra cost @ 100% | $326,930.00 | Extra cost @ 25% | $93,475.18 |
| Deficit | $135,595.95 | Deficit | $76,777.02 |
| Extra cost @ 150% | $463,882.77 | Extra cost @ 35% | $125,696.42 |
| Deficit | $272,548.72 | Deficit | $108,998.26 |
| Extra cost @ 200% | $586,196.88 | Extra cost @ 50% | $169,161.54 |
| Deficit | $394,862.83 | Deficit | $152,463.38 |

G. Assuming that the property of the Company is worth at least the amount of the State's valuation for purposes of taxation, the value of the property to be assigned to each class of Intrastate traffic, is as follows:

| | | | |
|---|---|---|---|
| Freight | 13.08% of | $14,784,442.14 or | $1,933,805.03 |
| Passenger | 47.03% of | 5,371,579.86 or | 2,526,254.01 |
| Total | | $20,156,022.00 | $4,460,059.04 |

Making no allowance for the extra cost of handling Intrastate traffic, the per cent of return on the values shown above would be:

Freight ..... 9.89% Passenger..... 0.66% Total..... 4.66%

Allowing 50% for the extra cost of handling Intrastate freight and nothing for passengers, the per cent of return upon the values shown above, would be:

Freight ..... 0.93% Passenger..... 0.66% Total..... 0.78%

STATEMENT No. 2.

St. Louis, Iron Mountain & Southern Railway Company, State of Arkansas.

*Formulæ Used in Dividing Gross Revenue Between Freight and Passenger and Between Intrastate and Interstate.*

No. 1. Freight Revenue:

2. *Passenger Revenue:* The revenue from freight and passenger moving wholly within the State is credited to the State under *Intra-State revenue.* The revenue from freight moving partly in another State or States, is divided between the States through which the shipment moved upon a stright pro-rata per mile basis. The same rule applies to the division of revenue from Passengers traveling partly in Arkansas and partly in other States where the maximum rate is two cents per mile. When the maximum passenger rate in any State is more than two cents per mile, that State is allowed constructive mileage on interstate business, making the division of revenue on a pro-rata per *rate* basis.

All revenue accruing to Arkansas from business moving partly in Arkansas and partly in other States is credited to the State under *Interstate revenue.*

No. 3. *Excess Baggage Revenue:* The revenue from excess baggage is credited to the various States upon the basis of the actual mileage over which the baggage moves.

No. 4. *Parlor & Chair Car Revenue:* The revenue from Parlor and Chair Cars is credited to the various States upon the basis of the actual mileage of each train in each State.

No. 5. *Mail Revenue:* The transportation of mail is done under contract with the United States Government and the territory is divided into various "Mail Routes" for which compensation is allowed at certain rates per pound-mile handled. In cases where the entire mail route is located entirely in one State, all of the revenue is credited to that State.

When the mail route is through two or more States, the revenue is divided between States upon the basis of the actual mileage in each State.

No. 6. *Express Revenue:* The revenue from the handling of express is reported to us by the Express Company in total, the railroad company having no record of the details of business handled. The amount received from the Express Company is divided between States upon the basis of the gross freight earnings in each State.

No. 7. *Milk Revenue (on Passenger Trains)*: Basis similar to Account No. 4.

No. 8. *Other Passenger Train Revenue:* Basis similar to Account No. 4.

No. 9. *Switching Revenue:* The revenue earned from switching service is credited to the State in which the service is performed.

No. 10. *Special Service Train Revenue:* Basis similar to Account No. 4.

5245

No. 11. *Miscellaneous Transportation Revenue:* The revenue credited to this account is credited to the States in which the service is performed.

No. 12. *Station and Train Privileges:* Revenue from station privileges is credited to the State in which the station is located. Earnings from Train Privileges are divided between States upon the basis of the mileage of lines covered by the contracts. These earnings are derived from contracts made with News Companies for the privileges of selling papers, fruit, etc., at stations and on trains.

No. 13. *Parcel Room Receipts:* Revenue from parcel-room receipts is credited to the State in which the Station is located.

No. 14. *Storage—Freight:* Revenue from the storage of freight is credited to the State in which the service is performed.

No. 15. *Storage—Baggage:* Basis similar to Account No. 14.

No. 16. *Car Service:* Basis similar to Account No. 14.

No. 17. *Telegraph Service:* This Company has no revenue credited to this account.

No. 18. *Rents of Buildings and Other Property:* The revenue from rent of buildings and other property is credited to the State in which the property is located.

No. 19. *Miscellaneous:* The revenue credited to this account is as a rule derived from services of a local nature and credited to the State in which the service is performed.

NOTE.—Revenue Accounts No. 3, 4, 5, 6, 7, 8, 10, 13, and 15 are credited to the passenger service; accounts No. 9, 14, and 16 are credited to the freight service and accounts No. 11, 12, 18, and 19 are divided between the passenger and freight service upon the basis of the actual freight and passenger earnings; Freight 77.26%, Passenger 22.74%.

No attempt has been made to divide miscellaneous revenue between State and Interstate for the reason that rates on this class of business are not an issue in this litigation and for the further reason that in the case of Mail and Express revenue, which is 19% of all passenger revenue, there is no reasonable basis by which such an apportionment can be made.

STATEMENT No. 3.

St. Louis, Iron Mountain & Southern Railway Company.

*Statement of Gross Revenue for Six Months Ending December 31st, 1907.*

| Character. | Whole line. | State of Arkansas. | Percentage of total credited to Arkansas. |
|---|---|---|---|
| 1. Freight Revenue | $8,925,034.34 | $4,773,458.50 | 53 |
| 2. Passenger Revenue | 2,393,913.82 | 1,405,018.41 | 59 |
| 3. Excess Baggage Revenue | 23,993.66 | 14,507.65 | 60 |

STATEMENT No. 5.

St. Louis, Iron Mountain & Southern Railway Company.

State of Arkansas.

*Bases Used in Dividing Operating Expenses, Taxes and Other Fixed Charges Between States and Between the Freight and Passenger Business.*

*Maintenance of Way & Structures:* This account includes all cost of repairs to and maintenance of roadway and track, bridges, trestles, culverts, Fences, etc., also material and supplies used in repairing same, and supervision. This expense is practically all localized and is charged to the State in which the expense is incurred. The total charge to Maintenance of Way & Structures is divided between freight and passenger upon the basis of the number of train miles in each class of service.

*Maintenance of Equipment:* This account includes all cost of repairs, renewals and depreciation of cars and locomotives also shop machinery and tools. The cost of repairs, renewals and depreciation of equipment being of a general nature and not applicable to any particular State is divided between all States upon the basis of the mileage of each class of service in each state. The cost of repairs to shop machinery and tools, stationery and printing and supervision is divided between States upon the basis of the total engine mileage over the territory under the jurisdiction of each shop superintendent. The cost of repairs to freight and passenger cars are compiled separately and all expense of a common nature is divided between freight and passenger upon the basis of the number of train miles in each class of service.

*Traffic Expenses:* Traffic expenses include salaries and expense of officers and employés directly in charge of traffic; General Commercial, district and other agents engaged exclusively in soliciting traffic; Advertising; Immigration Bureal, etc. Salaries and expenses of General Officers and Agents and all traffic expenses of a general nature are divided between States upon the basis of the gross earnings in each State. The expense of officers and employés having charge of both freight and passenger business, is divided between the freight and passenger service in proportion to the amount of work done for each.

*Station Service:* Station Service includes, the wages of Station Employés, Station Supplies and Expenses and Telegraph and Telephone expense. This expense is practically all local and is charged to the State in which the expense is incurred. Wages of employés at and expenses of stations handling both freight and passenger business are divided 75% freight and 25% passenger which is approximately the proportion of revenue of each class of business.

*Yard Service:* Yard Service includes the wages of all yardmen, yard enginemen and oil and fuel for yard locomotives and like the station service is localized. The total charge to yard service is divided 95% freight and 5% passenger. This is the proportion of yard engine mileage in each class of service.

*Train Service:* Train Service includes the wages of Trainmen and Oil and Other Train Supplies. The wages of trainmen are divided between States upon the actual mileage of each run in each State. The cost of supplies is divided between States upon the basis of the car mileage in each State. The cost of each class of service is ascertained and compiled separately, the mixed train expense being divided 75% freight and 25% passenger.

5252

*Engine Service:* Engine Service includes the wages of enginemen, fuel, water and other supplies furnished locomotives and enginehouse expense. The wages of engine crews are divided between States upon the actual mileage of each run in each State. Enginehouse expense is charged to the State in which the enginehouse is located. The cost of each class of engine service is ascertained and compiled separately, the mixed train expense being divided 75% freight and 25% passenger. Water and other supplies and enginehouse expense is divided between freight and passenger upon the basis of the number of train miles in each class of service.

*Other Transportation Expense:* Other expenses include Superintendence, Miscellaneous Labor and Supplies, Wrecks, and Casualties. Salaries and expenses of division officers are divided between States upon the basis of the mileage of line under their supervision in each State. Miscellaneous labor and supplies which cannot be localized are divided between States upon the basis of the mileage of the lines benefited. Wrecks and casualties are charged to the State in which the loss occurs. Items included in Other Expenses which are of a common nature are divided between freight and passenger upon the basis of the number of train miles in each class of service.

*General Expenses:* General Expenses include the salaries and expenses of General Officers, their clerks and attendants, general office supplies and expenses, Law expenses, etc. This expense is divided between States upon the basis of the gross earnings in each State and between freight and passenger upon the basis of the number of train miles in each class of service.

*Hire of Equipment:* This account includes the amount of Rentals, Mileage or Per Diem paid for the use of equipment belonging to other companies, less the amount received from other companies for the use of our equipment. This item is divided between States upon the basis of the total mileage of each class of equipment in each State. The net rental paid for passenger equipment is charged to the passenger service. The net rental paid for freight equipment is charged to the freight service, and the net rental paid for hire of locomotives is divided between freight and passenger upon the basis of the number of train miles in each class of service.

*Taxes:* The total amount of taxes paid in each State is divided between freight and passenger upon the basis of the gross earnings of each class of service.

*Rentals:* This account represents the net amount paid for the use of main tracks, side tracks and spurs belonging to other companies. It is charged or credited to the State in which the track is located and divided between the freight and passenger upon the basis of the gross earnings of each class of service.

| 50% extra cost for freight only | 0.78% | 0.77% | 0.65% |

NOTE.—This is a revision of Exhibit No. 3, paragraph- C, D, and G, based on additional Assessments. The value of the property used in this statement is double the assessment as shown in Exhibit 7*a*.

5259 Endorsed: Filed June 8th, 1910. W. P. Feild, Clerk, By W. Presley Feild, D. C.

Another basis for ascertaining the cost of handling Intrastate business, and for determining whether the same is profitable or not was laid down by Judge Willis Van Davanter of the United States Circuit Court, and upon the results shown by the adoption of that basis, a temporary injunction was granted. In granting the restraining order, Judge Van Davanter said:

"Here the additional cost is shown to be at least 100% in freight traffic and at least 15% in passenger traffic, and this is not more than what has been shown in other cases. Undoubtedly these differences furnish a standard by which to apportion the total cost between the traffic which is intrastate and that which is interstate. Other standards are suggested, but the proofs indicate that none of them is as satisfactory or accurate as is the difference in cost in its relation to the revenue."

This basis is shown in detail in Statement No. 1 and the result of applying this basis to the figures of the St. Louis, Iron Mountain & Southern Railway Company is as follows:

| | Freight. | Passenger. |
|---|---|---|
| Intrastate Revenue | $640,248.17 | $836,542.20 |
| Operating Expenses | 791,310.15 | 865,571.12 |
| Deficit | $151,061.98 | $29,028.92 |
| Return at six per cent upon the assessed value of the property | $184,911.34 | $202,326.15 |
| Deficit | $335,973.32 | $231,355.07 |

At an extra cost on Intrastate traffic of 50% instead of 100% as shown in paragraph F of Statement attached, the result is:

DARK PAGE

| | Freight. | Passenger. |
|---|---|---|
| Intrastate Revenue | $640,248.17 | $836,542.20 |
| Operating Expenses | 630,705.97 | 865,571.12 |
| Surplus | $9,542.20 | |
| Deficit | | $29,028.92 |
| Return at rate of 6% on the Assessed valuation | $147,421.14 | $202,326.15 |
| Deficit | $137,878.94 | $231,355.07 |

5262

STATEMENT No. 1.

St. Louis, Iron Mountain & Southern Railway Company.

State of Arkansas.

*Basis for Ascertaining the Cost of State Business, Adopted by Judge Willis Van Davanter in the Arkansas R. Rates Case,* 163 *Fed. Rep.,* 142.

After setting aside a proportion of the total operating expense to cover the cost of miscellaneous business, (this proportion based upon the percentage of miscellaneous earnings to the total earnings) "Increase the intrastate earnings by the ascertained percentage representing the difference in cost, thereby ascertaining what would have been earned by the same actual expenditure in conducting the intrastate traffic, had it been attended with the same relative cost as the interstate traffic. Then add the intrastate earnings, as so increased, to the interstate earnings, thereby ascertaining what would have been earned by the actual expenditure in conducting both the intrastate and the interstate traffic, had the former been attended with the same relative cost as the latter. Then ascertain what proportion of this total represents the intrastate earnings, as so increased, and what proportion

represents the interstate earnings, and then ascertain the corresponding proportion of the total cost of the intrastate and the interstate traffic."

The assessed valuation of the Company's property should be multiplied by two, and the amount thus ascertained should be divided between the various classes of business on the basis of the cost to operate each class of business.

Applying this basis to the revenue and expenses for the State of Arkansas, there is this result:

(A) Revenue.

| | Freight. Amount. | Freight. Per cent. | Passenger. Amount. | Passenger. Per cent. |
|---|---|---|---|---|
| Intrastate | $640,248.17 | 13.08 | $836,542.20 | 47.03 |
| Interstate | 4,133,210.33 | 84.41 | 568,476.21 | 31.96 |
| Miscellaneous | 122,814.41 | 2.51 | 373,785.47 | 21.01 |
| Total | $4,896,272.91 | 100.00 | $1,778,803.88 | 100.00 |
| (B) Expenses including | | | | |
| Taxes and Rentals | $3,432,065.11 | | $1,743,236.33 | |
| Expenses of Miscellaneous Traffic: | | | | |
| Freight 2.51% | 86,144.83 | | | |
| Passenger 21.01% | | | 366,253.96 | |
| Balance | $3,345,920.28 | | $1,376,982.37 | |

| | | Freight. | Per cent. | Passenger. | Per cent. |
|---|---|---|---|---|---|
| (C) Intrastate Revenue | | $640,248.17 | ..... | $836,542.20 | ..... |
| Increase representing extra cost: | | | | | |
| Freight | 100% | 640,248.17 | ..... | ..... | ..... |
| Passenger | 15% | ..... | ..... | 125,481.33 | ..... |
| Total | | $1,280,496.34 | 23.65 | $962,023.53 | 62.86 |
| Interstate Revenue | | 4,133,210.33 | 76.35 | 568,476.21 | 37.14 |
| Grand Total | | $5,413,706.67 | 100.00 | $1,530,499.74 | 100.00 |

(D) The total expense shown in paragraph B, divided on percentages shown above are as follows:

| Freight. | Amount. | Per cent. | |
|---|---|---|---|
| Intrastate | $791,310.15 | 15.29 | |
| Interstate | 2,554,610.13 | 49.36 | |
| Total | $3,345,920.28 | | |
| Miscellaneous | 86,144.83 | 1.66 | |
| Total Freight | $3,432,065.11 | | 66.31 |

| | | | |
|---|---|---|---|
| Passenger. | | | |
| Intrastate | $865,571.12 | 16.73 | |
| Interstate | 511,411.25 | 9.88 | |
| Total | $1,376,982.37 | | |
| Miscellaneous | 366,253.96 | 7.08 | |
| Total Passenger | $1,743,236.33 | | 33.69 |
| Grand Total | $5,175,301.44 | | 100.00 |

(E) The assessment of the State Board of Equalization is $20,156,022.00; twice this amount is $40,312,044.00 and 6% on this amount for six months is $1,209,361.32. Dividing these amounts between each class of traffic on per cents shown above, the result is as follows:

| | Assessed valuation. | Assessed valuation for six months. | Six per cent on valuation for six months. |
|---|---|---|---|
| Freight. | | | |
| Intrastate | $6,163,711.53 | $3,081,855.77 | $184,911.34 |
| Interstate | 19,898,024.92 | 9,949,012.46 | 596,940.75 |
| Miscellaneous | 669,179.93 | 334,589.96 | 20,075.40 |
| Passenger. | | | |
| Intrastate | 6,744,204.96 | 3,372,102.48 | 202,326.15 |
| Interstate | 3,982,829.95 | 1,991,414.97 | 119,484.90 |
| Miscellaneous | 2,854,092.71 | 1,427,046.36 | 85,622.78 |
| Grand Total | $40,312,044.00 | $20,156,022.00 | $1,209,361.32 |

DARK PAGE B

(F) If the extra cost of handling Intrastate freight is found to be 50% instead of 100%, then the result would be as follows:

| | | Freight. | Per cent. | Passenger. | Per cent. |
|---|---|---|---|---|---|
| Intrastate Revenue | | $640,248.17 | ..... | $836,542.20 | ..... |
| Increase representing extra cost: | | | | | |
| Freight | 50% | 320,124.08 | ..... | ..... | ..... |
| Passenger | 15% | ..... | ..... | 125,481.33 | ..... |
| Total | | $960,372.25 | 18.85 | $962,023.53 | 62.86 |
| Interstate Revenue | | 4,133,210.33 | 81.15 | 568,476.21 | 37.14 |
| Grand Total | | $5,093,582.58 | 100.00 | $1,530,499.74 | 100.00 |

The total expense shown in paragraph B, divided on percentages shown above is as follows:

| Freight. | Amount. | Per cent. | |
|---|---|---|---|
| Intrastate | $630,705.97 | 12.19 | |
| Interstate | 2,715,214.31 | 52.46 | |
| Total | $3,345,920.28 | | |
| Miscellaneous | 86,144.83 | 1.66 | |
| Total Freight | $3,432,065.11 | | 66.31 |

| | | | |
|---|---|---|---|
| Passenger. | | | |
| Intrastate | $865,571.12 | 16.73 | |
| Interstate | 511,411.25 | 9.88 | |
| Total | $1,376,982.37 | | |
| Miscellaneous | 366,253.96 | 7.08 | |
| Total Passenger | $1,743,236.33 | | 33.69 |
| Grand Total | $5,175,301.44 | | 100.00 |

Dividing the State's valuation of $40,312,044.00 between each class of traffic on the per cents shown above, the result is as follows:

| Freight. | Assessed valuation. | One-half valuation. | Six per cent for six months on valuation. |
|---|---|---|---|
| Intrastate | $4,914,038.17 | $2,457,019.09 | $147,421.14 |
| Interstate | 21,147,698.28 | 10,573,849.14 | 634,430.95 |

5275 EXHIBIT EIGHT.

5276 EXHIBIT No. 8.

St. Louis, Iron Mountain & Southern Railway Company.

*Statement of the Earnings and Expenses of the St. Louis, Iron Mountain & Southern Railway Company in the State of Arkansas for Six Months Ending June 30th, 1907.*

A. The Gross Revenue of the St. Louis, Iron Mountain & Southern Railway Company in the State of Arkansas, for the period mentioned above, is as follows:

| | Amount. | Per cent of Freight revenue. | Per cent of All revenue. |
|---|---|---|---|
| Intrastate Freight | $544,929.60 | 11.52% | 8.46% |
| Interstate Freight | 4,143,101.79 | 87.60 | 64.30 |
| Miscellaneous Freight | 41,381.25 | 0.88 | 0.64 |
| Total | $4,729,412.64 | 100.00 | 73.40 |
| | | Per cent of passgr. earnings. | |
| Intrastate Passenger | $726,679.60 | 42.40% | 11.28% |
| Interstate Passenger | 623,402.50 | 36.37 | 9.67 |
| Misc'l. Passenger | 363,927.18 | 21.23 | 5.65 |
| Total | $1,714,009.28 | 100.00 | 26.60 |
| Grand Total | $6,443,421.92 | ..... | 100.00 |

B. The total Operating Expenses and Fixed Charges of the St. Louis, Iron Mountain & Southern Raailway Company in the State of Arkansas, for the period mentioned, are as follows:

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Maint. of Way & Struct. | $384,112.07 | $314,398.01 | $698,510.08 |
| Maint. of Equipment | 741,481.50 | 314,933.05 | 1,056,414.55 |
| Traffic Expenses | 79,901.77 | 53,731.08 | 133,632.85 |
| Transportation Expenses | 1,424,342.53 | 624,662.70 | 2,049,005.23 |
| General Expenses | 165,636.50 | 119,746.82 | 285,383.32 |
| Total | $2,795,474.37 | $1,427,471.66 | $4,222,946.03 |
| Taxes | $147,891.55 | $53,212.00 | $201,103.55 |
| Rentals | 18,657.33 | 6,712.99 | 25,370.32 |
| Grand Total | $2,962,023.25 | $1,487,396.65 | $4,449,419.90 |

C. The assessment of the State Board of Equalization, for the purpose of taxation was $20,156,022.00, and, if multiplied by two and divided between the freight and passenger traffic in proportion to the gross earnings of each class of traffic, would be as follows:

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Total Assessed Valuation for six months | $14,822,738.58 | $5,333,283.42 | $20,156,022.00 |
| Six Per cent Interest on above | 889,364.31 | 319,997.01 | 1,209,361.32 |
| Seven Per cent Interest | 1,037,591.70 | 373,329.84 | 1,410,921.54 |
| Eight Per cent Interest | 1,185,819.09 | 426,662.67 | 1,612,481.76 |

5277

D. Recapitulation—Total Business—State of Arkansas.

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Gross Revenue | $4,729,412.64 | $1,714,009.28 | $6,443,421.92 |
| Operating Expenses | 2,795,474.37 | 1,427,471.66 | 4,222,946.03 |
| Net Operating Revenue | $1,933,938.27 | $286,537.62 | $2,220,475.89 |
| Less Taxes and Rentals | 166,548.88 | 59,924.99 | 226,473.87 |
| Balance | $1,767,389.39 | $226,612.63 | $1,994,002.02 |
| Per cent of return on the assessed value of the property after deducting Taxes and Rentals | 11.92% | 4.25% | 9.89% |

E. Results for the year ending December 31st, 1907—Total Business.

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Surplus six months ending June 30th, 1907 | $1,767,389.39 | $226,612.63 | $1,994,002.02 |
| Surplus six months ending December 31st, 1907 | $1,464,207.80 | $35,567.55 | $1,499,775.35 |
| Total | $3,231,597.19 | $262,180.18 | $3,493,777.37 |
| Return on the assessed value of the property | 10.91% | 2.45% | 8.67% |

F. The Intrastate gross freight and passenger revenue for the period shown above is as follows:

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Gross Revenue | $544,929.60 | $726,679.60 | $1,271,609.20 |
| Operating Expenses including Taxes and Rentals | 341,225.08 | 630,656.18 | 971,881.26 |
| Leaving | $203,704.52 | $96,023.42 | $299,727.94 |

From the sums thus left there should be deducted such amounts as the Court may find to represent the extra cost of handling Intrastate traffic. This extra cost is shown under various percentages in statements attached, and the result of deducting the extra cost is as follows:

| | Freight. | | Passenger. |
|---|---|---|---|
| Balance, after deducting taxes and rentals | $203,704.52 | | $96,023.42 |
| Extra cost @ 50% | 134,741.86 | Extra cost @ 15% | 49,105.03 |
| Surplus | $68,962.66 | Surplus | $46,918.39 |
| Extra cost @ 100% | $255,506.36 | Extra cost @ 25% | $78,796.44 |
| Deficit | $51,801.84 | Surplus | $17,226.98 |
| Extra cost @ 150% | $364,529.86 | Extra cost @ 35% | $106,203.89 |
| Deficit | $160,825.34 | Deficit | $10,180.47 |
| Extra cost @ 200% | $463,210.10 | Extra cost @ 50% | $143,746.40 |
| Deficit | $259,505.58 | Deficit | $47,722.98 |

5278 G. Assuming that the property is worth at least the amount of the State's valuation for purposes of taxation, and dividing that valuation on the basis of revenue, the amount to be assigned to each class of traffic is as follows:

| | |
|---|---|
| Freight | 11.52% of $14,822,738.58 or $1,707,579.48. |
| Passenger | 42.40% of $5,333,283.42 or $2,261,312.17. |

Allowing 50% for the extra cost of handling State freight and 15% for handling State passengers, the return upon the value of the property would be as follows:

Freight.....4.04% Passenger..... 2.07% Total..... 2.92%

H. Results for the year ending December 31st, 1907, Intrastate Traffic.

| | | Freight. | Passenger. | Total. |
|---|---|---|---|---|
| Surplus six months ending June 30th, 1907 | | $203,704.52 | $96,023.42 | $299,727.94 |
| Surplus six months ending December 31st, 1907 | | 191,334.05 | 16,698.16 | 208,032.21 |
| Total | | $395,038.57 | $112,721.58 | $507,760.15 |
| Extra cost: | | | | |
| Freight | 50% | $308,128.62 | $107,673.86 | $415,802.48 |
| Passenger | 15% | ..... | ..... | ..... |
| Balance | | $86,909.95 | $5,047.72 | $91,957.67 |

Making no allowance for extra cost, the return upon the State's valuation is:

Freight..... 10.84% Passenger..... 2.35% Total..... 6.02%

Allowing 50% for the extra cost of Intrastate freight and 15% for passenger, the return upon the State's valuation is:

Freight..... 2.39% Passenger..... 0.11% Total..... **1.09%**

# CIRCULAR No. 360

(Cancels Circular No. 344)

## Rules for Assigning Operating Expenses to State Accounting Divisions and Dividing the Same Between "Freight" and "Passenger."

St. Louis, Mo., July 1, 1907.

### STATE ACCOUNTING DIVISIONS.

1. Effective with the month of July, 1907, the accounts of the company will be kept by four accounting divisions, viz.: Illinois, Missouri, Arkansas and Louisiana. The assignment of operating expenses to state accounting divisions must be made strictly in accordance with the rules herein prescribed, except when otherwise specially instructed.

2. Operating expenses that are common to the entire line must be designated "Common to entire Line," and such items will be divided between state accounting divisions by the Accounting Department.

3. Operating expenses that can be localized to one or more state accounting divisions, and are not common to the entire line, must be assigned to the proper state accounting divisions direct, on the bases herein given.

### DIVISION BETWEEN FREIGHT AND PASSENGER.

4. All operating expenses must be divided between "Freight" and "Passenger," after the assignment to state accounting divisions has been made. Items of operating expenses pertaining exclusively to freight business, or to passenger business, must be assigned direct to "Freight" or "Passenger," as the case may be; items which cannot be classed as exclusively "Freight" or "Passenger" must be designated "Common" and such items will be divided by the Accounting Department.

5. It is important that the division of operating expenses between "Freight" and "Passenger" be made very carefully. All concerned must bear in mind that while the figures obtained under these rules give approximate results only, they are to be used for the purpose of developing operating efficiency.

6. In the right-hand column of this circular, opposite each account, is indicated the assignment of the same with reference to "Freight" or "Passenger." Where the word "Direct" is shown, items must be directly assigned to "Freight" or "Passenger," as the case may be; all other items must be designated "Common," as indicated.

| Accounts | Between State Accounting Divisions | Between Freight and Passenger |
|---|---|---|
| **MAINTENANCE OF WAY AND STRUCTURES—** | | |
| 1. Superintendence | Divide on basis of track miles over which the employes whose wages are charged to this account have jurisdiction (excluding Illinois Division). When jurisdiction covers the entire line, designate "Common to Entire Line" | Common. |
| 2. Ballast | Localize | Common. |
| 3. Ties | Localize | Common. |
| 4. Rails | Localize | Common. |
| 5. Other Track Material | Localize | Common. |
| 6. Roadway and Track | Localize | Common. |
| 7. Removal of Snow, Sand, and Ice | Localize | Common. |
| 8. Tunnels | Localize | Common. |

5321 EXHIBIT 19.

St. Louis Southwestern Railway Company.

*Statement of Ton-miles of Commercial Freight Handled on All Through and Local Trains in the State of Arkansas, Revenue Therefrom, Train Cost (Wages and Fuel), Divided Between "State" and "Inter-State," During Month of October,* 1908.

Through Trains.

| | State. | Interstate. | Total. |
|---|---|---|---|
| Commercial Ton Miles | 296,723 | 26,850,904 | 27,147,627 |
| Revenue | $6,794.96 | $257,768.68 | $264,563.64 |
| *Wages and Fuel | 610.96 | 22,887.65 | 23,498.61 |
| Avg. Cost (Wages and Fuel) per ton, per mile | 0.002059 | 0.000852 | 0.000865 |

Local Trains.

| | State. | Interstate. | Total. |
|---|---|---|---|
| Commercial Ton Miles | 1,084,580 | 2,236,361 | 3,320,941 |
| Revenue | $24,836.88 | $21,468.06 | $46,304.94 |
| *Wages and Fuel | 6,963.01 | 5,931.46 | 12,894.47 |
| Avg. Cost (Wages and Fuel) per ton, per mile | 0.006420 | 0.002652 | 0.003883 |

All Trains.

| | State. | Interstate. | Total. |
|---|---|---|---|
| Commercial Ton Miles | 1,381,303 | 29,087,265 | 30,468,568 |
| Wages and Fuel | $7,573.97 | $28,819.11 | $36,393.08 |
| Avg. Cost (wages and fuel) per ton mile | 0.005483 | 0.000991 | 0.001194 |

Cost per State ton-mile greater than Interstate ..... 5.5 Times.

*Divided between State and Interstate on basis of straight Revenue earned by each class of trains with no allowance for Extra Cost of handling State Freight.

NOTE.—Wages and Fuel sub-divided are as follows:

| | Through trains. | Local trains. |
|---|---|---|
| Wages of Enginemen | $5,182.29 | $2,665.60 |
| Wages of Trainmen | 7,744.39 | 4,616.81 |
| Overtime | 698.53 | 1,743.34 |
| **Fuel** | 9,873.40 | 3,868.72 |
| | $23,498.61 | $12,894.47 |
| Per Cent of overtime to total wages | 5% | 19% |

5331 EXHIBIT 23.

Question by Judge HILL:

I will ask you to work out the following example for me, using the Revenue Basis, as you have used it in your exhibit:

Assume that the entire revenue from Freight in the State was $100,00-.00; entire expenses in the State $70,-000.00; interstate freight revenue, $85,000.00; state revenue $15,000.00;

Then calculate the amount of expense charg-able to State business and the amount of expenses charg-able to Interstate business;

Then, assume that intrastate rates are increased 33⅓%;

Then make the same calculation showing what amount is charg-able to State business and what to interstate, assuming that the $70,000.00 expense account would remain stationary and that the other rates would remain stationary, except the changes I have indicated.

Also, under Judge Van Devanter's Rule, assuming 100% more cost for State Freight operations.

5332-5349 Ex. 23.

*Answer to Judge Hill's Example.*

| Item. | Per cent. | Amount on straight rev. basis. | Amount under Judge Van De Vanter's theory of 100% extra cost for State business. |
|---|---|---|---|
| State Freight Revenue | 15 | $15,000.00 | ..... |
| Interstate Freight Rev | 85 | 85,000.00 | ..... |
| | 100 | $100,000.00 | ..... |
| State Freight Expenses | 15 | $10,500.00 | 18,200.00— 26% |
| Interstate Freight Exps | 85 | 59,500.00 | 51,800.00— 74% |
| | 100 | $70,000.00 | $70,000.00—100% |

*State Freight Revenue Increased 33⅓% with no Corresponding Increase in Interstate Revenue.*

| | | | |
|---|---|---|---|
| State Freight Revenue..... | 19 | $20,000.00 | ..... |
| Interstate Freight Rev..... | 81 | 85,000.00 | ..... |
| | 100 | $105,000.00 | ..... |
| State Freight Expenses..... | 19 | $13,300.00 | $22,400.00— 32% |
| Interstate Freight Exps..... | 81 | 56,700.00 | 47,600.00— 68% |
| | 100 | $70,000.00 | $70,000.00—100% |

*Formula for Adding 100% Extra Cost.*

| | | | | |
|---|---|---|---|---|
| 15% x 2 = | 30 = | 26 | difference..... | 11%+ |
| 85% | 85 = | 74 | " ..... | 11%— |
| 100% | 115 | 100 | | |
| 19% x 2 = | 38 = | 32% | difference..... | 13%+ |
| 81% | 81 = | 68% | " ..... | 13%— |
| 100% | 119 | 100% | | |

5370 EXHIBIT THIRTY-SIX.

5371 *Document No.* 750.

Pacific Express Company and The Missouri Pacific Railway Company.

*Contract Providing Facilities for the Transportation of Express Matter Over Lines of the Railway Company.*

Dated May 1st, 1886; Expires May 1st, 1896.

General Auditor's Contract No. 503.

This Agreement, Entered into this first day of May, A. D. eighteen hundred and eighty-six, between The Missouri Pacific Railway Company, a corporation organized under the laws of the State of Missouri, for themselves and for all lines owned, operated or controlled by them, party of the first part, and the Pacific Express Company, a corporation organized under the laws of the State of Nebraska, party of the second part; witnesseth:

5372 That Whereas, the party of the first part now owns and is engaged in operating lines of railroad extending from St. Louis, Mo., to Texarkana and to Omaha, Nebraska, and diverging lines;

And Whereas, the party of the second part is an Express Company having a large and established business between the principal commercial cities of the east and various places upon the lines of said railroad, and points beyond such lines of railroad;

And Whereas, the party of the second part is desirous of securing for the benefit of itself and the persons employing it, permanent and reliable facilities for the transportation of its express matter, and the party of the first part is desirous of securing the business and patronage of the party of the second part;

It is agreed as follows:

First. The party of the first part agrees to provide, on each of its daily passenger trains, sufficient facilities of the kind customarily furnished to express companies by railroad companies for the transportation of all freight and express matters which may be tendered to them by the party of the second part for transportation upon any of their daily passenger trains, at any station at which such trains may stop, and to receive and transport such freight and express matter upon the said passenger trains leaving such station next after said tender, and carry and deliver the same without delay. But the carriage of more than one carload of express matter by any one passenger train, shall for convenience, be at the option of the party of the first part.

Second. The party of the second part shall be entitled to send free both ways, all its messengers' safes and empty packing trunks,

5373 and shall also have the privilege to send free of charge one person, with each car, as messenger, to take charge of its

property, and the property confided to it for carriage, and when necessary an additional messenger, armed as guard, for protection against highway robbers. Such messengers shall ride in the car provided by the party of the first part for the carriage of the goods in their charge. The agents of the party of the second part shall be carried free of charge on the passenger trains of the party of the first part, whenever such agents are traveling on the business of the party of the second part.

In case the cars for the transportation of express matter are furnished by the party of the second part, the said second party shall be entitled to receive from the party of the first part, such compensation for said cars, as is the customary mileage paid by said first party to connecting railways for similar cars.

Third. The party of the first part agrees to employ the party of the second part, exclusively, to receive, take charge of and deliver all money, remittances, packages and parcels which they may require to have sent or delivered on the line of its railway, by express, such service to be compensated as hereinafter provided.

Fourth. Settlements shall be made monthly, and the party of the first part shall be entitled to receive fifty (50) per cent of the total gross earnings of the party of the second part on the lines of the said first party's railroad.

Fifth. The party of the second part shall at all times be entitled to have its necessary equipment material transported free on freight trains, as compensation for receiving, caring for, and delivering the money, remittances, packages and parcels of the party of the first part, and shall not make any other charge for such services.

5374 Sixth. The party of the second part shall have the right to employ the agents and servants of the party of the first part as its own agents when such employment will, in the opinion of the parties of the first part not be to the interruption or detriment of their business. It is understood that in the case of such employment, the party is the exclusive employé of the party of the first part, as to any shipment to be made on account of said first party, until it is delivered to an exclusive employé of the party of the second part.

Seventh. This contract is to supersede and cancel and is a settlement in full for all existing contracts between the parties hereto, and shall be binding for ten (10) years from the first day of May, 1886, and shall apply to all lines of railroad now owned, operated or controlled by the party of the first part and also to such as may be owned, operated or controlled by them during the period of this contract.

The said second party in consideration of this contract, and the rights and privileges accorded by it, agrees to give to the said party of the first part $2,400,000.00 of its capital stock (and it is agreed that the capital stock of the second party shall not be increased above $6,000,000.00 without the consent of the first party).

Eighth. The party of the first part also agrees not to engage during the last named period in the Express business, nor to employ any other Express Company or individual in the carriage of its money,

remittances, packages, parcels or goods by express, and that they will not permit any of their employes, to receive, carry or deliver express matter except as hereinbefore provided. They also agree that they will not during such period give to any other person, firm, company or corporation any better or more advantageous terms, rates or facilities than they give to the party of the second part, and
5375 they will so far as they lawfully may, during all such period, protect and forward the interest and business of the party of the second part.

Ninth. The party of the first part in consideration of the payments received and hereafter to be received, and the benefits to be derived from this agreement, hereby appoints and constitutes the said party of the second part its sole agent to manage and carry on the express business of its lines of railway, and should any portion of said Railway be occupied by any other express company or firm, then such payments as may be received from such other express company or firm shall be considered gross earnings of said party of the second part, and treated as such.

EXHIBIT FIFTY-FIVE.

EXHIBIT No. 55.

St. Louis, Iron Mountain & Southern Railway Company.

*Results of Operation in Intrastate Traffic in Arkansas for Six Months Ending December 31, 1907, Using the Basis Outlined by Judge Farrington in the Case of Southern Pacific Company vs. Bartine et al.* (170 *Federal Reporter*, 725).

| | | Total operating expenses. | | Freight operating expenses. |
|---|---|---|---|---|
| Transportation and Hire of Equipment | | $2,404,802.34 | $553,395.11 | $1,755,255.76 |
| Maintenance of Way | $1,054,676.51 | | 723,431.33 | |
| Maintenance of Equipment | 1,035,566.07 | | 88,734.42 | |
| Traffic | 142,010.50 | | 132,218.24 | |
| General Expenses | 292,985.43 | | ..... | |
| Dining Car Service—Bal. | 1,183.90 | 2,526,422.41 | | 1,497,779.10 |
| Total | | $4,931,224.75 | | $3,253,034.86 |
| Transportation Expense to Earnings | | 36.03% | | 35.85% |
| Other Operating Expense to Earnings | | 37.85% | | 30.59% |
| Total Expense to Earnings | | 73.88% | | 66.44% |

The Transportation cost of the total Traffic is 100.50% of the Transportation cost of the freight traffic.
The Transportation cost per ton per mile is $1,755,255.76 ÷ 660,163,995, or $0.0026588+. This figure multiplied by 100.5 is equal to $0.0026721 and represents the average cost of hauling one ton of freight one mile, and

this figure multiplied by three is equal to $0.008016 and represents the transportation cost of intrastate traffic per ton per mile.

The total number of ton miles of Intrastate freight was 47,860,299. Multiplying the average cost per ton mile ($0.008016) by the ton miles results in a charge of $383,648.16.

The average cost per ton mile for other operating Expenses is $1,497,779.10 ÷ 660,163,995, or $0.022688. Multiplying this amount by the number of ton miles of state freight results in a charge of $105,585.45 for state traffic.

*Recapitulation.*

| | | |
|---|---|---|
| Total revenue from Intrastate traffic, including Miscellaneous | | $656,717.58 |
| Transportation Expenses | $383,648.16 | |
| Other Operating Expenses | 108,585.45 | |
| Taxes and Rentals | 24,007.96 | |
| | | 516,241.57 |
| Net earnings, Intrastate freight | | $140,476.01 |
| Net earnings, intrastate passenger, as shown in Exhibit 3 on straight revenue basis | | 16,698.16 |
| Total net earnings, intrastate traffic | | $157,174.17 |
| Per cent of return on 1907 valuation of property | | 3.51% |
| Per cent of return on 1909 valuation of property | | 2.92% |

Endorsed: Filed June 8th, 1910. W. P. Feild, Clerk. By W. Presley Feild, D. C.

## EXHIBIT FIFTY-SIX.

## EXHIBIT No. 56.

St. Louis, Iron Mountain & Southern Railway.

State of Arkansas.

*Statement Showing the Results of Operation on the St. L. I. M. & S. Ry. in the State of Arkansas for the Period of Six Months Ended December 31, 1907, on the Bases Outlined in the State's Exhibits "J," "K," "N," "O," and "Y," with Certain Revisions.—Freight Service.*

1. Maintenance of Equipment.

(*a*) Locomotives:

This account divided on the basis outlined in the State's exhibit is as follows:

| | | | |
|---|---|---|---|
| Yard Locomotive mileage | 130,150 | | |
| 50% added for extra repairs | 65,075 | 195,225 | 37.64% |
| Local Locomotive mileage | 70,583 | | |
| 75% added for extra mileage and repairs | 52,937 | 123,520 | 23.81 |
| Through Locomotive Mileage | | 199,981 | 38.55 |
| | | 518,726 | 100.00% |

| | Percentage. | Amount. |
|---|---|---|
| Yard Service | 37.64% | $69,135.80 |
| Local Service | 23.81 | 43,733.35 |
| Through Service | 38.55 | 70,807.25 |
| Total | 100.00 | $183,676.40 |

The expense of Maintenance of Yard Locomotives ($69,135.80) divided between state and interstate on the basis of the number of tons handled in the month of October, 1907, as shown in Exhibit No. 26, is as follows:

| | Percentage. | Amount. |
|---|---|---|
| Intrastate | 21.15% | $14,622.22 |
| Interstate (including transstate) | 78.85 | 54,513.58 |
| Total | 100.00 | $69,135.80 |

(*b*) Freight Cars:

The cost of repairs to freight cars divided on the basis used by the state, with the percentages revised to agree with the testimony of Mr. W. H. V. Rosing (page 235) is as follows:

| | | |
|---|---|---|
| Stopping and Starting | 32% | $152,926.60 |
| Terminal Handling | 23 | 109,916.00 |
| Other Expenses | 45 | 215,053.04 |
| Total | 100 | $477,895.64 |

Dividing each of the sub-divisions shown above on the basis adopted by the State and using other percentages, results in the following charge to Local and Through trains:

| Stopping and starting expenses: | Local. | Through. | Total. |
|---|---|---|---|
| Car Miles | 1,173,350 | 6,532,646 | 7,705,996 |
| Same, with local car miles multiplied by eight | 9,386,800 | 6,532,646 | 15,919,446 |
| Percentage of each | 58.96% | 41.04% | 100.00% |
| Expenses—Divided on above percentages | $90,165.52 | $62,761.08 | $152,926.60 |

| | | | |
|---|---|---|---|
| Terminal handling: | | | |
| Car Miles as above | 1,173,350 | 6,532,646 | 7,705,996 |
| Same, with local car miles multiplied by two | 2,346,700 | 6,532,646 | 8,879,346 |
| Percentage of each | 26.43% | 73.57% | 100.00% |
| Expenses—Divided on above percentages | $29,050.80 | $80,865.20 | $109,916.00 |

The balance of the expenses of freight car maintenance, is divided between local and through service in proportion to the number of car miles made in each class of service, as follows:

5728

| | Local. | Through. | Total. |
|---|---|---|---|
| Car Miles | 1,173,350 | 6,532,646 | 7,705,996 |
| Percentage of each | 15.22% | 84.78% | 100.00% |
| Expenses—Divided on above percentages | $32,731.07 | $182,321.97 | $215,053.04 |

The total cost of repairs to freight cars divided between local and through trains as shown above, is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Stopping and Starting | $90,165.52 | $62,761.08 | $152,926.60 |
| Terminal Handling | 29,050.80 | 80,865.20 | 109,916.00 |
| Other Expenses | 32,731.07 | 182,321.97 | 215,053.04 |
| Total | $151,947.39 | $325,948.25 | $477,895.64 |

(*c*) Supervision and General:

The total expenses under this head divided between local and through service and Intrastate and Interstate traffic on the basis of the direct charges as shown above, are as follows:

| | Direct charges. | Percentage. | Expenses. |
|---|---|---|---|
| Local trains | $195,680.74 | 29.58% | $18,297.98 |
| Through trains | 396,755.50 | 59.97 | 37,097.01 |
| Intrastate | 14,622.22 | 2.21 | 1,367.09 |
| Interstate | 54,513.58 | 8.24 | 5,097.21 |
| Total | $661,572.04 | 30 | $61,859.29 |

2. Traffic Expenses.

These expenses divided on the basis used by the State are as follows:

| | Freight revenue. | Percentage. | Amount. |
|---|---|---|---|
| Intrastate | $640,248.17 | 13.41% | $11,899.29 |
| Interstate | 4,133,210.33 | 86.59 | 76,835.13 |
| Total | $4,773,458.50 | 100.00 | $88,734.42 |

3. Transportation Expenses.

(*a*) Station Expenses:

This expense divided between Intrastate and Interstate traffic on the basis of the number of tons handled, assuming that each intrastate ton has two station handlings and 90% of the interstate tons has one and 10% has two station handlings, is as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Tons handled | 684,122 | 1,571,713 | 2,255,835 |
| Intrastate tons doubled to provide for two charges | 684,122 | ..... | 684,122 |
| 10% added to Interstate tons to provide for two charges | ..... | 157,171 | 157,171 |
| Total | $1,368,244 | $1,728,884 | $3,097,128 |
| | 44.18% | 55.82% | 100.00% |
| Station expenses divided on above percentages, are | $103,216.38 | $130,410.56 | $233,626.94 |

(*b*) Yard and Terminal Expenses:

These expenses divided between state and interstate traffic on the basis of the number of tons handled, as explained under the head of Maintenance of Yard Locomotives (1*a*.), is as follows:

| | Percentage. | Amount. |
|---|---|---|
| Intrastate | 21.15% | $62,042.99 |
| Interstate (including transstate) | 78.85 | 231,304.50 |
| Total | 100.00 | $293,347.49 |

5729 (c) Fuel and Locomotive Expenses:

These expenses, divided on the basis outlined in the State's exhibits, are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Engine Miles | 70,583 | 199,981 | 270,564 |
| Add 3½% to local engine miles to equalize fuel consumption | 2,470 | ..... | 2,470 |
| Total | 73,053 | 199,981 | 273,034 |
| Percentage of each | 26.76% | 73.24% | 100.00% |
| Expenses divided on above percentages | $59,301.61 | $162,303.79 | $221,605.40 |

(d) Enginehouse expenses—Road:

This expense divided on the basis used by the State is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Total Engine Miles | 70,583 | 199,981 | 270,564 |
| 12% added to Local Engine Miles to cover extra expenses. | 8,470 | ..... | 8,470 |
| Total | 79,053 | 199,981 | 279,034 |
| Percentage of each | 28.33% | 71.67% | 100.00% |
| Expenses divided on above percentages | $15,194.55 | $38,439.58 | $53,634.13 |

(*e*) Road Enginemen and Trainmen:

This expense is divided on the basis outlined in the State's exhibit "K" and is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Total amount, October, 1907 | $29,229.30 | $53,162.56 | $82,391.86 |
| Percentage of each | 35.47% | 64.53% | 100.00% |
| Expenses divided on above percentages | $165,866.65 | $301,758.52 | $467,625.17 |

(*f*) Other Train Expenses:

This expense divided on the basis outlined by the State is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Train Miles | 70,583 | 196,512 | 267,095 |
| Percentage of each | 26.42% | 73.58% | 100.00% |
| Expenses divided on above percentages | $34,957.06 | $97,355.81 | $132,312.87 |

(*g*) Loss and Damage—Freight:

The expenses under this head are divided between intrastate and interstate business on the basis of the actual claims paid during the month of October, 1907, as adopted by the State, and are as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Claims Paid | $4,840.10 | $15,087.48 | $19,927.58 |
| Percentage of each | 24.29% | 75.71% | 100.00% |
| Expenses divided on above percentages | $30,972.03 | $96,537.35 | $127,509.38 |

(*h*) Supervision and General:

These expenses divided between local, through, intrastate and interstate business on the basis of the direct charges to each of these classes, are as follows:

5730

| | Direct expenses. | Percentage. | Amount. |
|---|---|---|---|
| Local Trains | $275,319.87 | 18.00% | $8,352.53 |
| Through Trains | 599,857.70 | 39.21 | 18,194.58 |
| Intrastate Traffic | 196,231.40 | 12.83 | 5,953.49 |
| Interstate Traffic | 458,252.41 | 29.96 | 13,902.32 |
| Total | $1,529,661.38 | 100.00 | $46,402.92 |

4. Maintenance of Way & Structures.

5. General Expenses.

These expenses have no direct relation to any particular class of service nor to any other item of expense, if they are to be considered what the State's witnesses term "Overhead Expenses," then, following their plan, they should be divided between local, through, and intrastate and interstate business on the basis of the charges for all other expenses of these classes, and the result is as follows:

| | Direct expenses. | Percentages. | Maint. of way & struct. | General expenses. |
|---|---|---|---|---|
| Local Trains | $497,651.12 | 20.84 | $115,327.54 | $27,554.28 |
| Through Trains | 1,051,904.79 | 44.05 | 243,770.55 | 58,242.13 |
| Intrastate Traffic | 230,073.49 | 9.63 | 53,291.95 | 12,732.62 |
| Interstate Traffic | 608,600.65 | 25.48 | 141,005.07 | 33,689.21 |
| Total | $2,388,230.05 | 100.00 | $553,395.11 | $132,218.24 |

6. Total Train Costs.

The total cost of local and through trains divided between intrastate and interstate freight on the basis of the ton miles of each class of freight on each class of trains, as shown in the State's Exhibit "I," is as follows:

| | Percentages. | Amount. |
|---|---|---|
| Local Trains: | | |
| Intrastate | 28.51% | $182,615.94 |
| Interstate | 71.49 | 457,917.00 |
| Total | 100.00 | $640,532.94 |
| Through Trains: | | |
| Intrastate | 5.59 | $75,683.99 |
| Interstate | 94.41 | 1,278,233.48 |
| Total | 100.00 | $1,353,917.47 |

7. Miscellaneous Revenue, Taxes, Rentals, Hire of Equipment and Value of Property.

These expenses divided between state and interstate on the basis adopted by the state and by the railroad company in its exhibits, are as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Freight Revenue | $640,248.17 | $4,133,210.33 | $4,773,458.50 |
| Percentage of each | 13.41% | 86.59% | 100.00% |
| Division on these percentages: | | | |
| Miscellaneous Revenue | $16,469.41 | $106,345.00 | $122,814.41 |
| Taxes | 21,851.02 | 141,094.67 | 162,945.69 |
| Rentals | 2,156.94 | 13,927.62 | 16,084.56 |
| Hire of Equipment | 24,029.57 | 155,161.89 | 179,191.46 |
| **Assessed Value of Property Doubled (1907)** | **$1,966,586.20** | **$12,698,486.15** | **$14,665,072.35** |
| **Assessed Value of Property Doubled (1909)** | **$2,367,859.44** | **$15,289,556.23** | **$17,657,415.67** |

*Statement Showing the Results of Operation on the St. L., I. M. & S. Ry. in the State of Arkansas for the Period of Six Months Ended December 31, 1907, on the Bases Outlined in the State's Exhibits "L," "M," "N." and "O" with Certain Revisions.—Passenger Service.*

1. Maintenance of Equipment.

(*a*) Locomotives:

These expenses divided on a car mile basis, are as follows:

| | Car miles. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | 785,703 | 59.38% | $98,844.90 |
| Pullman | 279,878 | 21.15% | 35,206.63 |
| Mail | 148,194 | 11.20% | 18,643.70 |
| Express | 109,496 | 8.27% | 13,766.38 |
| Total | 1,323,271 | 100.00 | $166,461.61 |

(*b*) Passenger Train Cars:

This expense is divided between each class of service on the basis of the car miles, with various allowances on the basis of the testimony of Mr. W. H. V. Rosing. Page 243.

| | Car miles. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | 622,271 | 83.41% | $72,649.40 |
| 100% added for added cost | 622,271 | | |
| Baggage | 163,432 | | |
| Mail | 148,194 | 10.10 | 8,797.01 |
| 15% added for added cost | 22,229 | 6.49 | 5,652.74 |
| Express | 109,496 | | |
| Total | 1,687,893 | 100.00 | $87,099.15 |

(c) Supervision and General:

Expenses divided on the basis of the direct charges as shown above, are as follows:

| | Direct charges. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | $171,494.30 | 67.63% | $39,613.58 |
| Pullman | 35,206.63 | 13.89 | 8,135.93 |
| Mail | 27,440.71 | 10.82 | 6,337.70 |
| Express | 19,419.12 | 7.66 | 4,486.77 |
| Total | $253,560.76 | 100.00 | $58,573.98 |

## 2. Traffic Expenses.

These expenses divided between intrastate and interstate traffic on the basis of the gross earnings of each class, are as follows:

| | Gross earnings. | Percentages. | Expenses. |
|---|---|---|---|
| Intrastate | $836,542.20 | 59.54% | $31,720.58 |
| Interstate | 568,476.21 | 40.46 | 21,555.50 |
| Total | $1,405,018.41 | 100.00 | $53,276.08 |

## 3. Transportation Expenses.

(*a*) Station Expenses:

These expenses divided on the basis adopted by the state, are as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Number of Passengers Handled during the six months ended December 31, 1907 | 1,444,540 | 257,950 | 1,702,490 |
| Add 100% to Intrastate business to represent use of two terminals | 1,444,540 | ..... | 1,444,540 |
| Total | 2,889,080 | 257,950 | 3,147,030 |
| Percentage of each | 91.80% | 8.20% | 100.00% |
| Expenses—Divided on above Percentages (after allowing $2,325.00 as cost of handling the mails) | $52,377.81 | $4,678.63 | $57,056.44 |

5733 (*b*) Yard & Train Expenses:

This expense divided on the basis adopted by the State is as follows:

| | Percentages. | Expenses. |
|---|---|---|
| Coach | 59.38% | $326,037.62 |
| Pullman | 21.15 | 116,128.26 |
| Mail | 11.20 | 61,495.81 |
| Express | 8.27 | 45,408.07 |
| Total | 100.00 | $549,069.76 |

(*c*) Loss and Damage to Baggage:

This expense divided on the basis adopted by the State is as follows:

| | Earnings. | Percentages. | Expenses. |
|---|---|---|---|
| Intrastate | $836,542.20 | 59.54% | $984.39 |
| Interstate | 568,476.21 | 40.46 | 668.92 |
| Total | $1,405,018.41 | 100.00 | $1,653.31 |

(*d*) Supervision and General:

These expenses are divided on the basis of the direct charges as apportioned above, the bases adopted by the State, and are as follows:

| | Direct charges. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | $326,037.62 | 53.44% | $21,630.41 |
| Pullman | 116,128.26 | 19.03 | 7,702.59 |
| Intrastate | 53,362.20 | 8.75 | 3,541.65 |
| Interstate | 5,347.55 | 0.88 | 356.19 |
| Mail | 63,820.81 | 10.46 | 4,233.80 |
| Express | 45,408.07 | 7.44 | 3,011.42 |
| Total | $610,104.51 | 100.00 | $40,476.06 |

4. Maintenance of Way & Structures.

This expense, having no direct relation to any particular class of traffic, can be fairly considered an overhead expense, and, adopting the State's basis for expenses of that nature, it is divided on the basis of the direct charges to each class, as follows:

| | Direct charges. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | $558,775.91 | 55.00 | $275,704.77 |
| Pullman | 167,173.41 | 16.46 | 82,510.92 |
| Intrastate | 88,624.43 | 8.72 | 43,711.74 |
| Interstate | 27,259.24 | 2.68 | 13,434.34 |
| Mail | 101,833.02 | 10.02 | 50,228.40 |
| Express | 72,325.38 | 7.12 | 35,691.23 |
| Total | $1,015,991.39 | 100.00 | $501,281.40 |

5. General Expenses.

(*a*) This expense, less the amount paid to Train Auditors, is divided between each class of service on the basis of the direct charges to each class, as adopted by the State and is as follows:

| | Percentages. | Expenses. |
|---|---|---|
| Coach | 55.00% | $63,742.27 |
| Pullman | 16.46 | 19,076.32 |
| Intrastate | 8.72 | 10,106.05 |
| Interstate | 2.68 | 3,105.99 |
| Mail | 10.02 | 11,612.68 |
| Express | 7.12 | 8,251.72 |
| Total | 100.00 | $115,895.03 |

5734 (*b*) The expenses of Train Auditors divided between intrastate and interstate service on the basis of the number of passengers handled, is as follows:

| | Number of passengers. | Percentage. | Expense. |
|---|---|---|---|
| Intrastate | 1,444,540 | 84.85% | $38,074.03 |
| Interstate | 257,950 | 15.15 | 6,798.13 |
| Total | 1,702,490 | 100.00 | $44,872.16 |

6. Division of Cost of Coach and Pullman Service Between Intrastate and Interstate Business.

The cost of Coach Service, $898,222.95, is divided between intrastate and interstate business in proportion to the total passenger miles of each class of traffic handled in coaches, during the month of October, 1907, and is as follows:

| | Passenger Miles. | Percentages. | Coach Service. |
|---|---|---|---|
| Intrastate | 6,736,409 | 64.91% | $583,036.52 |
| Interstate | 3,641,494 | 35.09 | 315,186.43 |
| Total | 10,377,903 | 100.00 | $898,222.95 |

The cost of Pullman service, $268,760.65, is divided between intrastate and interstate business on the basis of the total passenger miles of each class of traffic handled in Pullman cars, during the month of October, 1907, and is as follows:

| | Passenger Miles. | Percentages. | Pullman Service. |
|---|---|---|---|
| Intrastate | 547,124 | 25.00% | $67,190.16 |
| Interstate | 1,641,371 | 75.00 | 201,570.49 |
| Total | 2,188,495 | 100.00 | $268,760.65 |

7. Miscellaneous Revenue and Dining Car Deficit.

These expenses are divided between intrastate and interstate business on the gross earnings basis as adopted by the State, and are as follows:

| | Gross earnings. | Percentage. | Miscellaneous revenue. | Dining car deficit. |
|---|---|---|---|---|
| Intrastate | $836,543.20 | 59.54% | $22,170.87 | $704.89 |
| Interstate | 568,476.21 | 40.46 | 15,066.07 | 479.01 |
| Total | $1,405,018.41 | 100.00 | $37,236.94 | $1,183.90 |

8. Taxes, Rentals, Hire of Equipment and Value of Property.

These expenses are divided on the basis adopted by the State and are as follows:

| | Total earnings. | Percentage. | Taxes. | Rentals. | Hire of Equipment. |
|---|---|---|---|---|---|
| Intrastate | $858,713.07 | 48.28% | $28,582.96 | $2,821.46 | $499.21† |
| Interstate | 583,542.28 | 32.80 | 19,418.42 | 1,916.81 | 339.15† |
| Mail | 202,637.71 | 11.39 | 6,743.16 | 665.63 | 117.77† |
| Express | 133,910.82 | 7.53 | 4,457.95 | 440.05 | 77.86† |
| Total | $1,778,803.88 | 100.00 | $59,202.49 | $5,843.95 | $1,033.99† |

[†In red ink in copy.]

| | Value of property—1907. | Value of property—1909. |
|---|---|---|
| Intrastate | $2,572,459.62 | $3,097,358.66 |
| Interstate | 1,747,652.76 | 2,104,253.60 |
| Mail | 606,883.08 | 730,714.90 |
| Express | 401,214.19 | 483,080.17 |
| Total | $5,328,209.65 | $6,415,407.33 |

NOTE.—The records of the Company for the month of October, 1907, show the total number of passenger miles to be,

| | |
|---|---|
| Intrastate | 7,283,533 |
| Interstate | 5,282,865 |
| Total | 12,566,398 |

The Company's records also show that in October, 1907, there were 2,188,495 passenger miles, carried in Pullman Cars; on the State's assumption that 25% of the Pullman Car passenger miles is intrastate traffic, the division of passenger miles for October, 1907, may be made as follows:

| | Coach. | Pullman. | Total. |
|---|---|---|---|
| Intrastate | 6,736,409 | 547,124 | 7,283,533 |
| Interstate | 3,641,494 | 1,641,371 | 5,282,865 |
| Total | 10,377,903 | 2,188,495 | 12,566,398 |

(Here follow pasters, marked pp. 5735 and 5736.)

5738 EXHIBIT No. 56-A.

St. Louis, Iron Mountain & Southern Ry. Co.

State of Arkansas.

*Statement Showing the Results of Operation on the St. L., I. M. & S. Ry., as Reported in Exhibit No. 56, After Certain Changes Have Been Made in the Passenger Miles Carried in Pullman Cars.*

In making a check of the number of passenger miles carried in Pullman cars for the month of October, 1907, it was found that owing to duplications of certain passenger miles in the train auditors' reports, the passenger mileage in Pullman cars should be 1,936,121 instead of 2,188,495. This will result in the following changes in the figures shown in Exhibit No. 56.

| | Passenger miles. | | |
|---|---|---|---|
| | Coach. | Pullman. | Total. |
| Intrastate | 6,799,503 | 484,030 | 7,283,533 |
| Interstate | 3,830,774 | 1,452,091 | 5,282,865 |
| Total | 10,630,277 | 1,936,121 | 12,566,398 |

The cost of Coach Service, $898,222.95, divided between intrastate and interstate business in proportion to the total passenger miles of each class of traffic handled in coaches, during the month of October, 1907, is as follows:

| | Passenger miles. | Percentage. | Coach service. |
|---|---|---|---|
| Intrastate | 6,799,503 | 63.96 | $574,503.40 |
| Interstate | 3,830,774 | 36.04 | 323,719.55 |
| Total | 10,630,277 | 100.00 | $898,222.95 |

The cost of Pullman service, $268,760.65, divided between intrastate and interstate business on the basis of the total passenger miles of each class of traffic handled in Pullman cars, during the month of October, 1907, is as follows:

| | Passenger miles. | Percentage. | Coach service. |
|---|---|---|---|
| Intrastate | 484,030 | 25.00 | $67,190.16 |
| Interstate | 1,452,091 | 75.00 | 201,570.49 |
| Total | 1,936,121 | 100.00 | $268,760.65 |

After applying these changes to the figures shown in Exhibit No. 56 the total passenger expense divided between each class of business is as follows:

| | |
|---|---|
| Intrastate Passenger Expense | $822,209.81 |
| Interstate Passenger Expense | 575,887.74 |
| Mail Expense | 163,674.10 |
| Express Expense | 116,268.33 |
| Total | $1,678,039.98 |

These changes applied to the last page of Exhibit No. 56 shows the following result:

| | Net earnings. | Percentage of net earnings to 1907 valuation. | Percentage of net earnings to 1909 valuation. |
|---|---|---|---|
| Intrastate Frt. | $54,282.06 | 2.76% | 2.29% |
| Interstate " | 1,409,925.74 | 11.10 | 9.22 |
| Total Freight | $1,464,207.80 | 9.98 | 8.29 |
| Intrastate Pasgr. | 4,893.16 | 0.19 | 0.16 |
| Interstate " | 13,820.55* | 0.79* | 0.66* |
| Mail | 31,672.59 | 5.22 | 4.33 |
| Express | 12,822.35 | 3.20 | 2.65 |
| Total Passenger | $35,567.55 | 0.67 | 0.55 |
| Total Intrastate | 59,175.22 | 1.30 | 1.08 |
| Total Interstate | 1,396,105.19 | 9.66 | 8.03 |
| Total Business | $1,499,775.35 | 7.50 | 6.23 |

St. Louis Southwestern Railway Company.

State of Arkansas—Freight Service.

*Statement Showing Results of Operating Freight Service in the State of Arkansas, for the Period of Six Months Ended December 31, 1907, on the Bases Outlined in the State's Exhibit "R," with Certain Revisions.*

1—Maintenance of Equipment.

(*a*) Locomotives:

Divided on the basis adopted by the State is as follows:

| | | Mileage. | Percentages. | Expenses. |
|---|---|---|---|---|
| Yard Locomotive Mileage | 7,507 | | | |
| 50% added for extra repairs | 3,754 | 11,261 | 9.04% | $5,377.98 |
| Local Locomotive Mileage | 25,797 | | | |
| 75% added for extra mileage and repairs | 19,348 | 45,145 | 36.26% | 21,571.40 |
| Through Locomotive Mileage | | 68,118 | 54.70% | 32,541.52 |
| Total | | 124,524 | 100.00% | $59,490.90 |

Yard.

The maintenance of yard locomotives ($5,377.98) divided between Intrastate and Interstate on the masis of the number of tons handled (excluding trans-state tons), as shown in Exhibit "A," is as follows:

| | Tons. | Percentages. | Amount. |
|---|---|---|---|
| Intrastate | 19,013 | 25.34% | $1,362.78 |
| Interstate (excluding trans-state) | 56,012 | 74.66% | 4,015.20 |
| Total | 75,025 | 100.00% | $5,377.98 |

(*b*) Freight Cars:

Divided on the basis adopted by the State and the percentages revised to agree with the testimony of Mr. W. H. V. Rosing (Page 235), is as follows:

| | Percentages. | Expenses. |
|---|---|---|
| Stopping and Starting | 32% | $58,169.80 |
| Terminal Handling | 23% | 41,809.54 |
| Other Expenses | 45% | 81,801.28 |
| Total | 100% | $181,780.62 |

5748

Starting and Stopping Expenses.

Terminal Handling.

Divided on the basis adopted by the State, except that local trains are charged eight times more than through trains in proportion to car-miles, instead of four times, to agree with the testimony of Mr. Frank Ward (Page 618), is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Car-miles (October, 1908) | 430,911 | 2,269,559 | 2,700,470 |
| Same, with local multiplied by eight | 3,447,288 | 2,269,559 | 5,716,847 |
| Percentage of each | 60.30% | 39.70% | 100.00% |
| Expenses divided as above | $60,287.54 | $39,691.80 | $99,979.34 |

Other Expenses.

Divided on the basis adopted by the State is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Car miles (October, 1908) | 430,911 | 2,269,559 | 2,700,470 |
| Percentage of each | 15.96% | 84.04% | 100.00% |
| Expenses divided as above | $13,055.48 | $68,745.80 | $81,801.28 |

Freight Cars—Summary.

| | Local. | Through. | Total. |
|---|---|---|---|
| Stopping and Starting and Terminal Hdlg. | $60,287.54 | $39,691.80 | $99,979.34 |
| Other Expenses | 13,055.48 | 68,745.80 | 81,801.28 |
| Total | $73,343.02 | $108,437.60 | $181,780.62 |

(c) Supervision and General:

Divided on the basis adopted by the State is as follows:

| | Direct Charges. | Percentages. | Expenses. |
|---|---|---|---|
| Local Trains | $94,914.42 | 39.34% | $7,463.70 |
| Through Trains | 140,979.12 | 58.43 | 11,085.51 |
| Intrastate | 1,362.78 | .57 | 108.14 |
| Interstate | 4,015.20 | 1.66 | 314.94 |
| Total | $241,271.52 | 100.00% | $18,972.29 |

Divided on the basis adopted by the State is as follows:

| | Direct Revenue. | Percentages. | Expenses. |
|---|---|---|---|
| Intrastate | $175,515.42 | 9.78% | $5,849.70 |
| Interstate | 1,619,840.07 | 90.22% | 53,963.18 |
| Total | $1,795,355.49 | 100.00% | $59,812.88 |

3—Transportation Expenses.

(*a*) Station Expenses:

Divided on the basis adopted by the State in Exhibit "X" is as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Total tons (excluding trans-state) | 197,600 | 389,039 | 586,639 |
| Double the intra-state tons | 197,600 | ..... | 197,600 |
| Total | 395,200 | 389,039 | 784,239 |
| Percentage of each | 50.39% | 49.61% | 100.00% |
| Expenses divided as above | $23,944.68 | $23,574.04 | $47,518.72 |

(*b*) Yard and Terminal Expenses:

Divided between Intrastate and Interstate on basis of tons handled (trans-state excluded) the same as was done for Maintenance of Yard Locomotives (1-*a*), is as follows:

| | Percentages. | Expenses. |
|---|---|---|
| Intrastate | 25.34% | $14,308.34 |
| Interstate | 74.66% | 42,157.08 |
| Total | 100.00% | $56,465.42 |

(c) Fuel and Locomotive Expenses:

Divided on the basis adopted by the State is as follows:

| | Local | Through. | Total. |
|---|---|---|---|
| Percentage of each | 28.15% | 71.85% | 100.00% |
| Expenses divided as above | $21,923.95 | $55,958.63 | $77,882.58 |

5750 (d) Enginehouse Expenses—Road:

Divided on the basis adopted by the State is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Percentage of each | 43.10% | 56.90% | 100.00% |
| Expenses divided as above | $4,505.35 | $5,947.89 | $10,453.24 |

(e) Road Enginemen and Trainmen:

Divided on the basis adopted by the State is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Percentage of each | 39.85% | 60.15% | 100.00% |
| Expenses divided as above | $51,837.17 | $78,243.56 | $130,080.73 |

(*f*) Other Train Expenses:

Divided on the basis adopted by the State is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Percentage of each | 27.47% | 72.53% | 100.00% |
| Expenses divided as above | $8,186.55 | $21,615.24 | $29,801.79 |

(*g*) Loss and Damage—Freight:

Divided on the basis adopted by the State is as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Percentage of each | 9.54% | 90.46% | 100.00% |
| Expenses divided as above | $1,810.37 | $17,166.29 | $18,976.66 |

(*h*) Supervision and General:

Divided on the basis adopted by the State is as follows:

| | Direct Charges. | Percentages. | Expenses. |
|---|---|---|---|
| Local Trains | $86,453.02 | 23.29% | $3,875.94 |
| Through Trains | 161,765.32 | 43.58% | 7,252.61 |
| Intrastate | 40,063.39 | 10.80% | 1,797.34 |
| Interstate | 82,897.41 | 22.33% | 3,716.18 |
| Total | $371,179.14 | 100.00% | $16,642.07 |

## 4. Maintenance of Way and Structures.

## 5. General Expenses.

These expenses have no direct relation to either Local, Through, Intrastate or Interstate. If they are to be considered what the State's witnesses term "Overhead Expenses," then they should, following the State's plan, be divided between the several classes on basis of the direct charges to each, as follows:

| | Direct charges. | Percentages. | M. of W. & S. | General expenses. |
|---|---|---|---|---|
| Local Trains | $192,707.08 | 27.22% | $47,426.05 | $11,981.70 |
| Through Trains | 321,082.56 | 45.35% | 79,014.37 | 19,962.16 |
| Intrastate | 49,181.35 | 6.95% | 12,109.15 | 3,059.25 |
| Interstate | 144,906.91 | 20.48% | 35,682.78 | 9,014.88 |
| Total | $707,877.90 | 100.00% | $174,232.35 | $44,017.99 |

## 6. Total Train Costs.

Divided on the basis of intrastate and interstate ton-miles handled on local and through trains, as adopted by the State, using, however, the results for the month of October, 1908, as per State's Exhibit "P," is as follows:

| Local Trains: | Percentages. | Expenses. |
|---|---|---|
| Intrastate | 32.66% | $74,443.57 |
| Interstate | 67.34% | 153,491.43 |
| Total | 100.00% | $227,935.00 |

| | | |
|---|---|---|
| Through Trains: | | |
| Intrastate | 1.09% | $4,842.44 |
| Interstate | 98.91% | 439,418.30 |
| Total | 100.00% | $444,260.74 |

7. Miscellaneous Revenue, Taxes, Rentals, Hire of Equipment, and Value of Property.

Divided on the revenue basis adopted by both this Company and the State is as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Percentage of Freight Revenue | 9.78% | 90.22% | 100.00% |
| Division on these percentages: | | | |
| Miscellaneous Revenue | $2,450.97 | $22,610.05 | $25,061.02 |
| Taxes | $5,495.26 | $50,693.51 | $56,188.77 |
| Rentals (Credits) | 5,547.49* | 51,175.32* | 56,722.81* |
| Assessed value of property, 1908 doubled | $1,076,548.28 | $9,931,102.56 | $11,007,650.84 |
| Assessed value of property, 1909 doubled | $1,364,345.27 | $12,586,015.34 | $13,950,360.61 |

EXHIBIT —.

St. Louis Southwestern Railway Company.

State of Arkansas—Passenger Service.

*Statement Showing Results of Operating Passenger Service in the State of Arkansas, for the Period of Six Months Ended December 31, 1907, on the Basis Outlined in the State's Exhibit "T," with Certain Revisions.*

1—Maintenance of Equipment.

(*a*) Locomotives:

Divided on the basis adopted by the State is as follows:

| | Car-Miles. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | 221,159 | 64.73% | $29,431.20 |
| Pullman | 59,334 | 17.37% | 7,897.73 |
| Mail | 35,480 | 10.38% | 4,719.54 |
| Express | 25,683 | 7.52% | 3,419.17 |
| Total | 341,656 | 100.00% | $45,467.64 |

(*b*) Passenger Train Cars:

Divided on the car-mile basis adopted by the State with various allowances, as per testimony of Mr. W. H. V. Rosing (Page 243), is as follows:

| | Car-Miles. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | 182,460 | 85.86% | $28,865.99 |
| 100% added for added cost | 182,460 | | |
| Baggage | 38,699 | | |
| Mail | 35,480 | 8.68% | 2,918.20 |
| 15% added for added cost | 5,322 | 5.46% | 1,835.65 |
| Express | 25,683 | | |
| Total | 470,104 | 100.00% | $33,619.84 |

(c) Supervision and General:

Divided on the basis adopted by the State is as follows:

| | Direct Charges. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | $58,297.19 | 73.71% | $8,115.15 |
| Pullman | 7,897.73 | 9.99% | 1,099.86 |
| Mail | 7,637.74 | 9.66% | 1,063.52 |
| Express | 5,254.82 | 6.64% | 731.03 |
| Total | $79,087.48 | 100.00% | $11,009.56 |

5754

2—Traffic Expenses.

Divided on the revenue basis adopted by the State, with Mail and Express Revenue excluded, is as follows:

| | Gross Revenue. | Percentages. | Expenses. |
|---|---|---|---|
| Intrastate Passenger Revenue | $246,101.33 | 59.04% | $15,350.13 |
| Interstate Passenger Revenue | 170,735.14 | 40.96% | 10,649.41 |
| Total | $416,836.47 | 100.00% | $25,999.54 |

3—Transportation Expenses.

(a) Station Expenses:

Divided on the basis adopted by the State is as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Number Passengers Handled | 504,392 | 82,064 | 586,456 |
| Add 100% a/c two terminals | 504,392 | ..... | 504,392 |

| | | | |
|---|---|---|---|
| Total | 1,008,784 | 82,064 | 1,090,848 |
| Percentage of each | 92.48% | 7.52% | 100.00% |
| Expenses divided as above (after allowing $1,149.75 to Mail) | $22,974.45 | $1,868.16 | $24,842.61 |

(*b*) Yard and Train Expenses (Excluding Train Auditor's Expense):

Divided on the basis adopted by the State is as follows:

| | Car-Miles. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | 221,159 | 64.73% | $84,809.06 |
| Pullman | 59,334 | 17.37% | 22,758.12 |
| Mail | 35,480 | 10.38% | 13,599.84 |
| Express | 25,683 | 7.52% | 9,852.68 |
| Total | 341,656 | 100.00% | $131,019.70 |

(*c*) Train Auditors' Expenses:

Divided on the basis of number of passengers handled, is as follows:

| | No. of Pass. Handled. | Percentages. | Expenses. |
|---|---|---|---|
| Intrastate | 504,392 | 86.00% | $7,670.67 |
| Interstate | 82,064 | 14.00% | 1,248.71 |
| Total | 586,456 | 100.00% | $8,919.38 |

(*d*) Loss and Damage—Baggage:

Divided on the revenue basis adopted by the State, is as follows:

| | Gross Revenue. | Percentages. | Expenses. |
|---|---|---|---|
| Intrastate Passenger Revenue | 246,101.33 | 59.04% | $246.22 |
| Interstate Passenger Revenue | 170,735.14 | 40.96% | 170.82 |
| Total | 416,836.47 | 100.00% | $417.04 |

5755 (*e*) Supervision and General:

Divided on the basis adopted by the State, is as follows:

| | Direct Charges. | Percentages. | Expenses. |
|---|---|---|---|
| Coach | $84,809.06 | 50.98% | $5,175.47 |
| Pullman | 22,758.12 | 13.68% | 1,388.79 |
| Intrastate | 30,891.34 | 18.57% | 1,885.22 |
| Interstate | 3,287.69 | 1.98% | 201.01 |
| Mail | 14,749.59 | 8.87% | 900.48 |
| Express | 9,852.68 | 5.92% | 601.30 |
| Total | $166,348.48 | 100.00% | $10,151.97 |

4—Maintenance of Way and Structures.

5—General Expenses.

These expenses have no direct relation to any particular class of traffic. If they are to be considered what the State's witnesses term "Overhead Expenses," then they should, following the State plan, be divided between the several classes on basis of the direct charges to each, as follows:

| | Direct Charges. | Percentages. | M. of W. & S. | General Expenses. |
|---|---|---|---|---|
| Coach | $156,396.87 | 53.46% | $67,890.43 | $12,359.68 |
| Pullman | 33,144.50 | 11.33% | 14,388.30 | 2,619.44 |
| Intrastate | 48,126.69 | 16.45% | 26,890.34 | 3,803.15 |
| Interstate | 14,138.11 | 4.83% | 6,133.76 | 1,116.67 |
| Mail | 24,351.33 | 8.32% | 10,565.81 | 1,923.54 |
| Express | 16,439.53 | 5.61% | 7,124.31 | 1,297.00 |
| Total | $292,597.03 | 100.00% | $126,992.95 | $23,119.48 |

6—Division of Cost of Coach and Pullman Service.

No record of the passenger-miles made in Pullman cars during any of the months, July to December, 1907, is available, but for the month of June, 1910, which month is about an average of the six months ended December 31, 1907, the records of the Company show:

| | |
|---|---|
| Passenger-miles in Coaches | 2,574,781 or 90.26% |
| Passenger-miles in Pullman | 277,764, or 9.74% |

9.74% of the total passenger-miles for the six months ended Dec. 31, 1907, should, therefore, be deducted (in the arbitrary proportion of Intrastate 25% and Interstate 75%, adopted by the State) before arriving at the percentages for dividing coach expenses between Intrastate and Interstate, as follows:

| 5756 Percentage for Division of Coach Expenses: | Pass-Miles Six Mos. Ended Dec., 1907. | Intrastate. | Interstate. |
|---|---|---|---|
| Total | 22,275,753 | 12,345,719 | 9,930,034 |
| Less Pullman Pass., 9.74% | 2,169,659 | 542,415 | 1,627,244 |
| | 20,106,094 | 11,803,304 | 8,302,790 |
| Percentages | 100.00% | 58.71% | 41.29% |

| Percentages for Division of Pullman Expenses: | Pass-Miles Six Mos. Ended Dec., 1907. | Intrastate. | Interstate. |
|---|---|---|---|
| Total | 2,169,659 | 542.415 | 1,627,244 |
| Percentages (arbitrary) | 100.00% | 25.00% | 75.00% |

| Division. | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Coach Expenses | $139,935.44 | $97,711.54 | $236,646.98 |
| Pullman Expenses | 12,538.06 | 37,614.18 | 50,152.24 |
| Total | $151,473.50 | $135,325.72 | $286,799.22 |

7—Miscellaneous Revenue, Taxes, Rentals, Outside Operations and Value of Property.

Divided on the revenue basis adopted by both this Company and the State, is as follows:

| | Intrastate. | Interstate. | Mail. | Express. | Total. |
|---|---|---|---|---|---|
| Miscl. Rev. | $5,081.63 | $3,525.47 | $..... | $..... | $8,607.10 |
| Out. Op. (def.) | 811.38 | 562.91 | ..... | ..... | 1,374.29 |
| Taxes | 8,077.78 | 5,603.89 | 1,068.16 | 1,098.28 | 15,848.11 |
| Rentals | 1,299.67 | 901.64 | 171.86 | 176.71 | 2,549.88 |

| Assessed Value of Property: | Year 1908 Doubled. | Year 1909 Doubled. |
|---|---|---|
| Intrastate | $1,540,304.82 | $1,952,079.33 |
| Interstate | 1,068,573.24 | 1,354,238.28 |
| Mail | 203,681.66 | 258,132.52 |
| Express | 209,423.44 | 265,409.26 |
| Total | $3,021,983.16 | $3,829,859.39 |

NOTE.—If item 3*b* "Yard and Train Expenses" was divided between Intrastate, Interstate, Mail and Express, on a straight revenue basis, the result would be as follows:

| | Gross Revenue. | Percentages. | Expenses. |
|---|---|---|---|
| Intrastate | $251,182.96 | 50.97% | $66,780.74 |
| Interstate | 174,260.61 | 35.36% | 46,328.57 |
| Mail | 33,218.77 | 6.74% | 8,830.73 |
| Express | 34,155.57 | 6.93% | 9,079.66 |
| Total | $492,817.91 | 100.00% | $131,019.70 |

If this basis is used, it will change the final results as follows:

| | Increase. | Decrease. |
|---|---|---|
| Intrastate Expense | $18,138.42 | $..... |
| Interstate Expense | ..... | 9,255.98 |
| Mail Expense | ..... | 7,657.41 |
| Express Expense | ..... | 1,225.03 |
| Total | $18,138.42 | $18,138.42 |

* The "Net Revenue" and the "Percentage of Net Revenue to Valuation" given herein, are based on the returns for the largest half of the fiscal year ended June 30, 1908, and it is, therefore, improper to arbitrarily double this percentage, or to cut the valuation half in two, and call the result the rate of annual return on the investment. For all business in Arkansas the net revenue for the six months, July to December, 1907, was 40.16% greater than the net revenue for the six months, January to June, 1908. To equalize the net revenue for the six months ended December 31, 1907, to a basis of one-half of the year, it would be necessary to reduce the same 20%.

150%: 9-10½-12-13½-16½. 61½.
Reduction 40%.

Sugar, CL Am'd't 5 to classification rulings, 11-20-05; reduces rates for distances exceeding 200 miles, 3%.

Mince meat; am'd't 5, classification rulings, 11-20-05; added to canned goods mixture; rates:

4th: 16-22-27-32-42. Total 139.
New rate: 12-15-17-18-20. " 82.
Reduction 41%.

3 Mile rate for CL; am'd't 5 to classification rulings, 11-20-05; reduced to 1¢ per 100 pounds; minimum $5. per car; former rates on different commodities ranged from 2 to 5¢ per 100.

Concrete building material, CL/ from Class E to 150% of brick rates; am'd't 5 to classification rulings, 11-20-05.

Class E: 5-7-8-10-13. Total 43.
New rates: 2-2-3-3½-5. 15½.
Reduction 66%.

5765 Vinegar and cidar CL and LCL Am'd't 5 to classification ruling, changed from 5th to CL Com'd'y, effective 11-20-05:
5th: 12-17-19-24-32. Total 104.
New rates: 5-7-10-11-13 46.
Reduction 56%.

Added to vegetable mx. LCL 4th to commodity:
4th: 16-22-27-32-42. Total 139.
New rates: 10-14-20-22-25. 91.
Reduction —.

Machinery to be repaired CL, changed from "A" to ½ of "A," effective 11-20-05:
A: 12-18-20-26-33. Total 109.
New rate: 6-9-10-13-16½. 54½.
Reduction 35%.

Machinery LCL (Voluntary) Saw mills, etc. 1st to 3rd:
1st: 24-32-42-47-71. Total 216.
New rates: 19-27-32-37-54. 169.
Reduction 22%.

Millet seed CL, Am'd't 5 to classifications rulings effective 5-6-06, changed from Class A to corn rates:
A: 12-18-20-26-33. Total 109.
New R.: 4-5-7-8-10. 34.
Reduction 69%.

L. C. L., changed from 3rd class to corn rates:
3rd: 19-27-32-37-54. Total 169.
New Rates: 14-15-20-24-30. 103.
Reduction 39%.

Iron Grate bars LCL Am'd't 5 to classification rulings, 5-6-06, 50 to 100 lbs. weight changed from 1st to 4th class:
1st: 24-32-42-47-71. Total 216.
New rates: 16-22-27-32-42. 139.
Reduction 36%.

Alfalfa, broom corn, clover and grass seed, Am'd't 5 to classification rulings, 5-6-06: CL changed from Class A to corn rates:
Class A: 12-18-20-26-33. Total 109.
New rates: 4-5-7-8-10. " 34.
Reduction 69%.

L. C. L., changed from 3rd to corn rates:
3rd: 19-27-32-37-54. Total 169.
New rates: 14-15-20-24-30. 103.
Reduction 39%.

Wire and Nails mxd., Am'd't 14 SDT 2, 1-20-05:
L. C. L. changed from 5th class to commodity, added to wire fencing, poultry netting, wire hoop, wire stretchers, and wire gates.
5th Class: 12-17-19-24-32. Total 104.
New rates: 6-8-10-11-14. 49.
Reduction 53%.

L. C. L., approximately changed from 3rd to commodity:
3rd: 19-27-32-37-54. Total 169.
New R.: 12-14-14-15-20. 75.
Reduction 55%.

5766 Saw dust added to cord wood, Am. 2 SDT 2, 3-20-05, CL changed from Class "E" to Commodity:
Class E: 5-7-8-10-13. Total 43.
New rates: 2-2-2½-5. 14½.
Reduction 66%.

Rice, Bran and Rice hulls, added to corn mxs, am'd't 2 to SDT 2 CL, changed from Class B to commodity:
Class B: 9-13-15-18-26. Total 81.
New rates: 4-5-7-8-10. 34.
Reduction 58%.

LCL 4th class changed to commodity:
4th Class: 14-15-20-24-30. Total 139.
New rates: 16-22-27-32-42. 103.
Reduction 26%.

Wheelbarrows Am. 14 to SDT 2, 11-20-05, CL changed from Class A to commodity:
Class "A": 12-18-20-26-33. Total 109.
New rates: 10-15-17-22-28. 92.
Reduction 16%.

Sawed and bent shapes for Agr. implements; Am. 14 to SDT 2, 11-20-05, CL changed from lumber and 5¢ to Lumber:
Old rate: 8-9-9½-10½. Total 48½.
New rate: 3-4-4½-5-7. 23½.
Reduction 53%.

Clariphos & Mexota, 11-20 05, added to veg. mx., account new drinks, small change.
Minimum charge rule changed 12-22-06:
35-25-25.
25-40-60.

Cotton, flat rate, amd. 15, 9-16-07, no change, as providing for concentration only. 10-12-14-15-40.

5772 EXHIBIT "D."

5773 EXHIBIT "D."

Sept. 8th, 1903:

Commission's Standard Freight Distance Tariff Rates made effective on the Searcy & Des Arc R. R. on application of the Rock Island.

Nov. 3rd, 1903:

Complaint of Kerlin Lumber Co. vs. St. Louis Southwestern Railway Dismissed.

Nov. 24th, 1903:

Application of Pine Bluff merchants for flat rates on uncompressed cotton—dismissed.

Feb. 23rd, 1904:

Application of Texarkana Merchants to equalize rates from Texarkana to points north on the Cotton Belt Ry. and Iron Mountain Ry. with the rates from Little Rock and Pine Bluff—denied and dismissed.

Feb. 5th, 1904:

Application of Prescott & Northwest R. R. to be excepted from Commission's Joint Tariff granted.

May 4th, 1904:

Cotton Belt Lumber Co. vs. Cotton Belt Railway for overcharge—Complaint dismissed.

June 7th, 1904:

Proposed change in Classification on Buggies and Carriages dismissed.

Nov. 4th, 1904:

Louisiana & Northwest Railway. The Commission made order allowing this road to charge $.50 passenger fare between McNeil and Magnolia—regular fare $.25.

5774 Aug. 9th, 1905:

Resolution of Commissioner B. B. Hudgins providing for reduction of passenger fare on lines of 75 miles or more to 2½ cents per mile—resolution defeated.

May 9th, 1906:

Petition of citizens of Lake Village, Ark., for increased passenger service on the Iron Mountain Railway—dismissed.

Oct. 10th, 1906:

Dyer, Ark.—Petition for Depot—Dismissed.

Jan. 9th, 1907:

Oil Rates raised at requests of Railroad Companies.

Apr. 3d, 1907:

Complaint of Rose City Cotton Oil Co. against Iron Mountain Railway and Cotton Belt Railway, that twenty days was required to transport one car from Rose City Mill to Conway, Arkansas—dismissed, it appearing that a portion of the delay was chargeable to complainant.

October 3d, 1907:

Petition for Agency at Cross Roads, Rock Island Railroad—denied.

Feb. 5th, 1908:

1. Tyronza, Arkansas—Petition for agency, Frisco Railroad—denied.

2. Proposed ruling in regard to discontinuing passenger
5775 trains, provided that the Commission be given notice on such occasions—after a full hearing, it appearing that the proposed ruling would work a hardship on the railroad companies, the matter was dismissed.

Application for reduction in rates on private cars, show cars, peddler cars, etc.—dismissed, it appearing that present rates charged by the railroads was reasonable and just.

Mar. 4th, 1908:

Application of the National Oil & Fuel Co., of Muskogee, Oklahoma, for commodity rate on crude oil was denied, it appearing that rates now in effect are reasonable.

May 6th, 1908:

(1) Petition for depot at Comal, Arkansas—dismissed.
(2) Petition for Sunday train service on Greenwood Branch of Iron Mountain Railway—dismissed.
(3) Application to require the Iron Mountain Railway Co. to fence its right of way in Arkansas, south of Little Rock—dismissed.

May 21, 1908:

Application of M. & N. A. R. R. to apply the Short Line Passenger Rate (three cents per mile) on each of the sections of its line of railway south of Leslie, Arkansas—granted.

June 4th, 1908:

(1) Pine City, Ark., Arkansas Midland Ry., Petition for Depot—dismissed.
(2) Moscow, Ark., Iron Mountain Railway, petition for railroad agency—dismissed.

(3) Simms, Ark., Rock Island Ry., petition for depot—
5776 dismissed.

(4) Wickes, Ark., Kansas City Southern Railway—petition for telegraph service—dismissed.

(5) Cove, Arkansas, Petition for telegraph service—dismissed.

(6) Application of Bryant Lumber Company for reduction of Rough Material Rates, denied.

Oct. 21st, 1908:

Danville, Arkansas—petition for night operator—dismissed. Rock Island.

Application of Little Rock jobbers for commodity rate on soda, carloads,—denied and dismissed.

*Bases Used in Arriving at Cost of Local and Through Freight Service and Intrastate and Interstate Freight Business in Arkansas for the Six Months Ended December* 31, 1907.

1. Maintenance of Way and Structures.

The proportion of these expenses applicable to the freight business, as shown by the statements in this case submitted by the Company, has been divided between local and through train service on the basis of the total engine and car miles of each class during the month of October, 1907, that month being considered representative of the business for the six months ended December 31, 1907. In arriving at the number of engine and car miles we have added 50% to the engine mileage of local trains for station switching, and have assumed that each engine mile was equivalent to 2½ car miles. The total engine and car miles, with the percentage and amount of expenses chargeable to each class of service on this basis, are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Engine Miles | 70,583 | 199,981 | 270,564 |
| 50% added to Local Engine Mileage for station Switching | 35,292 | ..... | 35,292 |
| Total | 105,875 | 199,981 | 305,856 |

| | | | |
|---|---|---|---|
| Engine Miles as above, multiplied by 2½ to get equivalent in car miles | 264,688 | 499,952 | 764,640 |
| Freight Car and Caboose Miles | 1,173,350 | 6,532,646 | 7,705,996 |
| Total | 1,438,038 | 7,032,598 | 8,470,636 |
| Percentage of each | 16.98% | 83.02% | 100.00% |
| Expenses—Divided on above percentages | $93,966.49 | $459,428.62 | $553,395.11 |

2. Maintenance of Equipment.

(a) Locomotives:

The expenses under this head are divided between yard, and local and through road locomotives on the basis of the locomotive mileage of each class during the month of October, 1907. We have added 50% to the mileage made by yard locomotives to provide for the possible extra maintenance due to yard service; have added 50% to the mileage of road locomotives in local service to provide for the possible extra switching mileage, and again have added 50% to the switching mileage of the local engines thus ascertained to provide for the possible extra maintenance due to switching service (making 75% added to the local engine mileage). The division between yard, and local and through road locomotives on this basis is as follows:

5794

| | | Mileage. | Percentage. |
|---|---|---|---|
| Yard Locomotive Mileage | 130,150 | | |
| 50% added for extra repairs | 65,075 | | |
| | | 195,225 | 37.64% |
| Local Locomotive Mileage | 70,583 | | |
| 75% added for extra Mileage and Repairs | 52,937 | | |
| | | 123,520 | 23.81 |
| Through Locomotive Mileage | | 199,981 | 38.55 |
| Total | | 518,726 | 100.00% |

The total expenses under this head amount to $183,676.40. The amount chargeable to yard locomotives on this basis is 37.64%, or $69,135.80; the amount chargeable to the local service is 23.81%, or $43,733.35, and the amount chargeable to through service is 38.55% or $70,807.25.

The expense of maintenance of yard locomotives ($69,135.80) is divided between local and through service on the basis of the number of cars of each class of service handled by yard engines during the month of October, 1907. The total number of cars handled at terminals, where yard engines were maintained, together with the percentage and amount of expenses chargeable to each class of service, is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Cars Handled | 32,232 | 133,482 | 165,714 |
| Percentage of each | 19.46% | 80.54% | 100.00% |
| Expenses—Divided on above percentages | $13,453.83 | $55,681.97 | $69,135.80 |

(*b*) Freight Cars:

The total amount of expense for Maintenance of Freight Cars is $477,895.64. This amount is apportioned to Arkansas by the Railway Company on a car mileage basis. In dividing this expense between local and through service, however, we have taken into consideration the element of repairs due to the stopping and starting of trains at way stations, and repairs due to extra terminal handling of cars in local service. Mr. A. M. Wellington, in his work on "Railway Location" (Page 203) says that the stopping and starting at way stations is the cause of approximately 21.5% of the repair expenses of freight cars, and that the terminal handling is the cause of approximately 13.5% of the repair expenses. Taking these elements into consideration, the maintenance expenses may be divided as follows:

| | | | |
|---|---|---|---|
| Stopping and Starting | 21.5% | $102,747.56 | |
| Terminal Handling | 13.5 | 64,515.91 | |
| | | | $167,263.47 |
| Other Expenses | 65.% | ..... | 310,632.17 |
| Total | | | $477,895.64 |

5795 Assuming that each local train makes a stop say each five miles and each through train a stop say each twenty miles, the local service should be charged with four times as much as the through service, in proportion to car mileage for the expenses due to stopping and starting. Assuming also that each car in local service receives two terminal handlings (including handling at local stations) to each terminal handling of a car in through service, the local service should be charged with two times as much as the through service, in proportion to car mileage, for the expenses due to terminal handling. These items may, therefore, be divided between local and through service on the following basis:

| Stopping and Starting Expenses: | Local. | Through. | Total. |
|---|---|---|---|
| Car Miles | 1,173,350 | 6,532,646 | 7,705,996 |
| Same, with local car miles multiplied by four | 4,693,400 | 6,532,646 | 11,226,046 |
| Percentage of each | 41.81% | 58.19% | 100.00% |
| Expenses—Divided on above percentages | $42,958.75 | $59,788.81 | $102,747.56 |
| Terminal Handling: | | | |
| Car Miles as above | 1,173,350 | 6,532,646 | 7,705,996 |
| Same, with local car miles multiplied by two | 2,346,700 | 6,532,646 | 8,879,346 |
| Percentage of each | 26.43% | 73.57% | 100.00% |
| Expenses—Divided on above percentages | $17,051.56 | $47,464.35 | $64,515.91 |

The balance of the expenses of freight car maintenance, $310,632.17 is divided between local and through service in proportion to the number of car miles made in each class of service, as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Car Miles | 1,173,350 | 6,532,646 | 7,705,996 |
| Percentage of each | 15.22% | 84.78% | 100.00% |
| Expenses—Divided on above percentages | $47,278.22 | $263,353.95 | $310,632.17 |

The total expenses of maintenance of freight cars chargeable to each class of service, under the plans outlined above, are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Stopping and starting | $42,958.75 | $59,788.81 | $102,747.56 |
| Terminal Handling | 17,051.56 | 47,464.35 | 64,515.91 |
| Other Expenses | 47,278.22 | 263,353.95 | 310,632.17 |
| Total | $107,288.53 | $370,607.11 | $477,895.64 |

(*c*) Supervision and General:

The total expenses under this head are divided between local and through service on the basis of the direct charges for maintenance of equipment, as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Direct Expenses | $164,475.71 | $497,096.33 | $661,572.04 |
| Percentage of each | 24.86% | 75.14% | 100.00% |
| Expenses—Divided on above percentages | $15,378.22 | $46,481.07 | $61,859.29 |

3. Traffic Expenses.

These expenses are incurred in securing and looking after traffic. The amount apportioned to the State of Arkansas is based on the revenue train mileage in that State as compared with the revenue train mileage of the whole road. We have divided these expenses on a straight revenue basis, although of the opinion that this unduly burdens the intrastate business, owing to the fact that a considerable portion of the traffic expense, is incurred in the effort to secure competitive business, while it is well known that intrastate business is largely non-competitive. The basis of dividing these expenses between intrastate and interstate business is as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Total Freight Revenue | $640,248.17 | $4,133,210.33 | $4,773,458.50 |
| Percentage of each | 13.41% | 86.59% | 100.00% |
| Expenses—Divided on above percentages | $11,899.29 | $76,835.13 | $88,734.42 |

4. Transportation Expenses.

(a) Station Expenses:

These expenses cannot be divided between the two classes of train service, as they are not train expenses. They may, however, be divided between intrastate and interstate business in proportion to the volume of traffic of each class handled in the State. We have divided the expenses between intrastate and interstate business on the basis of the number of tons of each class of traffic, assuming, however, that each intrastate ton was handled twice and each interstate ton once, as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Total Tons | 684,122 | 2,739,131 | 3,423,253 |
| Double number of Intrastate tons in order to provide for two handlings | 684,122 | ..... | 684,122 |
| Total | 1,368,244 | 2,739,131 | 4,107,375 |
| Percentage of each | 33.31% | 66.69% | 100.00% |
| Expenses—Divided on above percentages | $77,821.13 | $155,805.81 | $233,626.94 |

(*b*) Yard and Terminal Expenses:

These expenses are divided between local and through business on the basis of the number of cars handled at terminals, as explained under the head of Maintenance of Yard Locomotives (2*a*). Of the total expenses, 19.46%, or $57,085.42 are charged to local trains; and 80.54%, or $236,262.07, are charged to through trains.

5797 (*c*) Fuel and Locomotive Expenses:

According to a test made on the St. Louis Southwestern Railway during the month of October, 1908, the local engines consumed 3½% more fuel per engine mile than the through engines. Assuming that the same conditions would prevail on the St. Louis, Iron Mountain & Southern Railway during October, 1907, the fuel and the miscellaneous locomotive expenses would be divided between local and through service on the following basis:

| | Local. | Through. | Total. |
|---|---|---|---|
| Engine Miles | 70,583 | 199,981 | 270,564 |
| Add 3½% to local engine miles to equalize fuel consumption | 2,470 | ..... | 2,470 |
| Total | 73,053 | 199,981 | 273,034 |
| Percentage of each | 26.76% | 73.24% | 100.00% |

We have used these percentages in dividing fuel and miscellaneous locomotive expenses for the six months ended December 31, 1907, amounting to $221,605.40. The amount charged to local service is 26.76%, or $59,-301.61; and the amount charged to through service is 73.24%, or $162,303.79.

(*d*) Enginehouse Expenses—Road:

These expenses, amounting to $53,634.13, are divided between local and through service on the basis of the engine miles of each class of service during the month of October, 1907, assuming, however, that the local engines require 12% more enginehouse service per engine mile than the through engine. This assumption is based on the average engine run in the two classes of service. The engine miles and the percentages on which the expenses are divided, are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Total Engine Miles | 70,583 | 199,981 | 270,564 |
| 12% added to Local Engine Miles to cover extra expenses | 8,470 | ..... | 8,470 |
| Total | 79,053 | 199,981 | 279,034 |
| Percentage of each | 28.33% | 71.67% | 100.00% |
| Expenses—Divided on above percentages | $15,194.55 | $38,439.58 | $53,634.13 |

(*e*) Road Enginemen and Trainmen:

An actual division of these expenses was made by us during the month of October, 1907, as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Total Amount | $29,229.30 | $53,162.56 | $82,391.86 |
| Percentage of each | 35.47% | 64.53% | 100.00% |

5798 We have used these percentages in dividing the total expenses under this head for the six months ended December 31, 1907. These expenses amounted to $467,625.17, of which 35.47%, or $165,866.65, are charged to local service, and 64.53%, or $301,758.52, are charged to through service.

(*f*) Other Train Expenses:

These expenses are such as are incident to, or generally caused by, the operation of trains, and not included in the preceding classifications. They are divided between local and through service in proportion to the train miles of each class of service, during the month of October, 1907, as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Train Miles | 70,583 | 196,512 | 267,095 |
| Percentage of each | 26.42% | 73.58% | 100.00% |
| Expenses—Divided on above percentages | $34,957.06 | $97,355.81 | $132,312.87 |

(*g*) Loss and Damage—Freight:

The expenses under this head are divided between intrastate and interstate business on the basis of the actual claims paid during the month of October, 1907, as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Claims Paid | $4,840.10 | $15,087.48 | $19,927.58 |
| Percentage of each | 24.29% | 75.71% | 100.00% |
| Expenses—Divided on above percentages | $30,972.03 | $96,537.35 | $127,509.38 |

(*h*) Supervision and General:

These expenses are divided between local, through, intrastate, and interstate business on the basis of the direct charges to each of these classes, as follows:

| | Train costs. | | Other costs. | | |
|---|---|---|---|---|---|
| | Local. | Through. | Intrastate. | Interstate. | Total. |
| Direct Expenses | $332,405.29 | $836,119.77 | $108,793.16 | $252,343.16 | $1,529,661.38 |
| Percentage of each | 21.73% | 54.66% | 7.11% | 16.50% | 100.00% |
| Expenses—divided on above percentages | $10,083.35 | $25,363.84 | $3,299.25 | $7,656.48 | $46,402.92 |

5. General Expenses.

These expenses are general to all classes of service. They may, therefore, be apportioned to local and through and intrastate and interstate business, on the basis of the direct charges for all other expenses of these classes,
5799 that being, perhaps, the best measure of the supervision necessary for each. The total direct charges and the percentage of general expenses applicable to each, are as follows:

| | Train costs. | | Other costs. | | |
|---|---|---|---|---|---|
| | Local. | Through. | Intrastate. | Interstate. | Total. |
| Direct Expenses | $616,309.06 | $1,864,489.63 | $123,991.70 | $336,834.77 | $2,941,625.16 |
| Percentage of each | 20.95% | 63.38% | 4.22% | 11.45% | 100.00% |
| Expenses—divided on above percentages | $27,699.72 | $83,799.92 | $5,579.61 | $15,138.99 | $132,218.24 |

6. Total Operating Expenses.

The total freight operating expenses are, as hereinbefore explained, divided between local and through train service, and intrastate and interstate business. The train costs are intended to include everything relating to the direct cost of the movement of freight trains, with all expenses incident to such movement. Station expenses and other items which do not affect the expenses of train operations are divided between intrastate and interstate business direct.

7. Method of Dividing Train Costs.

During the month of October, 1907, 39.10% of all Intrastate ton-miles and 8.70% of all Interstate ton-miles of freight were handled on local trains; and 60.90% of all Intrastate and 91.30% of all Interstate ton-miles were handled on through trains. Assuming that these same relative conditions would exist during the six months ended December 31, 1907, the total ton-miles of Intrastate and Interstate freight handled during that period would have been divided between local and through service as follows:

Local Trains:

| | |
|---|---|
| Intrastate Business—39.10% of 47,860,299 ton-miles during six months' period | 18,713,377 |
| Interstate Business—8.70% of 612,303,696 ton-miles during six months' period | 53,270,422 |
| Total | 71,983,799 |

Through Trains:

| | |
|---|---|
| Intrastate Business—60.90% of 47,860,299 ton-miles during six months' period | 29,146,922 |
| Interstate Business—91.30% of 612,303,696 ton-miles during six months' period | 559,033,274 |
| Total | 588,180,196 |

5800 In the accompanying statement, train costs are divided between Intrastate and Interstate business in proportion to the volume of traffic of each kind handled in each class of service, as ascertained above. The percentages used and the train costs divided are as follows:

| Local Trains: | Ton miles. | Percentage. | Train costs divided. |
|---|---|---|---|
| Intrastate Business | 18,713,377 | 26.00% | $167,442.28 |
| Interstate Business | 53,270,422 | 74.00% | 476,566.50 |
| Total | 71,983,799 | 100.00% | $644,008.78 |
| **Through Trains:** | | | |
| Intrastate Business | 29,146,922 | 4.96% | $96,635.16 |
| Interstate Business | 559,033,274 | 95.04 | 1,851,654.39 |
| Total | 588,180,196 | 100.00% | $1,948,289.55 |

8. Total Cost of Intrastate and Interstate Business.

The total cost of these two classes of business is ascertained in the manner hereinbefore explained. These counts are carried into the "Statement of Revenue, Expenses, etc.," as item 2*a* (Operating Expenses) in columns #1 and 2.

Miscellaneous Revenue, Taxes, Rentals, Hire of Equipment, and Value of Property.

In the "Statement of Revenue, Expenses, etc.," the items under this head have been divided between intrastate and interstate business on a straight revenue basis, as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Freight Revenue | $640,248.17 | $4,133,210.33 | $4,773,458.50 |
| Percentage of each | 13.41% | 86.59% | 100.00% |
| Division on these percentages: | | | |
| Miscellaneous Revenue | $16,469.41 | $106,345.00 | $122,814.41 |
| Taxes | $21,851.02 | 141,094.67 | $162,945.69 |
| Rentals | 2,156.94 | 13,927.62 | 16,084.56 |
| Hire of Equipment | 24,029.57 | 155,161.89 | 179,191.46 |
| Assessed Value of Property Doubled | $1,966,586.20 | $12,698,486.15 | $14,665,072.35 |

Endorsed: Filed July 18th, 1910. W. P. Feild, Clerk. By W. Presley Feild, D. C.

St. Louis, Iron Mountain & Southern Railway Company.

*Bases Used in Arriving at Cost of Intrastate and Interstate and Interstate Passenger and Mail and Express Business in Arkansas for the Six Months Ended December* 31, 1907.

As nearly all passenger trains on the St. Louis Iron Mountain and Southern Railway Company do a local business, we have not considered it necessary to make any division of expenses as between local and through service. Our statement of operating expenses covers the six months ended December 31, 1907, and the division of expenses is between coach and Pullman service, and intrastate, interstate, mail, and express business. In general, the expenses are divided on a car-mile basis, the mileage used be considered representative of the entire period. The coach in mileage from month to month, the figures used may being that of October, 1907. As there is very little change mileage includes the mileage of baggage, dining and parlor cars. The various classes of expenses are divided as follows:

1—Maintenance of Way and Structures.

Expenses divided between Coach, Pullman, Mail, and Express service on a car-mile basis, as follows:

| | Car-Miles. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | 751,229 | 56.77% | $284,577.45 |
| Pullman | 279,848 | 21.15 | 106,021.02 |
| Mail | 155,398 | 11.75 | 58,900.56 |
| Express | 136,766 | 10.33 | 51,782.37 |
| **Total** | 1,323,241 | 100.00% | $501,281.40 |

2—Maintenance of Equipment.

(*a*) Locomotives:

Expenses divided between Coach, Pullman, Mail, and Express service on a car-mile basis, as in the case of Maintenance of Way and Structures, as follows:

| | Percentage. | Expenses. |
|---|---|---|
| Coach | 56.77% | $94,500.26 |
| Pullman | 21.15 | 35,206.63 |
| Mail | 11.75 | 19,559.24 |
| Express | 10.33 | 17,195.48 |
| Total | 100.00% | $166,461.61 |

5805 (*b*) Passenger Train Cars:

Expenses divided between Coach, Mail, and Express service on a car-mile basis, as follows:

| | Car-Miles. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | 751,229 | 72.00% | $62,711.39 |
| Mail | 155,398 | 14.89 | 12,969.06 |
| Express | 136,766 | 13.11 | 11,418.70 |
| Total | 1,043,393 | 100.00% | $87,099.15 |

(*c*) Supervision and General:

Expenses divided between Coach, Pullman, Mail, and Express service on the basis of the direct charges as apportioned, as follows:

| | Direct Charges. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | $157,211.65 | 62.01% | $36,321.73 |
| Pullman | 35,206.63 | 13.88 | 8,130.07 |
| Mail | 32,528.30 | 12.82 | 7,509.18 |
| Express | 28,614.18 | 11.29 | 6,613.00 |
| Total | $253,560.76 | 100.00% | $58,573.98 |

3—Traffic Expenses.

Expenses divided between Intrastate, Interstate, Mail and Express business on a gross earnings basis, as follows:

| | Gross Earnings. | Percentage. | Expenses. |
|---|---|---|---|
| Intrastate | $836,540.20 | 48.03% | $25,588.50 |
| Interstate | 568,476.21 | 32.64 | 17,389.31 |
| Mail | 202,637.71 | 11.63 | 6,196.01 |
| Express | 133,910.82 | 7.70 | 4,102.26 |
| Total | $1,741,566.94 | 100.00% | $53,276.08 |

4—Transportation Expenses.

(a) Station Expenses:

Divided between Intrastate and Interstate business on the basis of the number of passengers of each class handled after making an allowance of about ten cents per day for the handling of mails at certain stations; and assuming that each intrastate passenger makes use of two terminals and each interstate passenger makes use of one terminal, as follows:

| | Intrastate. | Interstate | Total. |
|---|---|---|---|
| Number of Passengers Handled during the six months ended December 31, 1907 | 1,444,540 | 257,950 | 1,702,490 |
| Add 100% to Intrastate business to represent use of two terminals | 1,444,540 | ..... | 1,444,540 |
| Total | 2,889,080 | 257,950 | 3,147,030 |
| Percentage of each | 91.80% | 8.20% | 100.00% |
| Expenses—Divided on above Percentages (after allowing $2,325.00 as cost of handling the mails) | $52,377.81 | $4,678.63 | $57,056.44 |

(*b*) Yard and Train Expenses:

Divided between Coach, Pullman, Mail and Express service on a car-mile basis, as in the case of Maintenance of Way and Structures, as follows:

| | Percentage. | Expenses. |
|---|---|---|
| Coach | 56.77% | $311,706.90 |
| Pullman | 21.15 | 116,128.25 |
| Mail | 11.75 | 64,515.70 |
| Express | 10.33 | 56,718.91 |
| Total | 100.00 | $549,069.76 |

(c) Loss and Damage—Baggage:

Expenses divided between intrastate and interstate business in proportion to the gross earnings of each, as follows:

| | Earnings. | Percentage. | Expenses. |
|---|---|---|---|
| Intrastate | $836,542.20 | 59.54% | $984.39 |
| Interstate | 568,476.21 | 40.46 | 668.92 |
| Total | $1,405,018.41 | 100.00% | $1,654.31 |

(d) Supervision and General:

Expenses divided between Coach, Pullman, Intrastate, Interstate, Mail, and Express business on the basis of the direct charges as apportioned above, as follows:

| | Direct Charges. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | $311,706.90 | 51.09% | $20,679.22 |
| Pullman | 116,128.25 | 19.03 | 7,702.59 |
| Intrastate | 53,362.20 | 8.75 | 3,541.66 |
| Interstate | 5,347.55 | .88 | 356.19 |
| Mail | 66,840.70 | 10.95 | 4,432.13 |
| Express | 56,718.91 | 9.30 | 3,764.27 |
| Total | $610,104.51 | 100.00% | $40,476.06 |

5—General Expenses.

Divided between all classes of service on the basis of the direct charges to each class, as follows:

| | Direct Charges. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | $810,496.95 | 53.42% | $85.881.83 |
| Pullman | 273,188.56 | 18.00 | 28,938.10 |
| Intrastate | 82,492.36 | 5.44 | 8,745.74 |
| Interstate | 23,093.05 | 1.52 | 2,443.66 |
| Mail | 176,406.88 | 11.63 | 18,697.22 |
| Express | 151,594.99 | 9.99 | 16,060.64 |
| Total | $1,517,272.79 | 100.00% | $160,767.19 |

6—Total Operating Expenses.

The total operating expenses are, as hereinbefore explained, divided between Coach, Pullman, Intrastate, Interstate, Mail, and Express business. The amounts charged to intrastate and interstate business are expenses not chargeable to the cost of train service. The expenses charged to mail and express business represent the total operating expenses assignable to those two classes of business. The expenses charged to coach and Pullman service represent the proportion of train expenses assignable to the hauling of passengers.

7—Division of Cost of Coach and Pullman Service Between Intrastate and Interstate Business.

The cost of coach service, $896,378.78, is divided between intrastate and interstate business in proportion to the total passenger miles of each class of traffic during the six months ended December 31, 1907, as follows:

| | Passenger Miles. | Percentage. | Coach Service. |
|---|---|---|---|
| Intrastate | 43,355,996 | 58.71% | $526,263.98 |
| Interstate | 30,486,624 | 41.29% | 370,114.80 |
| Total | 73,842,620 | 100.00% | $896,378.78 |

The cost of Pullman service, $302,126.66, is divided between intrastate and interstate business on the basis of 25% intrastate and 75% interstate, as follows:

| | Percentage. | Pullman Service. |
|---|---|---|
| Intrastate | 25% | $75,531.67 |
| Interstate | 75 | 226,59.99 |
| Total | 100% | $302,126.66 |

8—Total Cost of Intrastate, Interstate, Mail and Express Business.

5808

The cost of Coach and Pullman service divided as above and added to the other costs of intrastate and interstate business gives the total cost of these two classes of business for the six months ended December 31, 1907. The cost of Mail and Express business was ascertained before making the division of Coach and Pullman expenses. These costs are carried to the "Statement of Revenue, Expenses, Etc.," as item 2*a* (Operating Expenses) in columns #4, 5, 6, and 7.

Miscellaneous Revenue, Taxes, Rentals, Hire of Equipment, Dining Car Deficit, and Value of Property.

Miscellaneous revenue and dining car deficit are divided between intrastate and interstate business in proportion to the gross earnings of each class, as follows:

TORN PAGES

| | Gross Earnings. | Percentage. | Miscellaneous Revenue. | Dining-car deficit. |
|---|---|---|---|---|
| Intrastate | $836,542.20 | 59.54% | $22,170.87 | $704.89 |
| Interstate | 568,476.21 | 40.46 | 15,066.07 | 479.01 |
| Total | $1,405,018.41 | 100.00% | $37,236.94 | $1,183.90 |

Taxes, Rentals, Hire of Equipment, and value of Property are divided between intrastate, interstate, mail, and express business in proportion to the total earnings of each class, including the miscellaneous earnings above apportioned, as follows:

| | Total Earnings. | Percentage. | Taxes. | Rentals. | Hire of equipment. | Value of property. |
|---|---|---|---|---|---|---|
| Intrastate | $858,713.07 | 48.28% | $28,582.96 | $2,821.46 | *$499.21 | $2,572,459.62 |
| Interstate | 583,542.28 | 32.80 | 19,418.42 | 1,916.81 | *339.15 | 1,747,652.76 |
| Mail | 202,637.71 | 11.39 | 6,743.16 | 665.63 | *117.77 | 606,883.08 |
| Express | 133,910.82 | 7.53 | 4,457.95 | 440.05 | *77.86 | 401,214.19 |
| Total | $1,778,803.88 | 100.00% | $59,292.49 | $5,843.95 | *$1,033.99 | $5,328,209.65 |

State of Kansas—Rate Matter.

St. Louis Southwestern Railway Company.

*Bases Used in Arriving at Cost of Local and Through Freight Service and Intrastate and Interstate Freight Business in Arkansas—for the Six Months Ended December* 31, 1907.

1—Maintenance of Way and Structures.

The proportion of these expenses applicable to the freight business as shown by the statements in this case, submitted by the Company, has been divided between local and through train service on the basis of the total engine and car miles of each class during the month of October, 1908, that month being considered representative of the business for the six months ended December 31, 1907. In arriving at the number of engine and car miles, we have added 50% to the engine mileage of local trains for station switching, and have assumed that each engine mile was equivalent to 2½ car miles. The total engine and car miles, with the percentage and amount of expenses chargeable to each class of service on this basis, are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Engine Miles | 25,797 | 68,118 | 93,915 |
| 50% added to Local Engine Miles for Station Switching. | 12,899 | ..... | 12,899 |
| Total | 38,696 | 68,118 | 106,814 |

| | | | |
|---|---|---|---|
| Engine Miles as above multiplied by 2½ to get equivalent in car miles | 96,740 | 170,295 | 267,035 |
| Car Miles | 406,532 | 2,201,441 | 2,607,973 |
| Caboose Miles | 24,379 | 68,118 | 92,497 |
| Total | 527,651 | 2,439,854 | 2,967,505 |
| Percentage of each | 17.78% | 82.22% | 100.00% |
| Expenses—Divided on above Percentages | $30,978.51 | $143,253.84 | $174,232.35 |

2—Maintenance of Equipment.

(*a*) Locomotives:

The expenses under this head are divided between yard, and local and through road locomotives on the basis of the locomotive mileage of each class during the month of October, 1908. We have added 50% to the mileage made by yard locomotives to provide for the possible extra maintenance due to yard service; have added 50% to the mileage of road locomotives in local service to provide for the possible extra switching mileage, and again have added 50% to the switching mileage of the local train engines thus ascertained to provide for the possible extra maintenance due to switching service (making 75% added to the local engine mileage). The division be-
5819 tween yard, and local and through road locomotives on this basis is as follows:

| | | Mileage. | Percentage. |
|---|---|---|---|
| Yard Locomotive Mileage | 7,507 | | |
| 50% added for extra repairs | 3,754 | | |
| | | 11,261 | 9.04% |
| Local Locomotive Mileage | 25,797 | | |
| 75% added for extra mileage and repairs | 19,348 | | |
| | | 45,145 | 36.26 |
| Through Locomotive Mileage | | 68,118 | 54.70 |
| Total | | 124,524 | 100.00% |

The total expenses under this head amount to $59,490.90. The amount chargeable to yard locomotives on this basis is 9.04%, or $5,377.98; the amount chargeable to the local service is 36.26%, or $21,571.40, and the amount chargeable to through service is 54.70%, or $32,541.52.

The expense of maintenance of yard locomotives ($5,377.98) is divided between local and through service on the basis of the number of cars of each class of service handled by yard engines during the month of October, 1908. The total number of cars handled at terminals, where yard engines were maintained, together with the percentage and amount of expense chargeable to each class of service, is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Cars Handled | 4,333 | 30,639 | 34,972 |
| Percentage of each | 12.39% | 87.61% | 100.00% |
| Expenses—Divided on above percentages | $666.33 | $4,711.65 | $5,377.98 |

(*b*) Freight Cars:

The total amount of expense for maintenance of freight cars is $181,780.62. This amount is apportioned to Arkansas by the Railway Company on a car mileage basis. In dividing this expense between local and through service, however, we have taken into consideration the element of repairs due to the stopping and starting of trains at way stations, and repairs due to extra terminal handling of cars in local service. Mr. A. M. Wellington, in his work on "Railway Location" (Page 203) says that the stopping and starting at way stations is the cause of approximately 21.5% of the repair expenses of freight cars, and that the terminal handling is the cause of approximately 13.5% of the repair expenses. Taking these elements into consideration, the maintenance expenses may be divided as follows:

| | | | |
|---|---|---|---|
| Stopping and starting | 21.5% | $39,082.83 | |
| Terminal Handling | 13.5 | 24,540.39 | |
| | | | $63,623.22 |
| Other Expenses | | 65% | 118,157.40 |
| Total | | | $181,780.62 |

5820 Assuming that each local train makes a stop, say, each five miles and each through train a stop, say, each twenty miles the local service should be charged with four times as much as the through service, in proportion to car mileage, for the expenses due to stopping aand starting. Assuming also that each car in local service received four terminal handlings (including handling at local stations) to each terminal handling of a car in through service, the local service should be charged with four times as much as the through service, in proportion to car mileage, for the expenses due to terminal handling. Both of these items may, therefore, be divided between local and through service on the following basis:

| | Local. | Through. | Total. |
|---|---|---|---|
| Car Miles (October, 1908) | 430,911 | 2,269,559 | 2,700,470 |
| Same, with local car miles multiplied by four | 1,723,644 | 2,269,559 | 3,993,203 |
| Percentage of each | 43.16% | 56.84% | 100.00% |
| Expenses—Divided on above Percentages | $27,459.78 | $36,163.44 | $63,623.22 |

The balance of the expenses of freight car maintenance, $118,157.40, is divided between local and through service in proportion to the number of car miles made in each class of service, as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Car Miles (October, 1908) | 430,911 | 2,269,559 | 2,700,470 |
| Percentage of each | 15.96% | 84.04% | 100.00% |
| Expenses—Divided on above Percentages | $18,857.92 | $99,299.48 | $118,157.40 |

The total expenses of maintenance of freight cars chargeable to each class of service, under the plans outlined above, are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Stopping and Starting and Terminal Handling..... | $27,459.78 | $36,163.44 | $63,623.22 |
| Other Expenses ..... | 18,857.92 | 99,299.48 | 118,157.40 |
| Total ..... | $46,317.70 | $135,462.92 | $181,780.62 |

(c) Supervision and General:

The total expenses under this head are divided between local and through service on the basis of the direct charges for maintenance of equipment, as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Direct Expenses ..... | $68,555.43 | $172,716.09 | $241,271.52 |
| Percentage of each ..... | 28.41% | 71.59% | 100.00% |
| Expenses—Divided on above percentages..... | $5,390.03 | $13,582.26 | $18,972.29 |

5821 3—Traffic Expenses.

These expenses are incurred in securing and looking after traffic. The amount apportioned to the State of Arkansas is based on the revenue train mileage in that State as compared with the revenue train mileage of the whole road. We have divided these expenses on a straight revenue basis, although of the opinion that this unduly burdens the intrastate business, owing to the fact that a considerable portion of the traffic expense is incurred in the effort to secure competitive business, while it is well known that intrastate business is largely noncompetitive. The basis of dividing these expenses between intrastate and interstate business is as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Total Freight Revenue..... | $175,515.42 | $1,619,840.07 | $1,795,355.49 |
| Percentage of each ..... | 9.78% | 90.22% | 100.00% |
| Expenses—Divided on above Percentages..... | $5,849.70 | $53,963.18 | $59,812.88 |

## 4—Transportation Expenses.

(*a*) Station Expenses:

These expenses cannot be divided between the two classes of train service, as they are not train expenses. They may, however, be divided between intrastate and interstate business in proportion to the volume of traffic of each class handled in the State. We have divided the expenses between the intrastate and interstate business on the basis of the number of tons of each class of traffic, assuming, however, that each intrastate ton was handled twice and each interstate ton once, as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Total Tons | 197,600 | 797,865 | 995,465 |
| Double number of Intrastate Tons in order to provide for two handlings | 197,600 | ..... | 197,600 |
| Total | 395,200 | 797,865 | 1,193,065 |
| Percentage of each | 33.12% | 66.88% | 100.00% |
| Expenses—Divided on above Percentages | $15,738.20 | $31,780.52 | $47,518.72 |

(*b*) Yard and Terminal Expenses:

These expenses are divided between local and through business on the basis of the number of cars handled at terminals, as explained under the head of Maintenance of Yard Locomotives (2*a*). Of the total expenses, 5822 $2,452.50 are the expenses of the Little Rock Terminals, and are charged entirely to local trains; of the balance of these expenses, 12.39%, or $6,692.20 are charged to local trains; and 87.61%, or $47,320.72, are charged to through trains. The $2,452.50 of Little Rock expenses, and $6,692.20 of other expenses, make $9,144.70 of yard expenses charged to local trains.

(*c*) Fuel and Locomotive Expenses:

The Railway Company ascertained the actual consumption of fuel by local and through engines during the month of October, 1908. The value of the fuel consumed was as follows:

| | Local engines. | Through engines. | Total. |
|---|---|---|---|
| Total Amount | $3,868.72 | $9,873.40 | $13,742.12 |
| Percentage of each | 28.15% | 71.85% | 100.00% |

We have used these percentages in dividing fuel and the miscellaneous locomotive expenses for the six months ended December 31, 1907, amounting to $77,882.58. The amount charged to local service is 28.15%, or $21,-923.95; and the amount charged to through service is 71.85%, or $55,958.63.

(*d*) Enginehouse Expenses—Road:

These expenses, amounting to $10,453.24, are divided between local and through service on the basis of the engine miles of each class of service during the month of October, 1908, assuming, however, that the local engines require twice as much enginehouse service per engine mile as the through engine. This assumption is based on the average engine run in the two classes of service. The engine miles and the percentages on which the expenses are divided, are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Total Engine Miles | 25,797 | 68,118 | 93,915 |
| 100% Added to Local Engine Miles to Cover Extra Expenses | 25,797 | ..... | 25,797 |
| Total | 51,594 | 68,118 | 119,712 |
| Percentage of each | 43.10% | 56.90% | 100.00% |
| Expenses—Divided on above Percentages | $4,505.35 | $5,947.89 | $10,453.24 |

(*e*) Road Enginemen and Trainmen:

The Railway Company made an actual division of these expenses during the month of October, 1908, as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Total Amount | $9,025.75 | $13,625.21 | $22,650.96 |
| Percentage of each | 39.85% | 60.15% | 100.00% |

We have used these percentages in dividing the total expenses under this head for the six months ended December 31, 1907. These expenses amounted to $130,080.73, of which 39.85%, or $51,837.17, are charged to local service, and 60.15%, or $78,243.56, are charged to through service.

(*f*) Other Train Expenses:

These expenses are such as are incident to or generally caused by the operation of trains, and not included in the preceding classifications. They are divided between local and through service in proportion to the train miles of each class of service during the month of October, 1908, as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Train Miles | 25,797 | 68,118 | 93,915 |
| Percentage of each | 27.47% | 72.53% | 100.00% |
| Expenses—Divided on above percentages | $8,186.55 | $21,615.24 | $29,801.79 |

(*g*) Loss and Damage—Freight:

The expenses under this head are divided between intrastate and interstate business on the basis of the actual claims paid during the month of October, 1908, as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Claims Paid | $471.22 | $4,468.99 | $4,940.21 |
| Percentage of each | 9.54% | 90.46% | 100.00% |
| Expenses—Divided on above Percentages | $1,810.37 | $17,166.29 | $18,976.66 |

(*h*) Supervision and General:

These expenses are divided between local, through, intrastate, and interstate business on the basis of the direct charges to each of these classes, as follows:

| | | | | | |
|---|---|---|---|---|---|
| Direct Expenses ..... | $95,597.72 | $209,086.04 | $17,548.57 | $48,946.81 | $371,179.14 |

| | Train costs. | | Other costs. | | |
|---|---|---|---|---|---|
| | Local. | Through. | Intrastate. | Interstate. | Total. |
| Percentage of each ..... | 25.76% | 56.33% | 4.73% | 13.18% | 100.00% |
| Expenses—Divided on above Percentages ..... | $4,287.00 | $9,374.48 | $787.17 | $2,193.42 | $16,642.07 |

5824

5—General Expenses.

These expenses are general to all classes of service. They may, therefore, be apportioned to local and through and intrastate and interstate business on the basis of the direct charges for all other expenses of these classes that being perhaps the best measure of the supervision necessary for each. The total direct charges and the percentage of general expenses applicable to each, are as follows:

| | Train costs. | | Other costs. | | |
|---|---|---|---|---|---|
| | Local. | Through. | Intrastate. | Interstate. | Total. |
| Direct Expenses ..... | $204,808.69 | $548,012.71 | $24,185.44 | $105,103.41 | $882,110.25 |
| Percentage of each..... | 23.22% | 62.13% | 2.74% | 11.91% | 100.00% |
| Expenses—Divided on above Percentages ..... | $10,220.98 | $27,348.38 | $1,206.09 | $5,242.54 | $44,017.99 |

6—Total Operating Expenses.

The total freight operating expenses are, as hereinbefore explained, divided between local and through train service and intrastate and interstate business. The train costs are intended to include everything relating to the direct cost of the movement of freight trains, with all expenses incident to such movement. Station expenses and other items which do not affect the expenses of train operation are divided between intrastate and interstate business direct.

7—Method of Dividing Train Costs.

During the month of October, 1908, 78.52% of all intrastate ton-miles and 7.69% of all interstate ton-miles of freight were handled on local trains; and 21.48% of all intrastate and 93.31% of all interstate ton-miles were handled on through trains. Assuming that these same relative conditions would exist during the six months ended December 31, 1907, the total ton-miles of intrastate and interstate freight handled during that period would have been divided between local and through service as follows:

| | |
|---|---|
| Local Trains: | |
| Intrastate Business—78.52% of 8,512 ton-miles during six months' period | 6,684,256 |
| Interstate Business—7.69% of 184,831,455 ton-miles, during six months' period | 14,213,539 |
| Total | 20,897,795 |
| 5825 Through Trains: | |
| Intrastate Business—21.48% of 8,512,807 ton-mile during six months' period | 1,828,551 |
| Interstate Business—92.31% of 184,831,455 ton-miles during six months' period | 170,617,916 |
| Total | 172,446,467 |

In the accompanying statement, train costs are divided between intrastate and interstate business in proportion to the volume of traffic of each kind handled in each class of service, as hereinbefore ascertained. The percentages used and the train costs divided, are as follows:

| Local Trains: | Ton miles. | Percentage. | Train costs. Divided. |
|---|---|---|---|
| Intrastate business | 6,684,256 | 31.99% | $68,787.99 |
| Interstate business | 14,213,539 | 68.01 | 146,241.68 |
| Total | 20,897,795 | 100.00% | $215,029.67 |
| Through Trains: | | | |
| Intrastate business | 1,828,551 | 1.06% | $6,098.83 |
| Interstate business | 170,617,916 | 98.94 | 569,262.26 |
| Total | 172,446,467 | 100.00% | $575,361.09 |

8—Total Cost of Intrastate and Interstate Business.

The total cost of these two classes of business is ascertained in the manner hereinbefore explained. These costs are carried into the "Statement of Revenue, Expenses, etc." as item 2*a* (Operating Expenses) in columns #1 and #2.

Miscellaneous Revenue, Taxes, and Rentals and Value of Property.

In the "Statement of Revenue, Expenses, Etc.," the items under this head have been divided between intrastate and interstate business on a straight revenue basis, as follows:

St. Louis Southwestern Railway Company.

*Bases Used in Arriving at Cost of Intrastate and Interstate Passenger and Mail and Express Business in Arkansas—For the Six Months Ended December* 31, 1907.

All passenger trains on the St. Louis Southwestern Railway Company do a local business, and it has, therefore, been unnecessary to make any division of expenses as between local and through service. Our statement of operating expenses covers the six months ended December 31, 1907, and the division of expenses is between Coach and Pullman service, and Intrastate, Interstate, Mail, and Express business. In general, the expenses are divided on a car-mile basis, the mileage used being that of October, 1908. As there is very little change in mileage from month to month, the figures used may be considered representative of the entire period. The Coach mileage includes the mileage of baggage and parlor cars. The various classes of expenses are divided as follows:

1. *Maintenance of Way and Structures.*

Expenses divided between Coach, Pullman, Mail and Express service on a car-mile basis, as follows:

| | Car-Miles. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | 221,159 | 64.73% | $82,202.54 |
| Pullman | 59,334 | 17.37% | 22,058.67 |
| Mail | 35,480 | 10.38 | 13,181.87 |
| Express | 25,683 | 7.52 | 9,549.87 |
| Total | 341,656 | 100.00% | $126,992.95 |

2. *Maintenance of Equipment.*

(a) Locomotives:

Expenses divided between Coach, Pullman, Mail and Express service on a car-mile basis, as in the case of Maintenance of Way and Structures, as follows:

| | Percentage. | Expenses. |
|---|---|---|
| Coach | 64.73 | $29,431.20 |
| Pullman | 17.37 | 7,897.73 |
| Mail | 10.38 | 4,719.54 |
| Express | 7.52 | 3,419.17 |
| Total | 100.00% | $45,467.64 |

(*b*) Passenger Train Cars:

Expenses divided between Coach, Mail, and Express service on a car-mile basis, as follows:

5829

| | Car-Miles. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | 221,159 | 78.33% | $26,334.42 |
| Mail | 35,480 | 12.57 | 4,226.01 |
| Express | 25,683 | 9.10 | 3,059.41 |
| Total | 282,322 | 100.00% | $33,619.84 |

(*c*) Supervision and General:

Expenses divided between Coach, Pullman, Mail and Express service on the basis of the direct charges as apportioned above, as follows:

| | Direct Charges. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | $55,765.62 | 70.51% | $7,762.84 |
| Pullman | 7,897.73 | 9.99 | 1,099.86 |
| Mail | 8,945.55 | 11.31 | 1,245.18 |
| Express | 6,478.58 | 8.19 | 901.68 |
| Total | $79,087.48 | 100.00% | $11,009.56 |

3. *Traffic Expenses.*

Expenses divided between Intrastate, Interstate, Mail, and Express business on a gross earning basis, as follows:

| | Gross Earnings. | Percentage. | Expenses. |
|---|---|---|---|
| Intrastate | $251,182.96 | 50.97% | $13,251.96 |
| Interstate | 174,260.61 | 35.36 | 9,193.44 |
| Mail | 33,218.77 | 6.74 | 1,752.37 |
| Express | 34,155.57 | 6.93 | 1,801.77 |
| Total | $492,817.91 | 100.00% | $25,999.54 |

4. *Transportation Expenses.*

(*a*) Station Expenses:

Divided between Intrastate and Interstate business on the basis of the number of passengers of each class handled after making an allowance of about ten cents per day for the handling of mails at certain stations; and assuming that each intrastate passenger makes use of two terminals and each interstate passenger makes use of one terminal, as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Number of Passengers handled during the six months ended December 31, 1907..... | 504,392 | 82,064 | 586,456 |
| Add 100% to Intrastate business to represent use of two terminals ..... | 504,392 | ..... | 504,392 |
| Total ..... | 1,008,784 | 82,064 | 1,090,848 |
| Percentage of each..... | 92.48% | 7.52% | 100.00% |
| Expenses divided on above percentage (after allowing $1,149.75 as cost of handling the mails)..... | $22,974.45 | $1,868.16 | $24,842.61 |

(*b*) Yard and Train Expenses:

Divided between Coach, Pullman, Mail and Express service on a car-mile basis, as in the case of Maintenance of Way and Structures, as follows:

5829½

| | Percentage. | Expenses. |
|---|---|---|
| Coach ..... | 64.73% | $90,582.57 |
| Pullman ..... | 17.37 | 24,307.42 |
| Mail ..... | 10.38 | 14,525.67 |
| Express ..... | 7.52 | 10,523.42 |
| Total ..... | 100.00% | $139,939.08 |

(*c*) Loss and Damage—Baggage:

Expense divided between intrastate and interstate business in proportion to the gross earnings of each, as follows:

| | Earnings. | Percentage. | Expenses. |
|---|---|---|---|
| Intrastate ..... | $246,101.33 | 59.04% | $246.22 |
| Interstate ..... | 170,735.14 | 40.96 | 170.82 |
| Total ..... | $416,836.47 | 100.00% | $417.04 |

(*d*) Supervision and General:

Expenses divided between Coach, Pullman, Intrastate, Interstate Mail, and Express business on the basis of the direct charges as apportioned above, as follows:

| | Direct Charges. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | $90,582.57 | 54.45% | $5,527.75 |
| Pullman | 24,307.42 | 14.61 | 1,483.20 |
| Intrastate | 23,220.67 | 13.96 | 1,417.21 |
| Interstate | 2,038.98 | 1.23 | 124.87 |
| Mail | 15,675.42 | 9.42 | 956.32 |
| Express | 10,523.42 | 6.33 | 642.62 |
| Total | $166,348.48 | 100.00% | $10,151.97 |

5. *General Expenses.*

Divided between all classes of service on the basis of the direct charges to each class, as follows:

| | Direct Charges. | Percentage. | Expenses. |
|---|---|---|---|
| Coach | $241,841.32 | 57.64% | $13,326.07 |
| Pullman | 56,846.88 | 13.55 | 3,132.69 |
| Intrastate | 37,889.84 | 9.03 | 2,087.69 |
| Interstate | 11,357.29 | 2.71 | 626.54 |
| Mail | 41,756.71 | 9.95 | 2,300.39 |
| Express | 29,897.94 | 7.12 | 1,646.10 |
| Total | $419,589.98 | 100.00% | $23,119.48 |

6. *Total Operating Expenses.*

The total operating expenses are, as hereinbefore explained, divided between Coach, Pullman, Intrastate, Interstate, Mail and Express business. The amounts charged to Intrastate, and Interstate business are expenses not chargeable to the cost of train service. The expenses charged to Mail and Express business represent the total operating expenses assignable to these two classes of business.
5830 The expenses charged to Coach and Pullman service represent the proportion of train expenses assignable to the hauling of passengers.

7. *Division of Cost of Coach and Pullman Service Between Intrastate and Interstate Business.*

The cost of Pullman service, $59,979.57, is divided between Intrastate and interstate business in proportion to the total passenger miles of each class of traffic during the six months ended December 31, 1907, as follows:

| | Passenger Miles. | Percentage. | Coach Service. |
|---|---|---|---|
| Intrastate | 12,345,719 | 55.42% | $141,413.77 |
| Interstate | 9,930,034 | 44.58 | 113,753.62 |
| Total | 22,275,753 | 100.00% | $255,167.39 |

The cost of Pullman service, $59,919.57, is divided between Intrastate and Interstate business on the basis of 25% Intrastate and 75% Interstate, as follows:

| | Percentage. | Pullman Service. |
|---|---|---|
| Intrastate | 25% | $14,994.89 |
| Interstate | 75 | 44,984.68 |
| Total | 100% | $59,979.57 |

8. *Total Cost of Intrastate, Interstate, Mail and Express Business.*

The cost of Coach and Pullman service divided as above and added to the other costs of Intrastate and Interstate business gives the total cost of these two classes of business for the six months ended December 31, 1907. The cost of Mail and Express business was ascertained before making the division of Coach and Pullman expenses. These costs are carried to the "Statement of Revenue, Expenses, etc.," as item 2*a*. (Operating Expenses) in columns #4, 5, 6 and 7.

*Miscellaneous Revenue, Taxes, Rentals, Outside Operations, and Value of Property.*

Miscellaneous Revenue and Outside Operations (Dining car deficit) are divided between Intrastate and Interstate business in proportion to the gross earnings of each class, as follows:

5831

| | Gross Earnings. | Percentage. | Miscellaneous Revenue. | Outside Operations. |
|---|---|---|---|---|
| Intrastate | $246,101.33 | 59.04% | $5,081.63 | $811.38 |
| Interstate | 170,735.14 | 40.96% | 3.525.47 | 562.91 |
| Total | $416,836.47 | 100.00% | $8,607.10 | $1,374.29 |

Taxes, Rentals and Value of Property are divided between Intrastate, Interstate Mail and Express business in proportion to the total earnings of each class, including the miscellaneous earnings above apportioned, as follows:

| | Total Earnings. | Per-centage. | Taxes. | Rentals. | Value of Property. |
|---|---|---|---|---|---|
| Intrastate | $251,182.96 | 50.97% | $8,077.78 | $1,299.67 | $770.152.41 |
| Interstate | 174,260.61 | 35.36 | 5,603.89 | 901.64 | 534,286.62 |
| Mail | 33,218.77 | 6.74 | 1,068.16 | 171.86 | 101,840.83 |
| Express | 34,155.57 | 6.93 | 1,098.28 | 176.71 | 104,711.72 |
| Total | $492,817.91 | 100.00% | $15,848.11 | $2,549.88 | $1,510,991.58 |

Endorsed: Filed July 18th, 1910. W. P. Feild, Clerk, by W. Presley Feild, D. C.

5837 EXHIBIT "W."

State of Arkansas—Rate Matter.

St. Louis, Iron Mountain & Southern Railway Company.

*Tonnage Capacity of Engines in Freight Service as Shown by Official Time Cards (Issued for the Government of Employés Only), Effective During the Last Half of* 1909, *Compared on the Various Operating Districts Over Which So-called "Trans-state" Trains Would Pass Through the State of Arkansas. (As Various Classes of Engines With Varying Tonnage Ratings Are in Service on the Different Districts, the Maximum Rating on Each District Has Been Used Below as the Basis of Comparison.)*

An engine hauling a train into Arkansas from the north on the main line could haul into Hoxie terminal 2,300 tons gross of trans-state freight, destined beyond Texarkana. From Hoxie to Argenta the maximum rating of any engine being 2,000 tons gross the train would have to be reduced 300 tons at Hoxie; from Argenta to Texarkana the maximum rating of any engine being 1,600 tons a further reduction of 400 tons would have to be made at Argenta.

It is apparent that on the main line in Arkansas the maximum possible gross tonnage of a train of trans-state freight would be 700 tons less South of Argenta than it was North of Hoxie.

An engine hauling a train into Arkansas from the north on the main line, consisting of trans-state freight only, destined to Louisiana points via Argenta and Alexandria could haul into Hoxie 2,300 tons gross. From Hoxie to Argenta 2,000 tons gross. From Argenta to Pine Bluff the maximum rating of any engine is shown as 2,000 tons gross; from Pine Bluff to McGehee 2,400 tons gross; and from McGehee to Riverton, Louisiana 1,800 tons gross.

It is apparent that in traversing the route indicated above a so-called "trans-state" train would be reduced 300 tons at Hoxie, and even if allowed to run from Pine Bluff to McGehee without being increased to the maximum rating for that portion of the line would have to be reduced 200 tons at McGehee. It will be noted that when the train went south from McGehee into Louisiana it could carry as a maximum 500 tons less than it contained when it came into the State.

Traffic from Louisiana Points to Points in Other States via Little Rock and Any Line of the Iron Mountain to the Arkansas Border.

The maximum rating for any engine from Riverton, Louisiana to McGehee, Arkansas, is shown as 1,800 tons gross. If a train of this weight were allowed to run unbroken and without increase of

tonnage from McGehee to Pine Bluff (although the maxi-
5838 mum for that piece of road is 2,400 tons gross), assuming that 1,800 tons was the rating of the engine hauling the train when it reached Pine Bluff, its tonnage would have to be reduced to 1,550 tons, at Pine Bluff, unless a change of engines was effected at that point, and an engine of higher rating substituted. This procedure is improbable, however, as Pine Bluff is about the middle of a regular through freight division which extends from McGehee to Argenta.

A "trans-state" train coming into Arkansas from Oklahoma and beyond, destined beyond Texarkana via Argenta could not consist, according to the rating table, of more than 1,500 tons gross. This rating would apply as a maximum through Van Buren and as far south as Conway, from which latter point the rating to Argenta is given as 1,750 tons gross for an engine which could haul 1,500 tons to Conway. South of Argenta the maximum rating is given in the table as 1,600 tons gross. If no change were made in the train at Conway or Argenta the engine would not realize its full efficiency by 250 tons between Conway and Argenta, and by 100 tons between Argenta and Texarkana. On the other hand, if the tonnage were increased 250 tons at Conway it would have to be reduced 150 tons at Argenta.

"Trans-state Traffic to and from Memphis via Bald Knob.

Moving West from Memphis a train of trans-state freight reaching the main line at Bald Knob, and which if its engine had the highest tonnage rating on that line would carry out of Memphis 1,550 tons gross, would have to reduce at Levesque to 800 tons which rating would prevail as far as Crowley's from which point it would have to run light to Bald Knob or fill out at Crowley's to 1,550 tons the rating between Crowley's and Bald Knob.

Traffic moving in the opposite direction to that referred to in the preceding paragraph, would move under maximum tonnage rating of 1,550 tons from Bald Knob to Wynne, 800 tons from Wynne to Crowley's, and 1,550 tons from Crowley's to Memphis. Bald Knob to Memphis is one through freight division.

5839 Trans-state traffic coming into Arkansas via the White River division and destined to any point beyond the borders of Arkansas would be subjected to the following fluctuations in maximum engine rating between the Missouri-Arkansas State line and Newport on the main line. An engine could bring into Cotter from the North a maximum of 725 tons gross. (Cotter is the most Northerly terminal in Arkansas on the White River Division.)

From Cotter to Batesville the maximum rating for any engine is shown 1,400 tons gross and from Batesville to Newport the maximum rating of the same engine is but 700 tons gross.

From Cotter to Newport is one through freight division, and it is apparent that a "trans-state" train coming into Arkansas from the North on this division hauling the maximum tonnage of its engine as far as Cotter would either have to fill out 675 tons at Cotter or

run light that amount from Cotter to Batesville, and reduce 25 tons at the latter point to conform to the maximum rating between Batesville and Newport.

Fluctuation in Engine Tonnage Ratings Between the Termini of a Through Freight Division.

Such fluctuations occur on the White River Division at Batesville located between Cotter and Newport, the termini of a through freight division. It also occurs on the Central division at Conway, between Van Buren and Argenta, the termini of a through freight division. It also occurs at Pine Bluff, located between Argenta and McGehee, the termini of a through freight run on the Arkansas Division. It also occurs at Wynne, Levesque, and Crowley's all of which three points are located between Bald Knob and Memphis, the termini of a through freight run on the Memphis division.

5840 EXHIBIT "X."

5841 EXHIBIT "X."

State of Arkansas—Rate Matter.

St. Louis Southwestern Railway Company.

*Station Expenses—Freight.*

On the basis of the showing made by the St. Louis Southwestern Railway Company during the month of January, 1909 (Exhibit "A") 51.24% of the total interstate tonnage is trans-state tonnage. Deducting this proportion from the interstate tonnage for the six months ended December 31, 1907, leaves 389,039 tons of interstate freight. Assuming that this is the only interstate tonnage receiving station attention, the percentage on which the station expenses would be divided would be ascertained as follows:

| | | | |
|---|---|---|---|
| Intra-state tons ..... | 197,600 | | |
| Doubled, to represent two handlings. | 197,600 | | |
| | | 395,200 = | 50.39% |
| Interstate tons (excluding trans-state)..... | | 389,039 = | 49.61% |
| Total..... | | 784,239 = | 100.00% |

50.39% amounts to 17.27% more than the percentage (33.12% used in our Exhibit "Q," and this would represent a total increase in intrastate expenses as follows:

| | | |
|---|---|---|
| Transportation Expenses: | | |
| Station | $8,206.48 | |
| Supervision and General | 367.79 | |
| | | $8,574.27 |
| General Expenses | | 426.97 |
| Total | | $9,001.24 |

This amount, $9,001.24, deducted from net earnings of $119,-897.24, shown by Exhibit "V," would leave $110,896.00 as the net earnings on State business, after making the above allowance for trans-state freight, and without considering any extra station service for cotton, grain, and lumber, practically all of which is interstate. $110,896.00 equals an earning of 8.48% on the value of the property devoted to State business.

*Terminal Handling of Trans-state Freight.*

Conceding, for the sake of the argument, that a proportion of the trans-state cars on through trains do not receive as much terminal handling as we have assumed in Exhibit "R," and reducing the number of terminal handlings of cars in through service by 25% on that account, the result would be as follows:

| | | | |
|---|---|---|---|
| Cars handled for local trains | | 4,333 = | 15.86% |
| Cars handled for through trains | 30,639 | | |
| Less 25% | 7,660 | | |
| | | 22,979 = | 84.14% |
| Total | | 27,312 = | 100.00% |

5842 15.86% amounts to 3.47% more than the percentage (12.39%) used in Exhibit "Q," and this would represent an increase in local train expenses as follows:

| | | |
|---|---|---|
| Maintenance: | | |
| Yard Locomotives | $186.62 | |
| Supervision and General | 15.18 | |
| | | $201.80 |
| Transportation: | | |
| Yard and Terminal Expenses | $1,959.35 | |
| Supervision and General | 88.20 | |
| | | 2,047.55 |
| General Expenses | | 110.04 |
| Total | | $2,359.39 |

Of this increase, 30.93%, or $729.76 would be chargeable to State business. This amount deducted from the $110,896.00 of State earnings shown above, would leave net earnings of $110,166.24, or 8.42% on the value of property devoted to State business.

*Traffic Expenses.*

On the other hand, if traffic expenses were divided between State and Interstate business on a ton-mile basis, the State expenses would be decreased by $3,217.93, and the State earnings increased accordingly. This amount, added to the $110,166.24 of State earnings shown above, would make the State earnings $113,384.17, or 8.67% on the value of property devoted to State business.

*Maintenance of Way Expenses.*

If maintenance of way expenses had been apportioned on a gross-ton-mile basis instead of a car-mile basis, the amount chargeable to local service would have been 14.96% of the total expenses, instead of 17.78%, the percentage used in Exhibit "R." This decrease in percentage would have reduced local train expenses by $5,159.85, of which 30.93%, or $1,595.94, would be applicable to State business. This amount would increase the State earnings shown above to $114,980.11, or 8.79% on the value of property devoted to State business.

5843 EXHIBIT "Y."

5844 EXHIBIT "Y."

State of Arkansas—Rate Matter.

St. Louis, Iron Mountain & Southern Railway Company.

*Station Expenses—Freight.*

On the basis of the showing made by the St. Louis, Iron Mountain & Southern Railway Company during the month of October, 1907 (Exhibit #26), 42.62% of the total interstate tonnage handled during that month was trans-state tonnage. Deducting this proportion from the interstate tonnage for the six months ended December 31, 1907, leaves 1,571,713 tons of interstate business. Assuming that this is the only interstate tonnage receiving station attention, the percentage on which the station expenses would be divided would be ascertained as follows:

| | | | |
|---|---|---|---|
| Intrastate tons | 684,122 | | |
| Doubled, to represent two handlings | 684,122 | | |
| | | 1,368,244 = | 46.54% |
| Interstate tons (excluding trans-state) | | 1,571,713 = | 53.46% |
| Total | | 2,939,957 = | 100.00% |

46.54% amounts to 13.23% more than the percentage (33.31%) used in our Exhibit "J," and this would represent a total increase in intrastate expenses as follows:

| | | |
|---|---|---|
| Transportation Expenses: | | |
| Station Expenses | $30,908.84 | |
| Supervision and General | 937.34 | |
| | | $31,846.18 |
| General Expenses | | 1,427.96 |
| Total | | $33,274.14 |

This amount, $33,274.14, deducted from net earnings of $349,-100.52, shown by Exhibit "O," would leave $315,826.38 as the net earnings on State business, after making the above allowance for trans-state freight, and without considering any extra station service for cotton, grain, and lumber, or for Memphis and Ft. Smith tonnage, practically all of which is interstate. $315,826.38 equals an earning of 6.96% on the value of property devoted to State business.

*Terminal Handling of Trans-state Freight.*

Conceding, for the sake of the argument, that a proportion of the trans-state cars on through trains do not receive as much terminal handling as we have assumed in Exhibit "K," and reducing the number of terminal handlings of cars in through service by
5845 25% on that account, the result would be as follows:

| | | | |
|---|---|---|---|
| Cars handled for local trains | | 32,232 = | 24.35% |
| Cars handled for through trains | 133,482 | | |
| Less 25% | 33,370 | | |
| | | 100,112 = | 75.65% |
| Total | | 132,344 = | 100.00% |

24.35% amounts to 4.89% more than the percentage (19.46%) used in Exhibit "J," and this would represent an increase in local train expenses as follows:

| | | |
|---|---|---|
| Maintenance: | | |
| Yard Locomotives | $3,380.74 | |
| Supervision and General | 315.48 | |
| | | $3,696.22 |
| Transportation: | | |
| Yard and Terminal Expenses | $14,344.69 | |
| Supervision and General | 436.19 | |
| | | 14,780.88 |
| General Expenses | | 832.97 |
| Total | | $19,310.07 |

Of this increase, 21.04%, or $4,062.84, would be chargeable to State business. This amount, deducted from the $315,826.38 of State earnings shown above, would leave net earnings of $311,763.54, or 6.87% on the value of property devoted to State business.

*Traffic Expenses.*

On the other hand, if traffic expenses were divided between State and Interstate business on a ton-mile basis, the State expenses would be decreased by $5,717.25, and the earnings increased accordingly. This amount, added to the $311,763.54 of State earnings shown above, would make the State earnings $317,480.79, or 6.99% on the value of property devoted to State business.

Def't's Exhibit I-1. T. F. Wharton, 6/22/10.

In the Circuit Court of the United States for the Western Division of the Eastern District of Arkansas.

In Chancery.

WILBUR F. BOYLE, Complainant,
vs.
ST. LOUIS AND SAN FRANCISCO RAILROAD COMPANY and R. P. Allen, John Crockett, and J. E. Hampton, Railroad Commissioners of the State of Arkansas, and W. W. Dickinson and T. H. Bunch, Defendants.

*Affidavit of E. K. Voorhees.*

CITY OF ST. LOUIS,
*State of Missouri, ss:*

E. K. Voorhees, of lawful age, being first duly sworn on oath, deposes and says he resides at St. Louis, Mo., and that his occupation is that of general freight agent of the St. Louis and San Francisco Railroad Company, one of the defendants in the foregoing entitled case and that he has filled such position since July 1, 1904, and that his duties and employment as said general freight agent are to have general charge of the freight business of said railroad company under the supervision of the freight traffic manager of said railroad company and that prior to occupying such position he was in the service of said railroad company or of railroad companies owning and operating railroads which are now leased and operated by said defendant railroad company in the capacity of assistant general freight agent, commercial agent and local freight agent, for a period of about fifteen years and prior to that time he was in the service of said other railroad company or companies in the station service thereof for about six years.

Affiant states that he is acquainted now and has been for many years last past with the conditions existing upon the lines of railroads of said railroad company in the State of Arkansas, with reference to the transportation of freight, and the rates and earnings therefrom and the conditions surrounding such transportation, within the State of Arkansas.

Affiant states that in the early part of September 1908, he was directed and instructed by the freight traffic manager of said railroad company to prepare and submit a schedule of freight rates to be applied on the lines of said railroad company within the State of Arkansas to take the place of the Standard Freight Distance Tariff No. 3 of the Railroad Commission of Arkansas, the defendant rail-

road company having been enjoined in the Federal Courts from continuing the use of said Distance Tariff No. 3.

5867 Affiant further states that in the preparation of such tariff he took into consideration the rates in effect in other states where transportation conditions were somewhat similar to those existing in the State of Arkansas and also gave due consideration to the rates operated on interstate traffic to and from and through the State of Arkansas and other states similarly located, and further gave consideration to all other elements usually entering into the fixing of freight rates to the end that the schedule so prepared might contain rates which were reasonable, not alone from the standpoint of the carrier, but would be reasonable from the standpoint of the public and would not discriminate for nor against the citizens of the State of Arkansas nor the citizens of other states.

Affiant further states that he was directed and instructed to cooperate with the officials of other Arkansas railroads and to discuss and consider with them, in conference the schedule of rates which should be operated within the State of Arkansas in lieu of the said Standard Freight Distance Tariff No. 3.

Affiant states that early in September, 1908, he met representatives of the freight traffic departments of other railroads operating in the said State, in conference, and that said conference remained in session about fifteen days, and as a result the representative of each line recommended to his company the adoption of a schedule of charges to apply within the State of Arkansas in place of the said Standard Freight Distance Tariff No. 3.

Affiant states that the chief traffic officers of the lines named gave careful consideration to the schedule that was recommended and that before any schedule was adopted and published by the several lines conferences were held with a large number of Arkansas shippers who would be affected by the changes in rates, also with the Railroad Commission of Arkansas and that all objections which were offered by said shippers and receivers or the Railroad Commission of Arkansas were given due and proper consideration and a number of modifications were made in the rates first recommended before they were finally made effective by the several railroad companies, on November 2, 1908.

Affiant states that the representatives of the several lines discussed and considered the relations which should exist between the several class rates and after much study and comparison with the rates in other states and with the class rates applied on interstate traffic in various portions of the territory west of the Mississippi River and other elements affecting the fixing of class rates, it was decided to recommend that the various classes should bear the following relation each to the other:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E Classes. |
|---|---|---|---|---|---|---|---|---|---|
| 100 | 83⅓ | 66⅔ | 50 | 40 | 45 | 36 | 30 | 25 | 20 Per cent. |

Affiant repeats that this decision was reached only after full discussion by the representatives of the several lines and that

5868 such recommendation was adopted by the chief traffic officers of the several railroad companies only after careful consid-

eration and the affiant says that the relation of the class rates resulting from the application of this principle is fair and reasonable and just as applied to the traffic within the State of Arkansas.

Affiant says that in determining the class rates which should be embodied in its recommendation representatives of the several railroads gave careful consideration to the interstate rates applying to, from and through the State of Arkansas and in other localities and also to the class rates in effect in other states. It was found that the class rates applicable from Memphis, Tennessee, to Little Rock, Arkansas, distance of about 135 miles, were:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 70 | 60 | 45 | 36 | 27 | 29 | 22 | 18 | 15 | 12 |

The rates established by the carriers to apply within the State of Arkansas for similar distance are:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 70 | 58 | 47 | 35 | 28 | 32 | 25 | 21 | 18 | 14 |

The rates from Memphis to Fort Smith, distance of about 302 miles, were found to be:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 102 | 87 | 67 | 49 | 40 | 42 | 35 | 30 | 28 | 23 |

The rates established by the various Arkansas railroads to apply on state traffic for similar distance, 310 miles and over 300 miles are:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 101 | 84 | 67 | 51 | 40 | 45 | 35 | 30 | 25 | 20 |

The rates from St. Louis, Missouri, to Little Rock, Arkansas, a distance of 345 miles, were found to be:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 100 | 85 | 65 | 49 | 37 | 39 | 32 | 27 | 23 | 18 |

Tariffs established by the various Arkansas railroads to apply on Arkansas state traffic are, for similar distance, 350 miles and over 345 miles:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 105 | 88 | 70 | 53 | 42 | 47 | 37 | 32 | 26 | 21 |

and that these examples illustrate the fact that the class rates recommended by the said representatives of the several lines approximate the rates which are applicable between interstate points and points within the State of Arkansas. There are very few instances in which the rates for the same distances interstate to, from and through Arkansas are materially lower than the rates now charged by the rail-

roads within the State of Arkansas, and there are numerous cases where such interstate rates are higher than the rates within the State of Arkansas. For instances: Memphis to Eldorado, Arkansas, distance 264 miles, the rates are:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 110 | 93 | 78 | 59 | 43 | 46 | 38 | 30 | 26 | 22 |

The rates for the same distance within the State of Arkansas are:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 96 | 80 | 64 | 48 | 38 | 43 | 34 | 29 | 24 | 19 |

5869–5956 Memphis, Tennessee, to Texarkana, Arkansas, distance 291 miles, the rates are:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 117 | 105 | 96 | 79 | 60 | 62 | 50 | 42 | 36 | 29 |

Rates for same distance within the State of Arkansas are:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 100 | 83 | 67 | 50 | 40 | 45 | 35 | 30 | 25 | 20 |

Affiant states that the representatives of the several lines give careful consideration to the large number of special commodity rates shown in Standard Freight Distance Tariff No. 3 applicable on shipments of various commodities in less than carload quantities and the decision was reached that the tariff should not include special commodity rates on less than carload shipments of any articles, it being found on investigation and study that in other states similarly situated commodity rates were not usually applied on less than carload shipments but the classification ratings were used and the same thing is true with respect to the rates on interstate traffic, except that, during the period when the Standard Freight Distance Tariff No. 3 was in effect and which provides for special low rates on certain commodities in less than carload quantities, the carriers were obliged, in order to avoid discrimination against interstate shipments, to provide in interstate tariffs for commodity rates bearing a proper relation to the commodity rates established by the Railroad Commission of Arkansas applicable from the borders of the state to points within the state. The representatives of the several railroads therefore concluded that the application of any principle of classification different from the Western Classification between points in Arkansas would result in discriminations and was indefensible. This principle of applying class rates in preference to commodity rates on all shipments excepting heavy and bulky articles in carload lots is the practice in vogue in other surrounding states also on interstate shipments and is supported by many rulings of the Interstate Commerce Commission and by numerous text writers on the subject.

5957 The following opinion of Court was delivered and filed in the cause:

In the United States Circuit Court for the Western Division of the Eastern District of Arkansas.

No. 1637.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY and ST. LOUIS, IRON MOUNTAIN AND SOUTHERN RAILWAY COMPANY, Complainant-,
vs.
ROBERT P. ALLEN, et als.

Moore, Smith and Moore for Complainant-.
Joseph M. Hill and James H. Harrod for Defendants.

*Opinion of Court.*

5958 Published in 187 Fed. page 290.

*Opinion*

May 3, 1911.

Hon. JACOB TRIEBER, *Judge.*

The St. Louis, Iron Mountain & Southern Railway Co., which will be referred to herein as the Iron Mountain Railway, and the St. Louis Southwestern Railway Co., referred to as the Southwestern Railway Co., instituted these proceedings against the Board of Railroad Commissioners of the State of Arkansas to enjoin the enforcement of the freight and passenger tariffs promulgated by that board in pursuance of the powers delegated to it by the laws of the State of Arkansas. The grounds upon which the relief is sought are that the rates which apply solely to intrastate traffic are non-compensatory and confiscatory when applied to the entire intrastate business of each of the companies. A preliminary injunction was granted in 1908 by Mr. Justice Van Devanter, then one of the Circuit Judges of this circuit. His opinion is reported in 163 Fed. 141. In 1909 the temporary injunction was modified by this Court, 168 Fed. 720. The pleadings were perfected and a large volume of testimony taken by the parties. At the urgent request of counsel for all parties the services of a master to make findings of facts and state his conclusions of law were dispensed with, notwithstand-
5959 ing what was said in Chicago, Minneapolis & St. Paul Ry. v. Tompkins, 176 U. S. 167, and the cause heard by the Court upon the pleadings and proofs.

It is thought best that at the threshold of these cases the most important principles of law applicable to cases of this nature should be stated; these are rules of law which have been so frequently determined by the highest court of the land that they may now be properly regarded as elementary, and for this reason it will be sufficient

to merely state them without unduly lengthening this opinion with a long list of citations to sustain them.

(*a*) A State has the power to establish rates to be charged by common carriers for the exclusive intra-state carriage of freight and passengers, and this may be done by direct action of the law-making department or a commission to whom that department of the government has by law delegated it.

(*b*) The rates thus established must be reasonable and fair to the carriers as well as the public. The State may not make rates so as to confiscate the carrier's property; nor can the carrier make rates which are oppressive to those who by necessity are compelled to employ its services. Whether they are so or not is a question for judicial investigation and determination.

(*c*) Presumptively, rates thus established by authority are reasonable and just, and the burden of proof to show the contrary is upon the party attacking them.

(*d*) To justify courts to set aside rates thus established it is incumbent upon the carriers to prove by evidence which is clear, unequivocal and convincing and leaves the Court reasonably free from doubt that they are unjust, that they amount to a taking of property without just compensation and that to make them compen-
5960 satory the rates would not have to be so high as to make them oppressive to the public.

(*e*) The rights of carriers and the public are reciprocal. The carrier is entitled to ask a fair return upon the value of its property which it employs for the public convenience, and the public is entitled to demand that no more be exacted from it for the use of the public highway than the services rendered are reasonably worth, and not be oppressive.

Before passing upon the evidence and the law arising therefrom there are some other important rules of law raised by counsel for both parties which should be determined at this time, for some of them, if sustained, would relieve the Court of the necessity of examining the voluminous evidence in these cases, and others will, to a great extent, control the final conclusions to be drawn from the evidence.

*Interference with Interstate Commerce.*

It is claimed that as the rates prescribed for intrastate business, freight as well as passenger, necessarily affect interstate rates, such acts of the States, whether by direct legislation or through a commission clothed with such power, although limited by the provisions of the statute to intrastate business exclusively, are a burden upon interstate commerce and therefore violative of the commerce clause of the National Constitution.

That intrastate tariffs bear certain relations to, and to some extent control interstate rates cannot be doubted. The evidence in this case establishes that fact conclusively, and even in the
5961 absence of such evidence the Court would be justified to take judicial notice of it. No better illustration is needed than the facts and conclusions of law in Gulf C. & S. F. Ry. Co. v. Texas,

204 U. S. 403, 413. And this seems to be the rule adopted by the Interstate Commerce Commission since the decision in the Gulf R. R. case. Ambrey Semple v. Galveston, Etc., Ry. Co., 17 I. C. C. 267, and Rule 56-B of Administrative Rules. Although the Texas case was one involving freight only, the same principle applies to passenger rates. In fact, it is more apparent in the latter than in the former. Even in the absence of a rule to that effect by the Interstate Commerce Commission or of decisions of the courts. If the States of Arkansas, Texas and Missouri each enact a two-cent rate fare it would be folly for a carrier to attempt to charge a higher rate for interstate or trans-state passengers in those States, for passengers would purchase tickets to the State line of each State at the reduced local rates and thus defeat the higher interstate rates, although the State rates are by the statutes of these State limited to intrastate transportation solely. As stated by Mr. Justice Brewer in his opinion in Gulf C. & S. F. Ry. Co. v. Texas:

"In this respect there is no difference between an interstate passenger and interstate transportation. If Hardin, for instance, had purchased at Hudson an interstate ticket for Texarkana, intending all the while after he reached Texarkana to go on to Goldthwaite, he would not be entitled on his arrival at Texarkana to a new ticket from Texarkana to Goldthwaite at the proportionate fraction of the rate prescribed by the Interstate Commerce Commission for carriage from Hudson to Goldthwaite. The one contract of the rail-
5962 road company having been finished he must make a new contract for his carriage to Goldthwaite, and that would be subject to the laws of the State within which that carriage was to be made."

Nor does the intention of the shipper or passenger to avoid the higher interstate rates by the purchase of tickets or shipments at the lower interstate rates change the rule of law. On that point Mr. Justice Brewer in the Gulf case answered negatively the question thus propounded:

"If the only contract of shipment was for local transportation would the State law in respect to the mode of transportation be set one side by the Federal law in respect to interstate transportation on the ground that the shipper intended after the one contract of shipment had been completed, to forward the goods to some place outside the State?"

But does the fact that these intrastate rates bear such relation to interstate rates necessarily make the statutes of a State regulating charges for intrastate transportation by carriers engaged in interstate as well as intrastate commerce void? No authorities directly sustaining this claim have been cited to the Court, although the cases in which statutes of this nature have been attacked are numerous. The only cases cited are those holding in general terms that State statutes which amount to some regulation of foreign or interstate commerce, or which directly or by their necessary operation, burden interstate commerce are invalid as violative of the commerce clause of the National Constitution. On the other hand Mr. Justice
5963 Brewer in Ames v. Union Pacific Ry Co., 64 Fed. 165, 172, affirmed sub nominee Smyth v. Ames, 169 U. S. 466, expressly held:

"Neither can I understand how the reduction of local rates, as a matter of law, interferes with interstate rates. It is true the companies may, for their own convenience to secure business, or for any other reason, rearrange their interstate rates and make them conform to the local rates prescribed by the statute, but surely there is no legal compulsion. The statute of the State does not work a change in interstate rates any more than an act of Congress prescribing interstate rates will legally work a change in local rates. Railroad companies cannot plead their own convenience or the effects of competition between themselves and other companies in restraint of the otherwise undeniable power of the State."

Louisville & Nashville Ry. Co v. Eubank, 184 U. S. 27, cited for complainants, is not in point, as all that was decided in that case was that a State cannot compel carriers to adjust their intrastate rates with reference to their interstate rates.

But it is urged that in the Ames case the evidence failed to show the effect of the State rates on interstate rates, while in the cases at bar that fact is fully established. In Peik v. Chicago, etc., Ry. Co, 94 U. S. 164, 177, Mr Chief Justice Waite speaking for the Court on a contention of this nature said:

"As to the effect of the statute as a regulation of interstate commerce. The law is confined to State commerce or such interstate commerce as directly affects the people of Wisconsin. Until Congress acts in reference to the relations of this company to interstate commerce, it is certainly within the power of Wisconsin to regu-
5964 late its fares, etc., so far as they are of domestic concern. With the people of Wisconsin this company has domestic relations. Incidentally these may reach beyond the State. But certainly until Congress undertakes to legislate for those who are without the State, Wisconsin may provide for those within, even though it may indirectly affect those without."

While that part of the opinion which holds that a State may regulate such "interstate business as affects the people of Wisconsin" has been severely criticised if not overruled by later decisions, that part applying to the intrastate traffic has never been questioned and has been repeatedly followed. But, treating the question as one never before authoritatively determined, the conclusion of the Court, upon well-settled principles of elementary law, is that this contention of complainants cannot be sustained. The right of every sovereign State to regulate public service corporations and the rates to be charged by them, subject to the provisions of the fourteenth amendment prohibiting deprivation of one's property without due process of law and other provisions of the National Constitution, rests upon the police powers, which "are nothing more or less than the powers of government inherent in every sovereignty." License Cases, 5 How. 583; Reagan v. Farmers Loan & Trust Co., 154 U. S. 362, 393; Smythe v. Ames, 169 U. S. 466, 521.

While, generally speaking, the police power of a State is said to extend to the protection of "the public health, the public morals, and the public safety," the law does not recognize those as the extent

of the power, but, as stated by Mr. Justice Harlan in Chicago
5965 B. & Q. Ry. Co. v. Drainage Commissioners, 200 U. S. 561, 592:

"We hold that the police power of a State embraces regulations designed to promote the public convenience and the general prosperity, as well as the regulations designed to promote the public health, the public morals or the public safety."

In Lake Shore, Etc., Ry. Co. v. Ohio, 173 U. S. 285, the same learned Justice after reviewing the previous decisions of that Court, states the conclusions of the Court in the following language:

"Now it is evident that these cases (referring to the cases cited in the opinion) had no reference to the health, morals, or safety of the people of the State, but only to the public convenience. They recognized the fundamental principle that, outside of the field directly occupied by the general government under the powers granted to it by the Constitution, all questions arising within a State that relate to its internal order or that involve the public convenience or the general good, are primarily for the determination of the State, and that its legislative enactments relating to these subjects, and which are not inconsistent with the State Constitution are to be respected and enforced in the courts of the Union if they do not by their operation directly entrench upon the authority of the United States or violate some right protected by the National Constitution. The power here referred to is, to use the words of Chief Justice Shaw, the power 'to make, ordain and establish all manner of wholesome and reasonable laws, statutes and ordinances, either with penalties or without, not repugnant to the Constitution, as they shall judge to be for the good and wel-
5966 fare of the commonwealth and of the subjects of the same.' Commonwealth v. Alger, 7 Cush. 53, 85. * * * It may be that such legislation is not within the 'police power' of a State as those words have been sometimes, although inaccurately, used, but in our opinion, the power, whether called police, governmental or legislative, exists in each State, by appropriate enactments not forbidden by its own Constitution or by the Constitution of the United States, to regulate the relative rights and duties of all persons and corporations within its jurisdiction, and therefore to provide for the public convenience and the public good. This power in the States is entirely distinct from any power granted to the general government, although when exercised it may sometimes reach subjects over which national legislation can be constitutionally extended."

In Noble State Bank v. Haskell, decided January 3, 1911, and not yet reported, involving a banking law providing for a guaranty fund to secure depositors, Mr. Justice Holmes in speaking of the police power said:

"It may be said in a general way that the police power extends to all the great public needs. It may be put forth in aid of what is sanctioned by usage or held by the prevailing morality or strong and preponderate opinion to be greatly and immediately necessary to the public welfare."

Among other cases in which the same rule is recognized the following may be appropriately referred to. Canfield v. United States,

167 U. S. 518, 525; Chicago, Etc., R. R. Co. v. Nebraska, 170 U. S. 57, 73; Lake Shore, Etc., Ry. Co. v. Smith, 173 U. S. 684, 689; Bacon v. Walker, 204 U. S. 311, 318; Western Union Tel. Co. v. Milling Co., 218 U. S. 406.

5967 Professor Stimson of Harvard University in his able work on "Popular Law-making" says on that subject on page 164:

"Some writers endeavor to justify, under our Constitution, the regulation of rates by the principle of eminent domain; but this source seems far-fetched and unnecessary. It is, of course, done under the police power, but the precedent for that use of the police power is to be found in the history of English law and statutes. Thus we have noted in the Statute of Westminster I. A. D. 1275, that excessive toll contrary to the common custom of the realm was forbidden in market towns. The very phraseology of this statute indicates the antiquity of the doctrine that tolls must be reasonable; but toll was always a technical term, not for ordinary prices of commodities, but for a use or service which was in some way dependent upon law or ordinance."

The same views are expressed in 3 Thompson on Corporations, Sec. 2950, et seq., and Freund on Police Power, Sec. 377.

It has been held by eminent authority that the police power is founded upon that maxim of public policy, salus populi suprema lex.

Chief Justice Shaw in Commonwealth v. Alger, 7 Cush. 53, 85, after holding that certain powers are not exercised under the right of eminent domain, but the police power, says:

"The power we allude to is the police power, the power vested in the Legislature by the Constitution, to make, ordain and establish all manner of wholesome and reasonable laws, statutes and ordinances, either with penalties or without, not repugnant to the

5968 Constitution, as they shall judge to be for the good and welfare of the commonwealth, and of the subjects of the same."

The leading case on the subject of the State's power to regulate rates of corporations engaged in the management of public utilities is Munn v. Illinois, 94 U. S. 113, 125. Mr. Chief Justice Waite in his opinion in that case, after carefully reviewing the English as well as American authorities on that subject and referring to the police power as authority for such legislation, epitomizes his conclusions as follows:

"But we need not go further. Enough has already been said to show that when private property is devoted to public use it is subject to public regulation."

In Sands v. Manistee River Imp. Co. 123 U. S. 295 (8 S. Ct. 113, 30 L. Ed. 149), Mr. Justice Field, delivering the unanimous opinion of the Court, said on that subject:

"The internal commerce of a State—that is, the commerce which is wholly confined within its limits—is as much under its control as foreign or interstate commerce is under the control of the general government."

Mr. Justice Bradley, who concurred in the judgment in the Munn case, in his dissenting opinion in the Sinking Fund Cases, 99 U. S. 700, 747, explains the issue involved therein by saying:

"The inquiry there was as to the extent of the police power in cases where the public interest is affected."

If then the power to regulate carriers' rates rests upon the
5969 police power which, under the decisions cited is in fact co-extensive with the governmental power of the State, it requires no extended argument to prove that a regulation or statute of a state enacted under that power is not void because it incidentally affects the commerce clause or any other provision of the National Constitution, especially if it is not in conflict with any act of Congress on that subject or when Congress has not seen proper to act upon that subject. In the Legal Tender Cases, 12 Wall. 457, 551, it was claimed that a statute making depreciated currency a legal tender for the payment of debts previously contracted was in conflict with the spirit of the fifth amendment to the Constitution, but the Court in overruling that contention said:

"That provision has always been understood as referring only to a direct appropriation and not to consequential injuries resulting from the exercise of lawful power. It has never been supposed to have any bearing upon or to inhibit laws that indirectly work harm and loss to individuals. A new tariff, an embargo, a draft or a war may inevitably bring upon individuals great loss, may, indeed, render property almost valueless and may destroy the worth of contracts, but whoever supposed that because of this a tariff could not be changed or a non-intercourse act or an embargo be enacted or a war be declared?"

In Sherlock v. Alling, 93 U. S. 99, 103, it was held:

"In conferring upon Congress the regulation of commerce, it was never intended to cut the States off from legislating on all subjects relating to the health, life and safety of their citizens, though the legislation might indirectly affect the commerce of the country.

Legislation, in a great variety of ways, may affect commerce
5970 and persons engaged in it without constituting a regulation of it, within the meaning of the Constitution. * * * And it may be said generally, that the legislation of a State, not directed against commerce or any of its regulations, but relating to the rights, duties and liabilities of citizens and only indirectly and remotely affecting the operations of commerce, is of obligatory force upon citizens within its territorial jurisdiction, whether on land or water, or engaged in commerce, foreign or interstate, or any other pursuit."

In Hennington v. Georgia, 163 U. S., 299, 317, a statute of the State of Georgia prohibiting the running of freight trains on Sundays was attacked as an interference with interstate freight trains but it was upheld as a proper exercise of the police power of the State, although incidentally affecting interstate commerce. The Court, after reviewing the authorities on the subject, held:

"These authorities make it clear that the legislative enactments of the State passed under the admitted police powers, and having a real relation to the domestic peace, order, health and safety of their people, but which, by their necessary operation, affect to some extent, or for a limited time, the conduct of commerce among the

States, are yet not invalid by force alone of the grant of power to Congress to regulate such commerce, and if not obnoxious to some other constitutional provision, or destructive to some right secured by the fundamental law, are to be respected in the courts of the Union until they are superseded and displaced by some act of Congress passed in execution of the power granted to it by the Constitution."

5971 Other cases in which the same principle of law is recognized are Railroad Co. v. Fuller, 17 Wall. 560; Escanada Company v. Chicago, 107 U. S. 678, 687; Stone v. Mississippi, 111 U. S. 746, 751; Beer Company v. Massachusetts, 97 U. S. 25, 32; Railroad Commission Cases, 116 U. S. 307, 325; Mugler v. Kansas, 123 U. S. 623, 667; Plumley v. Massachusetts, 155 U. S. 461, 472; Kidd v. Pearson, 128 U. S. 1, 20; Greer v. Connecticut, 161 U. S. 519, 534; Smith v. Alabama, 124 U. S. 465, 480; N. Y. N. H. & H. R. R. Co. v. New York, 165 U. S. 628, 631; Potapso Guano Co. v. North Carolina Board, 171 U. S. 345, 350; Erb v. Morash, 177 U. S. 584; Gladson v. Minnesota, 166 U. S. 427, 430; Pennsylvania Railway Co. v. Hughes, 191 U. S. 477, 488; Crossman v. Lurman, 192 U. S. 189, 196; Austin v. Tennessee, 197 U. S. 343, 349; Pabst Brewing Co. v. Crenshaw, 198 U. S. 17, 26; McLean v. Denver & Rio Grande R. R. Co., 203 U. S. 38, 50; Hudson Water Co. v. McCarter, 209 U. S. 349, 357; Chicago, R. I. & Pacific Ry. Co. v. Arkansas, — U. S. — decided February 20, 1911, and not yet reported; Duluth Brewing & Malt Co. v. City of Superior, 123 Fed. 357, 59 C. C. A. 481, 485; Logan & Bryan v. Postal Telegraph Co. (C. C.), 157 Fed. 570.

In Covington, Etc., Bridge Co. v. Kentucky, 154 U. S. 204, 209, 210 (14 S. Ct. 1087, 38 L. Ed. 962), it was held that the class of commerce in which the power of the State is exclusive is that

"which concerns the strictly internal commerce of the State, and while the regulations of the State may affect interstate commerce indirectly, their bearing on it is so remote that it cannot be termed in any just sense an interference. * * * Congress has no power to interfere with police regulations relating exclusively to the internal trade of the States."

5972 Another matter not to be overlooked is if the State is without the power to regulate purely intrastate transportation because it affects interstate traffic indirectly, where is it vested? Congress is clearly without power to do so, and of course it cannot delegate to a commission a power it does not itself possess. In Gibbons v. Ogden, 9 Wheat. 195, the leading case on that subject, the rule of law, which has never been questioned since but always followed, was settled that the power committed to Congress by the Constitution does not extend to commerce wholly within the State. In the language of Chief Justice Marshall, "The enumeration presupposes something not enumerated, and that something, if we regard the language or the subject of the sentence, must be the exclusively internal commerce of a State.

"There can be but one rate, fixed by one authority, whether that

authority be the State or Congress." Hanley v. Kansas City Southern Ry. Co., 187 U. S. 617, 620. If complainants' contention is correct, transportation companies, so far as the exclusively internal commerce of a State is concerned, are beyond all control, either from the State or National Government, for as determined in Gibbons v. Ogden, supra, the Constitution excluded that class of commerce from the powers vested in Congress by the commerce clause, and as all State rates indirectly affect interstate rates they are, if complainants' contention is right, also void.

The result of such a construction would be that the States do not possess one of the most important powers inherent in every government. The adoption of such a construction by the courts would be justifiable only if any other would do violence to a plain provision of the National Constitution or principles of law so firmly
5973 established by previous decisions of the highest court of the land that there is no longer room for construction. In the language of Mr. Justice Peckham in Addyston Pipe & Steel Co. v. United States, 175 U. S. 211, 231:

"If neither Congress nor the State Legislatures have such power then we are brought to the somewhat extraordinary position that there is no authority, State or National, which can legislate upon that subject or prohibit such contracts. This cannot be the case."

Since preparing this part of the opinion that of Judge Sanborn, the senior Circuit Judge of this circuit, in Shepard v. Northern Pacific Ry. Co., 184 Fed. 765, has been received and carefully considered. The great learning of that eminent jurist entitles every opinion of his to the very highest consideration, and if not conclusive on this Court is certainly very persuasive. A careful examination of the facts found in that case by the Master and the Court shows that they differ very materially from those established by the evidence in these cases. How necessary it is to determine questions of that nature upon the particular facts of each case is thus pointed out by that learned Judge in his opinion:

"The reduction of local rates does not interfere with interstate rates 'as a matter of law,' yet it may do so as a matter of fact. Whether or not the general and sweeping reductions in local rates in Minnesota necessarily interfere with interstate rates and interstate commerce is in this case, as it must be in every case, a question of fact. The facts which determine that question in this case
5974 have been set forth in this opinion at great length, because it is upon them, and not upon legal inferences, that the answer to the question, whether or not the effect of the necessary operation of the acts and orders challenged is substantially to burden interstate commerce, now rests. Those facts are that it was not for 'their own convenience,' but at great inconvenience and loss, not on account of the 'effect of competition between themselves and other companies,' but because these acts and orders, the prohibition of discrimination between localities by the interstate commerce act and the laws of trade, forced them to do so, that the defendants reduced their interstate commerce rates to a parity with the local rates and submitted to the loss of interstate revenue this action entailed."

The schedule of rates adopted by the Minnesota State Commission as stated in that opinion, was such "that each rate for each class for any distance bore such an exact relation to each other rate that given one rate out of the schedule any other rate could be ascertained by mathematical calculation and without reference to the schedule itself."

It was also shown that a number of cities in that State were situated side by side with cities of the adjoining States of Wisconsin and North Dakota. These cities being the same distance they had always been accorded like rates, in and out, by the railroads, and a failure by the companies to maintain like rates for these cities would seriously impair the power to transact their interstate business with these cities in the neighboring States; and the natural effect of these lower Minnesota State rates would give to the cities of that State on its border line an undue and unjust preference, an advantage, in fact, over the neighboring cities in adjoining States.

5975 The same conditions applied to the passenger traffic.

From these facts the conclusions reached by the Master and approved by the Court were that the natural and inevitable effect of these reductions was to compel the railroad companies to give an undue and unreasonable preference to localities in the State of Minnesota over those in adjoining States in violation of the interstate commerce act of Congress. The Court said:

"The effect of the necessary operation of these acts and orders was substantially to burden and directly to regulate the interstate commerce of the companies by causing the transformation of that part of their transportation upon which their former interstate rates were higher than the sums of the locals over the border towns in Minnesota into local commerce at those sums, or by causing the companies to reduce their interstate fares and rates affected by the reduced local fares and rates to a parity therewith. This effect was unavoidable because the interstate commerce law prohibited the companies from giving to Minnesota towns and cities the undue and unreasonable advantage and from subjecting the cities and towns of other States in the vicinity to the undue and unreasonable disadvantages which a maintenance of their former interstate fares and rates and prescibed local fares and rates would have wrought, and because passengers and freight will move at the lowest available rates."

No such facts were proven in these cases, and for this reason the Court is of the opinion that the conclusions reached in the Shepard case are not applicable to these cases.

5976 *Rates in Other States.*

It is claimed by the attorneys for the State that as there is no evidence that the rates sought to be enjoined are lower than those in other States, it must be presumed that they are reasonable. But that is not the law. On the contrary, assuming that the evidence introduced establishes the fact that the rates now attacked are no lower than those charged in other States, that, of itself, would not be

sufficient to sustain this claim, especially in the absence of proof that all the conditions are the same. As stated by Mr. Justice Brewer, then Circuit Judge, in Chicaga & N. W. Ry. vs. Dey, 35 Fed. 886, 881:

"The fact that it is higher or lower (the schedule of rates) than other schedules in force elsewhere or at other times in this State, does not necessarily determine its validity."

In Ames v. Union Pacific Ry. Co., 64 Fed. 165, 188, that same proposition was advanced and denied by the Court. Mr. Justice Brewer in his opinion disposed of the contention by saying:

"It is, however, urged by the defendants, that in the general tariffs of these companies there is an inequality; that the rates in Nebraska are higher than those in adjoining States; and that the reduction by house rule 33 simply establishes an inequality between Nebraska and the other States through which the carriers run. The question is asked, are not the people of Nebraska entitled to as cheap rates as the people of Iowa? Of course, relatively, they are. That is, the carriers must not discriminate against the people of any one State.

But not necessarily absolutely as cheap, for the kind and
5977 amount of business and the cost thereof are factors which determine largely the question of rates, and these vary in the several States. The volume of business in one State may be greater per mile, while the cost of construction and maintenance is less. Hence, to enforce the same rates in both States might result in one in great injustice, while in the other it would only be reasonable and fair. Comparisons, therefore, between the rates of two States are of little value, unless all the elements that enter into the problem are present. It may be true, as testified by some of the witnesses, that the existing local rates in Nebraska are forty per cent higher than similar rates in the State of Iowa, but it is also true that mileage earnings in Iowa are greater than in Nebraska. In Iowa there are two hundred and thirty people to each mile of railroad, while in Nebraska there are only one hundred and ninety, and as a general rule the more people there are the more business there is. Hence, a mere difference between the rates in two States is of comparatively little significance."

Upon appeal, this excerpt was quoted in full and approved by the Supreme Court, that Court saying:

"In these views we concur, and it is unnecessary to add anything to what was said by the Circuit Court on that point." 169 U. S. 540.

*Existing Conditions.*

It is next claimed that in determining whether rates are reasonable or unreasonable, the controlling factors are "the kind of business, the amount of business, and the commercial conditions", Counsel then proceed to elaborate "in other words, a railroad that

has a virtual monopoly of the business of more than a million
5978 people, with all the business it can do all the time in hauling the coal and lumber, farm products and merchandise, is not

entitled to the rate that a carrier would deserve that serves a sparsely settled community with only an occasional haul". While this is true in some respects, it is equally true that such a carrier is entitled to rates sufficiently high to enable it to earn sufficient net profits to pay a reasonable interest on its investment, if it can be done without making the rates so high as to be oppressive. While a road "serving a sparsely settled community with only an occasional haul" would not be justified in charging rates sufficiently high to earn the same return, or in some extreme cases any return, on its investment, if such rates have to be so high as to be oppressive, that is no reason for making the rates of a carrier that has more business so low as to make them non-compensatory, for if that were the law, how would it benefit the carrier that its road is doing all the business it can handle? This question has been fully settled by numerous decisions of the courts, and without quoting from them, the following will be found sustaining the rules of law as stated in paragraphs "*b*" and "*e*" of this opinion. Reagan v. Farmers Loan & Trust Co., 154 U. S. 362; San Diego, etc., Co. v. Jasper, 189 U. S. 439, 466; Wilcox v. Consolidated Gas Company, 212 U. S. 19, 48; In re Arkansas Railroad Rates, 168 Fed. (C. C.) 720, 733.

*Limit of Time in Proofs.*

It is further claimed that the evidence on the part of complainants is confined to six months from July 1st to December 31st, 1907. It is true that the main evidence of the Iron Mountain Railway is
5979 confined to that period, and in the absence of other evidence or some satisfactory explanation for its omission, should not be considered as sufficient to set aside the acts of a sovereign state. But there is also evidence of the business for other periods. The earnings and expenditures of the Iron Mountain Railway for the six months ending June 30, 1907, appear in Exhibit "8" to Mr. Johnson's testimony and show the earnings for that period to be smaller than the later period, although the two cents per mile passenger rate did not go into effect until April, 1907. The business of the Southwestern Railway Company earnings and operating expenses for the entire fiscal year ending June 30th, 1908, is shown by Exhibit "11" to Mr. Kimbell's testimony. It is also shown by undisputed evidence that the year 1907 was one of the most prosperous years for both railways; that the effects of the financial panic were not felt by them at all until the latter part of November, 1907, and then only slightly, while they were more seriously felt during the year 1908. Exhibit "45" of Mr. Johnson, which is a statement of the gross earnings of the Iron Mountain for each six months' period from January 1st, 1900, to June 30, 1908, shows that the gross earnings for the period ending December 31st, 1907, were the largest of any period and the gross earnings per mile above the average of the eight years preceding it. The six months' period ending December 31st, 1907, is, therefore, the least favorable to the complainants, and for this reason no cause for complaint on the part of the State.

In addition to these facts counsel for the State in reply to a question from the Court, admitted that the officials of these railways not only produced all documents, books, waybills and other
5980 papers which would throw light on the subject, and furnished all information in their possession whenever requested by counsel for the State, but also permitted the attorneys and expert accountants for the State free access to all the books, accounts and other papers in their possession, having such as were at division points sent to headquarters when requested to enable them to prepare the defense or verifying the exhibits presented by complainants. In view of these facts there is no substantial ground for the claim that the period selected by complainants was unfair to the State or insufficient to enable the Court to determine the issues in these cases, or that the earnings and expenditures for these periods do not show a fair average of the business of complainants, at least fair to the defense. The fact that the able counsel for the State and expert accountants did not call for data of other periods than those produced by complainants and in evidence, is, if not conclusive at least persuasive that they considered the evidence offered sufficient for a just determination of the issues involved.

*Personal Injuries.*

It is also claimed that complainants are not entitled to "charge in the expense of operation the sums they paid for injuries to persons." This claim cannot be treated seriously. It is true, as claimed by counsel, "that the people of Arkansas are not insurers of the risks of the railroad business," but on the other hand, such accidents cannot be wholly avoided, and as there is no pretense that they were willful or intentional on the part of the officials of the companies they must be considered as unavoidable risks of operation of
5981 the business. Many persons and corporations engaged in industrial pursuits of a character dangerous to employés or others, insure themselves against such loss, and the premiums paid therefor are charged to expense of operation. Railroads, or rather these roads, for reasons which are not explained by the evidence in these cases, but probably economic, carry their own insurance against such losses and charge them as expense of operation as they would otherwise charge the premiums paid for the insurance if they obtained it from insurance companies. As these indemnity insurance companies make the charge high enough to cover the expense of the management of their business and a profit on their investment, the policy of the railroad companies is probably most economical.

*Premature Filing of Suit.*

It is next claimed that before applying for relief to this Court complainants should have applied to the commission, and only upon its refusal to grant it would an appeal to the courts lie. Prentis v.

Atlantic Coast Line, 211 U. S. 210, is relied on as sustaining this contention, but neither the facts nor the conclusions of the Court in that case are applicable to these now under consideration. In fact, so far as that case is applicable it is a strong authority against this claim. There the rates were made by a commission clothed with judicial functions, its acts subject to review by appeal to the Supreme Court of the State. Pending such appeal a writ of supersedeas may be obtained which would suspend operation of the action appealed from until the final disposition of the appeal. Yet the Court held that no matter what the statute called the acts of the commission,

5982 they were legislative and not judicial, but as the remedy by appeal had not been exhausted when the suits were instituted, the Circuit Court should have required them to exhaust their remedy by appeal before granting the injunction. The decision was placed upon the ground of comity, the Court saying:

"It seems to us only a just recognition of the solicitude with which their rights have been guarded that they should make sure that the State in its final legislative action would not respect what they think their rights to be before resorting to the Courts of the United States. * * * As our decision does not go upon a denial of power to entertain the bills at the present stage, but upon our view as to what is the most proper and orderly course in cases of this sort when practicable, it seems to us that the bills should be retained for the present to await the results of the appeals if the companies see fit to take them."

The opinion in that case is fully explained in Willcox v. Consolidated Gas Co., supra, and by Judge Hook in A. T. & S. F. Ry. Co. v. Love, 174 Fed. (C. C.) 59, and M. K. & T. Ry. Co. v. Love, 177 Fed. (C. C.) 493, affirmed March 28, 1911, — Fed. —, — C. C. A. —; the last cited cases arose under the Constitution and laws of Oklahoma, which were similar to those of Virginia, where the Prentis case arose.

In addition it may be proper to refer in this connection to the fact that Mr. Hampton, for a number of years, and at the time of the institution of these suits, a member of the Arkansas State Railroad Commission, and for two years its chairman, testified that "all the reductions of rates made by the commission were after public hearings to which the railroads were invited, and which they attended, and most always against their protest and objections."

5983 *Acquiescence.*

It is next claimed that the freight tariffs now attacked had been in force without any material change for five years before this bill was filed and the claim made that they were confiscatory; that this long delay was such an acquiescence as to prevent a court of equity from granting an injunction at this late day to restrain their further enforcement. While such long acquiescence undoubtedly raises a very strong presumption that the rates are reasonable, if the conditions are the same, it would not be conclusive, as changed conditions might overthrow this presumption entirely. The law is well settled

that rates made by a commission on one or more commodities so low as to be non-compensatory for the transportation of those particular commodities, do not justify an interference by the courts unless it is further shown that these rates would reduce the net earnings of the carrier on its entire business to an extent that they would cease to be compensatory. Minneapolis & St. Louis Ry. Co. v. Minnesota, 186 U. S. 257, 268; Atlantic Coast Line R. R. Co. v. North Carolina Corporation Commission, 206 U. S. 1, 24; Northern Pacific Ry. Co. v. North Dakota, 216 U. S. 579; Railway Company v. Gill, 54 Ark. 112, 115, affirmed in 156 U. S. 649, 665; Railway Company v. Smith, 60 Ark. 221, 244.

It is, therefore, incumbent upon the carrier complaining to show that the earnings of its entire business, after deducting the legitimate expenses, are non-compensatory within the meaning of the law before it is entitled to such relief as is sought in these cases.

The freight rates established eight years ago may have been high enough under conditions then prevailing to be compensatory.
5984 The increase of wages of employés and of material necessary for the operation of the road having been gradual, as shown by the evidence, although, as claimed, decreasing the net profits, may have left it doubtful whether they had ceased to be compensatory within the meaning of the law.

Additional burdens, and consequent expenditures, imposed on railroads between 1903 and 1907 by legislation, State and national, for the purpose of protecting the lives of passengers and employés, or protecting them from injury or adding to the comfort of the public, may have reduced the net earnings still lower and yet not so low as to make them confiscatory, but when in 1907 the passenger rates were reduced by the Legislature of Arkansas from three to two cents per mile, a reduction of 33⅓% on the gross earnings from the entire passenger traffic, this, added to the former reductions and increased expenditures, may have resulted, after a fair trial, in convincing complainants that the net profits from all the earnings in the State had reached almost the vanishing point. It was then that they were, for the first time, in position to invoke the aid of the courts with any reasonable prospect of success.

Another important factor to be considered in connection with this claim is that the evidence (Exhibit 30) establishes conclusively that in the ten years preceding the institution of these actions there has been a steady and very considerable increase in the cost of everything necessary for the maintenance and operation of the road, taxes and the cost of labor. It is true that by improvement of methods better results are obtained, and the cost thereby considerably reduced.
But, on the whole, it is claimed that the cost of operation has
5985 increased much more than the saving. The comparison of net earnings of the roads for the years 1897 and 1907, as shown by Exhibit "Z" of defendants, is not fair, as the report of the Interstate Commerce Commission, from which these figures were obtained, also shows that there was a great depression of railroad traffic at that time, and only in June, 1897, i. e., the last month of the

twelve covered by that report, did the earnings of the railroads show a healthy revival of commercial conditions.

The commission in that report say (page 9):

"A review of the statistics of operation since 1890 would disclose the fact that each year ending June 30, from 1890 to 1893, inclusive, closed with an increase in net and gross earnings as compared with the previous year. The year 1893-4, however, proved to be a disastrous one for railways, the gross earnings being less $147,000,000, and the net earnings $50,000,000 than the corresponding items of the previous year. The year 1894-5 showed practically no recovery from the depression of the previous year. The year 1895-6 closed with an increase in gross earnings of $74,000,000 and net earnings of $27,000,000. But this movement toward better conditions did not continue during the year covered by the present report, which as compared with 1896 shows again a decrease in gross earnings of $28,000,000, and in net earnings of $7,000,000. It was not until June, 1897, that is to say, the last month of the twelve covered by this report, that the railway earnings showed a healthy revival of commercial conditions. This fact indicates the character of the year covered by the present report, and must be held in mind by one who endeavors to interpret the figures about to be presented."

On the other hand the evidence shows that the year 1907
5986 with which the comparison was made, was one of the best in the history of railroads. As claimed by the testimony of Mr. McPherson, the increased efficiency of operation had been overcome, and far outrun by the forces working against it; that the increased rate of wages; the increased cost of material; the burdens imposed by legislation, and the increase of taxes, had "far outrun" the benefits that had accrued from those improvements.

"And even acquiescence in past continuing injury does not estop their victim from enjoying their future continuance." Layton Pure Food Co. v. Church & Dwight Co., 182 Fed. 35, 41, — C. C. A. —; Love v. A. T. & S. F. Ry. Co., — Fed. —, — C. C. A. —, and authorities cited there.

As stated by Judge Sanborn in the last cited case:

"Courts of equity have plenary power, and it is often their duty to issue mandatory injunctions to restore and then maintain a condition of things that has been wrongfully disturbed or changed.

Under such conditions it cannot be said that they had acquiesced for such a period of time as to preclude a court of equity from granting them relief if otherwise entitled thereto, especially in view of the testimony of Commisisoner Hampton that "the reductions in rates were made most always against their protest and objections." Whether they have succeeded in establishing such a state of facts by the evidence in the cases at bar can only be determined from a careful, analytical examination of the proofs and the application of the rules of law governing such cases.

2595

5987 *Continued Loss.*

It is next claimed that to entitle plaintiffs to an injunction it must be shown that they will suffer a "continued loss," and in support of that it is contended that the lower freight rates and the reduced passenger rates will increase the volume of traffic to such an extent as to make up the decrease of those reductions. This claim is wholly speculative. In the language of Mr. Justice Brewer in Chicago N. W. Ry. Co. v. Dey, supra, in reply to a similar contention:

"But speculations as to the future are not guides for judicial action; courts determine rights upon existing facts. Of course, there is always a possibility of the future; good crops may increase transportation business; poor crops reduce; high or low rates may likewise affect; but the only fair judicial test is to apply the rates to the business that has been done in the past and see whether upon that basis such rates will be remunerative or compel the transaction of business at a loss." 35 Fed. 881.

A year's trial after the two cents passenger rate had been put into effect, it is claimed by complainants, and that is the gist of their complaint, has demonstrated that the rates then in force were confiscatory and reduced the earnings of the entire business to a point which makes them non-compensatory. If this is found to be true from the proofs they are clearly entitled to relief. To avoid any injustice by changed conditions in the future, as prophesied by counsel for the State, the Court has the power to retain control of the cases with leave reserved to defendants to move the Court at any time for a reinvestigation of the question of the reasonableness of

5988 these rates, as was done by Mr. Justice Brewer in Ames v. Union Pacific Railway Co., supra. Nor would a permanent injunction in these cases prevent the commission from making new rates sufficiently low to protect the public from oppression and yet not so low as to make them confiscatory of the investment of the roads.

*Are the Rates Confiscatory?*

The matter of most importance to be determined is whether the rates, freight and passenger, in force at the time of the institution of these actions by order of the State Railroad Commission and the Legislature of the State, were so unreasonably low as to justify the Court to enjoin their enforcement upon the ground that they are non-compensatory to an extent which makes them practically confiscatory of complainants' property. To determine that question it is necessary for the Court to ascertain and make findings what the investment of each road is; what its gross earnings from the intrastate traffic, freight and passenger, are; what the expenditures necessary for the proper management of the roads are; how to apportion the investment and expenditures between the intra and interstate business; what the net earnings from all the intrastate traffic are, and what would be a reasonable return on the investment.

*Investment.*

By the acts of complainants the Court is relieved of a very difficult problem, that of the valuation of the property. In the bills of complaint the railroads only ask for compensatory rates on the basis of valuation according to the assessment of their property for
5989 taxation by the State of Arkansas made by the State Board of Railroad Assessors. Its reasonableness is, of course, conceded by the defendants, and, therefore, there is no necessity for the Court to determine what rules should govern in ascertaining what the investments on which complainants are entitled to a reasonable compensation are. It is proper to state here that it is agreed by the Parties that the assessments for taxation in the State of Arkansas are on a basis of fifty per cent of the real value of the property and that these assessments were made on that basis. For this reason the assesments must be doubled to ascertain the real value of the property. The values of the two roads thus assessed in this State when doubled, are:

| | |
|---|---|
| Iron Mountain | $39,986,564 |
| Southwestern | 14,029,634 |

The Gross Earnings.

The next question to be determined is what are the gross earnings from the entire business in the State of Arkansas, the expenditures therefor, and the cost of the intrastate business as distinguished from the interstate. The facts relating to this item are undisputed and show the earnings of the Iron Mountain for the six months ending December 31, 1907, to be:

Freight Revenue.

| | Amount. | Percentage of total revenue in state. |
|---|---|---|
| Intrastate | -$640,248.17 | 9.59% |
| Interstate | 4,133,210.33 | 61.92% |
| Miscellaneous | 122,814.41 | 1.84% |
| Total | $4,896,272.91 | 73.35% |

5990 Passenger Revenue.

| | | |
|---|---|---|
| Intrastate | $836,542.20 | 12.53% |
| Interstate | 568,476.21 | 8.52% |
| Miscellaneous | 373,785.47 | 5.60% |
| Total | $1,778,803.88 | 26.65% |
| Grand total from Freight and passengers in the State of Arkansas | $6,675,076.79 | 100.00% |

The earnings for the Southwestern Railway Company for the same period are:

Freight Revenue.

| | Amount. | Percentage of all earnings in state. |
|---|---|---|
| Intrastate | $173,064.45 | 7.56% |
| Interstate | 1,597,230.02 | 69.80% |
| Miscellaneous | 25,061.02 | 1.01% |
| Total | $1,795,355.49 | 78.37% |

Passenger Revenue.

| | | |
|---|---|---|
| Intrastate | $246,101.33 | 10.76% |
| Interstate | 170,735.14 | 7.46% |
| Miscellaneous | 75,981.44 | 3.41% |
| Total | $492,817.91 | 21.63% |
| Grand total | $2,288,173.40 | 100.00% |

Miscellaneous Earnings and Expenses.

In computing the net earnings the accountants for complainants have entirely eliminated the earnings from, as well as the expenditure for, what is termed "miscellaneous sources," neither crediting the intrastate earnings with any portion of this item nor charging them with any part of its expenses. The explanation given for this omission is that it is impossible to suggest any method whereby this item, which arises from state and intrastate traffic, can be separated or divided between them, either as to earnings or expenses.
5991 That it cannot be ascertained with mathematical accuracy is no doubt true, but neither can the apportionment of expenditures between the state and interstate or passenger and freight business be accurately ascertained. The exhibits filed by both companies specify the items which make up these miscellaneous items, and judging from them the Court is of the opinion that to divide them on the basis of the earnings from each source will be as approximately right as is possible without injustice to either of the parties. The Court can conceive of no good reason why these earnings from miscellaneous sources should not be credited to the state business in the proportion they bear thereto, and the expenses apportioned in the same manner, and that is the best conclusion which can be reached from the evidence in these cases.

The intrastate business of the express companies is not so insignificant as to justify a finding that there is neither profit nor loss from it for the railroads, and this applies also to the earnings from carriage of the mails. The local rates for express packages are considerably higher than those for the through carriage owing to the short haul, and the railroads receive the compensation on the basis

of gross earnings of the express company. From the evidence in this record the Court is of the opinion that the earnings from express traffic are, if anything, more profitable than from the passenger traffic, while mail probably yields a smaller net profit, but upon the whole all of the items classed as "miscellaneous earnings" will yield as much revenue as other sources of transportation. The Court therefore holds that the miscellaneous earnings should be credited to the other earnings, and as there is no evidence in the record which will enable the Court to divide them with mathematical exact-
5992 ness between the state and interstate earnings, they will be apportioned on the revenue basis, which will be as near correct as any other basis which can be adopted from the evidence in this record.

Omitted Earnings.

The next items to be considered for the purpose of determining the earnings of the complainants are those which counsel for the State claim are omitted from the statements filed by the Iron Mountain Railroad Company but are properly chargeable to it.

The evidence establishes the fact that as a part of the consideration for the exclusive privilege granted to the Pacific Express Company, The Missouri Pacific Railway Company, which is the owner of the entire capital stock of the Iron Mountain Railway Company, and therefore in absolute control thereof, received $2,400,000 of the express company's capital stock, or forty per cent of the entire capital stock. This was paid to them without any other consideration so far as the evidence shows.

There is a further provision in the contract that this capital stock shall not be increased above six million dollars without the consent of the railway company, which would indicate that if there is an increase of the capital stock of the express company the railway company will be entitled to forty per cent of this increase without paying any other consideration therefor than the privileges granted by the contract. It recites, "The said second party (the express company) in consideration of this contract and the rights and privileges accorded by it, agrees to give to the said party of the first part $2,400,000 of its capital stock (and it is agreed that
5993 the capital stock of the second party shall not be increased above six million dollars, without the consent of the first party)."

The evidence also establishes the fact that the Missouri Pacific Railway Company receives now, and for years has received from the express company, an annual dividend of six per cent on this stock, amounting to $144,000 annually Whether any larger earnings have been placed in the surplus and the value of the stock thus increased does not appear from the evidence. Although the express company, under this contract, enjoys the exclusive privilege over the Iron Mountain road, no part of this annual dividend, which is a part of the consideration, is credited to that road. As the contract expressly provides for the privilege of the railroad company to have the exclusive right on all trains from St. Louis to Texarkana, which

is the exclusive territory of the Iron Mountain Railway, controlled by the Missouri Pacific Railway, and also covers all lines "owned, operated and controlled by the Missouri Pacific Railway", which includes all other branches of the Iron Mountain Railway, the latter is clearly entitled in a court of equity to its pro rata share of this annual dividend, for in equity The Missouri Pacific Railway holds that stock as trustee for itself and its subsidiary lines. There is no evidence in this record that any other lines are interested in this contract except The Missouri Pacific and the Iron Mountain Railways, nor is there any evidence other than the mileage owned and operated by these two roads which could serve as a basis for division. The Court, therefore, adopts the mileage of the two roads as the proper basis. The mileage of the Missouri Pacific Railway and lines operated by it is 3,491.68 miles and that of the Iron Mountain
5994 2,599.15 miles, a total of 6,090.83 miles Of the Iron Mountain mileage 1,355.09 miles are in the State of Arkansas. Upon this mileage basis the Iron Mountain is entitled to receive of this dividend $31,968 for the State of Arkansas for the year, and for six months to one-half of that sum, amounting to $15,984, to be divided between the state and interstate business as other passenger revenues derived from miscellaneous sources are apportioned.

It is next claimed that the hotel, dining room, saloon, lunch stand and checking privileges in the Union Passenger Station at Little Rock, although of an annual rental value, as shown by the evidence, of $4,200.00 has been granted to the occupants for the nominal rental of one dollar per annum. While there can be no doubt that the company has a right in so far as it alone is concerned to give away any of its property, in a controversy of this nature, involving the claim that the revenues derived from its business in the State under the tariffs fixed by the State, are so small as to make them confiscatory, it cannot be permitted to do so and should be charged with the reasonable value of its property which, by its permission, is used by others not for the benefit of the railroad but for their individual profit. If by charging the value of these privileges, or any other matters which the law permits the carrier to charge for, the earnings on the rates fixed by the State are shown to be compensatory, it has no right to complain and insist upon higher rates to enable it to act generously toward favorites. Generosity cannot be practiced at the expense of justice, nor should it be permitted to be dispensed at the cost of others No evidence has been offered by the company to explain why these valuable privileges are given
5995 away; no consideration of any kind is shown to have passed to the company therefor. The evidence shows that the expense of repairs and preserving the premises in proper condition is also borne by the railroad company. The finding must therefore be that this generosity ought not to be charged to the people of the State, but the loss must be borne by the railway company. Neither the statutes nor orders of the commission require it to give this or any of its other property away. It had a right and it was its duty, so far as its claim in this cause is affected thereby, to charge and collect the fair value thereof. Knoxville v. Water Co., 212 U. S. 1, 12.

The reasonable rental value of these premises is found by the Court from the evidence to be $4,200.00 per annum, and for six months amounts to $2,100.00, which should be added to the miscellaneous earnings from passenger traffic in the State, to be properly apportioned between state and interstate earnings on the same basis as other miscellaneous passenger earnings are divided.

It is also claimed by the State that the Bunch Elevator was the property of the Iron Mountain Company and its rental value $20,000 a year, but was rented to the Bunch Company for the nominal sum of one dollar per annum. There is no evidence to warrant a finding that the elevator was the sole property of the railroad company at that time. The only testimony on that point is that the records of the railway company show that one dollar per annum is received for the rental, but whether that is for the use of the right-of-way of the railway company on which the elevator stands or for the elevator itself is nowhere shown.

In another proceeding had in the bankruptcy court for
5996 this district it appeared that the Bunch Company was the real owner of that elevator and the railroad company, since the institution of this suit, purchased it from the trustee in bankruptcy of the Bunch Company, with the approval of the Court, paying therefor the sum of $93,665 to the trustee in bankruptcy of the Bunch Company. Although this fact was not put in evidence in this case, still as there is no evidence which the Court feels would warrant it to make a finding that the railroad company was the owner of the elevator and that its rental value is as claimed, the Court finds that this claim of the State cannot be sustained.

Another claim made by the State is that among the expenses charged to the business of this State there is an item for repairs of all the tools and machinery in the shops of the railway company at Argenta, Arkansas, although the repair work there is not limited to the cars of the Iron Mountain but includes cars of the entire Missouri Pacific system. The amount charged to the State of Arkansas on this account is $48,671.67, or 77% of the entire amount paid out at that shop for the repairs of these tools. It is claimed that this large sum is expended at the Argenta shops because they are the largest of the entire system. The other shops are in Missouri and Kansas, but they are much smaller. There are also some other small repair shops on other parts of the system. There is nothing in the evidence to indicate what would be a proper sum to be charged, but it is claimed that as this State is charged on equipment with only 55% of the cost of repairs, the charge on this item should be no higher. The evidence shows that the cars requiring repairs are usually sent to the nearest shop, and as many of the cars of the Missouri Pacific equipment, when needed, were used on the Iron Mountain Railway, these cars when in need of repairs were
5997 sent to the Argenta shops. There is no claim that the cost of the repairs of the cars is not properly divided between the two systems, but the cost of the repairs of the tools, it is claimed is not. It is shown by the testimony introduced on the part of the railway company that 90% of the cost of the repairs of these tools is caused by repairs of locomotives, and these all belong to the Iron Mountain

Railway Company and none to The Missouri Pacific Railway. There would, therefore, be only ten per cent of this amount which would be improperly charged. The difference would only be 22% of this ten per cent, and when divided into the six months' period would leave the amount so insignificant, less than $150.00, that the net earnings can hardly be said to be affected by it.

Objections are also made by the State to the item, among the expenses, of a fine imposed on the Iron Mountain Railway by a court of this State for a violation of the law prohibiting the giving of free passes to members of the Legislature. The evidence fails to show whether this was done with the knowledge or approval of the higher officials of the company or by the inferior officials for whose acts the company is, under the statute, responsible. As there is no presumption of an unlawful intent, in the absence of proof, the Court is not inclined to sustain this claim without determining whether it could under any circumstances be sustained.

Objections are also made to the expenses of the Memphis and Ft. Smith terminals charged entirely to the Arkansas business, although all of the Memphis business being in the State of Tennessee is interstate, and a very considerable part of the Ft. Smith traffic is
5998 of that nature and all the earnings are credited to interstate business. The uncontradicted evidence shows that the Memphis terminal, which is the terminal point of that branch of the Iron Mountain, is used exclusively for the Arkansas business and differs in no respect from what would be incurred if it were in this State on the west side of the Mississippi River instead of being in Memphis on the east side of that river. This also applies to the Ft. Smith terminals in so far as the Arkansas business is concerned, the Oklahoma business being charged to that State with its proportion of expense These matters will be considered and allowance made therefor when considering the apportionment of expenses between the state and interstate business, and thus the injustice to the intrastate business rectified.

Another claim is that the State of Arkansas is charged with part of the salaries paid to Messrs. Phelps and Seibert, shown by the accounts of the Iron Mountain to have been connected with the legal department at the headquarters in the City of St. Louis, Mo., and of Mr. Cox, who was, during the year 1907, residing at Little Rock. It is claimed on the part of the State that the services of these parties were for lobbying and therefore not a proper charge. But there is no evidence to sustain the claim that the salaries were paid for such services. The failure of the railway company to show what the services were for which they were compensated does not justify the Court in finding upon a mere suspicion that they were for services which are unlawful and against public policy. The burdens to prove an unlawful act is upon the party charging it, and will not be presumed in the absence of evidence to that effect.

The rentals paid by the Iron Mountain Railway for the
5999 use of the Van Buren Bridge of the St. Louis & San Francisco Railway Company, and for the use of the tracks of the Southwestern Railway from Paragould, Arkansas, to the Missouri State line, both being used solely for interstate traffic, it is claimed

by the State that no part of that expense should be charged to the intrastate business. The Court finds from the evidence that while the intrastate business makes no use of these facilities and therefore obtains no direct benefit from them, the indirect benefits, by relieving the tracks of the company of the interstate trains using these leased facilities would make it inequitable not to charge it with its proportion. The amounts involved are comparatively small, still that fact alone would not prevent the Court from making allowance therefore if, in its opinion, it would be equitable to do so.

It is also claimed that the intrastate business should not be charged with any of the expense of commercial agents and solicitors employed by the railway companies in different sections of the country, because, the contention is, they only soilcit interstate business. But the evidence on the part of the railway companies shows that indirectly the intrastate business receives its full share of the business obtained through these agents. If a theatrical company intending to come to Arkansas is induced to come over that road into the State they will then continue to use that road for its intrastate trips to other cities in the State. Also new industries and homeseekers induced by the efforts of these men to locate in this State adds materially to their intrastate business. For these reasons the Court is of the opinion that the State business is properly chargeable
6000 with its proportion of that expense.

Some other matters of this nature involving small amounts have been presented by the learned counsel for the State. They were each and every one carefully considered and are disallowed. To state them and the reasons for the conclusions reached would make this opinion too lengthy and the amounts involved are too small to justify it.

The items which the Court finds should be charged to the companies and added to the miscellaneous earnings of the passenger service of the Iron Mountain Railway for the six months period are: For dividend from Pacific Express Company $15,984; rents from passenger station at Little Rock $2,100, a total of $18,084.00, making a total of miscellaneous earnings from passenger revenue $391,869.47. By adding these sums to the other passenger revenue it naturally changes the percentages to some extent. As changed they will be as follows:

Iron Mountain Railway.

*Passenger Revenue.*

| | Amount. | Percentage of passenger revenue. |
|---|---|---|
| State | $ 836,542.20 | 46.55 |
| Interstate | 563,476.21 | 31.64 |
| Miscellaneous | 391,869.47 | 21.81 |
| Total passenger earnings | $1,796,887.88 | 100.00 |

Dividing the miscellaneous earnings between state and interstate upon that basis the result is:

| | Passenger Revenue. | Per cent. | Miscellaneous. | Total. |
|---|---|---|---|---|
| State ....$ | 836,542.20 | 59.54% | $233,318.80 | $1,069,861.00 |
| Interstate | 568,476.21 | 40.46% | 158,550.67 | 727,026.88 |
| Total ...$ | 1,405,018.41 | 100.00% | $391,869.47 | 1,796,887.88 |

6001 Dividing the miscellaneous of the freight earnings between the state and interstate we have the following results:

| | Freight Revenue. | Per cent. | Miscellaneous. | Total. |
|---|---|---|---|---|
| State ....$ | 640,248.17 | 13.41% | $ 16,469.41 | $ 656,717.58 |
| Interstate | 4,133,210.33 | 86.59% | 106,345.00 | 4,239,555.33 |
| Total ..$ | 4,773,458.50 | 100.00% | $122,814.41 | $4,896,272.91 |

This makes the total earnings of the Iron Mountain Railway in the State of Arkansas for the six months ending December 31, 1907, $6,693,160.79.

Making the same division of the miscellaneous for the Southwestern Railway for the six months ending December 31, 1907, the result is:

*Passenger Service.*

| | Revenue. | Per cent. | Miscellaneous. | Total. |
|---|---|---|---|---|
| State ....$ | 246,101.33 | 59.04% | $ 44,859.44 | $ 290,960.77 |
| Interstate | 170,735.14 | 40.96% | 31,122.00 | 201,857.14 |
| Total ..$ | 416,836.47 | 100.00% | $ 2,450.97 | $ 175,515.42 |

*Freight Revenue.*

| | Revenue. | Per cent. | Miscellaneous. | Total. |
|---|---|---|---|---|
| State ....$ | 173,064.45 | 9.78% | $ 2,450.97 | $ 175,515.42 |
| Interstate | 1,597,230.02 | 90.22% | 22,610.05 | 1,619,840.07 |
| Total ..$ | 1,770,294.47 | 100.00% | $ 25,061.02 | $1.795,355.49 |

Total earnings of Southwestern in the State of Arkansas for the six months' period ending December 31, 1907, $2,288,173.40.

*Apportionment of Valuation of Property.*

What bases should be adopted for the purpose of apportioning the valuation of the property to each of the two classes of earnings, the state and interstate, in order to enable the Court to determine

whether the earnings of the railroads from its intrastate
6002 business under the rates established by the State Railroad Commission are compensatory?

As the issues in these cases involve the entire intrastate business in the State of Arkansas, freight as well as passenger, it is immaterial how the valuation of the property is apportioned between the freight and passenger service. After ascertaining the proportionate net earnings from all sources of the intrastate business, it can be ascertained what they yield on the entire investment, as apportioned between the state and interstate business, and the main issue involve, whether the rates are compensatory or confiscatory, satisfactorily determined.

On the part of complainants it is claimed that the revenue basis pure and simple should be adopted for that purpose, because it is claimed that values of railroad property, like all other property depend to a great extent upon its producing capacity and net earnings. On the other hand it is claimed that the division should be made on the basis of the ton mileage, because that is the use to which the property is put, and it is urged that the higher the rates for intrastate traffic are the greater will be the proportion of the valuation charged to that part of the earnings. Or, in the language of the learned counsel, "when they use the revenue to divide the property instead of using the ton miles, and the ton mileage as the expression of the use of the property, they have assigned 90 per cent more, that is the relation that seven bears to thirteen per cent, to the state business upon which they expect to earn a return. * * * When they have divided the property on a revenue basis it takes almost double
the use of the property; they have assigned 90 per cent more
6003 property to State use than it actually uses in addition to assigning 100 per cent on account of the double amount of State business revenue per ton per mile over interstate."

In estimating the value of property its net income, if not the most important, is certainly a very important factor. A building in New York City is valued much higher than a building exactly like it and the erection of which cost the same price, situated in Little Rock. The reason therefor is that the income from its rentals is much higher in the former city than in the latter. So a building in Little Rock, or any other city, on its main business street, is of much greater value than if standing in the suburbs, although both buildings may be exactly alike, put to the same uses and cost the same. That the same rule should and does apply to railroads is shown by the market value of the stocks. While the share of a railroad whose earnings enable it to pay a six per cent dividend annually will command a premium on its face value, those of a railroad earning no dividends and whose income is barely sufficient to earn the fixed charges are practically worthless, or will sell for a very low price, and that only on speculative grounds.

Take two roads, one in a level country with practically no grades, inexpensive to maintain, and constructed by reason of these facts, at a low cost, while another road built in a mountainous, rocky country where it was necessary to do a great deal of expensive blasting

of rock, building tunnels, with heavy grades and many curves. The latter road cost probably three or four times as much to build as the former, yet, owing to the level grades, absence of sharp curves and more productive lands along its line, the earnings of the
6004 former are much greater than of the latter. Not only that, but owing to the grades, the one road can carry only half as many cars as the other; the consumption of fuel; added to these the greater outlay for wages to employes, cause expenses to be so great as to leave small net earnings for that road whose cost was greatest, while the net earnings of the other are sufficient to pay large dividends. Can there be any doubt that the value of the first will be much greater than the latter, and that its shares will sell for a much higher price? The value of every investment or property is measured, to a large extent at least, by the value of its use, not by its use divorced from its value. The value of a railroad for taxation it has been uniformly held by the courts, may properly be determined by the value of its bonds and stocks. Without citing the numerous cases decided by the courts, both state and national, approving this method of assessing railroad, telegraph and other property of this nature, the following may be referred to:

State Railroad Tax Cases, 92 U. S. 575; Kentucky Railroad Tax Cases, 115 U. S. 321; Western Union Telegraph Co. vs. Massachusetts, 125 U. S. 530; Pullman Co. vs. Pennsylvania, 141 U. S. 18; Columbus, Southern Railway Co., vs. Wright, 151 U. S. 470; Pittsburgh, Etc., R. R. Co., vs. Barkus, 154 U. S. 421; Adams Express Co. vs. Ohio, 166 U. S. 186, where the Court said:

"Whatever property is worth for the purpose of income and sale it is worth for the purpose of taxation."

And this is the rule sanctioned by the Supreme Court of Arkansas. Wells Fargo Express Co. vs. Crawford County, 63 Ark. 576.

This is evidently the rule recognized and acted on by the
6005 railroad assessing board of the State of Arkansas as shown by the evidence in this case. The main line of the Iron Mountain Railroad is practically a water level road; no mountains to cross, no rocks to blast or tunnels to excavate, and the leading commercial cities and industries of the State along its line. On the other hand the White River Branch of that road was the most expensive road ever constructed in the State. Miles of it had to be cut out of rock and tunnels cut through rocky mountains; there are no large cities along its line, and the country is sparsely settled owing to the heavy grades and the many curves made necessary by the topography of the country it cannot possibly carry as many cars to a train and transport freight as economically as the main line. The State officials, charged by law with the duty of assessing the property, must have taken these facts into consideration when they assessed those railroads. The White River Branch, in spite of its great cost, was in 1907 valued by that board at $19,000 per mile and assessed on the basis of 50 per cent of its value at $9,500, while the main line was valued at $45,000 per mile and assessed at 50 per cent of that sum at $22,500 per mile.

For these reasons the earning capacity of a railroad is the most

important factor to be taken into consideration in determining its value. As shown above, it has been taken into consideration by the assessing officers of the State and should be taken into consideration for the purpose of determining the apportionment of values in this case. If by reason of the higher rates allowed by the State tariff the net earings of the property are increased the value of the
6006 property is correspondingly increased and the assessment for taxation made accordingly.

The proportions assignable to the intrastate business in the State based upon the assessments of 1907 for the six months ending December 31, 1907, are:

| | |
|---|---|
| Iron Mountain | $5,158,266.75 |
| Southwestern | 1,430,321.18 |

*Bases for Apportionment of Expense.*

The most important and serious problem to be determined is the basis to be adopted for apportioning the expense between the inter and intrastate business.

Smyth v. Ames, 169 U. S. 466, 541, has conclusively established as a rule of law that "the reasonableness or unreasonableness of rates prescribed by a state for the transportation of persons and property wholly within its limits must be determined without reference to the interstate business. The State cannot justify unreasonably low rates for domestic transportation, considered alone, upon the ground that the carrier is earning large profits on its interstate business, over which, so far as rates are concerned, the State has no control." It is therefore absolutely necessary to determine how these expenses should be apportioned between the two classes of earnings without injustice to either party.

All parties agree that there are no fixed bases which will enable the Court or the most experienced railroad statistician to make that apportionment with mathematical accuracy. All that can be done is to adopt those bases which will come nearest being right. As stated by Mr. Justice Brewer in Chicago, Etc., Ry. v. Tompkins, 176 U. S. 167, 178:

6007 "If the Court meant simply that it could not determine that fact (the actual cost of the local earnings) with mathematical accuracy, basing it upon testimony of the exact amount of money paid out for doing such work, it is undoubtedly true, but there are many things that have to be determined by court and jury in respect to which mathematical accuracy is not possible. Take the ordinary cases of condemnation of real estate. * * * Such testimony is not to be disregarded simply because it cannot demonstrate by figures the exact amount or per cent of the extra cost. It is obvious on a little reflection that the cost of moving local freight is greater than that of moving through freight, and equally obvious that it is almost, if not quite impossible to determine the difference with mathematical accuracy."

The first matter to be considered is what theory to adopt. Counsel, as well as accountants, statisticians and railroad men of experience

differ as to which one should be adopted. On the part of complainants it is claimed that the straight revenue basis furnishes an approximately correct result of the net earnings of each class of traffic, and no other will come as near it. On the other hand the contention on the part of the State is that for freight the ton mile basis, and for passenger earnings the passenger-mile basis, will produce the more correct results. The train-mile basis is conceded by all as the least accurate.

This question is not raised for the first time in these cases. It seems to have been considered as an important factor in every rate case and has perplexed other courts as much as it has this. The authorities on the subject are anything but harmonious, although the largest number of decisions, especially of the national courts,
6008 favors the contention of complainants. But a careful consideration of the facts in each case and the various methods employed to reach results shows that neither of them will produce approximately correct results if no other factors are taken into consideration.

The straight revenue theory as advanced by the learned counsel and accountants of the railroads is clearly wrong, as none of them takes into consideration the increased rates charged for the intrastate traffic. No further proof of the fallacy of this theory is required than the examples and calculations of the accountants for the railroads in the exhibits filed with their testimony. Mr. Nay, who, at the time he testified, had thirty-seven years' experience as a railroad accountant, having begun as a clerk of statistics, and was at the time his testimony in these cases was taken the comptroller of the Chicago, Rock Island & Pacific Railway Co., one of the great railroad systems of the country, gave the following illustration for the purpose of establishing the correctness of his theory and to controvert, as he states, "an argument which is sometimes used to the effect that using the revenue basis is like traveling in a circle, and those who take that position claim that when the revenue of intrastate traffic is doubled the operating expenses are also doubled and the end is just the same as in the beginning." He thereupon gives the following illustration to demonstrate the fallacy of that argument, as he states:

"First take for illustration a small railroad with freight operating revenue of $100,000 and freight operating expenses of $80,000, of which the intrastate freight traffic is $25,000 and the interstate freight traffic is $75,000. We have the following statement:

6009

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Operating freight revenue.. | $25,000.00 | $75,000.00 | $100,000.00 |
| Operating freight expenses, divide the expense between the intrastate and interstate on a revenue basis and it would be as follows. ..... | 20,000.00 | 60,000.00 | 80,000.00 |
| Net operating freight revenue ..... | $5,000.00 | $15,000.00 | $20,000.00 |

"Suppose that the rates on intrastate freight traffic are increased so as to exactly double the intrastate freight revenue, leaving the interstate freight revenue just the same, and the operating freight expenses exactly the same, an impossible condition in actual practice, but the extreme condition is used in order to emphasize the error of the argument that doubling the intrastate revenue in such a case would double the interstate expenses. After doubling the intrastate freight revenue just mentioned we would have the following statement:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Operating freight revenue... | $50,000.00 | $75,000.00 | $125,000.00 |
| Operating freight expenses to intrastate revenue, nearly 40% of the total revenue, the operating expenses of $80,000 divided on the revenue basis would now be ..... | 32,000.00 | 48,000.00 | 80,000.00 |
| Net operating freight revenue ..... | $18,000.00 | $27,000.00 | $45,000.00 |

From this it will be seen that although the intrastate freight earnings were increased $25,000 after the intrastate tariff rates had been raised 100 per cent without any increase in expenditures, in the final result it is the beneficiary to the extent of $13,000 only, while the interstate earnings, with no increase in these rates, increased $12,000.

Mr. R. E. Kimbell, the auditor of one of the complainant railroads, was requested to make a similar calculation, and the
6010 result was the same as that of Mr. Nay. His calculations are filed as Exhibit 23 to his deposition.

That such a rule cannot be adopted was clearly shown by Mr. Justice Brewer in Chicago, Milwaukee & St. Paul Ry. Co. v. Tompkins, where, speaking of such a contention, he said:

"But that there was some fallacy in this reasoning would seem to be suggested by the fact that although the defendants' schedule would have reduced the actual receipts 15 per cent on the passenger and 17 per cent on the freight business, the earnings capacity for the last year was diminished only one-tenth of 1 per cent. Such a result indicates that there is something wrong in the process by which the conclusion is reached. That there was can be made apparent by further computations, and in them we will take even numbers as more easy of comprehension. Suppose the total value of the property in South Dakota was $10,000,000, and the total receipts both from interstate and local business were $1,000,000, one-half from each. Then, according to the method pursued by the trial court, the value of the property used in earning local receipts would be $5,000,000, and the per cent of receipts to value would be 10 per cent. The interstate receipts being unchanged, let the local receipts by a proposed schedule be reduced to one-fifth of what they had been, so that instead of receiving $500,000 the company only re-

ceives $100,000. The total receipts for interstate and local business being then $600,000, the valuation of $10,000,000, divided between the two, would give to the property engaged in earning interstate receipts in round numbers $8,333,000, and to that engaged in earning local receipts $1,667,000. But if $1,667,000 worth of property earns $100,000 it earns 6 per cent. In other words, although
6011 the actual receipts from local business are only one-fifth of what they were, the earning capacity is three-fifths of what it was. And turning to the other side of the problem, it appears that if the value of the property engaged in interstate business is to be taken as $8,333,000, and it earned $500,000, its earning capacity was the same as that employed in local business—6 per cent. So that although the rates for interstate business be undisturbed, the process by which the trial court reached its conclusion discloses the same reduction in the earning capacity of the property employed in interstate business as in that employed in local business, in which the rates are reduced." 176 U. S. 176.

On the other hand, if the ton-mile basis is adopted for the division of the operating expenses between inter and intrastate earnings, without considering the additional expenses of the local business, which it is conceded by all exists, although they differ as to the percentages, the result would be just as far wrong as the other. But if proper allowances are made for the higher rate received for local business and also for the increased cost of the local business, as it appears from the evidence, it is wholly immaterial which of these two theories is adopted, whether the revenue or the ton-mile basis, as the results will be the same. As an illustration of the correctness of this statement the following example will serve. Adopt as factors that the entire earnings in the State from freight are $2,000,000; that $750,000 of that was realized from 75,000,000 ton miles of intrastate freight, and $1,250,000 from 250,000,000 ton miles of interstate business, thus showing that from the intrastate business the earnings were 1 cent per ton mile and from the interstate
6012 business 5 mills per ton mile; the articles carried, it is assumed, are practically the same. The cost of the entire business was $1,500,000, and the cost of the local business is 200 per cent greater than that of the through business. The calculations on these factors on the revenue and ton-mile basis *were* made by the accountants of the railroads and of the State are as follows:

Calculations made by accountants of the railroads:

Revenue Basis.

| | Amount. | Per cent. | | |
|---|---|---|---|---|
| Intrastate..... | $750,000 | 37.50x1½— | 56.25— | 47.37 |
| Interstate ..... | 1,250,000 | 62.50 | 62.50 | 52.63 |
| | $2,000,000 | 100.00 | 118.75 | 100.00 |

The total expenditures of $1,500,000 divided upon these percentages and deducted from the gross earnings will result in the following net earnings:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Gross revenue..... | $750,000 | $1,250,000 | $2,000,000 |
| Operating Expenses... | 710,550 | 789,450 | 1,500,000 |
| Net earnings... | $39,450 | $460,550 | $500,000 |
| Ton miles..... | 75,000,000 | 250,000,000 | 325,000,000 |
| Cost per ton mile..... | 9.474 | 3.158 | 4.615 |

Ton Mile Basis.

| | Amount | Per cent. | | |
|---|---|---|---|---|
| Intrastate ..... | 75,000,000 | 23.08x3— | 69.24— | 47.37 |
| Interstate ..... | 250,000,000 | 76.92 | 76.92— | 52.63 |
| Total ..... | 325,000,000 | 100.00 | 146.16 | 100.00 |

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Gross revenue..... | $750,000 | $1,250,000 | $2,000,000 |
| Operating expenses, per cent. | 47.37 | 52.63 | 100.00 |
| | $710,550 | $789,450 | $1,500,000 |
| Net earnings..... | $39,450 | $460,550 | $500,000 |

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Ton miles..... | 75,000,000 | 250,000,000 | 325,000,000 |
| Cost per ton mile..... | 9.474 | 3.158 | 4.615 |

6013 Calculations made by accountant for the State:

Revenue Basis.

| | Intrastate. | Interstate. |
|---|---|---|
| Interstate 62.5%—5 mills per ton mile)<br>Intrastate 37.5%—1 cent per ton mile) | $750,000 | $1,250,000 |
| Expenses (State costing 200% more than interstate, or three times as much as interstate, on ton mile basis, thus allowing 200% greater cost on ton mile basis),<br>Interstate 52.63%—$.003158 per ton mile;<br>Intrastate 47.37%—$.009474 per ton mile. | 710,550 | 789,450 |
| Net earnings on this basis..... | $39,450 | $460,550 |

Ton Mile Basis

| | | |
|---|---|---|
| Interstate 62.5%—½ cent per ton mile;<br>Interstate 37.5%—1 cent per ton mile.... | $750,000 | $1,250,000 |
| Expenses (State costing 3 times as much as interstate per ton mile),<br>Interstate 52.63%—$.003158 per ton mile;<br>Intrastate 47.37%—$.009474 per ton mile. | 710,550 | 789,450 |
| Net earnings on this basis..... | $39,450 | $460,550 |

The same result is reached by applying to the ton mile basis the rule laid down by Mr. Justice Van Devanter when the temporary injunctions in these cases were granted by him.

| | Tonnage per mile. | |
|---|---|---|
| Interstate | 250,000,000— | 250,000,000 |
| Intrastate | 75,000,000x3— | 225,000,000 |
| Total | | 475,000,000 ton miles |

Dividing the $1,500,000 expense by the sum of 475,000,000 shows the cost per ton mile to be $.003158.

| | |
|---|---|
| Interstate | 250,000,000x$.003158—$789,450 |
| Intrastate | 225,000,000x$.003158—$710,550 |

Deducting these sums from the earnings leaves:

| | Earnings. | Expenses. | Net earnings. |
|---|---|---|---|
| Interstate | $1,250,000 | $789,450 | $460,550 |
| Intrastate | 750,000 | 710,550 | 39,450 |
| Total | 2,000,000 | $1,500,000 | $500,000 |

6014 From this it clearly appears that a great deal of this voluminous testimony of the accountants for both parties as to what theory should be adopted, and the elaborate argument of counsel on that question need only be made use of for the purpose of ascertaining some of the items which will show the difference of cost between the two classes of traffic. For that purpose the testimony on the difference of cost, as well as difference in rates will have to be carefully considered, and the findings will determine how the apportionment should be made.

While the evidence is of such a nature that whatever conclusions the Court may reach they will not be mathematically accurate, it differs in no respect from other uncertain questions of fact which have to be determined by a court or jury, as stated in the excerpt from the Tompkins case hereinbefore copied. But to ascertain the cost of the different items of expense it is impossible to adopt either theory to the exclusion of the others in all matters. For some items the revenue theory will necessarily have to be adopted, while in others the ton mileage, car mileage or train mileage are the only basis which will enable the Court to determine from the evidence in these cases how the different items of expenditures should be apportioned. After ascertaining the difference of the cost of expenditures and the difference in the rates between state and interstate transportation, the final determination of what the net earnings of each road on its intrastate business are can be as correctly ascertained by adopting the revenue as the ton-mile basis.

6015 Inter and Intrastate Tariff Rates.—Freight.

Whether the ton mile, car mile, train mile or revenue basis is adopted to arrive at correct results it is necessary to ascertain the relation of the tariff rates charged for the interstate business and those charged for the intrastate business, for if the latter are sufficiently high to make up the difference in cost found to exist between the two then that difference has been fully provided for, and to make any additional allowance therefor would be doubling the cost and to that extent doing an injustice to the State. Or, in other words, if the evidence shows that while the interstate earnings are compensatory, the intrastate rates are so low as to make them non-compensatory, and if it is shown that the difference in cost of the two classes of traffic is 100 per cent, but that the rates for the intrastate are 100 per cent higher than those charged by the roads for the through traffic, then there would be no cause for interference by courts. That the interstate rates are too low is not claimed in these cases, the intrastate rates being the only ones complained of. In fact, it is shown by the evidence that the net earnings of the entire Iron Mountain system were sufficient to pay for the year 1907 and for several years prior thereto a dividend of 10 per cent on its capital stock, after paying the interest on its bonded indebtedness.

Taking up the freight tariffs first, it is claimed on the part of the State that the rates charged for the State business exceed those for the through business on the Iron Mountain 98 per cent, the earnings for the local business being 13.377 mills per ton mile and for the through business 6.75 mills, and on the South-
6016 western they exceed 141 per cent, the earnings for the local business being 20.945 mills and for the through 8.665 mills for the ton mile. The statistics of the two roads, as shown by the statements filed, sustain these figures, but it must be conceded that unless the commodities hauled in the State and through business are practically the same these figures cannot be adopted as proper factors for the determination of that question. This is easily proven by the following simple example: If the state business carries one-half high-class traffic at 3 cents a ton mile and one-half low class at 1 cent per ton mile, the average of the entire traffic would be 2 cents; but if it carries only 25 per cent high-class commodities at 3 cents and 75 per cent low class at 1 cent, the average would at once be reduced to 1.5 cents per ton mile, a difference of 33 1-3 per cent.

The heaviest tonnage in interstate traffic consists of lumber and grain, which are carried at the lowest rates; grain constitutes 13.75 per cent of the entire tonnage on the Iron Mountain, and something less on the Southwestern. The grain tonnage in local traffic is practically negligible. Other commodities of a low class, such as cement, salt and iron, are transported almost exclusively in interstate traffic, while practically very few, if any, very low class commodities are carried in local traffic to the exclusion of the through. But it is unnecessary to go into details to show that the difference in the earnings of the two traffics is largely affected by the commodities carried and the changes in ton-mile earnings at different times are caused by the shifting of the commodities transported. In the

opinion of the Court this is conclusively shown by the fact that although the rates, inter as well as intrastate, of both roads, the Iron Mountain and Southwestern, as established by the Arkansas
6017 Railroad Commission, and the tariffs published by the roads for interstate business, are identical, the earnings of the Southwestern on local business are 20.945 mills per ton mile, while those of the Iron Mountain are only 13.377 mills, a difference of over 55 per cent, and on interstate business the earnings of the Southwestern are 8.665 mills and those of the Iron Mountain 6.75, a difference of 20 per cent. This difference is, in part at least, explained by the fact that the Iron Mountain carries a great deal of coal in inter as well as intrastate traffic, having branches through the coal fields of the State, 22.83 per cent of the entire state traffic of the Iron Mountain being of that character. This is carried at an average of 6 mills per ton mile against 13.377 mills for the entire business. The Southwestern transports very little coal, practically none local and comparatively little interstate. Other low commodities carried in much larger quantities locally by the Iron Mountain than the Southwestern are stone, brick and lumber, the local lumber carried on the main line of the Iron Mountain and especially when reduced to ton miles being considerably greater than on the Southwestern, owing to the fact that most of the large cities of the State are on that line and the number of saw-mills on the north half of that line in the State being few as compared with those on the Southwestern. The Arkansas standard distance tariff shows that stone, which constitutes 7.20 per cent of the total state traffic on the Iron Mountain, was required to be carried at an average rate of 5¼ mills per ton mile; lime, brick and cement, which constitute 6.13 per cent, were carried at the same rate. The length of the haul is another important matter to be considered, for as the rate per mile
6018 gets lower, under the State distance tariff, as the distance increases, the shorter the haul the greater the revenue is per ton mile.

That the shifting of commodities is the principal cause of these differences in earnings per ton mile is further shown by the testimony of Mr. Kimbell. At the request of counsel for the State he prepared a statement (Exhibit G) of the earnings of the Southwestern for the month of January, 1909, after the temporary injunction had been granted, and the higher rates made by that road had been put in effect. This showed an increase of 96.1 per cent of the intrastate earnings for the ton mile; but a statement prepared by him showing the revenue under the then current rates, and what they would have been under the commission rates (Exhibit 58) shows that the actual increase of the rates was only 48.18 per cent, a difference of almost 100 per cent.

It is therefore impossible to adopt these figures as proper factors for the purpose of ascertaining the difference between the two rates. The only method by which this can be ascertained with anything near accuracy is to compare the state rates as established by the State Railroad Commission with the interstate tariffs of the railroads, taking into consideration the different commodities and quantities

carried in local and through traffic. And this comparison is at best only approximately correct. The transstate rates are considerably lower than the Arkansas state rates and they constitute 51.16 per cent of the entire tonnage in Arkansas over the Iron Mountain and considerably more on the Southwestern. For some commodities the interstate rates, especially between Arkansas and Louisiana
6019 and Missouri and Arkansas, are higher than the local rates. This is due to the fact that in many instances they are carried under the State tariff at commodity rates while under the interstate tariffs they are transported at class rates. The lowest rates in the interstate, or rather transstate traffic, are those which are controlled by zones and common points, there being 2,600 common points in the State of Texas which carry the same rates regardless of distance. On behalf of the railroads it is claimed these great differences are more apparent than real. The Texas common points are explained very fully and clearly by Mr. Perkins. He says:

"In establishing the rates to this territory from St. Louis and the east we have a peculiar condition in that the Texas territory is entered by the transportation lines from three sides out of a possible four. The M. K. & T., the Santa Fe and the Frisco enter the State from the north; the Iron Mountain, the Cotton Belt, the V. S. & P. and the T. & P. from the east; the Southern Pacific, the Illinois Central and also the steamer lines from the Atlantic Coast enter from the south. Denison, Texas, a point in the extreme northern part of the State, and reached by the M. K. & T. and Frisco, will produce the minimum haul for those two lines from St. Louis or the east, while a similar shipment to the same point of destination handled by the Illinois Central and the Southern Pacific through New Orleans, Houston and then north, would offer the maximum haul for that route. A shipment to Houston, Texas, routed via M. K. & T., the Santa Fe or Frisco, would offer nearly the maximum haul for shipments handled by either of these routes; while if routed via the Illinois Central or the Southern Pacific would yield the maxi-
6020 mum haul via that route. This is true in nearly all parts of the State and indicates very largely why a blanket zone in the State of Texas is necessary. If the Cotton Belt or the Iron Mountain railroads were the only routes by which to reach the State of Texas the conditions would be entirely different. We could then, and would no doubt, make our rates on a graded scale, making them higher as they proceeded south or southeast through the State."

The transstate lumber business is ten per cent of the entire transstate, equal to over five per cent of the entire tonnage. The roads only solicit that business nearest to them, and in any event it is hardly reasonable to suppose that any considerable business originating in the southern part of Texas would be given to the roads entering the State from the north or vice versa, as the delay in the transportation, which must be considerable, would be sufficient to prevent it. Besides, the connecting lines will naturally transfer their freight to the shortest line in order to obtain for their roads the maximum proportion possible. This also applies to the citrus movement from California, which the testimony shows is not solicited by

these roads, and practically none transported over their lines, in fact none over the Southwestern.

Mr. Watson, the assistant general freight agent of the Southwestern, in testifying to refusals to accept shipments offered to his road where, owing to river competition, the rate was too low to be profitable, gave the following explanation when asked what the principle upon which traffic men act in determining when they will not solicit or take business:

"When the business is unremunerative or will not yield a fair rate for the services we are required to perform after deduct-
6021 ing the arbitrary we must pay."

This, he declares, is a universal rule with his road and all others.

The lumber and grain zones are controlled by commercial and competitive conditions and yield but small profits at the rates carried, but on the other hand cars loaded with grain from the north are loaded with lumber on the return trip, thus creating a reciprocal haul, which is an important item in the earnings of every road, and is taken into consideration by all rate makers. Besides the low rates on lumber, enabling the mills of the far south to compete with those farther north and nearer the commercial centers, aid in the development of the country, which would otherwise remain unsettled and thus gives the roads considerable high-class traffic and creates local business which otherwise would not exist. To that extent the local traffic is indirectly benefited. In addition to this, the State tariff also provides for some zones for commercial reasons and competition necessarily compels the consideration of competitive points. In order to enable coal mine operators in the extreme western part of the State to compete with those nearer the center of the State the State Commission has made a blanket rate, applying the Coal Hill rate, which is 114 miles from Little Rock, the railroad and geographical center of the State, to all mines west of it in Logan, Franklin and Sebastian counties, extending to the western State line, a difference of over fifty miles in some instances. It has also made the Spadra rate applicable to all coal mines on the Dardanelle and Russellville road to all points in the State north, south and east of Little Rock. On sugar there is a blanket rate, including in those
6022 rates every road in the State regardless of the number of roads over which it is handled, to all points 150 miles and over. Competitive points in the State take the tariff of the shortest road of necessity, for it is a rule in railroad tariffs which may be called axiomatic that the shortest road establishes the rate for all competitive roads in that territory. While the competitive points in Arkansas are not so many, still, considering the length of the hauls and the volume of business (8 per cent only of the entire traffic on the Iron Mountain and 2.95 per cent on the Southwestern) they are sufficiently numerous to require consideration in determining the difference in rates. A few illustrations will show what they are. The following are some of the points which are competitive and therefore must be served by all roads at the rate fixed by the shortest road. From Little Rock to other points of the state the differences in mileage are here given:

Camden:

Iron Mountain..... 93 miles
Southwestern.....124.5 miles

Fordyce:

Rock Island..... 82 miles
Southwestern..... 95 miles

Warren:

Rock Island..... 86 miles
Iron Mountain.....149 miles

Helena:

Iron Mountain.....160 miles
Rock Island and Arkansas Midland.....118 miles

Paragould:

Iron Mountain.....163 miles
Southwestern.....197 miles

Jonesboro:

Iron Mountain.....147 miles
Southwestern.....176 miles

6023 Newport:

Iron Mountain..... 83 miles
Rock Island.....117 miles

Texarkana:

Iron Mountain.....145 miles
Southwestern.....207 miles

Forrest City:

Iron Mountain.....117 miles
Rock Island..... 88 miles

Brinkley:

Rock Island..... 64 miles
Southwestern.....101 miles

Crossett:

Iron Mountain.....114 miles
Rock Island.....138 miles

Hope:

Iron Mountain.....112 miles
Southwestern.....173 miles

Bridge Junction:

Iron Mountain.....146 miles
Rock Island.....129 miles
Southwestern.....185 miles

Texarkana to Ft. Smith:

| | |
|---|---|
| Iron Mountain | 208 miles |
| Kansas City Southern | 160 miles |

Helena to Pine Bluff:

| | |
|---|---|
| Iron Mountain | 203 miles |

Southwestern and Arkansas:

| | |
|---|---|
| Midland | 100 miles |

As it is conceded by all parties that the longer the haul the less expense per mile the zones naturally increase with the length of the haul. This is fully recognized by the Arkansas Railroad Commission in its distance tariff. With few exceptions, as the distance increases the mileage rates proportionately decrease.

6024 In the class rates the increase in the rates is made every five miles for the first 100 miles. When the distance is over 100 miles the increase of rates is for every 10 and in some instances 20 miles, and over 200 miles for every twenty or thirty miles. The commodities tariff, under which the great bulk of the local business moves, with few exceptions, increases the rates every 25 miles for the first 100 miles, and if over 100 miles for every fifty miles and on a number of commodities the zones are larger. On lumber and other forest products, for the first one hundred miles, the increase in rates is every twenty-five miles, and over one hundred miles every fifty miles. The same difference is made on packing-house products and grain. On salt the same rates apply to two hundred miles as to one hundred miles. For forest products, rough material, when the manufactured product is reshipped over the same line bringing in the rough material, the rates are much lower than the regular tariff; for the first fifty miles it is two cents a hundred, for the next fifty miles two and one-half cents, for the next fifty miles three and one-half cents, from 150 to 250 miles five cents, and over 250 miles eight cents. As nearly all the lumber when manufactured is reshipped this latter rate practically applies to nearly all through material of forest products except that carried to the mills by the tap lines. As construed by the Supreme Court of the State this rate also applies when the reshipment of the manufactured product is made to points outside the State of Arkansas. Chapman & Dewey Lumber Co. v. Jonesboro L. C. & E. Ry. Co., 24 Ark. Law Rep. 535.

6025 Another important matter to be considered in this connection is the fact that the Arkansas distance tariff in fixing the minimum weight of carloads is on an average 40 per cent lower than for interstate transportation. The only commodity for which the minimum is fixed at 40,000 pounds is fire brick, and the only commodities at 30,000 pounds a car are common brick, sawdust, iron, staves and stone. Coal at 25,000 pounds, eighteen commodities, including lumber and forest products, at 24,000 pounds, and the rest at 20,000 pounds and less. On the other hand the average capacity of the Iron Mountain cars is 67,000 pounds, and the minimum fixed by the western classification on through business

averages 40 per cent more than that of the State. Most of the coal cars used in interstate traffic carry 100,000 pounds.

The difference between the minimum of carloads as established by the State Commission and the western classification was ascertained by the Court by comparing the two item by item, and the difference of 40 per cent in favor of the interstate is a very conservative estimate.

Taking all these matters into consideration, and after careful calculations, which it is unnecessary if not impossible to set out in this opinion, the finding of the Court is that, altogether, the intrastate freight rates in force at the time of the institution of these actions and in 1907 were 50 per cent higher than the inter an dtransstate.

*Passengers.*

While the rates for passengers apparently are the same for intra and interstate, the evidence shows that the actual charge for, or rather revenue from, the state business is greater, due, no doubt, to the much longer haul and competitive conditions. For the
6026 period in controversy the actual fares collected for each passenger mile on the Iron Mountain was: Intrastate, 1.929 cents; interstate, 1.865 cents, a difference of 3.48 per cent, for which allowance will be made.

*Expenses Between State and Interstate.*

That there is a material difference between the expense of state and interstate business is conceded by all. On the part of the State it is claimed this difference is not exceeding 87 per cent, while on the part of the railroads the contention is that it is much greater. This 87 per cent is the result of the calculations after deducting the share with which the interstate traffic is chargeable for its proportion of the freight carried on local trains. The actual difference between the expense of local and through trains per ton mile, as calculated by the State's accountants, and testified by Mr. Hamilton, is 162.67 per cent. But, it is claimed, as a large proportion of the freight transported on local trains is interstate, that part of it should be charged with its proportionate share of this additional cost, and when that is done the actual difference in cost, it is claimed, is 87 per cent. The lowest estimate made by any witness for complainants seems to be that it is at least 200 per cent greater, while some estimate it as much as 700 per cent. The witnesses for the railroads do not base their opinions upon itemized statements, as no records were kept by either of the roads for the purpose of dividing the expenses between the state and interstate business, but as all these witnesses are men who have been engaged in railroad work and connected with railroads from their earliest manhood, starting at the bottom of the
6027 ladder and now occupying most responsible positions, some as general managers, comptrollers, auditors, superintendents and other high positions, it is claimed that their testimony, based upon their great experience, should be controlling. These witnesses for the railroads all agree on the one point, that to divide these expenses

on any other than the revenue theory would not give accurate results; that their practical experience enables them to determine from a given state of facts the difference of cost between state and through business on percentages as nearly correct as it is possible to arrive at, unless separate accounts of the expenditures had been kept, not only for the inter and intrastate business, but also the transstate.

On the other hand the accountants for the State offered in evidence schedules which they claim are based on facts as they appeared from the records of the railroads when such were obtainable, and on the experience of men long in the railroad service when factors had to be adopted arbitrarily. The scheme for obtaining these facts is new, never having been used by any accountants in any of the numerous rate suits which have heretofore been before the courts. It was devised by Mr. Wharton, a member of the firm of Haskins & Sells, expert accountants of national reputation. Mr. Wharton himself testifies frankly that he has had no practical experience in the management of any work on railroads; that his knowledge of railroad accounting is limited to what he acquired from his connection as one of the accountants for the State of Missouri in the railroad rate litigation of that State and the testimony of the expert railroad men who testified in those cases; that he also consulted with railroad men of experience and from the knowl-
6028 edge thus acquired he has evolved the scheme now presented to the Court on behalf of the State. Who the railroad men whom he consulted are, or what their experience at that time was, what positions they had ever occupied with railroads, he fails to state, except that Mr. Hamilton, who is one of the accountants employed by his firm, and under whose supervision most of the work offered in evidence was conducted, had for a number of years been in the employ of railroads. Mr. Hamilton, who was present at the protracted hearing of this case and explained to the Court many of the items in the statements filed as exhibits for the State, impressed the Court as a man of ability, a fine accountant and a fair witness.

In this connection it is but proper for the Court to say that all the witnesses in these cases impressed the Court as having testified as intelligently and as fairly as is possible. It is true they differ widely in their views, but it is an acknowledged psychological fact that the opinions entertained for years by a man cannot be discarded at once, and that all persons are to a certain extent influenced in their views by their environments, as well as the duties they are called upon to discharge for others.

But the experience of Mr. Hamilton in connection with the management of a railroad, when compared with that of the witnesses introduced for the complainants, is very limited. At the age of fifteen he began as a messenger boy for a railroad and continued in different positions until 1906, when at the age of thirty-two he entered the employ of Haskins & Sells as accountant and has been in their employ ever since. Their and his employment has always been as accountants for the State and in opposition to the claims of the carriers; his employment by railroads was always in a
6029 subordinate position, his highest position being that of chief clerk to a chief of a division; his duties were practically all of a

clerical nature. Since he has been in the employ of Haskins & Sells he assisted in gathering evidence and making investigations for the use of the State in the Missouri rate cases, acting under the direction of a superior official of that firm. But whatever the experience or lack of experience of these gentlemen may be, the statistics, as far as they go, and the assumptions although adopted arbitrarily where they could find no accurate data from the records, are of considerable value so far as they have not been successfully attacked by witnesses of greater experience introduced by complainants in rebuttal. That they cannot be adopted by the Court as a whole will no doubt be admitted by the learned counsel for the State, for not only have many of them been shown to be based upon arbitrary assumptions which are incorrect, but many important items which contribute materially to the greater cost of the State business are conclusively shown to have been wholly overlooked by them. But, in the opinion of the Court, the scheme itself furnishes the best method of solving this problem that has been called to the attention of the Court, depending, of course, upon the correctness of the numerous factors necessary to obtain accurate results.

To determine these important issues under consideration the Court intends to adopt their scheme and ascertain in that manner, in connection with all the other testimony in these cases, the difference in the cost of the intrastate as compared with the through business, and it is of the opinion that in this way it will reach conclusions as nearly accurate as from the evidence is possible. That it
6030 will be mathematically accurate the Court does not claim for it, but that is impossible, no matter what bases or schemes are adopted.

*Freight.*

A most serious objection made is that the calculations of the State's accountants are based on the business of one month only and treated as representative of a year or even a six months' period, their schedules being based on the business of the Iron Mountain during the month of October, 1907, and of the Southwestern the month of October, 1908. The reasons therefor are stated to be that the roads furnished these statements, Exhibit 26 being that of the Iron Mountain, and Exhibits 19 and 20 of the Southwestern. The auditors and statisticians of the roads who prepared and filed these statements deny emphatically that they represent a fair average of one-twelfth of a year's or one-sixth of a half year's earnings or expenses of either road, and give the following explanation for preparing these statements. On the part of the Iron Mountain it is claimed that it was prepared at the request of the State's accountants and filed in compliance with that request; that of the Southwestern was prepared for the purpose of ascertaining as near as possible the relative business and cost thereof as soon as possible after the temporary injunctions in these cases had been granted; that they were granted in September, 1908, and the test was made the first month thereafter; that it will show a fair relative condition of the business of the entire

year is practically admitted, but it is emphatically denied that it shows such a fair average of the year's business as will enable the Court to reach even an approximately correct conclusion as to what the average cost of the year's or half year's business is. The
6031 testimony establishes conclusively that the freight earnings of these roads for the month of October of any year are greater than those of any other month of that year. Exhibit 54, which gives the ton miles of the intrastate freight of the Iron Mountain for the six months ending December 31, 1907, shows that the average of ton miles for one month was 7,976,716, while that for the month of October of that period was 9,622,508 ton miles, a difference of over twenty per cent. The revenue received for the same period shows a still greater difference. The average revenue for one month during that period was $106,708.03, while that for the month of October was $131,286.45, a difference of nearly twenty-two per cent in favor of the month of October. The interstate freight mileage for the six months' period averages 102,050,616 ton miles, while that carried in October exceeds that average 8,646,842 ton miles, nearly eight per cent. The Southwestern did not file any statistics for the latter half of the year 1908, the year its October test was made, but has filed statistics for the last half of 1907 and the first half of 1908. But it would not be fair to make a comparison with the first half of 1908, as the evidence shows that while in 1907 the traffic was the most prosperous the roads had ever enjoyed, that of the first half of 1908 was very much less, owing to the financial crisis then felt most severely by the railroads of the country. But the conditions of the two roads, the sections traversed by them, are, so far as freight transportation is concerned, so nearly alike, with the exception of some of the low-class commodities, that it may be assumed that the results would be the same, after making allowance for the differences mentioned.

It is also shown in evidence that owing to the exception-
6032 ally large business of the railroads during the year 1907 it was almost impossbile for these roads to carry all the freight offered to them for transportation. The freight yards were all congested, and in order to move the freight from five to eight hundred tons of interstate freight (this includes the dead weight) would be sent on each local train, thus relieving to some extent the congested condition, but materially increasing the amount of through freight carried on local trains. As these conditions were exceptional and the month of October, as shown, cannot be considered as an average of the year's business, they should not be considered as representative of those prevailing in normal times. But there is sufficient evidence to enable the Court to make proper allowances which will equalize these conditions.

As the October business exceeded that of the average month of the six months' period over 20 per cent. multiplying it by that factor of course increases the entire totals by that amount, and as the greater the tonnage the smaller the proportionate cost, all calculations should be made, when that month is used as the basis, after a reduction of 20 per cent, which will leave over 2 per cent of the

earnings (the earnings for that month being 22 per cent greater than the average) for the additional expenses incurred by reason of the increased tonnage. It is also established by the evidence that errors were made in the tonnage of many cars transported during that month. On thirty-four cars the errors were found to run from 2,000 to 34,000 pounds a car. The investigation of Mr. Hamilton was confined solely to the records of the local cars, and they constituted, according to his testimony, 11.18 per cent of all the cars moved on the Iron Mountain that month and 10.09 per cent.
6033 of the Southwestern. Other serious objections made to the fairness of adopting the business of the month of October as a basis for a year's or six months' period are the inaccuracy of his figures, but these can be corrected when the final calculations are made if not corrected in the calculations made in detail.

*Apportionment of Expenses.*

The schedules of apportionment of expenses submitted by the accountants for the State will each be taken up separately and findings made on them. The items which it is claimed by complainants were omitted will be considered separately hereafter.

*Freight Operating Expenses.*

1. Maintenance of Way and Structures.

Objections are made to this item as compiled by the accountants for the State upon the ground that it is guess-work solely, and that there is no basis upon which there can be a proper apportionment except upon the straight revenue theory. It would serve no useful purpose to state the many objections made except the one which, in the opinion of the Court, is controlling. The overwhelming weight of the testimony shows that but a small part of the expenditures for maintenance of way and structures is caused by the operation of trains. Stations, platforms and fences are but very slightly, if at all, affected by the operation of trains. Nor are the roadbed, ties and ballast nearly as much affected by the operation of trains as by other causes. The greatest expense, it is shown by the testimony, is due to deterioration and action of the elements regardless
6034 of the operation of trains. It is claimed by the witnesses introduced on behalf of the complainants that from 75 per cent to 90 per cent of this expense is due to the action of the elements and only from 10 per cent to 25 per cent to the operation of trains. In view of these facts any attempt to apportion this item of expense on the ton, car or train mileage basis would be an injustice to the roads. The Court is of the opinion that the straight revenue basis will get more accurate results. The difference in intrastate and interstate rates will be taken care of by proper allowance to be made on the final calculations of the entire cost.

2. Maintenance of Equipment.

(*a*) Locomotives. These expenses are divided between yard service, local and through service. On the part of the State the yard locomotive mileage is based on cars, while, on the other hand, complainants urge the revenue basis. In the opinion of the Court the car mile basis, as adopted by the State's accountants, including the allowance of 50 per cent to the yard locomotive mileage and 75 per cent for local locomotive mileage is proper.

(*b*) Freight cars. This is divided between stopping and starting, terminal handling and other expenses. On the part of the State the percentages suggested by Mr. Wellington in his work on Railway Expense Location are adopted, charging for stopping and starting 21.5 per cent, for terminal handling 13.5 per cent and other expenses 65 per cent. The objection to the Wellington figures on the part of the railroads is that they were prepared in 1877 and
6035 since then many changes, which make them inapplicable, have been made, and for that reason, should not be applied to conditions now prevailing. The evidence on that point is conflicting, but after a careful examination of all the testimony, taking into consideration the fact that while the cars now in use are built much stronger than those in use at the time Mr. Wellington wrote his book, the appliance of the air brakes instead of hand brakes, the less care exercised by trainmen by reason of the use of the automatic couplers, which dispenses with the necessity of going between the cars, and other items mentioned in the testimony, the Court is of the opinion that 25 per cent is a proper charge for damage to cars caused by stopping and starting; for terminal handling 13.5 per cent is found by the Court from the evidence as approximately correct.

In making the calculations on these items the accountants for the State assume that while the local trains stop every five miles, each through train stops every twenty miles, and therefore that the local service should be charged with four times as much as the through service in proportion to the car mileage for expenses due to stopping and starting; they also assume that each car in local service receives two terminal handlings to one terminal handling of a car in through service, and for that reason the local service should be charged with two times as much as through service in proportion to car mileage for expenses due to terminal handling. The Court finds from the evidence that while local trains stop every five miles, the through trains stop only every thirty-five miles, and for that reason the local trains stop only every thirty-five miles, and for that reason the local trains are chargeable with seven times as much for that item
6036 as the through trains. In charging the through trains with one terminal handling in the State they include the trans-state freight and charge that with one terminal handling. As the trans-state business of the roads constitutes a very large percentage of the business, over 51 per cent of the entire freight business in the State of Arkansas for the Iron Mountain, and nearly 65 per cent of the Southwestern business, it is a matter of considerable importance to determine what should be properly charged for this item. The

trans-state business, which merely passes through this State, both of the terminals, that of starting and destination, being in other States, it will be seen that there should be a difference in the charge of terminal expense in this State.

A great deal of evidence has been introduced on the part of the State to show when through trains carrying this trans-state freight come into division yards they are broken up and handled in the same manner as the interstate business, and for this reason it was very earnestly argued that it should be charged with one terminal. On the other hand the evidence introduced on behalf of the railroads shows that while there are some yard expenses connected with the trans-state business, it is entirely free from the great expense caused by terminal handlings. It is true the handling of these trans-state cars at terminal points differs very materially from the "crossing of a bridge", a figure of speech indulged in by one of the witnesses for complainants, still the evidence leaves no doubt in the mind of the Court that the work connected with the trans-state cars is not of that nature which should properly be called and charged as a terminal handling at any other place except that of starting and desti-
6037 nation. The switching necessary for delivering and receiving the cars is saved. It is true there is considerable switching at every division point, but as established by the evidence, in making up a through freight train the trans-state cars are placed in such position in each train that all cars intended for a certain territory or for a certain branch road that they can be moved at one time and placed in a solid mass on the track from which they are to be finally moved. Besides, it is admitted that local freight originating at and destined for a point not a terminal, but which must pass an intermediate terminal yard, receives at such yards the same service as trans-state cars do. As the trans-state business is much heavier than either the interstate or local the number of cars in these trains merely passing through the terminals is naturally larger. From the exhibits filed by Mr. Moore, who was night yardmaster at the Little Rock terminal in 1907, the trans-state freight in these trains would average from 60 per cent to 70 per cent; the cars would be moved in one body to tracks on which they were to be transported farther; interstate business intended for that point would have to be taken to the different commercial tracks and from there hauled to the industries to which they were consigned; they are handled by carrying them in small lots of from one to three cars; they would be carried in some instances a distance of several miles, and after having been emptied they would have to be sent for and switched back to the freight yards of the company. If intended for other points in the State they would be handled like trans-state cars, being switched over to the track on which the trains for these localities would be made up. The same expense would be incurred and the same injury to the cars caused in receiving and handling as
6038 local freight passing through these terminals. Mr. Moore filed with his testimony (Exhibit 53) what is called a "consist" of the through freight trains handled during the month of October, 1907, which shows the movement of the cars after they

reached the Little Rock Division yards. He takes for illustration the movement of one train and thus explains it in his own language:

"It is shown by this consist that the cars destined to Texas are in the train beginning from the caboose, including forty-two cars destined for Texas, and ahead of that are the cars for the Valley Division and Little Rock proper and local south on short points beyond Little Rock. The first car mentioned in the consist at the top is the car next to the caboose at the rear of the train. The last car on the list is the car which is next to the engine. Those 42 cars destined to Texas would remain on the train on which they were received, and the 16 cars (there were 58 cars in the train) would be taken off the head of the train and put on such tracks as are designated for that purpose. The 42 cars would remain on the track on which they were received and there would be added to that train more tonnage and forwarded from the track on which we received it; they would not be switched; they would be sent out on the day they came in."

This consist shows that a very large percentage of the cars on all through freight trains and trans-state were moved as testified by Mr. Moore. Mr. Cannon, who in 1907 was Superintendent of the Arkansas Division of the Iron Mountain, testified to the same facts, and also that at the Hoxie Division yards the percentage of through freight is still greater and subject to less switching than at
6039 Little Rock. On the other hand a former yardman of the Iron Mountain testified that as a rule the number of cars intended for trans-state transportation constituted a small percentage and are handled almost as much as those intended for local transportation.

All agree that the injury to freight cars incident to delivering and hauling them back to the yards is not incurred for the trans-state cars. When cars are received from other lines for trans-state transportation there are no terminal expenses except the yard charges and that is so well known that all of the witnesses who testified on that subject, those for the railroads as well as those for the State, agree that when the transportation is over three or more lines, in the division of the earnings, extra allowances are made to the terminal roads, receiving as well as delivering, while a smaller proportion is paid to intermediate carriers for the reason that there are no terminal expenses. Mr. Lincoln, one of the witnesses introduced by the State, who has had a great deal of experience as a railroad man, and although at present not connected with any railroad, occupies the position of manager of the St. Louis Freight Bureau, which necessarily requires that he keep himself fully informed in all matters of this nature, agreed with the witnesses of complainants, on that subject that there should be no expenses charged in Arkansas for the terminal service of trans-state business.

Mr. Parker, a witness introduced by the State, who is the expert engineer for the Texas State Railroad Commission, also testified that while trans-state business would have the same expense as interstate attached to it in the yard service there is none at the terminals.

6040 But there are some items of the interstate business which are only charged with one terminal, which, in the opinion of the Court, should be charged with two. The evidence shows that all the cotton handled in the State is credited to interstate earnings. While 30 per cent of that is transported uncompressed and therefore has only one terminal handling in the State, the other 70 per cent has two terminal handlings in this State. The evidence shows that cotton is brought to the concentrating points either on local trains or on what is called "pick-up" trains, trains which during the cotton season are used exclusively for picking up the cars loaded with cotton along the line, and before it is transported out of the State it is compressed. These cars are taken to the compress, there unloaded, the empty cars hauled to the yards, and after the cotton is compressed empty cars are carried to the compress for reloading. That part of the interstate traffic has two terminal handlings as much as the local business, except that it is carried in trainloads to the compress instead of being hauled in small lots, but that is fully made up by the additional expense caused by first delivering the cotton to the compress and then delivering the empty cars for the purpose of transporting it out of the State after having been compressed. The evidence shows that cotton constitutes about 7 per cent of the interstate business, or about 2.5 per cent of the interstate and intrastate business of the Iron Mountain. It is, therefore, proper that of the 34 per cent of the interstate business 2.5 per cent should be charged with two terminal handlings instead of one for this cotton.

Another item of interstate traffic which receives to a great extent two terminal handlings in the State is lumber and forest prod-
6041 ucts. The evidence shows that a material part of forest materials, especially staves and headings, are brought in the rough to the mills and then, after having been finished as manufactured material, are reshipped on the interstate rate for the entire haul and the earnings credited to interstate traffic. Many of the larger mills have short roads which carry the rough material to the mills; these are called "tap lines". Allowances made to them for these hauls will be considered by the Court and included in determining the difference in rates between inter and intrastate business and for that reason need not be considered in determining this item.

A small proportion of the grain brought in from other States is also handled twice. From all the evidence the conclusion reached by the Court is that 2 per cent of the interstate business should be charged for the transportation of lumber and grain with two terminal handlings in the State.

Another item of interstate business which should be charged with two terminals is the Memphis and Ft. Smith freight for the State of Arkansas. As has been stated hereinbefore, all of the Memphis business for points in Arkansas, and most of the Ft. Smith business destined to points in this State, is treated as interstate business, but the entire expense thereof charged to this State. It is hard to determine from the evidence how much this business amounts

to, but a liberal estimate will make it 2 per cent and this should also be charged with two terminals.

6042 This item of terminal expense should therefore be divided upon the following basis:

| | | | |
|---|---|---|---|
| Trans-state receiving no terminal handling | ..... | 51.16% |
| Interstate receiving one " " | ..... | 34.19% |
| Intrastate receiving two " " | ..... | 6.50% |
| Intrastate receiving two " " | ..... | 8.15% |
| | | 100% |

The balance of expense on this item may properly be divided upon the basis adopted by the State's accountants, except that the ton mileage should be used instead of the car mileage, as the weight of the car adds to the expense, and there is less injury in transporting empty cars than those loaded.

Supervision in general.—The expenses under this head may properly be divided between local and through service on the basis of direct charges for maintenance and equipment after ascertaining the percentages according to the rules stated hereinbefore.

3. Traffic expenses.—The accountants for all parties agree that those expenses should properly be divided on a straight revenue basis.

4. Transportation expenses.

*a*. Station expenses.—These expenses should properly be divided on the basis of the ton mileage of each class of traffic, charging each intrastate ton with six handlings, the interstate with one handling, and the transstate with one-half handling. The intrastate is chargeable with six station expenses to equalize the difference in the length of the haul, taking into consideration only the difference in this State, which on the Iron Mountain is three

6043 times as long for interstate as for local, and therefore for the same distance the local cars would have to have three hauls to one for the interstate. This may do some slight injustice to the interstate business, after having made allowance for two handlings for 6.5 per cent of that business, but it is not sufficient to affect the final result to any appreciable extent.

*b*. Yard and terminal expenses.—These expenses will be apportioned in the same manner as those of road locomotives. This does the interstate business some injustice because every car passing through the terminal yards, whether transstate or interstate, has been included in this expense by the accountants and charged twice, once for being hauled in and again for being hauled out, although they receive but very little handling, as shown heretofore. But in view of the fact that no allowance was made for any handling under the head of terminal handling of cars, charging them with this station expense will equalize the two items.

*c*. Fuel and locomotive expenses and wages of train crews.—In apportioning the expenses these two items will be considered together. The Court finds from the evidence that the cost of fuel and wages

paid per train mile on local trains is 50 mills, while on the through trains it is 34 mills, a difference of 47 per cent. The local trains should therefore, be charged with 47 per cent greater cost for these two items.

*d.* Enginehouse expenses.—The basis adopted by the State's accountants in apportioning this item of expense between local and through trains is approved.

*e.* Other train expenses.—These should be divided between
6044 state and interstate traffic on the basis of the gross earnings of each class of traffic during the six months' period ending December 31, 1907. The difference in the dead weight of the different classes of trains will be considered hereafter.

*f.* Loss and damage to freight.—The basis upon which this division is made by the accountants for the State is upon the claims paid during the six months in controversy, the claims during the month of October having been examined for the purpose of determining which are properly chargeable to local trains and through trains. The figures used by the State's accountants are undisputed and will be adopted by the Court.

*g.* Supervision and general.—These expenses should be divided on the basis of the direct charges to each of the transported classes as found in the foregoing items.

5. General expenses.—The apportionment of these expenses should be made on the basis of the supervision and general expenses under the head of equipment and transportation.

## Method of Dividing that Cost.

The State, in dividing these costs, adopted the movement for the month of October, 1907, as a fair average for the entire period with the result that the interstate freight cars are charged with nearly 75 per cent of the freight carried on local trains. The evidence is practically conclusive that owing to the congestion caused by the heavier freight traffic in 1907, from five to eight hundred tons gross of through freight were added to each local train in order
6045 to relieve the congestion. It is claimed, and there is testimony to support it, that the intrastate freight carried on local trains of the Iron Mountain is about 25 per cent and the intrastate 75 per cent.

To adopt the State's contention would certainly be unfair. When conditions are normal the evidence shows that practically the only through freight carried on local trains is that intended for or coming from points intermediate between division yards. The practice is that through freight trains receive or deliver freight only at division points, and that all interstate freight consigned to intermediate points is taken from the through train at the division yard nearest the place to which it is destined and then hauled to the final destination on the local trains, and if shipped from this State it is carried on local trains to the division yards and then put on the through train. In view of the fact that the largest shipping point in the State, Little Rock, is the principal division point, a great

deal of the freight intended for this State will naturally go there on through trains.

That the intrastate freight on local trains, when conditions are normal, is only 25 per cent, is too low, in the opinion of the Court. The interstate business carried on local trains averages about 40 per cent of the entire freight carried, and the calculations should be made on that basis, but the interstate must be charged with only one terminal. Of the local freight carried on through trains 1 per cent is a proper apportionment and the calculations will be made accordingly.

6046 10. Taxes.—Taxes should be apportioned between freight and passenger and inter and intrastate earnings on the straight revenue basis. A part of the taxes paid by the railroads is for local improvements, such as levees, drainage and roads. The local traffic, by reason of the development of the country and increased acreage of fertile lands, otherwise untillable, is benefited to a much greater extent than the through, especially the trans-state, and should, therefore, bear its full proportion of that expense.

10a. Rental of tracks, etc.—This should be divided on the straight revenue basis as has been done by the accountants for the State.

11. Hire of equipment.—As the cars used on local trains are delayed much more by reason of the slow schedules, great delays in returning cars to consignors and consignees, each being entitled by the laws of the State to retain the car forty-eight hours for loading and unloading; the fact that the local trains are not running at night and the haul shorter, the apportionment of this item on the straight revenue basis adopted by the accountants for the State is approved, but there should be an extra charge of 30 per cent to the local traffic. The Court having determined what the basis of apportionment of expense should be has referred it to the accountants employed by the complainants as well as the defendants, and they have presented to the Court the result of their calculations which are filed with this opinion as Exhibit A. Those calculations show that the percentage of extra cost of the intrastate business over the trans-state and interstate is 201.5 per cent for the Iron Mountain Railway.

6047 Omissions.

The Court finds from the evidence that in preparing their schedules the accountants for the State omitted several items which add materially to the cost of the local as compared with the through traffic and which should be taken into consideration in determining the difference in cost. The evidence shows that the dead weight on local trains exceeds that on the through over 14 per cent, the percentage being on local 75.5 per cent, and through 64.75 per cent; there is considerable loss on the investment in rolling stock from several causes not included in any of the State's schedules. The evidence shows that while the through freight trains are run day and night, the local trains run only during the day; that the local trains do not run on Sundays, while the through trains do; that the

average run a day of the locals is 60 miles and that of the through 240 miles. Local trains are run regularly every day except Sundays as scheduled, whether loaded or not, while through freight trains, there being a number of them daily, are not all sent out unless there is sufficient tonnage to justify it. The expenses of trains thus not sent out, including fuel and wages, is saved. Demurrage on cars received or delivered, as hereinbefore stated, is an item which adds to the loss on the investment. While the difference in the length of the haul in the State has been considered, that in the other states even on the lines of these roads has not been taken into consideration. As all agree that the longer the haul the less the cost per mile, the fact that this haul is in other states cannot in anywise affect the decrease of the cost, as the crossing of imaginary
6048 state lines can neither add to nor decrease it. What this mileage amounts to cannot be ascertained from the evidence, but that it is very considerable, especially for the trans-state traffic, must be apparent. The great bulk of the grain comes from Kansas and Nebraska and is transported through the State to the Gulf ports for export; cotton shipped from the State is transported almost exclusively to the seaports for export or the cotton mills of New England on the Atlantic Coast; most of the lumber shipped from the State goes to the prairie states of the West and to the commercial centers of the East and North; iron, steel, and machinery comes principally from the Pittsburg district in Pennsylvania.

The evidence also shows that the percentage of freight in less than carloads on the local trains exceeds that on the through trains of the Iron Mountain considerably. It is also shown that the loading of less than carloads of freight on through trains is much heavier and less expensive to handle, as it is consigned to large cities which enables the roads to a very great extent to fill cars so that they require only one loading and unloading, while on local trains the less than carload freight is consigned to many small stations in small lots, requiring a number of unloadings with a continual decrease of tonnage.

The reciprocal tonnage, it is shown, is much less on local than on through trains. Other items which it is claimed by complainants have been omitted have either been considered or proper allowance made therefor by the Court in the items of the schedules or are not proper items for additional allowance.

Upon full consideration of the additional cost of these additional items the Court is of opinion that an additional charge of
6049 8.5 per cent will be reasonable and fair, making the total difference in cost between intra and interstate freight 210 per cent in favor of the intrastate.

## Passenger.

The evidence shows that for the year 1907 the actual fares collected for each passenger mile on the Iron Mountain were for the local 1.930 cents and on through 1.865 cents, a difference of 3.48 per cent. The Court does not deem it necessary to have the same item-

ized calculations made to ascertain the difference in cost between the intrastate and interstate passenger traffic as were made on the freight. The evidence does establish the fact that there is some difference in the cost. Some of these items which cause additional cost are that transstate passengers cause no terminal expense and but very little station expense; interstate passengers only use one terminal while local passengers incur two; the average haul of intrastate passengers is 30 miles, that of through 118 miles in this State, leaving out of consideration the length of the haul in other states, which, for the transstate is no small item; the additional expense in the sale of tickets, checking baggage for short trips, the overhead expenses connected therewith, the more frequent cleaning of coaches after every trip; the additional expense for fuel and wages, the slower time, the more frequent stops, the shorter trains, the loss on the investment by reason of less mileage, the greater danger of injury to passengers by the more frequent getting on and off, the greater injury to the equipment by the more frequent stops and starting, are all matters which add to the cost. On the other hand allowance must be made for the local passengers riding
6050 on through trains and interstate passengers on local trains. Giving due weight to all these items and others appearing in the testimony, the Court is of opinion that after deducting the increased revenue the intrastate passenger service should be charged with 10 per cent greater net cost than the through.

*Southwestern Railway Company.*

Freight.

It will serve no useful purpose to make calculations item by item for this road as has been done in the case of the Iron Mountain, as, with few exceptions, the conditions are the same and the exceptions only need be considered. The evidence shows that the freight traffic of that road between transstate, interstate and intrastate is less favorable to the State than that of the Iron Mountain. The percentages on this road are:

| | |
|---|---|
| Transstate | 64.93% |
| Interstate | 32.12% |
| Intrastate | 2.95% |
| | 100 % |

It is also shown that the average length of the haul is greater for the interstate than on the Iron Mountain, the state haul of this road being 40.79 miles and the interstate 222.42 miles. The average haul of all interstate freight over that line, disregarding state lines, is 344.41 miles.

There are some other matters which add some to the increased cost of the local business, but they are so small that it is unnecessary to mention them. Upon the whole the Court is of the opinion that

an additional allowance of 40 per cent above that of the Iron
6051 Mountain for extra expenses of the local traffic, making the difference in cost 250 per cent, will be fair. The State tariff is found to be, as that of the Iron Mountain, 50 per cent higher than the interstate.

*Passenger.*

The Court finds that the extra cost of the intrastate passengers on this road is something less than on the Iron Mountain, although the length of the carriage of interstate passengers as compared with the local is greater than that of the Iron Mountain, the local being 23 miles and through 120 miles.

It also appears that all of its trains do a local passenger business; its so-called through trains stop with few exceptions at almost every station in the State and a great deal of the local traffic is carried on these trains. It also appears that the difference in the fares between local and through passengers is greater than that on the Iron Mountain, the percentage being a little over 10 per cent. The Court is of the opinion that the difference in cost between the two classes of passenger service is no greater than the higher fares which have been collected, and for this reason no extra allowance should be made therefor.

Upon these bases the Court finds the net profits on the entire business of the two roads to be as follows:

IRON MOUNTAIN RAILWAY.

*Intrastate Freight.*

| | |
|---|---|
| Cost on basis of 210 per cent additional cost calculated on ton mile basis for operating expenses and revenue basis for taxes, rentals and hire of equipment.. | $643,679.33 |

6052 *Intrastate Passenger.*

| | |
|---|---|
| Cost on basis of 10 per cent additional cost calculated on revenue basis | $1,044,879.50 |
| Total cost of intrastate | $1,688,558.83 |

*Earnings from Intrastate Traffic.*

| | | |
|---|---|---|
| Freight | $656,717.58 | |
| Passenger | 1,069,861.28 | |
| Total earnings | | $1,726,578.86 |
| Cost deducted | | 1,688,558.83 |
| Net earnings | | $38,020.03 |

The valuation of the investment apportioned to the intrastate business is $5,158,266.56, which makes the net earnings less than three-fourths of one per cent.

SOUTHWESTERN RAILWAY.

*Intrastate Freight.*

| | |
|---|---|
| Cost apportinoed as above on basis of 250 per cent additional cost | $156,171.86 |

*Intrastate Passenger.*

| | |
|---|---|
| Cost on straight revenue basis with no extra allowance. | $273,049.21 |
| Total cost of intrastate | $429,221.07 |

6053 *Earnings From Intrastate Traffic.*

| | | |
|---|---|---|
| Freight | $175,515.42 | |
| Passenger | 290,960.77 | |
| Total earnings | | $466,476.19 |
| Cost deducted | | 429,221.07 |
| Net earnings | | $37,255.12 |

The valuation apportioned to the intrastate business is $1,430,321, which makes the net earnings 2.6 per cent on the investment.

*Net Profits on Investment.*

There is no charge on the part of the State that these roads are not efficiently, economically and honestly managed; nor is it denied that they traverse a fertile agricultural section with natural resources such as timber, coal, stone and minerals sufficient to justify their construction; that they were constructed in pursuance of a public demand and are in every way necessary for present conditions, and that they were not built merely for speculative purposes dependent on the future development of the natural resources so bountifully bestowed on the people of this State by Providence. Nor is there any claim that owing to the topographical conditions the cost of building them or the investment necessary for their construction and operation is greater than the average cost of roads in the southwest. What would under these conditions be a reasonable net return on the investment?

In Wilcox v. Consolidated Gas Co., 212 U. S. 19, 49, Mr.
6054 Justice Peckham, speaking for the Court, said on that subject:

"There is no particular rate of compensation which must, in all cases and in all parts of the country, be regarded as sufficient for capital invested in business enterprises. Such compensation must depend greatly upon circumstances and locality; among other things the amount of risk in the business is a most important factor, as

well as the locality where the business is conducted, and the rate expected and usually realized there upon investments of a somewhat similar nature with regard to the risk attending them. There may be other matters which, in some cases, might also be properly taken into account in determining the rate which an investor might properly expect or hope to receive and which he would be entitled to without legislative interference. The less risk, the less right to any unusual returns upon the investments. One who invests his money in a business of a somewhat hazardous character is very properly held to have the right to a larger return, without legislative interference, than can be obtained from an investment in Government bonds or other perfectly safe security. The man that invested in gas stock in 1823 had a right to look for and obtain, if possible, a much greater rate upon his investment than he who invested in such property in the City of New York years after the risk and danger involved had been almost entirely eliminated.

In an investment in a gas company, such as complainant's, the risk is reduced almost to a minimum. It is a corporation which, in fact, as the Court below remarks, monopolizes the gas service of the largest city in America, and is secure against competition under the circumstances in which it is placed, because it is a proposi-
6055 tion almost unthinkable that the City of New York would, for purposes of making competition, permit the streets of the city to be again torn up in order to allow the mains of another company to be laid all through them to supply gas which the present company can adequately supply. And, so far as it is given us to look into the future, it seems as certain as anything of such a nature can be, that the demand for gas will increase, and, at the reduced price, increase to a considerable extent. An interest in such a business is as near a safe and secure investment as can be imagined with regard to any private manufacturing business, although it is recognized at the same time that there is a possible element of risk, even in such a business. The court below regarded it as the most favorably situated gas business in America, and added that all gas business is inherently subject to many of the vicissitudes of manufacturing. Under the circumstances, the Court held that a rate which would permit a return of 6 per cent would be enough to avoid the charge of confiscation, and for the reason that a return of such an amount was the return ordinarily sought and obtained on investments of that degree of safety in the City of New York."

And the Court concurred with the conclusions of the trial court, that in view of the conditions found in that case 6 per cent upon the value of the property of the Gas Company devoted to public use would be a just compensation.

But it is urged on behalf of complainants that in States like Arkansas, owing to many conditions, including the higher rates of interest for the use of money, they are entitled to a greater compen-
sation than a gas company in a city like New York. It is
6056 urged that a railroad company cannot be as secure against competition as a gas company in a large and populous city. It requires no permits for the tearing up of the streets of a com-

mercial city and thus seriously interfere with its traffic, nor would the experience of the past justify the conclusion that an investment in railroads is "as near a safe and secure investment as can be imagined with regard to any private manufacturing business," for it is claimed that it is a well-known fact that the number of railroads of the United States, especially those west of the Mississippi River which have escaped insolvency proceedings, at all times is very small, if there be any. Whether some allowance should be made for that period which may be called the "developing period" when the earnings are barely sufficient to cover actual operating expenses, followed by that period during which the net profits above the operating expenses are barely sufficient to pay the interest on the bonded indebtedness with no margin of profit to the shareholders, it is unnecessary to determine in these cases as there is no evidence in the record that these complainants have suffered from such conditions. It is true the records of this and other courts show that insolvency proceedings against these roads were had at one time or more than once perhaps and foreclosures had, but there is no such evidence in this record and therefore cannot be considered.

That under the laws of this State competitive roads may at any time be constructed is no doubt true, but the stringent regulations under the national and state laws now in force have made the construction of railroads for the mere speculative purpose of selling bonds and stocks, regardless of a legitimate demand or neces-
6057 sity, too unprofitable for promoters and speculators to indulge in.

The Court therefore concludes that net earnings which will give the owners a return of 6 per cent per annum on the actual value of the property are fair, provided, of course, that the rates necessary to make whatever net profits the Court finds the owners to be entitled to are reasonable and not so high as to be oppressive to those compelled to make use of the roads, for, as stated in the first part of the opinion, "the rights of the carriers and the public are reciprocal. The carrier is entitled to ask a fair return upon the value of its property which it employs for the public convenience, and the public is entitled to demand that no more be exacted from it for the use of the public highways than the services rendered are reasonably worth and not be oppressive." But when such a limitation of profits is adopted as the construction of railroads is beneficial and necessary for the development of a country, and for that reason it would be against the public welfare to discourage them, provision should be made for making this limited profit as nearly permanent and uniform as is possible by providing a surplus for those years when, owing to contingencies likely to arise at any time, the net earnings will not yield a sufficient fund for such earnings. By this the Court does not mean to be understood that the State must be an insurer of profits on railroad investments; but when the profits on investments, based as they are in these cases on the actual value of the property, ascertained by the State itself, and not a speculative value of bonds and stocks issued in many instances regardless of cost or

values, are limited to the current and legal rate of interest
6058 of the State, such investments are entitled to a greater consideration than when there is no such limitation and the investor takes his chance of large profits when times are prosperous and small or no profits during lean years. Besides, rates of carriers cannot and ought not to be changed every year or at short periods to meet conditions as they vary, for not only would the commerce of the country be seriously affected by such changes and consequent uncertainties, but it would necessitate frequent investigations and hearings, expensive and uncertain of results, with strong probabilities that before one investigation is completed and conclusions reached, conditions will again be changed and necessitate another. Earnings which would yield a profit of 6 per cent in a year like 1907, which was the most profitable year in the history of railroads of this country, or which would yield such a profit when crops and financial conditions are normal, all branches of manufacture and trade flourishing, the elements favorable, would soon decrease to an extent which would reduce net profits considerably below 6 per cent if not wipe them out entirely when conditions are reversed. The most learned and advanced political economists have not yet discovered a remedy to prevent the periodical financial crises, although many theorists sincerely believe that they have; the scientists of the Agriculture Department, even with the aid of the learned men of the Weather Bureau, are still unable to prevent drouths or too much railfall, hot winds, destructive storms or other unfavorable conditions which may cause failures of crops and which in an agricultural State, such as this is, will very materially affect the earnings of its railroads. Continued rain storms, which are not so unusual in this section that they should not be taken into consideration,
6059 may cause washouts and damage to the tracks and bridges which to replace will materially reduce the net earnings. Breaks in the levees of the Mississippi or other rivers now protecting these roads and the lands served by them may cause sufficient destruction to wipe out all profits of that year. It frequently happens that many miles of railroad have to be abandoned or reconstructed to an extent to make the cost equal to the construction of a new road for that section; bridges must in time be renewed, and with the continual increase of weight of locomotives and cars must at times be rebuilt. The Interstate Commerce Commission in "In re Investigation of Advance in Rates, Eastern Cases," 20 I. C. C. Rep. 271, said on that subject:

"It may well be said that they should be allowed to accumulate a fund out of its revenues for operation against the time when this piece of railroad must be entirely thrown away. Under our present system of accounting railways are required to make a depreciation charge with respect to the equipment for the purpose of providing against contingencies of this sort; but they make no such charge with respect to way and structures and it seems proper that the accumulation of surplus should be allowed for this, also."

Ought not all these matters be taken into consideration and provision made for emergencies which experience teaches the roads are

at all times subject to and which at any time may occur? To provide for these the Court is of the opinion that in addition to the 6 per cent earned when everything is prosperous and no extraordinary losses by casualties have been sustained, an allowance of 1.5 per cent additional for a surplus fund should be made. As
6060 stated by the Interstate Commerce Commission in "In re Investigation of Advance in Rates, Western Cases," 20 I. C. C. Rep. 307, 336:

"A railroad is justified no doubt in maintaining a surplus which will insure dividends to its stockholders during lean years and it may accumulate through the years funds to meet obsolescence in plant unless this charge is taken care of in maintenance. * * * Such a surplus gives strength and tone to the securities of a carrier. It invigorates and stimulates the management."

In the Eastern Cases of that investigation, 20 I. C. C. 243, 271, 288, the Commission said on that subject:

"Then, too, a railroad must be allowed to accumulate a surplus in good years which will offset bad years, and if its financial position is to be a reasonably strong one, that surplus must be large enough to remove doubt from the mind of the investing public. We think that a railroad in ordinary years should be permitted to show a substantial surplus over and above the payment of a reasonable dividend. * * * If this company is to preserve its financial integrity upon the basis of its present capitalization and maintain its credit it is proper that it should be allowed to earn a sufficient amount to pay its interest, its preferred dividend, a dividend on its common stock, and have remaining a small surplus. The credit of the company cannot be maintained for year after year upon any other basis. We are of the opinion that the sum remaining after payment of fixed charges, including as a fixed charge the dividend upon the preferred stock, should be equivalent to between 7 and 8 per cent upon the common stock. It should have sufficient earnings so that it may pay a dividend of 5 per cent upon its
6061 common stock and carry 2.5 per cent to surplus, or pay 6 per cent on the common stock and carry 1.5 per cent to surplus. This is on the assumption that the capitalization does not exceed its actual value."

In the cases at bar only the actual value is considered regardless of capitalization. That such a surplus may be necessary is shown by the facts appearing in the testimony in these cases. The Iron Mountain for the years 1904, 1905, 1906 and 1907 paid its stockholders 10 per cent annually; for the year 1908 the dividend was reduced to 5 per cent, and for the year 1909 to 4 per cent. The evidence fails to show the reasons for this reduction of dividends, but the Court does not feel justified in assuming that it was owing to an increase in net earnings caused by the granting of the injunction in these cases. The Southwestern has never paid any dividend on its common stock, and only for the last two years a dividend of 2 per cent in 1909 and 5 per cent in 1910 on its preferred stock. It is also proper to state that the calculations made in these cases are all based on earnings for the six months ending

December 31, 1907, which, as appears from the evidence, were approximately 20 per cent greater than under usual conditions.

In the opinion of the Court the rates enjoined at the commencement of these actions are non-compensatory and confiscatory, and for this reason the injunctions will be made permanent. The costs in these cases should be divided, each party paying its own costs for depositions, etc., and the Court costs proper to be paid one-half by the complainants and one-half by the defendants. As conditions
6062 may change which may require a reinvestigation of the question of the reasonableness of these rates the Court will retain jurisdiction of these causes with leave to the parties to move the Court for a reinvestigation. This course was adopted by Justice Brewer in Ames v. Union Pacific Ry. Co., supra, and commends itself to the Court as proper in these cases.

*Conclusion.*

In the absence of separate accounts kept by the railroads the scheme suggested by the State's accountants in these cases commended itself favorably to the Court. The omissions and those bases which in the opinion of the Court were found to be erroneous in these cases may properly be attributed to the fact that such a scheme has never been attempted before this, and the further fact that these gentlemen have not had that experience which can only be obtained by those who have devoted many years to the management and operation of railroads. The testimony of these gentlemen of experience has shown these errors and omissions and the Court has tried to correct them. To do so it was necessary to read carefully all the voluminous testimony in these cases, not only once, but in many instances a number of times. If the expenses were kept separately for the different classes of traffic for the year, or if that is too expensive, if they were kept for the months of March and November of every year they would furnish a very fair average for
6063 the year for this section of the country and would relieve the courts in cases of this nature of a great deal of work. In fact, if such accounts were kept the Court believes that State Railroad Commissions would be guided by them to a great extent in making rates.

In conclusion the Court wishes to acknowledge the assistance it has received from Messrs. Johnson and Hamilton, the accountants for the complainants and the State, in these cases, in making the calculations for its use. The accuarcy with which they performed this work is attested by the fact that the result of their calculations, made under direction of the Court, did not differ one cent. The extended and able arguments of the counsel for both sides were of inestimable assistance to the Court, and the final result reached by the Court, if correct, is in a great measure due to their aid.

EXHIBIT A.

State of Arkansas—Rate Matter.

St. Louis, Iron Mountain & Southern Railway.

Result of Operation Obtained on the Formulæ Prescribed by the Court.

*Revenue.*

The miscellaneous revenue has been divided between intrastate and interstate traffic, on the basis of the actual state and in-
6064 terstate revenue, and some additional items have been added to the passenger revenue.
The result of this division is as follows:

| | | Per cent of each class. | Per cent of all revenue. |
|---|---|---|---|
| Freight Revenue. | | | |
| Intrastate | 656,717.58 | 13.41% | 9.81 |
| Interstate | 4,239,555.33 | 86.59% | 63.34 |
| Total | 4,896,272.91 | 100.00 | 73.15 |
| Passenger Revenue. | | | |
| Intrastate | 1,069,861.28 | 59.54 | 15.99 |
| Interstate | 727,026.60 | 40.46 | 10.86 |
| Total | 1,796,887.88 | 100.00 | 26.85 |
| Grand total | 6,693,160.79 | | 100.00 |

*Operating Expenses.*

1.—Maintenance of Way & Structures.

The total expense assigned to the freight business under this head has been divided between intrastate and interstate on the straight revenue basis, and the result is as follows:

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Freight revenue ... | $656,717.58 | $4,239,555.33 | $4,896,272.91 |
| Percentage of each. | 13.41 | 86.59 | 100.00 |
| Expenses divided on above percentages. | $74,210.28 | $479,184.83 | $553,395.11 |

6065 2.—Maintenance of Equipment.

(*a*) Locomotives:

The expenses under this head were divided between yard and local and through road locomotives on the basis adopted by the State in its Exhibit "K," and are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Yard ..... | $13,453.83 | $55,681.97 | $69,135.80 |
| Road ..... | 43,733.35 | 70,807.25 | 114,540.60 |
| Total ..... | $57,187.18 | $126,489.22 | $183,676.40 |

(*b*) Freight Cars:

This expense is divided between stopping and starting, terminal handling and other expenses on the following basis:

| | Percentages. | Expenses. |
|---|---|---|
| Stopping and Starting..... | 25% | $119,473.91 |
| Terminal Handling ..... | 13½% | 64,515.91 |
| Other Expenses ..... | 61½% | 293,905.82 |
| Total..... | 100 | $477,895.64 |

The expense of "Stopping & Starting" is divided as shown in the State's Exhibit "K," and is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Car Miles ..... | 4,693,400 | 6,532,646 | 11,226,046 |
| Percentage of each..... | 41.81% | 58.19% | 100.00% |
| Expenses divided on above percentages.... | $49,952.04 | $69,521.87 | $119,473.91 |

6066 The expense of "Terminal Handling" divided between trans-state, interstate and intrastate freight on basis of the ton mileage for the month of October, 1907, as shown in Exhibit 26 and subdivided by the Court, is as follows:

| | |
|---|---|
| Trans-state freight (receiving no terminal handling).... | 51.16% |
| Interstate freight (receiving one terminal handling).... | 34.19% |
| Interstate freight (receiving two terminal handlings).... | 6.50% |
| Intrastate freight (receiving two terminal handlings).... | 8.15% |
| | 100.00% |

The total expense is therefore divided on the following percentages:

| | | | Percentages. | Expense. |
|---|---|---|---|---|
| Interstate | 34.19 x 1—34.19 | | 53.85% | $34,741.82 |
| | 6.50 x 2—13.00 | | 20.48% | 13,212.86 |
| Intrastate | 8.15 x 2 | 16.30 | 25.67 | 16,561 23 |
| | | 63.49 | 100.00 | $64,515.91 |

The balance of the expense of freight cars is divided between local and through trains on the basis of the number of car miles as shown in the State's Exhibit "K," and is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Car miles | 1,173,350 | 6,532,646 | 7,705,996 |
| Percentage of each | 15.22% | 84.78% | 100.00% |
| Expense | $44,732.47 | $249,173.35 | $293,905.82 |

6067 The total expense of maintenance of freight cars chargeable to each class of service, under the plans outlined above, is as follows:

| | Stopping and starting. | Terminal handling. | Other expense. | Total. |
|---|---|---|---|---|
| Local | $49,952.04 | ..... | $44,732.47 | $94,684.51 |
| Through | 69,521.87 | ..... | 249,173.35 | 318,695.22 |
| State | ..... | $16,561.23 | ..... | 16,561.23 |
| Interstate | ..... | 47,954.68 | ..... | 47,954.68 |
| Total | $119,473.91 | $64,515.91 | $293,905.82 | $477,895.64 |

(*c*) Supervision & General:

This expense is divided between local and through trains and State and Interstate on the basis of the direct charges for maintenance of equipment, and is as follows:

| | Direct expense. | Percentages. | Amount. |
|---|---|---|---|
| Local | $151,871.69 | 22.96 | $14,202.89 |
| Through | 445,184.44 | 67.29 | 41,625.12 |
| State | 16,561.23 | 2.50 | 1,546.48 |
| Interstate | 47,954.68 | 7.25 | 4,484.80 |
| Total | $661,572.04 | 100.00 | $61,859.29 |

3.—Traffic Expense.

These expenses divided on the straight revenue basis are as follows:

| | Percentages. | Amount. |
|---|---|---|
| Intrastate | 13.41 | $11,899.29 |
| Interstate | 86.59 | 76,835.13 |
| Total | 100.00% | $88,734.42 |

6068 4.—Transportation Expense.

(*a*) Station Expense:

This expense is divided on basis of the proportions of the ton miles for the month of October, 1907, as shown in Exhibit #26, assuming that one-half of the trans-state and all the interstate freight is chargeable with one station handling compared with six station handlings for state freight, for a given number of ton miles, as follows:

| | Ton Mile | Per Cents. | | Expense. |
|---|---|---|---|---|
| Trans-state | 51.16 x ½ | — 25.58 | — 22.21 | — $51,888.54 |
| Interstate | 40.69 x 1 | — 40.69 | — 35.33 | — 82,540.40 |
| Intrastate | 8.15 x 6 | — 48.90 | — 42.46 | — 99,198.00 |
| | 100.00 | 115.17 | 100.00 | $233,626.94 |

(*b*) Yard & Terminal Expense:

This expense is divided between local and through trains on the basis of the number of cars handled at terminals as shown in the State's Exhibit "K" and is as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Cars handled | 32,232 | 133,482 | 165,714 |
| Percentage of each | 19.46% | 80.54% | 100.00% |
| Expenses divided on the above percentages | $57,085.42 | $236,262.07 | $293,347.49 |

(*c*) Fuel & Locomotive Expenses, Road Enginemen & Trainmen:

These expenses are divided between local and through trains on the basis of the number of engine miles of each class, assuming that the local train expense is 47% greater per engine mile than the through train expense.

6069

| | Train Miles. | Percentages. | Percentages. | | Expenses. |
|---|---|---|---|---|---|
| Local.... | 70,583 | 26.42 x 1.47— | 38.83 | 34.54 | $238,060.24 |
| Through. | 196,512 | 73.58 | 73.58 | 65.46 | 451,170.33 |
| Total | 267,095 | 100.00 | 112.41 | 100.00 | $689,230.57 |

(*d*) Engine house expenses:

These expenses are divided on the basis shown in the State's Exhibit "K" and are as follows:

| | Local. | Through. | Total. |
|---|---|---|---|
| Engine miles ..... | 79,053 | 199,981 | 279,034 |
| Percentage of each..... | 28.33% | 71.67% | 100.00% |
| Expenses divided on above percentage..... | $15,194.55 | $38,439.58 | $53,634.13 |

(*e*) Other train expense:

These expenses are divided between state and interstate traffic on the basis of the gross earnings of each class of traffic as follows:

| | Percentages. | Amount. |
|---|---|---|
| Intrastate ..... | 13.41 | $17,743.16 |
| Interstate ..... | 86.59 | 114,569.71 |
| Total ..... | 100.00 | $132,312.87 |

(*f*) Loss and damage to freight:

6070 The division of this expense is shown in State's Exhibit "K" as follows:

| | Amount. |
|---|---|
| Intrastate ..... | $30,972.03 |
| Interstate ..... | 96,537.35 |
| Total ..... | $127,509.38 |

(*g*) Supervision and general:

This expense is divided on the basis of the direct charges to other accounts under transportation and is as follows:

| | Direct Expense. | Percentages. | Amount. |
|---|---|---|---|
| Local ..... | $310,340.21 | 20.28% | $9,410.51 |
| Through ..... | 725,871.98 | 47.46 | 22,022.83 |
| State ..... | 147,913.19 | 9.67 | 4,487.16 |
| Interstate ..... | 345,536.00 | 22.59 | 10,482.42 |
| Total..... | $1,529,661.38 | 100.00 | $46,402.92 |

5.—General Expenses.

This expense is divided on the basis of the supervision and general expense under the head of maintenance of equipment and Transportation, and is as follows:

| | Direct Expense. | Percentages. | Amount. |
|---|---|---|---|
| Local | $23,613.40 | 21.81 | $28,836.80 |
| Through | 63,647.95 | 58.80 | 77,744.33 |
| State | 6,033.64 | 5.57 | 7,364.55 |
| Interstate | 14,967.22 | 13.82 | 18,272.56 |
| Total | $108,262.21 | 100.00 | $132,218.24 |

6071 6.—Total Operating Expenses.

The total operating expenses divided on the various bases outlined above are as follows:

| | Amount. |
|---|---|
| Local | $514,662.10 |
| Through | 1,312,448.70 |
| State | 263,982.18 |
| Interstate | 982,750.42 |
| Total | $3,073,843.40 |

7.—Local Train Expenses.

These expenses are divided between intrastate and interstate on the following percentages:

| | Percentages. | Amount. |
|---|---|---|
| Intrastate | 60 | $308,797.26 |
| Interstate | 40 | 205,864.84 |
| | 100 | $514,662.10 |

8.—Through Train Expenses.

These expenses are divided between intrastate and interstate on the following percentages:

| | Percentages. | Amount. |
|---|---|---|
| Intrastate | 1.00 | $13,124.49 |
| Interstate | 99.00 | 1,299,324.21 |
| | 100.00 | $1,312,448.70 |

9.—Recapitulation—Operating Expenses.

| | Intrastate | Interstate. | Total. |
|---|---|---|---|
| Local train ..... | $308,797.26 | $205,864.84 | $514,662.10 |
| Through train..... | 13,124.49 | 1,299,324.21 | 1,512,448.70 |
| Direct charges..... | 263,982.18 | 982,750.42 | 1,246,732.60 |
| Total ..... | $585,903.93 | $2,487,939.47 | $3,073,845.40 |

6072 10.—Taxes and Rentals.

The taxes and rentals divided on a straight revenue basis, are as follows:

| | Per cent. | Taxes. | Rentals. |
|---|---|---|---|
| Intrastate ..... | 13.41 | $21,851.02 | $2,156.94 |
| Interstate ..... | 86.59 | 141,094.67 | 13,927.62 |
| Total..... | 100.00 | $162,945.69 | $16,084.56 |

11.—Hire of Equipment.

This amount is divided between intrastate and interstate traffic on the revenue basis, with 30% added to cover the additional cost of the state traffic, the result is as follows:

| Intrastate— | | | | |
|---|---|---|---|---|
| Revenue. | Percentage | Percentage. | | Amount. |
| $656,717.58 | 13.41 x 1.3 | —17.43 | 16.76 | $30,032.49 |
| Interstate— | | | | |
| Revenue. | Percentage | Percentage. | | Amount. |
| $4,239,555.33 | 86.59 | 86.59 | 83.24 | $149,158.97 |
| Total— | | | | |
| $4,896,272.91 | 100.00 | 104.02 | 100.00 | $179,191.46 |

6073 12.—Recapitulation—Freight.

| | Intrastate. | Interstate. | Total. |
|---|---|---|---|
| Gross revenue ..... | $656,717.58 | $4,239,555.33 | $4,896,272.91 |
| Operating Expenses, Par. No. 9..... | $585,903.93 | $2,487,939.47 | $3,073,843.40 |

No. 1637.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY, WILLIAM F. MCKNIGHT, Railroad Commissioners of the State of Arkansas.

Come the parties by their respective Solicitors and file stipulation as follows:

It is here agreed and stipulated between Counsel representing all the parties in these causes, that the testimony in the two cases were taken together and that the same was heard and submitted on the combined testimony as one case, and it is further agreed that the transcript of the testimony and the opinion of the Court transmitted by the Clerk of this Court to the Supreme Court of the United States in the case of St. Louis, Iron Mountain & Southern Railway Company vs. Robert P. Allen, George W. Bellamy and William F. McKnight, Railroad Commissioners of the State of Arkansas, shall be treated and considered in all respects as the transcript and record of the testimony taken in the case of St. Louis Southwestern Railway Company vs. Robert P. Allen, et al., and that said transcript and testimony and opinion of the Court, so transmitted, shall be used, considered and treated as the record in the above cases.

No. 1637.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY, and WILLIAM F. MCKNIGHT, Railroad Commissioners of the State of Arkansas.

Now, on this day the Defendants here applying for an appeal to the Supreme Court of the United States from the final decree in this cause, the Complainant being present by its Solicitor; and the Court purposing to grant said appeal as the Defendants are entitled thereto and desiring to preserve the status quo pending the determination of said appeal in the Supreme Court of the United States,

It is accordingly ordered that the Court Tariff heretofore put in force under the orders of this Court during the pendency of this proceeding be continued in force during the pendency of this appeal.

(Signed) JACOB TREIBER, *Judge.*

And on the same day the following proceedings were had, to-wit:

No. 1637.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY and WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas, and Henry Leigh and George L. McLean.

In this cause come all parties by their Counsel and it appearing to the Court that Henry Leigh and George L. McLean, De-
6079 fendants have been invited to join in the prayer for appeal herein and have declined to do so, it is by the Court, by consent of Henry Leigh and George L. McLean, and by consent of all parties to this cause, ordered that said Henry Leigh and George L. McLean are severed from the cause and from the appeal prayed.

(Signed) JACOB TREIBER, *Judge.*

And on the same day the following proceedings were had, to-wit:

No. 1637.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY, and WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas.

Now on this day come the Defendants, Robert P. Allen, George W. Bellamy and William F. McKnight, Railroad Commissioners of the State of Arkansas, and file herein their assignment of errors and present a petition for appeal to the Supreme Court of the United States from the final decree herein and also present a bond in the sum of Five Hundred Dollars, ($500.00), conditioned as required by law, with good and approved security.

It is ordered by the Court that the petition for an appeal, assignment of errors and appeal bond be made a part of the record and that the appeal be allowed and bond approved; and it is ordered that a certified transcript of the record and all proceedings
6080 herein be transmitted to the Supreme Court of the United States, and it further being made to appear to the Judge that the Clerk of this Court will be unable, owing to the size of the record, to prepare a transcript within thirty days from the date of the signing of the Citation, it is therefore ordered that the time for filing the transcript with the Clerk of the Supreme Court of the United States, be enlarged until the second day of October, 1911.

Dated this 26th day of June, 1911.

(Signed) JACOB TREIBER, *Judge.*

Which Assignment of Errors is as follows:

6081 In the United States Circuit Court, Eastern District of Arkansas, Western Division.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY, Plaintiff,

vs.

ROBERT P. ALLEN, GEORGE W. BELLAMY, WILLIAM F. MCKNIGHT, Railroad Commissioners of the State of Arkansas, Defendants.

*Assignment of Errors.*

Now comes Robert P. Allen, George W. Bellamy, William F. McKnight, constituting the Railroad Commission of the State of Arkansas, Defendants in the above entitled cause and aver that in the record and proceedings herein that there has been manifest errors committed in this, to-wit:

1st. The Court erred in not sustaining the motion to dissolve the temporary injunction herein, which motion was filed and considered by the Court prior to taking the testimony herein, on the ground therein set forth that the complainant had filed this bill in equity in the United States Circuit Court, asking relief against freight rates promulgated by the predecessors of the present Railroad Commissioners, without first praying relief from the Commission; which was authorized and required by law to grant relief against unreasonable, unremunerative or confiscatory freight rates.

2nd. The Court erred in not dismissing the bill of Plaintiff on final hearing because the evidence showed that the freight rates embraced in Standard Distance Freight Tariff No. 3, sought to be injoined herein, had been in force with only minor changes made from time to time and those not materially affecting the revenue of the Plaintiff, for a period of six years prior to the filing of the suit herein, and the complainant did not before filing this suit apply to the Railroad Commission for relief against any of said frieght rates as unjust, unreasonable, unremunerative or confiscatory; when the evidence showed that the scheme of freight rates embraced in said tariff were originally put in force in the year 1900, subsequently re-enacted in 1903, and when put in force the Railroad Commission stated and declared to the Plaintiff and other carriers affected thereby that if on fair test of said rates, in whole
6082 or in part, they proved to be unjust, unreasonable, unremunerative or confiscatory that relief would be granted by the Commission upon proper showing of such facts.

3rd. The Court erred in not dismissing the bill on final hearing because the evidence shows that since 1900 the general scheme of freight rates sought to be injoined herein has been in force under order of the Railroad Commission and the whole body of freight rates sought to be injoined, save and except minor changes made from time to time which did not materially affect the revenue of the plaintiff, had been in force since 1903 and the plaintiff and other carriers had acquiesced for said period of time in said scheme of

freight rates, which were embraced in Standard Distance Freight Tariff No. 3, complained of in the bill herein.

4th. The Court erred in finding, as stated in the opinion of the Court, that the evidence showed an increased cost of operation for ten years prior to the filing of this suit, and that rates that had been remunerative ten years prior to its filing would no longer be so on account of increased cost of operation, and on such account that there was no acquies-ence in the plaintiff in submitting to the schedule of freight rates; when the evidence shows that the increased efficiency of locomotives, cars and tracks and other similar causes had rendered the cost of carrying freight less than at the beginning of the ten years' period referred to by the court and less than at any prior period.

5th. The Court erred in holding that the reduction by the Legislature of passenger rates from three cents to two cents per mile was an excuse for the complainant to seek relief in the Federal Court prior to applying to the Railroad Commission for relief therein against the freight rates, because under the law the Railroad Commission is authorized, upon proper showing, to increase the freight rates so as to compensate the plaintiff for its loss in passenger rates, if any loss occurred on account of said legislative reduction of the passenger rates.

6th. The Court erred in its decree in adjudging and decreeing that the freight rates in Standard Distance Tariff No. 3 and passenger rates fixed by the General Assembly of 1907 were confiscatory and would not afford complainant fair and reasonable return upon its property, and erred in decreeing that a compliance with said freight and passenger rates would be taking the property of the complainant without due process of law, because the evidence shows that said freight and passenger rates are reasonable and compensatory and that they do afford the complainant a fair and reasonable return upon the value of its property invested in intrastate tariff.

6083 7th. The Court erred in making perpetual the temporary injunctions heretofore granted in this cause and injoining these defendants from enforcing Standard Distance Freight Tariff No. 3, or any rate or schedule therein, and from enforcing the passenger Rate Act of 1907 and particularly erred in injoining any rates in said Standard Freight Distance Tariff No. 3, as many, if not all, of said rates are reasonable, just and compensatory.

8th. The Court erred in not dismissing plaintiffs' bill because plaintiff failed to establish by clear and decisive evidence that the intrastate freight and passenger rates sought to be injoined were confiscatory and in holding upon the evidence offered by the plaintiff that said rates were confiscatory when said evidence was based wholly on opinion testimony without sufficient data upon which an intelligent opinion could be based and said evidence was not of that decisive and clear character which is required to satisfy a court that rates promulgated by a state were confiscatory.

9th. The Court erred in not dismissing the plaintiff's bill because the plaintiff had not overcome the presumption that the rates established by the State were reasonable and compensatory by a preponderance of the testimony.

10th. The Court erred in not dismissing the bill of plaintiff because the preponderance of the testimony established the fact that the freight and passenger rates sought to be injoined were compensatory and earning the complainant a fair return on its property.

11th. The Court erred in sustaining the plaintiff's bill upon the evidence offered by the plaintiff, when it was shown in the evidence that better testimony than that offered was obtainable by the plaintiff in the form of detailed statements of revenue derived from local and through freight trains, and detailed statements of the expenses of local and through freight trains and the amount of state and interstate traffic carried respectively on the local and through freight trains; that the plaintiff instead of resorting to the best evidence to ascertain the relative cost of state and interstate traffic produced only opinion testimony, which was of insufficient probative force to overcome the presumption of the validity of the rates established by the State, when better and more reliable testimony could have been produced by the plaintiff and was in its possession and control.

12th. The Court erred in holding the passenger rates to be confiscatory when the evidence shows that the complainant voluntarily made passenger rates equal and less than those fixed by the State and the plaintiff carried a large volume of passenger traffic on rates voluntarily made by it and other carriers on rates as low as,
6084 and in many cases, lower than, those fixed by the State herein complained of.

13th. The Court erred in holding the freight rates to be confiscatory when the evidence shows that the complainant voluntarily made freight rates equal and less than those fixed by the State, and the plaintiff carried a large volume of freight traffic on rates voluntarily made by it and other carriers on rates as low as, and in many instances, lower than, those fixed by the State herein complained of.

14th. The Court erred in finding that the period of six months ended December 31st, 1907, fairly represented the earnings and expenses of the plaintiff, and further erred in not holding that the revenue and expense of October, 1907, fairly represents one-sixth of said period.

15th. The Court erred in not charging the plaintiff with a fair annual rental for the use of the Bunch elevator, when the evidence shows that said property had a fair rental value of $20,000 per year and the plaintiff only charged $1.00 to its tenant per year rental therefor.

16th. The Court erred in holding that the division of expense apportioned to Arkansas by the plaintiff for the repairs of tools and machinery was fair.

17th. The Court erred in not deducting from operating expenses the fine of $10,000.00 and costs imposed on the plaintiff for illegally giving free passes to members of the Legislature.

18th. The Court erred in charging the expense of the Memphis Terminals and the portion of plaintiff's road in Tennessee to the expenses incurred in Arkansas.

19th. The Court erred in charging all the expense of the Fort Smith Terminals to the Arkansas expenses.

20th. The Court erred, in sustaining as proper, salaries paid by the

plaintiff to lobbyists, and salaries and fees paid attorneys outside of Arkansas.

21st. The Court erred in charging any part of the expense incurred for the leased line known as the Paragould trackage to intrastate traffic when the evidence shows such expense to be incurred wholly for interstate traffic.

22nd. The Court erred in charging the rental of the Van Buren Bridge to the Arkansas expense, particularly any part thereof to the intrastate expense.

23rd. The Court erred in holding the plaintiff road was efficiently operated.

24th. The Court erred in apportioning the property of the plaintiff in the state between the intrastate and interstate traffic on the revenue basis in order to ascertain the proportion of said property used in intrastate business.

25th. The Court erred in the basis adopted for apportioning expense between intrastate and interstate traffic.

6085 26th. The Court erred in apportioning the miscellaneous expenses on the revenue basis.

27th. The Court erred in declaring in the opinion that the State contended for a division of property and expenses on the "ton mile basis."

28th. The Court erred in finding that the intrastate freight rates were only 50% higher than the interstate rates, when the undisputed evidence showed that the revenue per ton per mile under Standard Distance Freight Tariff No. 3 produced 98% more revenue per ton per mile on the Iron Mountain Railway Company than the interstate traffic produced per ton per mile and on the St. Louis-Southwestern Railway Company, 141% more per ton per mile.

29th. The Court erred in using the revenue basis for dividing any expenses and particularly without allowing for the excess of at least 50% which the Court found the State revenue was higher than the interstate revenue; the evidence shows that by using the revenue as a factor without making allowances for the difference between the two that the state expenses are burdened unduly in proportion to the excess of the State revenue over the interstate revenue.

30th. The Court erred in not adopting as a whole the plan of division of expenses presented by the State, which said basis of division was sustained by preponderance of the testimony as being the best basis for fairly apportioning the expense between intrastate and interstate traffic.

31st. The Court erred in not accepting the results of the statistics obtained from the test months which were put in evidence by the complainant. The evidence shows that October, 1907 was a fairly representative month of the six months period introduced in evidence by the Iron Mountain Railway Company; that October, 1908 was fairly representative month between state and interstate traffic on the St. Louis-Southwestern and further the evidence shows that the plaintiff was estopped from questioning that said months are fairly representative for the purposes used by the State.

32nd. The Court erred in charging to interstate business only 40% of the expense of the local trains when the evidence shows that

on the Iron Mountain it should be about 73% and on the St. Louis Southwestern about 68% of the expense of the local trains is chargeable to interstate freight business and said finding of 40% was not supported by the evidence.

33rd. The Court erred in dividing Maintenance of Way expenses on a revenue basis and particularly in not making allowances for the difference between the intrastate and interstate revenue when using the revenue as a factor in dividing said expense.

34th. The Court erred in its division of expense between
6086 local and through trains in charging 50% extra to yard locomotives as against the local train and 75% additional for local locomotive mileage when the evidence shows much lower percentage should be used to equalize them.

35th. The Court erred in the division of the expense of the Maintenance of Equipment of freight cars in charging 25% extra to the local trains for starting and stopping and 13½% for terminal handling when the evidence shows that much lower percentage should be charged for said causes. The Court also erred in this item in estimating that the through trains stop every thirty five miles as against five miles to the local trains: The Court also erred in this item in not charging transstate and interstate traffic with the cost of starting and stopping freight cars and in making different allowance for interstate and intrastate traffic, when the evidence shows that this is an element of expense from the physical starting and stopping of freight cars unconnected with the class of traffic carried in said cars.

36th. The Court erred in not apportioning general expenses according to the plan adopted by the State:—The Court particularly erred in charging all of these expenses on the basis of the supervision in Maintenance of Equipment and Transportation only, whereas, the evidence shows a proper share of such expenses should be charged to the Maintenance of Way and all of the other expenses.

37th. The Court erred in dividing the item of Hire of Equipment on the revenue basis and erred in charging an additional 30% to local traffic when the evidence shows there is no relation between the revenue and said item of expense and there is no evidence to show that 30% or any other percentage should be added to local traffic for this item of expense.

38th. The Court erred in the basis adopted for apportioning station expenses.

39th. The Court erred in finding various omissions from the expenses apportioned to the State in the State's plan of dividing expenses between intrastate and interstate traffic and particularly erred in finding that the dead weight on local trains exceeded the dead weight on through trains 14%, and particularly in finding that for all such alleged omissions that 8½% should be charged to the local trains, when the evidence fails to show any basis for such alleged omissions or such percentages as found by the Court.

40th. The Court erred in the basis adopted for apportioning fuel and locomotive expenses and in the basis adopted for "other train expenses."

41st. The Court erred in charging the State passenger traffic with

10% greater cost than the interstate passenger traffic, when the preponderance of the testimony shows the interstate traffic is the most expensive.

6087 42nd. The Court erred in holding that the St. Louis-Southwestern freight and passenger traffic was more expensive than the Iron Mountain's freight and passenger traffic.

43rd. The Court erred in finding the extra expense of intrastate traffic over the interstate freight traffic on the Iron Mountain Road was 210% and on the St. Louis-Southwestern 250%, when the evidence shows that at the outside the extra expense of such freight traffic is less than the greater percentage of the revenue per ton per mile of the intrastate over the interstate revenue.

44th. The Court erred in holding that the plaintiff was entitled to earn 6% interest on the value of its property and 1.5% surplus and that a return of less than 7½% on the value of its property devoted to the intrastate traffic was confiscatory.

45th. The Court erred in not holding a return on the plaintiffs' investment equal to the rate of interest prevailing on Railroad securities was compensatory, which rates of interest the evidence shows to have been a little less than 4½% on Railroad securities in Arkansas.

46th. The Court erred in retaining jurisdiction of this cause for any other purpose than to permit these defendants to show a changed situation which might relieve them of the injunction.

Wherefore for the errors aforesaid, and each and every of them and many more apparent on the face of the record, the defendants Robert P. Allen, George W. Bellamy and William McKnight, Railroad Commissioners of the State of Arkansas, pray for a reversal of the decree aforesaid and that the Court be directed to enter a decree dismissing plaintiffs' Bill of Complaint and such other relief as equity and good conscience will show the defendants entitled to receive.

JOS. M. HILL,
JAMES H. HARROD,
*Solicitors for said Defendant Railroad Commission.*

Dated this June 26th, 1911.
Endorsed: Filed June 26th, 1911. W. P. Feild, Clerk.

Which Prayer for Appeal is as follows:

6088 In the United States Circuit Court, Eastern District of Arkansas, Western Division.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY, Plaintiff,

vs.

ROBERT P. ALLEN, GEORGE W. BELLAMY, WILLIAM P. MCKNIGHT, Railroad Commissioners of the State of Arkansas, Defendants.

*Prayer for Appeal.*

Now comes Robert P. Allen, George W. Bellamy, William F. McKnight, Railroad Commissioners of the State of Arkansas, defendants in the above entitled cause, conceiving themselves to be aggrieved by the decision herein rendered on the 3rd day of May, 1911, wherein the Court made perpetual the temporary injunction hereinbefore issued and found, adjudged and decreed that the freight rates embraced in Standard Distance Freight Tariff No. 3, and intrastate passenger rates enacted by the Act of the General Assembly of Arkansas of 1907, were confiscatory and the keeping of the same in force was taking the property of the plaintiff without due process of law; and prays an appeal from the said final decree of the Circuit Court of the United States for the reasons specified in the Assignment of Errors, which is filed herewith, and prays that this appeal may be allowed and a transcript of the record, proceedings and papers upon which said decree was made, duly authenticated, be sent to the Supreme Court of the United States.

JOS. M. HILL,
JAMES H. HERROD,
*Attorneys for Defendants.*

Dated this 26th day of June, 1911.

The petition for appeal is hereby granted and the appeal allowed, this 26th day of June, 1911.

(Signed) JACOB TRIEBER,
*District Judge, Presiding in Circuit Court.*

6089 Endorsed: Filed June 26th, 1911. W. P. Feild, Clerk.

Which bond for appeal is as follows:

6090 In the United States Circuit Court, Eastern District of Arkansas, Western Division.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY, Plaintiff,

vs.

ROBERT P. ALLEN, GEORGE W. BELLAMY, WILLIAM F. MCKNIGHT, Railroad Commissioners of the State of Arkansas, Defendants.

*Bond for Appeal.*

Know all men by these presents, That we, Robert P. Allen, George W. Bellamy, and William F. McKnight, as principals and John W. Crockett, as sure*ties*, are held and firmly bound unto the St. Louis, Iron Mountain & Southern Railway Company in the sum of Five Hundred ($500.00) Dollars to be paid unto the said St. Louis, Iron Mountain & Southern Railway Company, its successors and assigns; to which said payment well and truly to be made we bind ourselves, our heirs, executors and administrators, jointly and severally by these presents. This obligation is upon this condition:

Whereas, the above named Robert P. Allen, George W. Bellamy and William F. McKnight have prosecuted their appeal to the Supreme Court of the United States to reverse the decree rendered in the above entitled cause by the Circuit Court of the United States for the Eastern District of Arkansas, Western Division thereof; Now if the above named Robert P. Allen, George W. Bellamy, and William F. McKnight shall prosecute their said appeal to effect, and answer all costs if they shall fail to make good their plea, then this obligation to be void, otherwise to remain in full force and virtue.

Given under our hands and seals this 26th day of June, 1911.

R. P. ALLEN.
GEO. W. BELLAMY.
W. F. McKNIGHT.
JNO. W. CROCKETT.

The above bond is hereby approved and ordered to be filed and made part of the record.

(Signed) JACOB TRIEBER, *Judge.*

Endorsed: Filed June 26th, 1911. W. P. Feild, Clerk.

6091 And on the same day the following proceedings were had, to-wit:

No. 1637.

ST. LOUIS, IRON MOUNTAIN AND SOUTHERN RAILWAY COMPANY
vs.
ROBERT P. ALLEN, GEORGE W. BELLAMY AND WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas.

Come the defendants Robert P. Allen, George W. Bellamy and William F. McKnight, Railroad Commissioners of the State of Arkansas, by Joseph M. Hill and James H. Harrod, Esqs., their solicitors, and file herein their Citation, which is duly signed by the Judge of this Court and service of the same duly accepted by Moore, Smith and Moore, Esqs., solicitors of record for the complainant in this cause.

Which Citation is as follows:

6092 UNITED STATES OF AMERICA, *ss:*

The President of the United States to the St. Louis, Iron Mountain and Southern Railway Company, Greeting:

You are hereby cited and admonished to be and appear at the Supreme Court of the United States at the City of Washington within thirty days from date of this writ pursuant to an appeal duly allowed by the Circuit Court of the United States for the Eastern District of Arkansas, Western Division thereof, and filed in the Clerk's Office of said Court on the 26th day of June, 1911, in a cause wherein Robert P. Allen, George W. Bellamy and William F. McKnight, Railroad Commissioners of the State of Arkansas are appellants and you are appellees to show cause, if any, why the decree rendered against the appellants as in said appeal mentioned should not be corrected, and why speedy justice should not be done in their behalf.

Witness the Honorable Jacob Trieber, District Judge presiding in the Circuit Court of the United States for the Eastern District of Arkansas, Western Division thereof, this 26th day of June, 1911.

JACOB TRIEBER, *Judge.*

Service of the above Citation this day acknowledged.

MOORE, SMITH & MOORE,
*Solicitors for the St. Louis, Iron Mountain and Southern Railway Company.*

June 26th, 1911.

6093 And on Sept. 27th, 1911, the following proceedings were had, to-wit:

ST. LOUIS, IRON MOUNTAIN AND SOUTHERN RAILWAY COMPANY
vs.
ROBERT P. ALLEN, GEORGE W. BELLAMY AND WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas.

It appearing from the statement of the Clerk of this Court that it will be impossible for him to complete a transcript of the record in this cause in time to file the same with the Clerk of the Supreme Court of the United States on the second day of October, 1911,—the day to which it was made returnable by me, when the appeal was granted and the Citation signed by me—

It is therefore ordered by me that the time for filing the transcript of the record in this cause with the Clerk of the Supreme Court of the United States is hereby extended until the 12th day of October, 1911.

September 27th, 1911.

(Signed) JACOB TRIEBER,
*U. S. District Judge for the Eastern District of Arkansas.*

6094 UNITED STATES OF AMERICA,
*Western Division of the Eastern District of Arkansas:*

I, W. P. Feild, Clerk of the Circuit Court of the United States for the Western Division of the Eastern District of Arkansas, in the Eighth Circuit, hereby certify that the foregoing writings annexed to this certificate are true, correct and compared copies of the originals remaining of record in my office, and constitute a true copy of the record, assignment of errors and of all proceedings in case St. Louis, Iron Mountain & Southern Railway Company v. Robert P. Allen et al., Railroad Commissioners of the State of Arkansas.

In witness whereof, I have hereunto set my hand and the seal of said Court, this 29th day of September, in the year of our Lord, One Thousand Nine Hundred and Eleven, and of the Independence of the United States of America, the One Hundred and thirty-sixth.

[The Seal of the Circuit Court, Western Division of East. Dist. Ark., U. S. A.]

W. P. FEILD, *Clerk.*

Attest:

——— ———.

6095 UNITED STATES OF AMERICA, *ss:*

The President of the United States to the St. Louis, Iron Mountain & Southern Railway Company; Greeting:

You are hereby cited and admonished to be and appear at the Supreme Court of the United States at the City of Washnigton

within thirty days from date of this writ, pursuant to an appeal duly allowed by the Circuit Court of the United States for the Eastern District of Arkansas, Western Division thereof, and filed in the Clerk's office of said Court on the 26th day of June, 1911, in a cause wherein Robert P. Allen, George W. Bellamy and William F. McKnight, Railroad Commissioners of the State of Arkansas are appellants and you are appellee, to show cause, if any, why the decree rendered against the appellants as in said appeal mentioned, should not be corrected, and why speedy justice should not be done in their behalf.

Witness the Honorable Jacob Trieber, District Judge presiding in the Circuit Court of the United States for the Eastern District of Arkansas, Western Division thereof, this 26th day of June, 1911.

JACOB TRIEBER, *Judge.*

Service of the above citation this day acknowledged.

MOORE, SMITH & MOORE,
*Solicitors for the St. Louis Iron Mountain & Southern Railway Company.*

June 26th, 1911.

Endorsed: Filed June 26th, 1911. W. P. Feild, Clerk.

6096 In the Supreme Court of the United States.

No. 813.

ROBERT P. ALLEN et al., Railroad Commissioners, Appellants,
v.
THE ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY, Appellees.

*Stipulation.*

It is stipulated by counsel that the following parts of the record in the above entitled cause be not printed:

1. Standard Freight Distance Tariff No. 3, which appears as Exhibit A to complaint and found at pages 36-92 inclusive, and also found as Exhibit N-1, pages 5900-5956 inclusive. "Court Tariff," which is Exhibit A to the order modifying the injunction and is to be found at pages 490-520 inclusive. Western Classification No. 47, and its supplements, which constitute Exhibit No. 49, which is to be found at pages 5417-5678 inclusive.

It is stipulated that either party may cause twenty-five copies of any of the publications above referred to, to be filed with the printed record and treated as a part thereof.

2. The following diagrams and maps in colors, graphic charts and maps, to-wit: Exhibit 1, Map of the Missouri-Pacific System, including the St. Louis, Iron Mountain & Southern Railway, found

at pages 5235-5236. Exhibit 9, Map of St. Louis Southwestern Railway lines, found at pages 5287-5288. Exhibit 24, Map of the United States, found at pages 5333-5334. Exhibit 30, graphic chart to the testimony of McPherson, found at pages 5358-5359. Exhibits 38, 39, 40, 41, 42 and 43, which are maps illustrating the "zone rates" and found at pages 5380-5391 inclusive. C-1 found at page 5853, D-1 found at page 5855, and L-1, including nine graphic charts found at pages 5886-5896 inclusive. M-1, a graphic chart illustrating the proportion of the rates to the St. Louis, Iron
6097 Mountain & Southern Railway in Arkansas, of the first class rate to sundry Texas common points, found at pages 5897-5898. J-1, being a blue print showing the main tracks of the St. Louis, Iron Mountain & Southern Railway, within the city limits of Fort Smith, Arkansas, found at page 5881.

This stipulation is intended to cover all graphic charts, diagrams and maps in the record. Should any other diagram or map be in the record not herein enumerated, the same shall not be printed. It is further stipulated that either party may cause twenty-five copies of any of the above maps, charts, or diagrams, to be made and treated as a part of the record, and any of the same may be used in briefs by either side.

3. The following exhibits are not to be printed, to-wit: Exhibit 7, page 5272, as Exhibit 7-A takes its place. Exhibit 11, page 5292, as Exhibit 11-A or 11-Revised, takes its place. Exhibit 25, pages 5335-5349, same being an employés' time table. Exhibit 53, detailed statement of train movements, found at pages 5690-5721 inclusive. Exhibit A-1, pages 5848-5850, the same being blank form of freight conductors' wheel report. B-1, pages 5351-5352, being form of way bill. None of Exhibit I-1, being the affidavit of E. K. Voorhees, after paragraph in the middle of page 4 of said affidavit. K-1, page 5885, General Instructions on General Classification of Bridges.

4. The affidavits presented to Judge Van Devanter for preliminary injunction, shall be omitted with the right reserved to either party to hereafter publish any part of the same that may be desired by such party, and either party may use any part of said affidavits in their brief with the same effect as if it were printed, said affidavit being found at pages 133-451 of the record.

6098 5. Any part of the record omitted from being printed under this stipulation, may by either party be hereafter printed or otherwise treated as a part of the record.

6. If either party shall file any of the exhibits or use any part of the affidavits presented to Judge Van Devanter or any other matter herein referred to, in their brief in said case, they shall notify opposing counsel thereof at least twenty days prior to the date the case is set for submission.

Given under our hands this 24th day of October, A. D. 1911.

J. M. HILL,
*Attorney for Appellants.*
J. M. MOORE,
*Attorney for Appellees.*

1 In the United States Circuit Court for the Western Division of the Eastern District of Arkansas.

In Chancery.

Be it remembered, That on the 18th day of July, A. D., 1908, come into the office of the Clerk of the Circuit Court of the United States for the Western Division of the Eastern District of Arkansas, the St. Louis, Southwestern Railway Company, by Moore, Smith & Moore, Esqs., its Solicitors, and filed thereon on the Chancery side of said Court, its Bill of Complaint against Robert P. Allen, John W. Crockett and John E. Hampton, Railroad Commissioners of the State of Arkansas, Henry Leigh and George L. McLean, which Bill of Complaint is as follows:

In the United States Circuit Court for the Western Division of the Eastern District of Arkansas.

In Chancery. No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Plaintiff,

v.

ROBERT P. ALLEN, JOHN W. CROCKETT, and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas; Henry Leigh and George L. McLean, Defendants.

2 To the Honorable Judges of the Circuit Court of the United States for said District:

Your orator, St. Louis, Southwestern Railway Company brings this, its Bill of Complaint against Robert P. Allen, John W. Crockett and John E. Hampton, as members of and constituting the Railroad Commission of the State of Arkansas and Henry Leigh and George L. McLean.

First. Your orator is a corporation organized under the laws of the State of Missouri, with its domicile at the City of St. Louis, in said State.

Second. The said Defendants, Robert P. Allen, John W. Crockett and John E. Hampton, are citizens and residents of the State of Arkansas, and constitute the Railroad Commission of said State. Said John W. Crockett and John E. Hampton reside in said District, and Robert P. Allen resides at Van Buren, in Crawford County, in the Western Judicial District of said State.

The Act of the Legislature of said State under which said Commission was created, fixes and establishes the domicile of the Commission at the City of Little Rock, in the County of Pulaski, in said State and in the Western Division of the Eastern Judicial District thereof. The Defendants, Henry Leigh and George L. McLean are citizens of the State of Arkansas, and reside at the city of Little Rock, in said District.

Third. Your orator further avers that the act creating said Railroad Commission heretofore referred to, approved March 11, 1899, entitled, "An Act to provide for the regulation of Railroad, freight and passenger tariffs, in this State, to prevent unjust discrimination by extortion in the rates charged for transportation of passengers and freights, and to prohibit railroad companies, corporations and lessees in this State from charging other than just and reasonable rates, and to punish the same, and to prescribe the mode of procedure and rules of evidence in relation thereto, and to appoint Commissioners and to prescribe rules for their government and define their powers and duties in relation to the same", and acts supplemental to and amendatory thereof, invest in said Railroad Commission the power and impose upon it the duty to make and put in effect reasonable and just rates of freight, express and passenger tariffs, to be observed by all persons and corporations operating any railroad or engaged in transporting persons or property in said State, and to make just and reasonable rates of freight, express and passenger traffic on connecting railroads operated by different and independent companies or corporations between stations within said State, to be observed by all persons, companies or corporations operating connecting railroads within the State, and if two or more connecting lines of railroad in said State shall fail to agree upon the division of charges arising from transportation of freights, passengers or cars over their lines, said Commission is authorized to make the division and fix the pro rata of such charges to be received by each of said connecting lines. Said Act further provided that in case any person or corporation engaged in operating a railroad in the State shall not do, or permit to be done, any act, matter or thing in said act required to be done, or shall be guilty of the violation of any of the provisions of the Act, such person or corporation shall be held to pay to the person, firm or corporation thereby injured double the amount of the damage by him sustained, and all costs to be recovered by such person, firm or corporation; and in all actions between private parties and railroad companies, brought under said Act, the rates, charges, orders, rules, regulations and classifications prescribed by said Commission prior to the institution of such action shall be held to be reasonable, fair and just and shall not be controverted therein. It is also provided by said Act that if any person or corporation operating a railroad in said State or any lessee of such person or corporation shall violate any of the provisions of the Act, or aid or abet therein, or shall violate any tariff of charges as fixed by said Commission, or any rules, regarding railroads or express companies as made by said Commission, such person corporation or lessee shall be liable to a penalty of not less than $500.00 nor more than $3000.00 for each violation of said Act, in an action brought in the name of the State, and in the County in which such violation shall occur, and the said Commission shall institute such actions as may be necessary for the recovery of the penalties prescribed therein through the prosecuting attorney of the proper district, or through Counsel specially employed by said Commission.

And your orator avers that the effect of the aforesaid provisions

of said Act is to deny your orator and all persons and corporations operating railroads in said State of the right to a judicial investigation of the validity and reasonableness of the rates, rules,
5 regulations and classifications prescribed by said Commission, and to deprive your orator and all others in like condition of the due process of law, contrary to the provisions of Section 1 of the Fourteenth Amendment to the Constitution of the United States.

Fourth. Your orator further alleges that on the 15th day of July, 1904, the predecessors of Defendants, the then acting Railroad Commissioners of said State, assuming to act under the authority of the aforesaid provisions of the Statutes of said State, promulgated Standard Freight Distance Tariff No. 2, prescribing freight rates and charges applicable to classes and commodities between all stations in said State, on all railroads operated therein subject to western classifications as adjusted to traffic in said State. The rates therein prescribed were continued in force, with certain amendments thereof made and promulgated by said Commission from time to time, until June 4, 1908, when said Defendants, acting in their official capacity, adopted Standard Freight Distance Tariff No. 3, applying on classes and commodities between all railroad stations in said State, subject to western classifications as adjusted to traffic therein, cancelling Standard Freight Distance Tariff No. 2 aforesaid, and ordered that the same take effect on June 15, 1908. Said tariff contains many of the rates and regulations that were contained in Standard Freight Distance Tariff No. 2, as aforesaid, and the changes and amendments made therein by said Commission since said Tariff No. 2 was promulgated, and other changes in rates on classes and
6 commodities made in the order of said Commission adopted on June 4, 1908. A copy of said Standard Freight Distance Tariff No. 3 is herewith filed as Exhibit "A" and made a part hereof.

Fifth. Your orator avers that each and all of the charges and rates prescribed in said Tariff No. 3 aforesaid, as well as the preceding Tariff No. 2, applying on classes and commodities as aforesaid, are unreasonable, unjust, oppressive, discriminative, confiscatory and void, both in respect to said order as a whole and in respect to each and every rate, charge, tariff, schedule, classification, rule and regulation separately:

(1) The railroad equipment, property and franchises owned and used by your orator in operating its said road in said State represents an investment of $16,023,090.00, according to the last assessment of said property for taxation by the State of Arkansas through the State Board of Railroad Assessors, which assessment is now in force. Orator has exercised as great a degree of economy in the use and operation of said property as was compatible with the interest of the public with safe and efficient service to the public, only employing such officers, agents and employees, and expending such amounts in the maintenance and repair of its road bed, tracks and stations and new equipment of engines, cars and other appliances necessary to the operation of its road and the maintenance of said property, as was necessary and essential to the due and proper oper-

ation of its trains, and to the maintenance of said property with due regard to its preservation and the safety of the public.
7 That no unreasonable salaries or wages have been, or are now being, paid to any of its officers or employees. But notwithstanding that orator has practiced all reasonable and proper economy in operation and maintenance as aforesaid, it has been unable and will be unable to operate said road at a profit at the rates prescribed in said tariff. On the contrary, said rates do not and will not yield a just and reasonable return upon the value of orator's property used in said service, either in respect to the money invested in said property or the service rendered. And in that behalf your orator alleges that the total earnings from its interstate business in the transportation of freights in the State of Arkansas, during the year ending June 30th, 1908, did not exceed the sum of $351,735.60; that the expense of operation solely incident to said business, and the fixed charges solely incident and chargeable to intrastate transportation of freights was $346,245.47. That the total earnings of said property from the transportation of freight, wholly within the State of Arkansas is not and will not be sufficient under the rates on classes and commodities prescribed as aforesaid as a whole, after paying operating expenses, charges for maintenance, taxes and other necessary fixed charges appertaining to said business, to yield any return by way of compensation for the service rendered by your orator, and the effect of such rates is and will be to prevent your orator from receiving any return or profit for the service rendered by it to the public, and will deprive orator of its property without due process of law and will deny to it the
8 equal protection of the laws.

(2) Your orator represents that among the principal commodities transported on the lines of railroad in the State of Arkansas are coal and coal slack; that the principal, in fact, the only, coal fields now or heretofore operated in said State, are situated in the Counties of Johnson, Franklin, Sebastian and Logan; that the coal mined in said counties is shipped from the following stations: That in Johnson County from Spadra, Coal Hill, Clarksville, Cabin Creek; That in Franklin County from Denning; that in Sebastian County from Jenny Lind, Huntington, Burma, Montreal, Hackett, Jensen, Bonanza, Dallas, Dennison, Excelsior, Greenwood, Gunther, Harp, Hartford, Hoffman, Hoye, Fidelity, Midland, Patterson and Prairie Creek; and that in Logan County from Knoxville, Piney and Paris.

That under the commodity rates prescribed in the aforesaid tariff the rate on coal for a distance of 110 to 120 miles is $1.00 per ton; 120 to 140 miles, $1.05 per ton; 140 to 160 miles, $1.10 per ton; 160 to 170 miles, $1.25 per ton; 170 to 180 miles $1.30 per ton; 180 to 190 miles, $1.30 per ton; 190 to 200 miles, $1.40 per ton; 200 to 210 miles, $1.45 per ton; 210 to 220 miles, $1.50 per ton. That the principal market in said State for coal and coal slack is the city of Little Rock and points north, south and east of said city; that the City of Little Rock is 114 miles from Coal Hill, from 141 to 156 miles from the aforesaid coal stations situated in Sebastian County

and 165 miles from the station of Paris, in Logan County, by
9 the lines of road connecting said points with said City, and over which the product of the said coal mines is shipped to said markets. All coal shipped to said markets and each of them is routed through the city of Little Rock, and the same difference in the length of haul from the stations at which said shipments of coal originate exists as to all of them. That the coal shipped to points north, south and east of said city is there transferred to different lines of road, and in most cases is subject to the joint through rates prescribed by said Commission. That the coal mines situated in Sebastian County are on the line of the St. Louis & San Francisco Railroad and the Midland Valley Railroad, and the St. Louis, Iron Mountain & Southern Railroad. All of said lines of road connect with your orator's road at the City of Little Rock, either directly, or through intermediate connecting lines.

That under the regulations adopted by said Commission in regard to rates on commodities Coal Hill rates apply from all points in Logan, Franklin and Sebastian Counties, and all points in Johnson County west of Coal Hill to the City of Little Rock and points north, south and east of said City, thus fixing the maximum rate from any of said points to the City of Little Rock at $1.00 per ton. That said rate does not pay the cost, including the terminal service, of handling said product, and is unreasonable, unjust and confiscatory. That all the coal shipped from Mansfield, Hartford and Paris has to be transported over connecting lines of railroad, and the rate prescribed as aforesaid applies whether said commodities are shipped
10 over one or more than one railroad, under the regulations adopted by the said Commission as aforesaid in connection with joint rates on commodities established by said Board. That the distance by rail from the aforesaid stations to Little Rock is from 143 to 165 miles; that the rate from said stations to the city of Little Rock, as prescribed by said Commission on the several connecting roads is $1.60 per ton, and yet your orator and its connecting lines are compelled under the aforesaid regulations to transport said products, from said stations to all stations on your orator's road, on a basis of $1.00 per ton, and it avers that the aforesaid rates are not only confiscatory, but they are discriminative, and do not afford to the said lines, or either of them, a fair, reasonable, or just compensation for the service rendered in transporting said products.

(3) Your orator alleges that a large proportion of the entire tonnage transported over its lines of railroad originating in Arkansas, consists of timber and timber products; that at least 90 per cent of said tonnage is shipped from points in said State to points in other States and is interstate commerce. Under the universal practice prevailing among shippers and railroad companies in said State, where the timber is situated at a distance from the mills, it is transported by rail and concentrated at milling points for the purpose of being converted into lumber and other products, and takes the prevailing rate under interstate shipments from the point at which the shipment of the rough material originated in said State to the

destination of the mill product in other States; that said
11 milling privilege in transit does not affect the interstate character of said shipments, but is an incident only in the interstate movement. The practice of all the railroads in the State engaged in the transportation of that commodity was, prior to April 1, 1907, to collect from the shipper the local rate from the place at which the shipment originated to the milling or concentration point. After the product had been milled and shipped to market the regular interstate rate from the point of origin to the point of destination was applied, allowing the shipper the difference between the local and through rate between the stations at which the rough material was received and the point of concentration. All shipments of rough material and the several products thereof, viz., lumber, staves, bolts, spokes, handles, hooks, hubs, boat oars, furniture, etc. took that course. On April 1, 1907, said Commission recognizing the aforesaid practice, and for the purpose of regulating the same, made an order that the following rates should apply on the shipment of rough lumber, staves, flitches, bolts and logs, in car loads, between all points in Arkansas, viz: For a distance of from—

1 to 50 miles, inclusive, 2 cents per cwt.
51 to 100 miles, inclusive, 2½ cents per cwt.
101 to 150 miles, inclusive, 3½ cents per cwt.
151 to 250 miles, inclusive, 5 cents per cwt.
250 miles and over, 8 cents per cwt.

Said rates are made upon condition expressed in said order that the manufactured product shall be reshipped over the same line bringing in the rough material.

12 Said order further provided that carriers would be allowed to require consignee- desiring to avail themselves of the benefit of said rate to enter into contracts with reference to the reshipment of the finished product under the rules prescribed by said Commission, and your orator avers that said order of the Commission was made with the direct intent and purpose of establishing, regulating and fixing interstate rates on such material and commodities, by the device of establishing rates applicable between the point of origin of the rough material and the point of concentration for milling purposes, and intending and requiring that such rates should be applied to all shipments of such material from the point of origin in said State to the point of destination in other States; and orator avers that such order is a direct interference with interstate commerce over which said Board has no jurisdiction, and is, for that reason, unlawful and void. Orator further avers that the aforesaid rates are unreasonable and oppressive, because they do not afford to carriers any compensation whatever for the service rendered in connection with the transportation of said commodities and are therefore confiscatory, and take the property of orator and other carriers in said State, without compensation, and are in violation of Section 1 of the Fourteenth Amendment of the Constitution of the United States, prohibiting the taking of property without due process of law and

without compensation, and guaranteeing to all persons the equal protection of the laws.

(4) Your orator alleges that cotton is the principal agri-
13 cultural product of the State of Arkansas; that practically the entire crop raised in the State each year is shipped to markets in other States and foreign markets. That on account of economy in transporting said product it has come to be a universal practice to compress the same in small bales or packages, whereby a large number of bales can be loaded on a car; that it is impracticable to establish and operate plants and machinery for the purpose of compressing cotton, except at a few central points in the State, and for that reason all cotton destined to markets outside of said State are shipped in the original bales or packages as prepared at the local ginneries throughout the country and concentrated at points on the lines of railroad, where compresses are operated for compression. Under the universal practice and the rulings of the Interstate Commerce Commission of the United States, all cotton raised in said State and shipped to points in other States and foreign markets is subjected to a process of compression for the purpose aforesaid, the shipper being required in the first instance to pay the local rate to the point of concentration; but upon reshipment to points of destination the through, or interstate rate, is applied to the entire shipment from the point of origin (that is to say, the station from which the same was consigned to the point of concentration), to the point of ultimate destination, the difference in the local rate between the point of origin and the place of concentration being allowed the shipper and adjusted in the charge applied to the interstate shipment. Said privilege of compression in transit does
14 not affect the interstate character of said shipment, but is an incident only in the interstate movement. On September 16, 1907, said Commission made and promulgated an order, prescribing the following rates on uncompressed cotton in bales between all stations in said State on the following lines of railroad, viz:—Chicago, Rock Island and Pacific Railway and branches, Kansas City Southern Railway, Louisana & Arkansas Railroad, St. Louis Southwestern Railway and branches, St. Louis, Iron Mountain & Southern Railway, Leased, Independent and Operated Lines—For a distance of thirty miles and under, 10 cents per cwt.

For a distance of forty-five miles and over thirty miles, 11 cents per cwt.

For a distance of fifty miles and over forty-five miles, 12 cents per cwt.

For a distance of seventy-five miles and over fifty miles, 14 cents per cwt.

For a distance of one hundred miles and over seventy-five miles, 15 cents per cwt.

For a distance of one hundred and twenty-five miles and over one hundred miles, 20 cents per cwt.

For a distance of one hundred and fifty miles and over one hundred and twenty-five miles, 30 cents per cwt.

For a distance of over one hundred and fifty miles, 40 cents per cwt.

Said order provides further that—

"In so far as the jurisdiction of the Commission is involved, the railroad companies operating in this State may continue in effect the present rates, rules and regulations in respect to the
15 concentration of cotton at compress points, or the railroad companies may make such reasonable modifications of same as they may desire, provided, that before any such change or modification desired to be made by any railroad company shall become operative, the same shall be first submitted to and approved by the Commission.

"All rates, rules and regulations in effect in this respect with reference to the shipment of cotton, which is not expressly disturbed or affected by the provisions of this order, shall remain in effect to the same extent as if this order had not been issued." Referring therein to the practice hereinbefore alleged in regard to the concentration and shipment of cotton from said State into other States and to markets in foreign countries.

Orator avers that the movement of cotton as aforesaid, and each and all of the parts thereof, as hereinbefore alleged, have been treated and recognized by the public and by the Interstate Commerce Commission of the United States as interstate commerce, and the direct intent and effect of the aforesaid rules, rates and orders made and promulgated by the Railroad Commission of the State of Arkansas, in regard to the transportation of cotton is a direct and intentional interference with interstate commerce, both as regards the rates and regulations in reference to the transportation thereof. Wherefore it avers that the same is unlawful and void. And orator further avers that said rates are so unreasonable, unjust and oppressive as not to afford any profit to the carriers handling the
16 same, and are confiscatory and in violation of the aforesaid provision of the Fourteenth Amendment to the Constitution of the United States.

(5) Your orator alleges that its main line of Railroad extends from St. Louis, in the State of Missouri, to Texarkana, in the State of Arkansas, and is 564 miles in length, that it likewise owns and operates the following branch lines, viz: Stuttgart Branch from Stuttgart to Gillett, 35.1 miles; Little Rock Branch, Altheimer to Little Rock, 44.8 miles. That all of said lines, owned and controlled by your orator as aforesaid are operated as a unit; that a very large amount of interstate traffic passes over them and each of them between the States in and through which the same are operated and into and through other States with which said lines form connections at their several termini. That the local rates in the several states into and through which said lines pass enter to a very large extent, and have a controlling influence on the through rates charged on interstate shipments, which are made on a combination, or percentage of the combination, of the intermediate local rates, by adding the local rates within the several states into and through which such shipments pass. Said through rates are thus constructed, and from necessity and under the rulings of the Interstate Commerce Commission of the United States, and the orders of said Commission

of the State of Arkansas, affects and controll*s* rates on interstate shipments passing from, into or through said State, by its effect in reducing interstate rates to the sum of the combination or
17 percentage of the combination of the local rates on such shipments. Orator avers that many of the rates established by said Defendants were made with reference to the local rates in adjoining States, and for the purpose of compelling the reduction of through rates on the basis of local rates in the States into and through which shipments pass.

And so your orator avers that many of the rates established by the said Railroad Commission of the State of Arkansas, as aforesaid, were made with the intention and for the purpose, and each and all of said rates so established as aforesaid, will have the effect of regulating and fixing interstate rates on all such classes and commodities, and is therefore an attempt to regulate interstate rates and affect interstate commerce, and is in violation of the Constitution and laws of the United States, and an invasion by the Defendants of the powers, rights and duties vested exclusively by the Act of Congress, in officials of the United States.

(6) Your orator further alleges that it is provided by an Act of the Legislature of said State, approved April 8th, 1903, that all persons, companies or corporations operating any railroad in said State that forms part of a continuous line of railway communication, between points in the State, shall issue through passenger tickets and check baggage through, to and from all points on such continuous line of communication at through rates and fares; that all freight and traffic carried wholly within this State to and from stations on lines of continuous carriage shall be way-billed through at
18 through rates and tolls from points of departure to the point of arrival, without being rebilled at junction points; and in the case of carload freights the forwarding carrier shall receive and forward the same in the car or cars in which the freight is tendered and without breaking bulk of packages; that in all cases where there is by physical connection of railroads, a continuous line of railway communication between stations within this State, whether such stations be on railroads operated by one and the same company or corporation, or on railroads operated by different and independent companies or corporations, it shall be the duty of said Commission to make just and reasonable rates of freight, express, and passenger traffic to and from such stations, to be observed by all persons, companies or corporations operating any railroad or engaged in transporting persons or property as express or freight in this State. That if any two or more connecting lines of railroad shall fail to agree upon a fair and just division of the charges arising from the transportation of freights, passengers or cars over such lines, the Commission shall make the division and shall fix the pro rata part of such charges to be received by each of said connecting lines.

That said Commission, assuming to act under and by virtue of the authority of the provisions of the aforesaid statute, by the order adopted by it on June 4, 1908, as aforesaid, attempted to make and put in force through joint rates for the transportation of shipments

of merchandise by classes and commodities over two or more lines of railroad, which are not under the same manage-
19 ment and control, by adding to the rates prescribed in the schedules prescribed by said Commission for single line or continuous mileage, certain differentials, and by fixing a maximum of through joint rates on classes and commodities to be charged by all railroads on shipments between stations in this State. The differential prescribed on merchandise by classes is as follows:

Less than car loads—

| | |
|---|---|
| First Class | 10c |
| Second Class | 8c |
| Third Class | 7c |
| Fourth Class | 6c |
| Fifth Class | 5c |

Car load—

| | |
|---|---|
| Class A | 5c |
| Classes B and C | 4c |
| Classes D and E | 3c |

Provided, that when the sum of the rates prescribed for local application is less than the through joint rate ascertained as aforesaid, such sum of rates shall be used as a joint rate, and further, that the through joint rate shall not, in any case, exceed the following figures:

Less than car load—

| | |
|---|---|
| First Class | 82c |
| Second Class | 79c |
| Third Class | 65c |
| Fourth Class | 74c |
| Fifth Class | 37c |

Car loads—

20

| | |
|---|---|
| Class A | 41c |
| Class B | 31c |
| Class C | 27c |
| Class D | 23c |
| Class E | 21c |

The joint rates on commodities on two lines of Railroad are determined in the same manner, with the proviso that the total through joint rate shall not exceed that charged for a single line haul on such commodities.

The through joint rates for the transportation of shipments of merchandise by classes over three or more lines of railroad are determined by adding the charges on the several railroads, or parts of railroads, as prescribed, for the respective distances such class merchandise is carried over each line, and deducting from the sum ten per cent, provided that the through joint rate shall in no case exceed the following:

Less than car load—

| | |
|---|---|
| First Class | 92c |
| Second Class | 84c |
| Third Class | 72c |
| Fourth Class | 53c |
| Fifth Class | 42c |

Car Loads—

| | |
|---|---|
| Class A | 46c |
| Class B | 35c |
| Class C | 31c |
| Class D | 26c |
| Class E | 24c |

21 The joint through rates for the transportation of commodities over three or more lines of Railroad, are determined in the same manner as in the case of merchandise by classes provided that said rates shall not exceed the commodity rates for three hundred miles plus the differential applied to through commodity rates for two lines of railroad, and shall not be less than the rates applying for seventy-five miles. Orator here refers to sheets, 19, 20 and 21 of Exhibit "A" hereto, for a full statement in detail of the through joint rates attempted to be established by and through the aforesaid order of said Commissioners. Your orator avers that neither the State of Arkansas nor the Defendants, acting as the State Railroad Commission of said State, has the power or authority to make contracts for joint through rates, or joint through routing, or to compel separate and independent lines of railroad to enter into contracts for joint rating or routing of freight over separate lines of railroad, or to accomplish the same result by prescribing arbitrary rules for the creation and division of through joint rates on separate lines of railroad; or to make and enforce joint rates between your orator and other connecting lines of railway in said State; that the effect of the aforesaid order is to create and establish traffic arrangements between separate and independent lines of railroad in relation to the transportation of merchandise between points on lines of each of said roads, and to compel said railway companies to enter into contract relations with each other without their consent, although the same may
22 be hurtful to their interests. Orator further alleges that the joint through rates prescribed in said order are insufficient to afford any return whatever for the service rendered by the several railroads engaged in the transportation of through freights; that said order is unjust, oppressive, confiscatory, and its effect is to deprive your orator and all other railroad companies operating in said State of their property without due process of law, and will deprive them of the equal protection of the laws in violation of the provision of the Fourteenth Amendment of the Constitution of the United States.

Sixth. Your orator further represents that by an Act of the legislature of the State of Arkansas, approved the 9th day of February, 1907, entitled, "An Act To Amend Section 6611, of Kirby's Digest of the Statutes of the State of Arkansas, by Fixing Passenger Rates

in this State and For Other Purposes," it is provided that the maximum sum which any corporation or person operating a line of railroad in this State shall be authorized to charge for carrying each first class passenger over such line within the State shall be fixed at five cents per mile on lines of railroad fifteen miles or less in length, three cents per mile on lines of railroad over fifteen and less than eighty five miles in length, and two cents per mile on all lines of railroad, over eighty-five miles in length; and for carrying children between the ages of five and twelve years, in charge of adults, one half the rates above named, and for such children as are under the
23 age of five years, that no charge whatever shall be made beyond what is collected from the adults having them in charge. It was further provided that said Act should take effect and be in force sixty days after its passage. Said Act was passed for the purpose of amending and is an amendment to Section 6611 of Kirby's Digest of the Statutes of said State.

Section 6620 of said Digest provides that if any person or corporation mentioned in section 6611 aforesaid shall charge, demand, take or receive from any person or corporation any greater compensation for transportation of passengers than is therein prescribed, such person or corporation shall forfeit and pay for every such offense a sum not less than $50.00 nor more than $300.00 and costs of suit, including a reasonable attorney's fee to be taxed by the Court, to be recovered in a suit at law in any Court of competent jurisdiction. That any officer, agent, or employee of any such person or corporation, who shall knowingly and willfully violate the provision of the Statute, by charging a greater rate than is therein prescribed shall be liable to the same penalty to be recovered in the same manner.

That on May 15, 1907, the Defendants, acting as Railroad Commissioners for said State, made and promulgated an order providing that—

"The maximum sum which any corporation, person or association of persons operating a line of railroad in this State shall be authorized to charge and collect for carrying each passenger over such line within the State is fixed at the following rates:
24 "On lines of Railroad fifteen miles or less in length, 5c. per mile.

"On lines of railroad fifteen miles in length and not over eighty-five miles in length 3c. per mile.

"On lines over eighty-five miles in length, 2c. per mile.

"And for carrying children in charge of an adult there may be charged and collected one half the above named rate for such of said children as may be under the age of twelve years and over the age of five years, and for such of said children as may be under the age of five years, no charge whatever shall be made beyond what is collected for the adults who shall have them in charge."

Prior to the passage of the aforesaid Statute and promulgation of the aforesaid order by the Defendants, your orator and all other railroads in said State operating lines over seventy-five miles in length, charged three cents per mile for the transportation of adults between all stations on its and their lines of railroad. That notwithstanding it at all times operated its trains in said State with as great a degree

of economy as was compatible with the comfort of passengers, safe and efficient service to the public and the maintenance and preservation of its property, as hereinbefore alleged, the gross receipts from carrying passengers within the limits of said State at the rate of three cents a mile aforesaid, after deducting therefrom the cost of conducting such business in the State, including operating expenses and maintenance and fixed charges properly appertaining to said business, were not sufficient to leave any adequate and reasonable profit or return upon the value of the property used in and about said business or for the service rendered the public.

Orator alleges that the rates fixed and established by the late Act of the Lesislature and by the order of said Commission as now in force in said State has caused a large reduction in the rates theretofore prevailing on the transportation of passengers and excess baggage. That it felt constrained, on account of the large number of actions, for double damages to which it would become subject under the provisions of the Statutes of said State and the provisions of said Statutes making the rates, charges, orders, rules, regulations and classifications, prescribed by said Commission in actions between private parties and railroad companies conclusive, and denying such companies the right to question or investigate the fairness, reasonableness and legality of such rates, charges, orders, rules, regulations and classifications in such action as well as of the harsh and severe penalties prescribed for the failure and refusal to put in force tariffs of charges and rules, regulating railroads prescribed and put in force by said Commissioners, as well as by the penalties specially prescribed for the failure to comply with the provisions of the Act of the Legislature, reducing passenger rates as aforesaid, to reduce its rates, in compliance with the provisions of said Statute and the aforesaid order; that said rates have been in force on its lines of railway in said State since the aforesaid statute and order took effect, and orator avers that all its earnings from intrastate transportation of freight and passengers in said State during said period have not been sufficient to pay operating expenses and the cost of maintenance and fixed charges properly chargeable to said business, and it has been compelled to operate its passenger and freight trains at a loss of revenue. Your orator alleges that the total earnings from the transportation of passengers between stations in the State of Arkansas during the year ending June 30, 1908, did not exceed $440,355.13; that the total expense of operation solely incident to said business, including all fixed charges, except interest charges, was $469,823.10 for the same time.

Seventh. Your orator alleges that the State of Arkansas contains no large cities and very few commercial centers; that a great deal of the jobbing and wholesale trade of said State is interstate business; that the population is sparse and very small as compared with the mileage of railroads operated in said State; that both freight and passenger business of your orator and of all other railroads operated in said State is light; that the rate of two cents per mile for the carriage of passengers and the freight rates prescribed in the aforesaid orders of the Railroad Commission of said State are unreasonably

low, and neither your orator, nor, it is informed, any other line of railroad operating in said State is able to earn a reasonable compensation for the services rendered either in the carriage of passengers or freight within said State, after paying the necessary
27 expenses of operating and other expenses necessary and incident to the intrastate business of said State. That while the rates of passenger fare, as well as freight rates have been reduced by the Acts of the Legislature of said State, as well as by the order promulgated by said Commission, the expense of operating and maintaining the railroads, and properties used in connection therewith, in said State, has been materially increased by reason of the legislation of said State, and the rules, regulations and orders of said Commission. That during the session of the Legislature of 1907, at which the Statute requiring the reduction of one third in the passenger rates was enacted, many statutes imposing burdens and increasing the expense of operating and maintaining railroads were passed. Among such enactments was a law requiring railroads exceeding fifty miles in length to employ three brakemen on freight trains consisting of more than twenty five cars, whereas previous to that time two brakemen had been employed and were sufficient for the efficient management of freight trains; requiring railroads to drain roadbeds, to construct foot walks to passenger depots, to equip all locomotives with electric headlights, limiting the hours of service of employés, making railroads liable for injuries caused by fellow-servants and absolutely liable for damages caused by fire, and numerous special acts affecting and increasing the expense of operating passenger trains and maintaining depots and station houses. That many of the requirements contained in said Act were not necessary to the safe and efficient operation of trains. That a large amount of expense has been incurred and will be neces-
28 sary in making and maintaining the changes provided for in said legislation, without any increase in the revenues by reason thereof. The result of all of which legislation has been greatly to increase the cost of conducting the business of your orator and other persons and corporations engaged in like business in said State. And orator alleges that all the earnings of all its lines of railroad within said State on the business transacted by it in the State are not sufficient to pay the expense of operating properly applicable to said business and afford any adequate or reasonable returns on the money invested in said property.

Eighth. Your orator alleges that the lines of road operated by it were constructed under grants of the State of Arkansas, which confer the right to collect reasonable rates of toll and fare for the transportation of freight and passengers over and upon said railroad, and such as would enable your orator to operate said road profitably. That there grew out of said grants and was necessarily implied therefrom an agreement or contract on the part of the State that your orator should have the right to impose reasonable charges and tolls for the transportation of persons and property

That the General Assembly of the State of Arkansas, by an Act approved July 23, 1868, passed a general law for the creation and

organization of railroad corporations, for the purpose of owning, maintaining and operating railroads in said State, under which Act your orator was incorporated. That said Act among other things provided that—

29 "The Legislature may, when any such railroad (meaning any railroad organized under the provisions of said Act) shall be open for use from time to time, alter or reduce rates of toll, fare, freights, or other profits upon such road; but the same shall not, without the consent of the corporation be so reduced as to produce with said profits less than 15 per cent per annum on the capital actually paid in, nor unless on an examination of the amounts received and expended to be made by the Secretary of State, he shall ascertain that the net income derived by the Company from all sources for the year then last passed shall have exceeded an annual income of 15 per cent upon the capital of the corporation actually paid in."

Said provision of the Statute is now in force, never having been repealed, and is contained in Kirby's Digest of the Statutes of Arkansas, as Section 6590.

Said lines were constructed by your orator and those from whom it acquired and under whom it holds the same, on the faith that the State would, in good faith, carry out and perform its aforesaid agreement in regard to rates to be charged by railroads in said State as aforesaid, as well as with reference to the annual profits, and that it would not, by direct legislation, or through any agency created by it, impose on the persons and corporations owning and operating said railroads, such rules, regulations and tariffs as would deprive them of the right to establish and charge such rates as should

30 be reasonable, just and fair and as will enable it to earn a profit of fifteen per centum per annum on the capital actually paid in. Your orator alleges that while it has voluntarily reduced its rates from time to time as the development of the business upon its lines and the condition of the country would warrant, it has never consented to such reduction of its rates by the State as would reduce its profits annually below the rates provided for in the aforesaid Statute.

Your orator avers that, disregarding its contract and obligation in the premises, the State of Arkansas, by and through the aforesaid Act of the Legislature of said State approved the 9th day of February, 1907, aforesaid, and the orders of the State Railroad Commission, established rates of passenger fare and freight charges which do not enable your orator to earn fifteen per centum per annum on the capital actually paid in, or in fact sufficient to pay the expense of operating, maintaining and keeping down the fixed charges pertaining to the business of carrying passengers and freight in said State, or on its entire lines of railroad and business conducted therein. That the action of said State in fixing said unreasonable and confiscatory rates, and in depriving your orator by the aforesaid legislation and Acts and orders of said Railroad Commission, of the power to earn a profit of not less than fifteen per cent per annum on its capital actually paid in, impairs the obligation of the

contract of the State contained in said Statute, as herinbefore set out, in violation of the provisions of Section 10, of Article 1
31 of the Constitution of the United States, prohibiting the State from passing any law impairing the obligation of its contract.

Ninth. Your orator represents that by the provisions of the aforesaid Acts of the Legislature of the State of Arkansas, any railroad failing or refusing to put in force any tariff ordered by said Board of Railroad Commissioners, or any of the rules and regulations prescribed by said Commission, is not only liable to a penalty of not less than $500.00 nor more than $3000.00 for each violation, but is also made liable to pay to any person, firm or corporation injured by such violation double the amount of damages sustained by him and all costs, and as a cumulative penalty, any railroad that shall charge, take or receive any greater compensation for the transportation of passengers than the rate prescribed by law shall forfeit and pay for every such offense not less than fifty dollars nor more than three hundred dollars and the cost of suit, including a reasonable attorney's fee, to be taxed by the Court; and it is further provided that any officer, agent or employee of any railroad, who shall knowingly and willfully demand, take or receive a greater compensation for the transportation of passengers than the amount allowed by law, shall likewise forfeit not less than fifty dollars nor more than three hundred dollars and cost of suit, including attorney's fee, to be taxed by the Court, for each offense. Orator alleges that the penalties and liability imposed by the aforesaid provision of the Statutes are so severe as to constrain persons and corporations subject to the provisions of said legislation to submit thereto, however illegal, rather than take the risk of in-
32 curring such enormous liability and penalties, the effect of which would be to utterly bankrupt and detroy them, and cause the persons whose money is invested in such property to forfeit their entire investment. That no prudent officer, agent or employee of any such railroad could afford to take the risk of the penalties and forfeitures imposed on him personally by said Statute. Wherefore, your orator and all other persons and corporations operating railroads in said State and subject to the provisions of the aforesaid Statutes, have been coerced into compliance with the aforesaid illegal and confiscatory legislation by said State, and orders made and promulgated by said Railroad Commission, rather than to subject said property, and the officers, agents and employees employed in and about the operation of the same, to the great multitude of suits and prosecutions that would have followed the failure or refusal to put said rates in force. But your orator avers that said rates, both as to freight and passengers, can not be continued in effect without irreparable loss to it, and serious and irreparable injury to and destruction of the property, rights and interest of your orator and of all persons interested in said property as creditors or stockholders of your orator.

Tenth. Your orator further alleges that the penalties prescribed by the Statutes of the State of Arkansas for a violation of the Rules

and Regulations of said Commission, and the rates of freight and passenger fare, put in force by said Commission are unreasonable and excessive in amount. That the penalties that would
33 accrue against your orator each day for the violation of the rates prescribed by the aforesaid orders of said Commission for the carriage of freight between stations in said State, on the basis of the minimum fine prescribed by law, would amount to $200,500.00 and for the violation of the rates prescribed as aforesaid for carrying passengers within said State on the basis of the minimum fine imposed by the aforesaid Statutes would amount to $118,000.00. That said penalties are immoderate and out of proportion of the acts designed to be punished; they are absurd and unreasonable in that they apply without discrimination to a great variety of acts and omissions that are wholly unlike and dissimilar, both in regard to the nature of the Act done or omitted and its effect upon the rights of the public and of individuals, and said provisions are manifestly designed to operate as a menace to compel unquestioning obedience on the part of railroad companies, their officers, agents and employees to all orders, rules and regulations promulgated by said Commission without regard to their lawfulness, by exposing said companies to such ruinous fines and penalties, and the officers, agents and employees of said companies likewise to such severe and ruinous penalties as to deter the said companies and the officers, agents and employees thereof, from resisting on any ground, however harsh or unreasonable, the action of said Commission may be or seem, and by deterring all said parties from resorting to the Courts for the purpose of contesting the legality of such rules, regulations and rates, for fear of being harassed and oppressed by a multitude of prosecutions and suits, during the pendency
34 of such proceeding, and of the consequences to them in case they should fail to maintain the ground of contest, notwithstanding that the same may have been instituted in the utmost good faith and for the purpose of testing and judicially determining the validity and legality of such order, rule or regulation. Wherefore, your orator avers that said provisions are discriminative and deprive your orator and all others in like condition of their property without due process of law and of the equal protection of the law, and are, therefore, in violation of Section 1 of the Fourteenth Amendment of the Constitution of the United States.

Said provisions are likewise in violation of Section 9 of Article 2 of the Constitution of the State of Arkansas, which provides that no person shall be subject to excessive fines, and that no unusual punishment shall be inflicted.

Eleventh. Your orator further alleges that the Defendants are shippers on your orator's lines of railroad and make frequent shipments of freight between stations situated wholly within said State. Said defendants are also in the habit of travelling on your orator's passenger trains between stations in said State, and alleges and shows that many thousand other citizens and residents of said State are engaged in business in said State and are large shippers of freight over your orator's lines of railroad between stations in said State,

and that large numbers of persons residing in said State are in the habit of traveling on your orator's passenger trains between
35 stations in said State. Orator further alleges that if it shall disregard, violate, or refuse to put or keep in force the aforesaid rates prescribed by said Commission for the transportation of freight and passengers, or any or either of said rates, or shall violate or fail to carry into effect any of the rates, charges, orders, rules, regulations and classifications prescribed by said Commission, on the ground that the same is unjust, unfair, unreasonable, confiscatory, and in violation of the Constitution and laws of the United States, as hereinbefore alleged, said Commission will cause penalty suits to be instituted against it, as authorized by the provisions of the aforesaid Statute, through the prosecuting attorneys of the various judicial districts in said State, through which your orator's lines of railroad extend; that a great number of suits at law for the recovery of penalties for the violation of the numerous rates contained in the schedule known as the Commission's Standard Freight Distance Tariff No. 3 will be brought; that said suits will be brought against your orator for the violation of each of the rates for the transportation of passengers as well as freight between the many stations on its lines of railroad; that a large number of suits for penalties and double damages will be brought against your orator by the aforesaid defendants who are shippers and patrons of your orator and others of the same class, involving a very large number of suits in many counties in said State; that your orator will be required to produce its books and papers in the defense of each
36 of the numerous cases brought by and under the direction of said Commission, and by private shippers and patrons for the purpose of showing that the rates established by said Commission are unreasonable, and would be greatly harassed by being compelled to defend such a multitude of suits.

Orator further alleges that the expense involved in the defense of such suits as will be instituted against it in case it refuses to comply with the illegal, unjust and confiscatory rates, rules and regulations of said Commission would be very great, and would involve great and serious loss to your orator, without regard to the result of such litigation; that under the provisions of the Statutes hereinbefore referred to, your orator would be precluded from pleading or proving the unreasonableness of said rates in proceedings instituted by private shippers, and judgment would doubtless be recovered in many of said actions, and orator would be compelled, in order to protect its property from levy and sale thereunder, to file numerous supersedeas bonds, by which it would be put to considerable expense and inconvenience; that the question as to whether the rates prescribed by the Commissioners as aforesaid are unreasonable or not could not be properly determined in suits of that character, and that the loss which would be sustained by your orator in an attempt to defend such suits would be so serious as to be irreparable. Wherefore, your orator prays leave to sue the aforesaid Defendants, as representatives of all said classes of persons, whether as shippers of freight or as passengers.

Twelfth. Your orator alleges that this cause arises under
37 the Constitution and laws of the United States and that the matter in dispute and controversy exceeds, exclusive of interest and costs, the sum and value of Two Thousand Dollars.

Premises considered, for as much as your orator is remediless at law and *and* can only obtain relief in a Court of equity, where matters of this kind are cognizable, your orator prays:

(1) That the orders of the Railroad Commission of the State of Arkansas, fixing rates and charges for freight transported by your orator within said State and fixing and establishing joint through freight tariffs on different and independent lines of railroad, and all rules and regulations affecting and concerning the same and each and every part thereof, and each schedule in said orders contained, be set aside and held for naught: that the order of said Commission made on June 4, 1908, to take effect June 15, 1908, fixing and establishing tariffs and charges on freights transported over your orator's line of railroad between stations situated within said State on classes and commodities, and fixing and establishing joint through rates on independent connecting lines of railroad, and all rules and regulations affecting and concerning the same, and contained in said order of June 4, 1908, be set aside and held for naught.

(2) That said Act of the Legislature of the State of Arkansas, approved the 9th day of February, 1907, and the orders of the Railroad Commission of said State, establishing and fixing a rate of two cents per mile for the transportation of passengers between
38 stations in said State on your orator's railroad and over lines leased and operated by it in said State, be set aside and held for naught, and that so much of the order made by said Commissioners on June 4, 1908, to take effect June 15, 1908, as relates to the aforesaid passenger rates, and fixes and establishes the same on the basis of two cents per mile, be set aside and held for naught.

(3) That the Defendants, as Railroad Commissioners of the State of Arkansas, be restrained and enjoined from putting into force or taking any step or action whatsoever, looking to the putting into force and effect the aforesaid tariff of charges for the transportation of freight and passengers on your orator's railroad, within the State of Arkansas, adopted by it on June 4, 1908, as aforesaid, and that said Tariffs and all rules, regulations and orders made and promulgated by said Defendants for the purpose of putting the same into effect be set aside and held for naught.

(4) That the provisions of the aforesaid Statute of the State of Arkansas, prescribing penalties against your orator and others in like condition for the failure or refusal to put into force any tariff ordered by the Railroad Commission of said State, or any of the rules and regulations prescribed by said Commission or for charging, taking, or receiving any greater compensation for the transportation of passengers than the rate prescribed by law, be declared void and of no force or effect whatsoever, and that said Commissioners and each and every one of them, their successors in office, agents,

servants and employees be temporarily and permanently
39 restrained from enforcing or attempting to enforce the rates, charges, rules and regulations fixed by the orders of said Commission aforesaid, respecting the carriage of freight and passengers within the State of Arkansas, or from enforcing or attempting to enforce through any agency provided in the Statutes of the State of Arkansas, or otherwise, any of the penalties prescribed by the Statutes of said State for failure on the part of your orator to observe any of the aforesaid orders made by said Commission; and that said Commissioners be temporarily and perpetually enjoined and restrained from prosecuting any suit or action, or causing the same to be prosecuted, by any officer or agent of said Commission, or by any officer of the State of Arkansas, or any other person, for the failure to put or keep in effect and to observe the rates of freight and passenger fare and the rules and regulations of said Commission, so fixed and established as aforesaid, or from taking any action with the intent and for the purpose of enforcing the provisions of the order made by said Board on May 15, 1907, fixing rates for the carriage of passengers and freight as aforesaid, or from doing or attempting to do any act or thing, or to require your orator to do any act or thing, by way of compliance with, or for the purpose of carrying out said order, rules and regulations or any part thereof.

(5) That the Defendants, Henry Leigh and George L. McLean, and all other persons belonging to the same class, including all patrons of your orator's railroad, either in the shipments of freights between stations on your orator's lines of railroad in said
40 State, or as passengers on said lines between stations in said State, be enjoined and restrained during the pendency of this proceeding from instituting any suit or suits, action or actions, against your orator for the recovery of any penalties under and by virtue of the provisions of any of the aforesaid acts of the legislature of the State of Arkansas, or for the recovery of double damages under and by virtue of the provisions of any of the aforesaid Acts of the Legislature of said S[illegible] and upon the final hearing herein that said Defendants, and all other persons belonging to the classes aforesaid, and who are engaged or may be engaged in intrastate shipments of freight on or over your orator's lines of railroad, or may become intrastate passengers thereon, be perpetually enjoined and restrained from instituting any such suits or actions against your orator.

And your orator prays for such other and further relief as may seem meet, and as it may be entitled to.

And may it please Your Honor to grant unto your orator a writ of subpœna of the United States of America issuing out of and under the seal of this Honorable Court, directed to the said Robert P. Allen, John W. Crockett and John E. Hampton, constituting the Railroad Commission of the State of Arkansas, and the said Henry Leigh and George L. McLean, thereby commanding them and each of them on a day certain therein to be named, under certain penalty, to be and appear before this Honorable Court, and then and there full, true, direct and perfect answer to make to all and singular the

premises, but not under oath—answer under oath being ex-
41–99 pressly waived—and to perform and abide by such order, direction and decree as may be made in the premises. And your orator will ever pray.

MOORE, SMITH & MOORE,
*Solicitors for Complainant.*

STATE OF MISSOURI,
*City of St. Louis, ss:*

S. C. Johnson, being duly sworn, says:
He is General Auditor of St. Louis Southwestern Railway Co., he has read the foregoing bill of complaint and knows the contents thereof. He further states that all facts alleged in said bill on his personal knowledge are true, and such as are stated upon information he believes to be true.

(Signed) S. C. JOHNSON.

Subscribed and sworn to before me this the 16th day of July, 1908.

ALROY S. PHILLIPS,
[SEAL.] *Notary Public, City of St. Louis, Mo.*

My commission Expires the 3rd day of January, 1910.

Endorsed on back: Filed and writ issued July 18, 1908. W. P. Feild, Clerk.

Which Exhibit "A" to Complainant's Bill of Complaint is as follows:

(Omitted in printing per stipulation.)

100 UNITED STATES OF AMERICA,
*Western Division of the Eastern District of Arkansas.*

Be it remembered, That at a Circuit Court of the United States of America, in and for the Western Division of the Eastern District of Arkansas, begun and holden on Monday, the 6th day of April, Anno Domini, One Thousand Nine Hundred and Eight, at the United States Court Room, in the City of Little Rock, Arkansas, the Honorable Jacob Treiber Judge presiding and holding said Court, the following proceedings were had, to-wit: On July 25th, 1908.

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Come Robert P. Allen, John W. Crockett and John E. Hampton, as Railroad Commissioners of the State of Arkansas, by Morris M. Cohn, Esq., their Solicitor, and file herein their answer.
Which Answer of the Defendants is as follows:

101 In the United States Circuit Court for the Western Division of the Eastern District of Arkansas.

In Chancery.

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, JOHN W. CROCKETT and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas, et al.

To the Honorable Judges of the Circuit Court of the United States for said District:

The Defendants, Robert P. Allen, John W. Crockett and John E. Hampton, as members of and constituting the Railroad Commission of Arkansas, saving and reserving to themselves all manner of objection and exception which they may be entitled to save to the many imperfections and insufficiencies in the Bill of Complaint, for answer thereto say:

(1) The Defendants Robert P. Allen, John W. Crockett and John E. Hampton, admit that they are members of and constitute the Railroad Commission of the State of Arkansas.

Answering the first paragraph of the Bill of Complaint, they say that it is true that the Complainant is a corporation, organized under the laws of the State of Missouri, and that its domicile is at the city of St. Louis, in that State, but they also say that as a condition to be permitted to do business as a railroad company in the State
102 of Arkansas it filed a copy of its Articles of Association in the office of the Secretary of State of said State of Arkansas, as provided by Art. 34, p. 34, and following of the Acts of the General Assembly of the State of Arkansas, being Act approved March 13, 1899, and that said Complainant as such corporation operates lines of railroad between different points in the said State of Arkansas, including the cities of Little Rock, Pine Bluff, Texarkana and many other cities and towns in said State.

(2) Answering the 2d paragraph of the Bill of Complaint, they say that it is true that they reside in the districts therein mentioned and that the Legislature of the State of Arkansas has fixed and established the domicile of said Railroad Commission at the City of Little Rock, in the County of Pulaski in said State; and the Defendants, Henry Leigh and George McLean, therein mentioned, are citizens of the State of Arkansas, and reside in the city of Little Rock in said District.

(3) Answering the 3d paragraph of the Complaint, the Defendants say that it is true that the said Railroad Commission was created by the Act of March 11, 1899, as set forth in said paragraph, but that said paragraph has omitted to state that suits for damages and costs sustained by any person, firm or corporation under the

provisions of the Act referred to had to be instituted within a year from the accrual of the right, or same became barred.

But the Defendants deny that the effect of the provisions
103 of said Act of March 11, 1899 was to deny to the Complainant and to all other persons and corporations operating railroads in said State, the right to a judicial investigation of the validity and reasonableness of the rates, rules, regulations and classifications prescribed by said Commission, or, that it deprived Complainant and all others in like condition of due process of law, contrary to the provisions of Section 1 of the Fourteenth Amendment to the Constitution of the United States. For they say that by the terms of Sections 6813 and 6814 of Kirby's Digest of the laws of the State of Arkansas, as construed by the Supreme Court of Arkansas, the rates, rules, regulations and classifications referred to have only prima facie effect, and they aver that this did not amount to a deprivation of due process of law within the meaning of Section 1 of the Fourteenth Amendment to the Constitution of the United States.

(4) Answering the 4th paragraph of the Complaint, Defendants say that it is true that Standard Freight Distance Tariff No. 3 was adopted in lieu of all preceding tariffs on June 15, 1908, but they aver that said Standard Freight Distance Tariff No. 3 was substantially similar to Standard Freight Distance Tariff No. 2, adopted by said Railroad Commission on the 15th day of July, 1904; and they also aver that the Standard Freight Distance Tariff No. 2 was a repetition in substance of the first Standard Freight Distance Tariff adopted by the said Railroad Commission on April 10, 1900. Defendants say at different times during the history of said Railroad Commission, technical questions were raised as to whether certain items
104 were faithfully adjusted, and it was necessary to dispose of such matters by rulings or constructions. This being found unsatisfactory, when Standard Freight Distance Tariff No. 3 was issued, the said Railroad Commission gave notice that it would take up, at the meeting of June 4, 1908, the question of adopting it as a whole. It was formally adopted and thus disposed of any inadvertent discrepancies which had crept into the compilation previously. And the Defendants aver that there is no substantial difference between the freight rates adopted by the said Standard Freight Distance Tariff No. 3 and those first put into effect on April 10, 1900.

(5) Defendants, answering the 5th paragraph of the Bill of Complaint, deny that the charges and rates prescribed in the said Standard Freight Distance Tariff No. 3, as well as the preceding Tariff No. 2, applying on commodities and classes, or otherwise, were, or are, in any respect, unreasonable, unjust, oppressive, discriminatory, confiscatory or void, either in respect to said order as a whole or in respect to each and every rate, charge, tariff, schedule, classification, rule or regulation separately considered. And they say they do not know how much the railroad equipment, property and franchises, owned and used by complainant in operating its said road in said State, represents, but they deny that the sum of $16,023,090.00 correctly represents the said investment. They deny that Complainant has exercised as great a degree of economy in the use and operation

of said property as was compatible with the interests of the public and with safe and efficient service to the public, or, that it
105 only employed such officers, agents or employés, or expended only such amounts in the maintenance and repair of its roadbed, tracks and stations, or for new equipment of engines, cars or other appliances necessary to the operation of its road and the maintenance of said property, as was necessary and essential to a due and proper operation of its trains or to the maintenance of said property with due regard to its preservation and the safety of the public.

They deny that no unreasonable salaries or wages have been or are now being paid to any of its officers, agents or employees. They deny that Complainant has practiced all reasonable and proper economy in the operation and maintenance of its railroad, and they deny that the operation of said road, if properly and economically conducted, would not yield a profit exceeding fifteen per cent at the rates prescribed in said tariff. They deny that said rates do not and will not yield a just and reasonable return upon the value of Complainant's property used in said service, whether in respect to the money invested in said property or the service rendered. They deny that the total earnings of the Complainant from its intrastate business in the transportation of freight in the State of Arkansas, during the year 1907 did not exceed the sum of $351,735.80. They aver that the condition of affairs in the United States in the year 1907, financially and commercially, should form no criterion for other years, because they say that conditions were very much depressed in the concluding and busy months of said year, by reason
106 of a panic which stopped a great many industries and curtailed business of all kinds, including transportation by railroad. They deny that the expense of operation solely incident to intrastate business, and the fixed charges solely incident and chargeable to the intrastate transportation of freight, was $246,245.47. They deny that the total earnings of the Complainant's property from the transportation of freight, wholly within the State of Arkansas is not and will not be sufficient, under the rates on classes and commodities prescribed in the said tariff, — pay operating expenses, charges for maintenance, taxes and other necessary fixed charges, appertaining to said business, and yield any returns by way of compensation for the services rendered by Complainant. And they deny that the effect of such rates is and will be to prevent Complainant from receiving any returns or profits for the service rendered by it to the public, or will deprive it of its property without due process of law, or will deny it the equal protection of the law.

(6) Defendants, answering the second part of the 5th paragraph of the Complaint, admit that coal fields are situated as stated therein, and that coal mined in said counties is shipped from the stations mentioned therein, and that commodity rates on coal are as stated therein, but they deny that the said rates, either as a whole or otherwise, do not pay the cost of service, including the terminal service, or, are in any respect unreasonable, unjust or confiscatory. They admit that some of the coal shipped from the aforesaid stations,

is transported over connecting lines of railroad, but they
107 deny that a large part of it is. They say on information and belief that a very small part of said coal was transported over connecting lines of railroad. And, they further aver that if the rates prescribed applied, whether said commodity was shipped over one or more than one railroad under the regulations adopted by them, there was nothing unusual or unjust about it; that such rates were fair and remunerative, and that Complainant never heretofore complained to the Commission by any specific method of complaint wherein it set forth that the rates were confiscatory, or asked the said Railroad Commission to increase said rates whether applicable to hauls that required the service of more than one carrier, or otherwise. They deny the allegations in said part of said Complaint that any one of said rates was discriminatory or did not afford to the said lines or either of them a fair, reasonable or just compensation for the services rendered in transporting said products.

(7) Answering the part numbered 3 of the 5th paragraph, Defendants say that they do not know how large a proportion of the entire tonnage transported over Complainant's lines of railway originating in Arkansas consists of timber and timber products, but they deny that at least 90 per cent of said tonnage was shipped from points in said State to points in other States, or was interstate commerce. They are advised that it is not material for them to reply to that part of the said Complaint which states the custom prevailing between shippers and the railroad companies in said State of concentrating rough lumber at milling points. But they deny that on
April 1, 1907, or at any other time, they recognized the
108 said practice and for the purpose of regulating the same made an order that the rates mentioned in said part of the complaint should apply on the shipment of rough lumber, staves, fitches, bolts and logs in car loads between all points in Arkansas set forth in said Complaint. They admit that said rates were made upon the condition expressed in the order that the manufactured products should be reshipped over the same line bringing in the rough material. But they deny that such shipment contemplated an interstate shipment or a shipment beyond the limits of the state, or that it was an attempt in any manner to control shipments beyond the State. They deny that at any time any rate established by them was published or had the effect of operating as a rate applicable to interstate commerce. And they deny that any order made by them in relation to the rate of transportation for lumber in the rough or otherwise was made with the intent and purpose of establishing, regulating or fixing interstate rates on such material or commodities by any device, though they admit that the rates established from the point of origin of rough material to the point of concentration for milling purposes was based upon the custom of railroad companies to recognize the somewhat cheaper rates from the point of origin to the place of concentration, in consideration of their obtaining the whole haul. But the Defendants deny that there is any universal practice prevailing among shippers and railroad companies in said State where the timber is situated at a dis-

tance from the mills, to have it transported by rail and concentrated at milling points for the purpose of being converted into lumber and other products, and take the prevailing rate under in-
109 terstate shipments from the point at which the shipment of rough material originated in said State to the destination of the milled product in other States. They deny that there is any milling in transit privilege recognized or countenanced by them, which is an incident of interstate commerce, or affects the interstate character of shipments of lumber. They deny that the aforesaid rates are unreasonable or oppressive, or that they do not afford the carrier any compensation whatever for the service rendered in connection with the transportation of said commodities, or are confiscatory, or take the property of complainant or other carriers in said State without compensation, or are in violation of Section 1 of the Fourteenth Amendment to the Constitution of the United States, prohibiting the taking of property without due process of law and without compensation, or denying to any person the equal protection of the law.

(8) Answering the part numbered 4 of the 5th paragraph of the complaint, defendants say that the rates set out therein are correctly stated, but that the rates are flat or local rates, and have no reference to any interstate shipments whatever; that the said Defendants, as such Railroad Commission, have not at any time adopted any custom of concentrating cotton at compression points for the purpose of having the same compressed and transported outside of the State of Arkansas; that they have not made any regulations in reference to any such custom, but have confined themselves to making flat rates for delivery of cotton at points in the said State of Arkansas.

They are advised that it is not for them to answer that part
110 of said complaint that describes the manner in which cotton is concentrated at compression points, and they deny that the order, copied by the Complainant in said part of its Complaint, in any way attempts to regulate interstate commerce; that no attempt was made by the said Railroad Commission, by anything recited in the said order, nor has it ever taken any action which could be construed as intending to affect the transportation of cotton from a point in the State of Arkansas to a point without the State of Arkansas, which, during the transportation, was unloaded at a Compress and put into compressed form instead of an uncompressed form. And they deny that the flat rates so made in any manner conflict with the jurisdiction of the Interstate Commerce Commission of the United States, or with the movement of cotton, or any part thereof, which has been treated and recognized by the Interstate Commerce Commission as interstate commerce. They deny that there was any direct or intentional interference with interstate commerce, either as regards the rates or regulations in reference to the transportation of said cotton. They deny, therefore, that the said rates were unlawful and void, and they also deny that they are unreasonable, unjust or oppressive, or did not afford any profit to the carriers handling the same or are confiscatory, or are

in violation of the aforesaid provisions of the Fourteenth Amendment to the Constitution of the United States.

(9) Answering that part of the 5th paragraph, which is numbered 5, Defendants admit that the Complainant owns and controls
111 the lines of railroad mentioned in said part of its complaint, but they deny that the said roads are operated as a unit. They admit that a very large amount of interstate traffic passes over the said roads and each of them. They deny that the local rates in the several states in which and through which said lines pass enter to a very large extent and have a controlling influence on the through rates charged on interstate commerce. They aver that all local rates established by the said Railroad Commission are within the province of the said Commission, and have reference solely to intrastate commerce; that the said Railroad Commission of the said State of Arkansas has had nothing to do with through rates applying to interstate commerce on the lines of the said Complainant or any other railroad company. They deny that the matters alleged in said part of said complaint, as far as they seek to show that the local rates made by Defendants enter into through rates made by the Complainant in interstate traffic, are material. They deny that, by reason of any of the matters set forth in said part of said complaint, the rates established by said Railroad Commission were made with the intention and for the purpose, or that each and all of said rates so established will have the effect of regulating and fixing interstate rates on all such classes and commodities or that the same amount to an attempt to regulate interstate rates or affect interstate commerce, or are in violation of the Constitution of the United States, or are an invasion by the Defendants of the powers, rights or duties vested exclusively by the acts of Congress in
112 officials of the United States.

(10) Answering that part of paragraph 5th which is numbered 6, Defendants say that the Act of April 8th, 1903, passed by the General Assembly of the State of Arkansas, the said Railroad Commission was invested with the power to establish joint rates and to provide for continuous carriage; that they do not know whether the terms of the said Act are correctly copied in the said part of said complaint or not. They admit that they have assumed to act under the terms of the said Act and that they have put in force joint rates, and that the rates are correctly stated in said part of said Complaint. They aver that prior to the enactment of the said Act of the Legislature, the said Commission did not have the power to deal with continuous transportation and joint rates, and that the said Act was passed for the purpose of enabling the said Commission to deal with the matter, which was necessary to the protection of the shippers of the State of Arkansas; that prior to the enactment of the said act, there were great evils growing out of the practice of the railroad companies in said State, including that of the Complainant, whereby a haul that was really continuous was split up into fragments over the different lines which were formally described as independent lines, though all under one management, and different local rates over each of the lines was applied to the great damage of numer-

ous shippers in the said State; that it was deemed to be just and proper by the Legislature of the State of Arkansas to correct this practice by passing and to provide a method of joint rates
113 and joint routes that should be just to the railroads of said State as well as to the shippers. So, the said Act was passed by the Legislature of Arkansas at the time stated. That the rates so established by Defendants were established after careful inquiry and proper hearing of the railroad companies and other parties concerned; that the said Complainant has never filed any petition before the said Railroad Commission, complaining of the said joint rates so established, or any other orders relating to joint traffic, established by the said Railroad Commission. They say, as they are advised, that the said law was within the proper province of the Legislature of the said State of Arkansas, and they deny that the said joint rates are insufficient to afford any return whatever for the service rendered by the several railroads engaged in the transportation of through freight, or that said order is unjust, oppressive or confiscatory, or that its effect would be to deprive Complainant or any other railroad company operating in said State of their property without due process of law, or will deprive them of the equal protection of the law, in violation of any provision of the Fourteenth Amendment to the Constitution of the United States.

(11) Answering paragraph marked 6th, Defendants admit the passage of the Act of February 9, 1907, referred to in said paragraph, and admit the provisions of Section 6620 of Kirby's Digest of the laws of the State of Arkansas. They admit that the said Railroad Commission on May 15, 1907, made the order mentioned in the said paragraph, but they deny that there was any necessity
114 for the order, or that it worked any damage or detriment to the said Complainant. They say, upon information and belief, that the railroad companies were in the habit of charging three cents a mile on lines seventy five miles in length prior to the enactment of said law, but they deny that the said three cents per mile, after deducting therefrom the cost of conducting said business in said State, the actual operating expenses and maintenance and fixed charges principally appertaining to the said business, were not sufficient to yield adequate and reasonable profits or returns upon the value of the property used in and about said business, or for the service rendered the public.

They aver that the traffic in the said State of Arkansas, as they are informed and believe, by reason of the reduction in the rate from three to two cents has increased to such an extent that the said Complainant was not in any manner injured thereby, and that it yielded a large enough revenue to leave a considerable profit to the said Complainant, unless it was unreasonable and extravagant in the management and operation of its road, or demanded profits upon fictitious values. Defendants deny that the Complainant felt constrained to abide by the provisions of the Statutes of said State of Arkansas, by reason of any of the matters alleged by it in said part of its complaint. They deny that any statutes of said State made any rates, charges, orders, rules, regulations or classifications

prescribed by said Commission in actions between private parties and railroad companies conclusive. They deny that such companies were denied the right by any Statute of the State of Arkan-
115 sas to question or investigate the fairness or reasonableness or legality of any rates, charges, orders, rules, regulations or classifications. They deny that there were any harsh or severe penalties prescribed for the failure or refusal to put in force tariffs or charges or rules, regulating railroads prescribed and put in force by said Commission. They deny that there was anything unusual about the penalties prescribed for the failure to comply with the provisions of the Act reducing passenger fares. They admit that said two cent rate has been in force on Complainant's lines of railroad in said State since the aforesaid Statute and order took effect, and they say that the said Complainant never heretofore made any complaint on account thereof. And they deny that the earnings from intrastate transportation of freight and passengers in said State during any period have not been sufficient to pay operating expenses and the cost of maintenance and fixed charges properly chargeable to said business, or that it has been compelled to operate its freight and passenger trains at a loss of revenue. They deny that the total earnings from the transportation of passengers between stations in the State of Arkansas, during the last half of the year 1907, did not exceed $440,355.13, or that the total expense of operation solely incident to said business, including all fixed charges, except interest charges, was $469,823.10 for the same period, or that said period represents the average earnings through the entire year. They aver that during the latter part of the year 1907 a monetary and commercial panic prostrated all industries in the United States,
116 including the State of Arkansas, and that by reason of this fact the business of transporting passengers and freight was very much reduced on all the lines of railroad throughout the United States and in the State of Arkansas, and that by reason of this fact the earnings from that source in the said part of the year 1907 could not be taken as a criterion.

(12) Answering the 7th paragraph of the complaint said defendants say that they are unable to understand what is meant by the allegation that the State of Arkansas contains no large cities and very few commercial centers. They admit that a great deal of the jobbing and wholesale trade of said State is interstate business, and they say that the interstate feature of the business is for the most part confined to shipments from the Eastern Seaboard, from the north and from the south, to the wholesale jobbers of the State. They deny that the population is sparse and very small as compared with the mileage of railroads operating in said State, or that either the freight or passenger business of Complainant and of all other railroads operating in said State is light, or that the rate of two cents per mile for the carriage of passengers and the freight rates prescribed in any orders of the Railroad Commission of said State are unreasonably low. They deny that neither Complainant nor any other line of railroad operated in said State is able to earn a reasonable compensation for the service rendered in the carriage of

passengers or freight within said State, after paying the necessary expenses of operating and other expenses necessary and incident to the intrastate business in said State.

117 They deny that the expense of operating and maintaining the railroads and properties of the Complainant in said State has been materially increased by reason of the legislation of said State, or the rules, regulations or orders of said Railroad Commission. They deny that during the session of the legislature at which the Statute requiring the reduction of one third in the passenger rates was enacted, many Statutes imposing burdens and increasing the expense of operating and maintaining the railroads were passed, and they say that whatever laws were passed were rendered necessary by evils and necessities which grew up with the increasing population in the said State, and the indifference of the Complainant and other railroad companies for the lives of brakemen. They deny that many of the requirements contained in the said Acts were not necessary to the safe and efficient operation of trains, or that a large amount of expense had been incurred or will be necessary in making and maintaining the changes provided for in such legislation without any increase in the revenue by reason thereof. They deny that the said legislation as construed by the Supreme Court of the said State, will greatly increase the cost of conducting the business of complainant or other persons or corporations engaged in like business in said State. They deny that all the earnings of all its lines of Railroad within said State on the business transacted by it in the State are not sufficient to pay the expense of operating principally applicable to said business, or that they do not afford any

118 adequate or reasonable returns on the money invested in said property.

(13) Answering the 8th paragraph of the Complaint, Defendants admit that the lines of railroad operated by Complainant were constructed under grants of the State of Arkansas, but deny that the said Complainant had any other right to collect tolls than was implied in the organization of said railroad company. They admit that the said Complainant was entitled to a return upon the fair value of its investment over and above the expense of operating and maintaining it, but they deny that the Complainant can include in the yearly expense of operation and maintenance expenditures made for permanent improvements or those matters that are in the nature of permanent improvements. They deny that there grew out of said grants and was necessarily implied therefrom any other agreement or contract than has just been stated. They admit that the General Assembly of the State of Arkansas on July 23, 1868, passed a general law for the creation and organization of railroad corporations, and that the section which is still written in Kirby's Digest of the Statutes of Arkansas, and known as Section 6590 was contained therein. But they allege that at the time the said Act was passed, there was a provision in the then existing Constitution of the State of Arkansas, Art. V. Sec. 48, Constitution of 1868 of said State, which provided:

"That the General Assembly shall pass no special Acts conferring

corporate powers. Corporations may be formed under general laws; but all such laws may, from time to time, be altered
119 or repealed," said Section applying to railroad corporations, but subsequently to-wit: on the 30th day of October 1874, a new Constitution was adopted, by Art. XII, Sec. 6., of which it was provided:

"That corporations may be formed under general laws, which laws may, from time to time, be altered or repealed. The general assembly shall have the power to alter, revoke or annual any charter of incorporation now existing and revokable at the adoption of this Constitution, or any that may hereafter be created, whenever, in their opinion, it may be injurious to the citizens of this State, in such manner, however, that no injustice shall be done to the incorporators."

That whatever rights accrued to any railroad company organized under either of said Acts were taken subject to the right of the General Assembly of the State of Arkansas to alter or repeal the same; and that subsequently, by the provisions of the Act of March 11, 1899, and Acts supplementary thereto, of the General Assembly of the State of Arkansas, the Railroad Commission was invested with power to fix the reasonable rate for all railroad companies and that it adopted the rates which have been heretofore mentioned, pursuant to the authority vested in said Commission by the Acts of the General Assembly aforesaid. And these Defendants deny that the said Section 6590, of Kirby's Digest is in force and effect. They deny that the Complainant's lines of railroad, or any of those which it acquired and under whom it holds were constructed on the faith that the State would in good faith carry out and perform any
120 agreement in regard to rates to be charged by railroads in said State, either with reference to annual profits or otherwise. They deny that upon the pretended faith of said provision of Kirby's Digest, or any other provision of the laws of the State of Arkansas, the General Assembly agreed with the Complainant, or otherwise, that it would not by direct legislation or through any agency created by it, impose on the persons and corporations owning and operating said railroads, rules, regulations or tariffs as would deprive them of a profit of fifteen per cent per annum on the capital actually paid in. They aver, however, as they are informed and believe*d*, that the said Complainant is earning a profit of fifteen per cent per annum, if not more, on the capital actually paid in. They deny that Complainant has voluntarily reduced its rates from time to time as the developement of the business of the lines and the conditions of the country would warrant and demand; they say that when the rates were made which it now complains of, it made no complaint thereof to the Railroad Commission of Arkansas, in order to have the matter inquired and corrected, if any complaint is had, which they deny. They deny that the Complainant is not able to earn fifteen per cent per annum on the capital actually paid in by reason of the Act of February 9, 1907, or any orders of the Railroad Commission of said State. They deny that the action of said State in fixing said rates was unreasonable and confiscatory, or that

it deprived complainant by any legislation or acts or orders of said Railroad Commission, of the power to earn a profit of not less
121 than fifteen per cent per annum on capital paid in. They deny that there was any impairment of any obligation of any contract which the State entered into with said Complainant in conflict with any provision of the Constitution of the United States.

(14) For answer to the paragraph marked 9th of the Complaint, said Defendants say that no penalty imposed by any provision of any legislation of the Legislature of the State of Arkansas applies except where the act of wrong doing is done by the Complainant. And they aver that the occasion on which the provisions of said Statutes of the State of Arkansas were disregarded by the said Complainant and the occasions when its action was oppressive and harmful to shippers and other persons in the said State of Arkansas, were so numerous and repeated and became so intolerable and unbearable, that the General Assembly found it necessary to attach penalties of greater or less size to enactments and requirements of the laws of said State in order to obtain an observance thereof by the said Complainant and other railroad companies in said State of Arkansas; and that if the said Complainant and other railroad companies had shown a disposition to act fairly with the shippers and other persons in the said State of Arkansas, such enactments would not have been passed; that there is no way that they may know nor of which they have been advised, by which a railroad company can be induced to carry out its obligations, except by the infliction of penalties, and that if sometimes these penalties are severe, it is because, in the wisdom of the Legislature of
122 the State, a smaller penalty would be disregarded. They deny that the penalties and liabilities imposed by any provisions of any Statute are so severe as to constrain persons and corporations subject to the provisions of said legislation to submit thereto, however illegal, rather than take the risk of incurring such pretended enormous liabilities and penalties. They deny that the effect of these would be to utterly bankrupt and destroy said Complainant or any other railroad company, or cause the person whose money is invested in such property to forfeit their entire investment. They say that the Complainant has not hesitated to disregard the law whenever it saw fit to do so and contest its rights before the Courts of the State of Arkansas, and whenever it was in the right the Courts of Arkansas have protected it, as disclosed by decisions under the Statutes enacted by the last General Assembly of the State of Arkansas. They deny that no private officer, agent or employee of any such railroad could afford to take the risk of the penalties and forfeitures imposed upon him personally by said Statutes. They deny that the Complainant and all other persons and corporations operating railroads in said State, subject to the provisions of the aforesaid Statutes have been coerced into compliance with any illegal or confiscatory legislation by said State or orders made or promulgated by said Railroad Commission, rather than to subject said property, or the officers, agents or employees employed in and

about the operation of the same to a great multitude of
123 suits or prosecutions that would have followed the failure or refusal to put such rates in force, and they deny that the said rates, both as to freight and passenger, can not be continued in effect without irreparable loss to the Complainant or serious or irreparable injury to and destruction of the property, rights and interests of the Complainant, and of all persons interested in said property as creditors or stockholders.

(15) And for answer to the paragraph marked 10th of the complaint, said Defendants say that it is not true that the penalties prescribed by the Statutes of the State of Arkansas for the violation of the rules and regulations of said Commission, and the rates of freight and passenger fares put in force by said Commission are unreasonable and excessive in amount. They aver that they have been advised that it is not a ground of complaint against the laws of the State of Arkansas that a party has been a frequent and persistent offender, and because of this fact the penalties that he may have incurred may aggregate a considerable sum. And they have been advised and aver that if accumulated penalties are incurred on any account by an offender of the said laws, it is due to a disposition of the person to frequently offend. And they have also been advised and aver that it is not an excuse to an offender that he has a constitutional disposition to disregard the law and commit offenses prohibited by the laws of the State under which he exists and does business. They deny that the said penalties were immoderate or out of proportion of the acts designed to be punished. They deny that they are absurd or unreasonable in that they apply
124 without discrimination to a great variety of acts that are wholly unlike and dissimilar, both in regard to the nature of the act done or omitted, and in the effect thereof upon the right of the public and individuals. They deny that any provisions of the Statutes are designed to operate as a menace to compel unquestioning obedience on the part of the railroad companies, their officers, agents and employees, to all orders, rules and regulations promulgated by said Commission without regard to their lawfulness, by exposing said companies to such ruinous fines and penalties, and the officers, agents and employees of said companies likewise to such severe and ruinous penalties, as to deter said companies and the officers, agents and employees thereof, from resisting on any ground, however harsh or unreasonable, the action of said Commission may be or seem, or for the purpose of deterring any parties from resorting to the Courts for the purpose of testing the validity of any rules, regulations and rates for fear of being harassed and oppressed by a multitude of prosecutions and suits during the pendency of such proceeding, or because of the consequences to them in case they should fail to maintain the ground of contest. And they deny that any of said provisions were discriminative, or deprived complainant, and all others in like condition, of their property without due process of law or the equal protection of the law, or imposed unreasonable fines or unusual punishment, within the meaning of the Constitution of the United States or of the State of Arkansas.

(16) And for answer to the said paragraph- marked 9th
125 and 10th of the complaint, and also some of the preceding paragraphs of the said complaint, in which an effort is made to maintain a bill in equity for the purpose of testing the constitutionality of the laws of the State of Arkansas applicable to railroads and railroad rates, without reference to any existing and actual cause of complaint, these defendants aver, as they are advised, that such matters are not within the jurisdiction of a Court of Equity and do not present a case for equitable relief.

(17) For answer to paragraph marked 11th of the said complaint, said defendants say that they do not know and are not advised whether Henry Leigh or George McLean, their co-defendants, are in the habit of traveling on Complainant's trains or not, nor whether they are large shippers of freight on the lines of railroad of the Complainant, but they admit that a large number of persons residing in the said State are in the habit of travelling on Complainant's passenger trains between stations in said State. They deny that if the Complainant shall disregard, violate or refuse to put into force the aforesaid rates prescribed by said Commission for the transportation of freight and passengers, or any or either of said roads, or shall violate or fail to carry into effect any of the rates, charges, orders, rules, regulations or classifications prescribed by said Commission, on the ground that the same are unjust or unfair or unreasonable or confiscatory, or in violation of the Constitution or laws of the United States, that the said Commission will cause penalty suits to be instituted against it as authorized by the provisions
126 of the aforesaid Statutes, through the prosecuting attorneys of the various judicial districts in the State. They deny that at present a great number of suits at law for the recovery of penalties for any prospective violation of rates contained in the schedules known as Standard Freight Distance Tariff No. 3 are in contemplation. They deny that any suits will be brought against complainant for the violation of each of the rates for the transportation of passengers as well as freight between the many stations on its lines of railroad, or that any large number of suits for penalties or double damages will be brought against Complainant by these defendants or by any defendants who are shippers and patrons of Complainant and others of the same class involving a large number of suits in many counties in said State. But they admit that if suits are brought it may be that the said Complainant will be ordered to produce its books and papers in the defense of such cases, but no more so than other persons whose defense depends upon books of account. They deny that the said Complainant has been afflicted with suits for acts of wrong-doing done by it to shippers and other residents within the said State of Arkansas, but aver on the contrary that the disposition of the people of said State and of the said Railroad Commission has been to overlook most of the acts of wrong, if not nearly all the acts of wrong, done by said Complainant, except in instances where the wrongdoing of the said Complainant was of so aggravating a character and involving such gross discrimination in favor of its coal mines as to justify action upon the part of the said Railroad Com-

mission. And they said that if the said Commission ever had
127 to institute suits, they were finally decided in favor of the contention of the said Railroad Commission. And they further say that in all cases where the General Assembly of the State of Arkansas came up for consideration, relating to the duties of common carriers by rail, the acts have been so construed as to give the said common carriers the benefit for any reasonable excuse they had for not complying with said provisions of the Statutes. They deny that any improper expense would be entailed by the said Complainant by reason of the enforcement of any of the said rates, rules or regulations of said Commission, or that it would be in any manner great or involve any great or serious loss to Complainant. And they say that if the complainant is correct in saying that it would be precluded from pleading or proving the unreasonableness of said rates and proceedings instituted by private shippers, it could correct the same by testing the reasonableness thereof in a direct proceeding had for that purpose. But they say, as they have heretofore said, that by the provisions of the Statutes of Arkansas, the rates fixed by said Railroad Commission are not conclusive; that it can be shown in defense thereto that they are unjust, and the only effect they have is that they are taken to be prima facie binding until they are shown to be unreasonable and for that reason unenforceable. They deny that the question as to whether the rates prescribed by the Commission are reasonable or not could not properly be determined in a suit of that character, or that the loss sustained by Complainant in an attempt to defend such suits would be serious or would be irreparable.

128 And, having answered, these defendants ask that the complaint be dismissed, and that they be permitted to go hence with their costs.

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Now on this day comes the Complainant by its solicitors, and come the Defendants by their solicitors, and thereupon the hearing of Complainant's application for temporary injunction is continued and said application is set for further hearing on August 31, 1908, before the undersigned Circuit Judge at Chambers at St. Paul, Minn.; and it is thereupon ordered that the Complainant serve the Solicitors of the Defendants with copies of affidavits and exhibits to be used by the Complainant at said hearing, on or before August 8th, 1908; that the Defendants serve the Complainant's Solicitors with all affidavits and exhibits to be used by them at said hearing on or before August 24, 1908; and that Complainants serve Defendant's Solicitors with any rebutting affidavits and exhibits that they intend to use at said hearing on or before August 29, 1908.

Done at St. Paul, Minn., July 28, 1908.

(Signed) WILLIS VAN DEVANTER,
*Circuit Judge.*

And on September 3, 1908, the following proceedings were had to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
130 ROBERT P. ALLEN, JOHN W. CROCKETT, and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas, and Henry Leigh and George L. McLean.

*Injunction.*

This cause came on to be heard on the motion of the Complainant for a temporary restraining order, and after submission of the proofs was argued by Counsel; and now upon consideration thereof, it is ordered as follows:

That as to the Complainant, all the rates prescribed by the Defendants, the Railroad Commissioners of the State of Arkansas, for transporting and carrying intrastate freights in said State in Standard Freight Distance Tariff No. 3, which was issued by the order of said Commissioners, which took effect on June 15, 1908, and all amendments and supplements thereto, be and are hereby suspended and the enforcement of each and all thereof be and the same is hereby restrained and enjoined until the further order of the Court.

It is further ordered that the enforcement of the two cent per mile rate, prescribed in an act of the Legislature of the State of Arkansas, approved February 9, 1907, entitled, "An Act to Amend Section 6611, of Kirby's Digest of the Statutes of Arkansas, by fixing passenger rates in this State, and for other purposes," and also prescribed in the order made by the Defendants, the Railroad Commissioners of the State of Arkansas, on May 15th, 1907, putting in force the rates prescribed by the aforesaid Statute, be and the same is hereby suspended and restrained as to the Complainant herein, until the further order of the Court.

It is further ordered that no suit or suits, action or actions,
131 shall, at any time, be instituted or maintained against the Complainant, its officers, agents or employés, by any of the Defendants for or on account of its failure to continue or keep in force any of the aforesaid inhibited rates, during the time that this order shall continue in force, and that the Defendants, the Railroad Commissioners of the State of Arkansas be and they are hereby enjoined from at any time instituting or prosecuting any suit or action as aforesaid, or causing the same to be instituted or prosecuted by any officer, agent or attorney, of said Commission, or by any officer of the State of Arkansas, or any other person for a failure to keep in effect and observe the aforesaid inhibited rates; that the Defendants, Henry Leigh and George L. McLean, and all other persons and each of them from and after the time that they shall have knowledge of this order be enjoined from at any time instituting any such suit or action for or on account of any failure of the Complainant to keep in effect and observe said inhibited rates or for the recovery of damages by reason of such failure during the time that this order shall continue in effect.

It is further ordered that Complainant execute a bond to the United States of America in the penal sum of two hundred thousand dollars, conditioned that said Complainant shall keep a correct account showing as respects every carriage of passengers and freight, the difference between the tariff actually charged and that which would have been charged had the rates inhibited hereby been applied, showing the particular carriage in question, and the stations between which the same occurred, the name of the person affected,
so far as may be practicable, which record shall be made and
132 kept subject to the further order of this Court, and further conditioned that if it should eventually be decided that so much of this order as inhibits the enforcement of existing rates should not have been granted, that said complainant shall, within a reasonable time to be fixed by the Court refund in every instance to the party entitled thereto the excess of charge over what would have been charged had the inhibited rate been applied, together with lawful interest and damages.

It is further ordered that this order suspending the aforesaid inhibited rates and restraining the said defendants take effect upon the filing of the aforesaid bond and the approval thereof by the Clerk of this Court, but not within less than ten days hereof. Nothing recited in this order shall operate to prevent the said Railroad

Commissioners of the State of Arkansas from establishing and enforcing any reasonably compensatory and lawful rates in place of those whose enforcement is hereby inhibited.

Dated September 3rd, 1908.

(Signed) WILLIS VAN DEVANTER,
*Circuit Judge.*

And on the same day the following Memorandum Opinion of Court was filed:

133 In the Circuit Court of the United States for the Eastern District of Arkansas, Western Division.

In re ARKANSAS RAILROAD RATES.

Mr. John M. Moore, for Complainants.
Mr. William F. Kirby, Attorney General, Mr. George B. Rose, and Mr. Morris M. Cohn, for Defendants.

*Memorandum Opinion.*

VAN DEVANTER, *Circuit Judge:*

The matter now under consideration is an application in each of four suits against the railroad commissioners of the State of Arkansas and others for a temporary injunction restraining the enforcement of the prescribed rates for the transportation of freight and passengers in intrastate commerce in that State, it being contended on the part of the complainants that these rates are unreasonable, non-compensatory and, therefore, confiscatory. The matter was first brought on for hearing on July 28th last, when, at the request of the defendants, the hearing was postponed until August 31st that they might be better prepared to meet the contentions of the complainants. On the latter date the parties appeared, and three days were consumed in the presentation of proofs and in the arguments of counsel. Each of the four railroad companies is engaged in the transportation of freight and passengers, both intra-state and inters-state, in the State of Arkansas, and each has made a practical and extended application or test of the rates in question. The freight rates were
134 prescribed by the railroad commissioners while acting under the state statutes, and the passenger rate, which is two cents per mile, was prescribed by statute. The proofs disclose the revenues actually derived by each railroad, upon the application of these rates, from its business in the State, the revenues from each class of traffic being stated so as to show separately the earnings from intra-state freight, inter-state freight, intra-state passenger and inter-state passengers; and also disclose the value of the property employed by each road in the traffic within the state, the taxes paid thereon, the actual cost of conducting the freight traffic and the actual cost of conducting the passenger traffic. The first question for consideration is, How shall this cost be apportioned between the intra-state and inter-

state traffic? The proofs make it quite plain that the production of a given amount of revenue is attended with greater cost in intra-state business than in inter-state business; and that this is a generally recognized fact is attested by the decisions in other cases where the reasons which make it so are fully stated. Chicago, etc., Co. vs. Thompkins, 176 U. S. 167, 178; Minneapolis, etc., Co. vs. Minnesota, 186, U. S. 257, 262; Northern Pacific Ry. Co. vs. Keyes, 91 Fed. 51, 53. Here the additional cost is shown to be at least 100 per cent in freight traffic and at least 15 per cent in passenger traffic, and this is not more than what has been shown in other cases. Undoubtedly these difference- furnish a standard by which to apportion the total cost between the traffic which is intra-state and that which is inter-state. Other standards are suggested, but the proofs in the case that none of them are as satisfactory or accurate as is the difference in costs in its relation to the revenue. That standard must therefore be applied, and this may be done in this way, taking the freight and passenger traffic separately; Increase the intra-state earnings by
135 the ascertained percentage representing the difference in cost, thereby ascertaining what would have been earned by the same actual expenditure in conducting the intra-state traffic, had it been attended with the same relative cost as the inter-state traffic; then add the intra-state earnings as so increased, to the inter-state earnings, thereby ascertaining what would have been earned by the actual expenditure in conducting both the intra-state and the inter-state traffic, had they been attended with the same relative cost; then ascertain what proportion of this total represents the intra-state earnings, as so increased, and then ascertain the corresponding proportion of the total cost of the intra-state and the interstate traffic. When this mode of apportionment is applied in these cases, the result shows that the earnings of each road from its intra-state freight traffic is much less than the proportion of the operating expenses and taxes properly attributable to it, and that the earning- of two of them from intra-state passenger traffic is a little less than the proportion of the operating expenses and taxes properly attributable to it. As to the other two roads the earnings from the traffic last named are somewhat in excess of the proper proportion of the operating expenses and taxes, but not enough so to yield a return of one per centum per annum upon that proportion of the value of the property rightly attributable to such traffic. So the conclusion necessarily follows that the rates in question, both freight and passenger, are non-compensatory and unreasonable, and that their enforcement, although not so intended, is nothing other than a using or taking of property of these railroad companies without due compensation, which is confiscation. This the Constitution of the United States does not permit, for it was said in Smyth vs. Ames, 169 U. S. 466, 526:

"1. A railroad corporation is a person within the meaning
136 of the Fourteenth Amendment declaring that no State shall deprive any person of property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

"2. A state enactment, or regulation made under the authority

of a state enactment, establishing rates for the transportation of persons or property by railroad that will not admit of the carrier earning such compensation as under all the circumstances is just to it and to the public, would deprive such carrier of its property without due process of law and deny to it the equal protection of the laws, and would therefore be repugnant to the Fourteenth Amendment of the Constitution of the United States.

"3. While rates for the transportation of persons and property within the limits of the State are primarily for its determination, the question whether they are so unreasonably low as to deprive the carrier of its property without such compensation as the Constitution secures, and therefore without due process of law, cannot be so conclusively determined by the legislature of the State or by regulations adopted under its authority, that the matter may not become the subject of judicial inquiry."

It is pertinent in this connection to observe that in that case it was also said, p. 541:

"So far as rates of transportation are concerned, domestic business should not be made to bear the loss on inter-state business, nor the latter the losses on domestic business. It is only rates for the transportation of persons and property between points within the State that the State can prescribe; and when it undertakes to prescribe rates not to be exceeded by the carrier, it must do so with reference exclusively to what is just and reasonable, as between the carrier and the public, in respect to domestic business. The argument that a railroad line is an entirety; that its incomes goes into, and its expenses are provided for, out of a common fund; and that its capitalization is on its entire line, within and without the State, can have no application where the State is without authority over rates on the entire line, and can only deal with local rates and make such regulations as are necessary to give just compensation on local business."

But it is urged that a temporary injunction ought not to be granted because these railroads have heretofore applied and given effect to the rates in question, the contention being that a temporary injunction may be employed to preserve the status quo pending the suit but not to change it. It may be conceded that such an injunction is generally employed as stated, and that the Courts are generally reluctant to employ it otherwise, but this does not mean that they may not or ought not to employ it otherwise, when the exigencies of the case justly require it; for as has been often held,

courts of equity are not thus limited in their powers, but may
137 by a temporary injunction effect a change in the status quo,
if it be necessary to do so, as here, to avoid irreparable injury

from what is plainly a continuing wrong. In re Lennon, 166 U. S. 548, 566; Chicago, etc., Co. vs. Winnett —— C. C. A. ——, 162 Fed. 242, 249; Prokegama Co. vs. Klamath Co. 86 Fed. 528, 533, 535. It would hardly do to say to a railroad company that by resorting to the very best method of testing the adequacy of a prescribed rate, that is, by putting it into actual practice for a reasonable period, all right to a temporary injunction, which might otherwise

exist, will be lost; and yet that would be the result if the narrow view of the use of such an injunction here contended for were to prevail. True, some of the rates in question have been in force substantially in their present form for a considerable time, but enough of influence is accorded to this fact when it is made a reason for requiring stronger and more persuasive proof of inadequacy than otherwise would be required; and that influence has been accorded to it here. A temporary injunction will be granted as prayed for, but it will be required, for the protection of shippers and passengers, that a proper bond be executed in the sum of Two Hundred Thousand Dollars conditioned that the railroad company shall keep a correct account showing, as respects every carriage of freight or passangers, the difference between the tariff actually charged, and what would have been charged had the restrained rates been applied, and showing the particular carriage in question, the stations between which it occurred, and the name of the person affected, such record to be made and kept subject to the further order of the court; and also conditioned that the excess charged, with lawful interest and damages, shall be returned in each instance to the party entitled thereto within a reasonable date to be fixed by the Court, if it should eventually be determined that the temporary injunction ought not to have been granted.

138-369 Endorsed: Filed September 3rd, 1908. W. P. Feild, Clerk.

The following affidavits, on behalf of the complainant, were introduced and read at the hearing on the motion for a temporary restraining order:

(Omitted in printing per stipulation.)

370 And on September 12th, 1908, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
vs.
ROBERT P. ALLEN et al.

Comes the complainant, by S. H. West, Esq., its solicitor, and files herein its injunction bond in the sum of Two Hundred Thousand Dollars ($200,000.00), with the United States Fidelity and Guaranty Company as surety, which bond is approved by the Clerk of this Court.

371 Which Injunction Bond is as follows:

In the Circuit Court of the United States within and for the Western Division of the Eastern District of Arkansas.

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Complainant,

v.

ROBERT P. ALLEN, JOHN W. CROCKETT and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas; Henry Leigh and George L. McLean, Defendants.

*Injunction Bond.*

Know all men by these presents, that the above Complainant, as principal, and The United States Fidelity & Guaranty Company, a corporation organized and existing under and by virtue of the laws of the State of Maryland, as surety, are held and firmly bound unto the United States of America in the penal sum of Two Hundred Thousand Dollars, ($200,000.00), well and truly to be paid in lawful money of the United States, for the payment of which they bind themselves, their successors and assigns firmly by these presents.

Signed with our hands and sealed with our seals, and dated this 11th day of September, A. D. 1908.

This bond is made upon the following conditions, to-wit:—

372 Whereas, the Court in the above entitled cause, made an order on the 3rd day of September, A. D. 1908, granting a restraining order and providing among other things as follows, to-wit:

It is further ordered, that Complainant execute a bond to the United States of America in the penal sum of Two Hundred Thousand Dollars, conditioned that said Complainant shall keep a correct account showing, as respects every carriage of passengers and freight, the difference between the tariff actually charged and that which would have been charged had the rates inhibited hereby been applied, showing the particular carriage in question and the stations between which the same occurred, and the name of the person affected as far as may be practicable, which record shall be made and kept subject to the further order of this Court, and further conditioned that if it should eventually be decided that so much of this order as inhibits the enforcement of the existing rates should not have been made, that said Complainant shall, within a reasonable time to be fixed by the Court, refund in every instance to the party entitled thereto, the excess of charge over what would have been charged, had the inhibited rate been applied, together with lawful interest and damages."

Now, if the above named Complainant, St. Louis Southwestern Railway Company, shall well and truly keep and perform all and singular the conditions of said restraining order, as above set forth, then this obligation shall be null and void; otherwise to be

373 and remain in full force and effect.

In testimony whereof, the above bounden principal has

caused its corporate name to be hereunto subscribed by its Vice-President, and its corporate seal to be hereunto affixed and duly attested, and said Surety has caused its corporate name to be hereunto subscribed and its corporate seal to be hereunto affixed by C. P. Perrie and D. H. Cantrell, its duly authorized attorney in fact for this purpose, the 11th day of September, A. D., 1908.

[SEAL.] ST. LOUIS SOUTHWESTERN RAILWAY COMPANY,
By F. H. BRITTON, *Vice-President.*.

Attest:

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
V.
ROBERT P. ALLEN et al.

Come the undersigned and withdraw their further appearance for the Defendants, Robert P. Allen, John W. Crockett and John E. Hampton, as Railroad Commissioners of the State of Arkansas; they no longer being connected with said causes as attorneys for said Defendants.

MORRIS M. COHN,
ROSE, HEMINGWAY,
CANTRELL & LOUGHBOROUGH.

Feb'y 4, '09.

Endorsed on back thereof: Filed Feb'y 4, 1909. W. P. Feild, Clerk.

And on February 18th, 1909, the following proceedings were had, to-wit:—

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Come the defendants, the Railroad Commissioners of the State of Arkansas, by Hal L. Norwood, Joseph M. Hill, William F. Kirby and James H. Harrod, Esqs., their Solicitors, and file herein their motion to dissolve the injunction heretofore granted herein.

Which motion to dissolve the injunction is as follows:—

377 In the United States Circuit Court for the Western Division of the Eastern District of Arkansas.

No. 1636. In Chancery.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Complainant,
v.
ROBERT P. ALLEN, JOHN W. CROCKETT and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas, et al., Defendants.

*Motion to Dissolve Injunction.*

Come the Defendants herein Robert P. Allen, John W. Crockett and John E. Hampton, constituting the Railroad Commission of the State of Arkansas, and move the Court that the temporary injunction herein granted by His Honor Willis Van Devanter, Circuit Judge, be not continued until the final hearing, or until the further order of the Court and that the same be dissolved, or, if in the judgment of the Court the injunction should be continued, that it be so modified as to give the Defendants and those they represent the equitable relief to which they are entitled. That the Defendants allege the following grounds for discontinuance of said injunction, to-wit:—

I.

That said injunction was improvidently granted, for these reasons, to-wit:—

(*a*) That the evidence of the Plaintiff, which sought to
378 sustain the allegations of the bill that the freight and passenger rates were confiscatory, was based upon statistics of six months' business of the Plaintiff Railroad Company and during almost half of said period there was a financial and business panic, when the industries and traffic all over the country, and particularly the State of Arkansas, were partially paralyzed and there was a scarcity of money to move the crops and products, and a lack of demand for coal, timber and manufacturing products. And since the granting of said injunction the Supreme Court of the United

States has, on January 4th, 1909, said, in regard to a similar situation:

"We think it was error to confine the investigation to, and base the judgment upon, that year alone. The precise subject of the inquiry was, what would be the effect of the ordinance (referring to an ordinance fixing rates in the future. The operations of the preceding fiscal year, or of any other fiscal year, were valueless if the year was abnormal, and were only of significance so far as they foretold the future. If, as in this case, sufficient time has passed, so that certainty instead of prophecy can be obtained, the certainty would be preferable to the prophecy."

Had that Court made this utterance prior to the preliminary hearing herein, it is confidently asserted that His Honor, Judge Van Deventer, would not have granted the temporary injunction upon the evidence adduced based upon statistics of the operation of the Plaintiff's road during half of an abnormal year.

(*b*) The injunction was improvidently granted for the
379 further reason that it changed the status quo of the freight and passenger rates, which had long been in force, particularly the freight rates, and it is contrary to the principles of equity jurisprudence that a status quo be changed by a preliminary injunction. The facts in regard thereto are these, to-wit: The freight rates established by the Commission, which were enjoined, with the exception of a few changes made from time to time, which did not materially diminish the aggregate of the Plaintiff's income, had been in force on single lines since April 10th, 1900, and on two or more lines since July, 1903. And the reports made to the Commission by the Plaintiff, which it was required by law to make, showed that it made more money on its Arkansas business in the years 1906, 1907 and 1908, than it did prior to the promulgation of said tariff in April, 1900. That in said last three years the percentage of income to operating expense was steadily increasing. That the passenger rates had been put in effect by an Act of the General Assembly and the railroads had operated under same for a period of about sixteen months prior to the injunction herein, and said reduced passenger rates did not cause any material loss, if loss at all to the Plaintiff railroad company, as the increased travel without a corresponding increase in expense compensated for the reduced passenger fare.

Wherefore, said injunction, having been issued contrary to the established principles of equity jurisprudence, should not be continued, but should be dissolved.

II.

380 These Defendants assert that the filing of the bill in equity herein, seeking a temporary and permanent injunction, bound said Plaintiff to do equity, and, when said temporary injunction was granted restraining the enforcement of the passenger and freight rates upon the ground that said rates were unreasonable and confiscatory, the said Plaintiff was bound by the principles of equity jurisprudence, to put in force, if it exercised its power, only

reasonable rates, and it was not at liberty to avail itself of the injunction against the rates established under the law and put in force unreasonable rates. In violation of this settled principle of equity jurisprudence, the Plaintiff has, since the rates established by the Commission and the General Assembly were temporarily enjoined, established freight and passenger rates of all intrastate shipments and said freight and passenger rates are unreasonable and exorbitant and are destroying many of the industries of the State. And said Plaintiff is maintaining interstate rates so low that the same amount to a discrimination against the business and industries of the State of Arkansas. That it discriminates in favor of longer hauls of interstate shipments, under similar and like circumstances, against shorter hauls of intrastate shipments to the great detriment of the shippers and consumers of the State of Arkansas.

The tariff put in by the railroads since said injunction upon the leading articles of commerce in the State is an unreasonable increase. On grain there is an increase of 50% over the Commission rate; on cotton 140% over the Commission rate; on packing house products 100%, on coal, 35%, on brick, stone and sand, 75%, on lumber 107%, and on the various lines of merchandise about 75%.

381 There is an average increase on the principal commodities of the State of 77% over the Commission rate, which these Defendants aver is unreasonable, extortionate and oppressive to the shippers of the State.

The Commission avers that its freight tariff as a whole is fair, compensatory and reasonable and this these Defendants expect to maintain by satisfactory evidence at the final hearing of this suit. And said Commission has, since the injunction by Judge Van Devanter, by proper action, after notice to the Plaintiff and all other railroads, putting in such unreasonable and exorbitant rates, after a hearing, declared said freight rates so established by the Plaintiff and the other railroads to be unreasonable. And these Defendants now submit with this petition many affidavits to sustain the action of said Commission in declaring the rates unreasonable, and to sustain the allegation herein that said rates are unreasonable, extortionate and discriminatory against the State of Arkansas and destructive and detrimental to the shippers of the State.

These Defendants allege that it is a principle of equity that detriment to the public is a consideration proper to be considered by a Chancellor when considering an application for a discontinuance of an injunction. That the Plaintiff has taken advantage of its injunction against the Commission and put in force unreasonable, extortionate and oppressive rates. Wherefore, having violated the spirit of the injunction obtained by it, the Plaintiff is not entitled to a continuance thereof, but, under the settled principles of equity, the same should be dissolved.

382 The Defendants further allege that in many instances the unreasonably high rates established by the railroads since the temporary injunction herein has diminished the volume of traffic, and the Plaintiff itself is suffering a material loss of business from its destruction of the industries of the State, and, in

many instances, the injunction is injuring it as well as the shippers and consumers and industries of the State.

The Defendants allege that, after the injunction was granted temporarily restraining the two cent passenger rate put in force by the Act of the General Assembly, that the Plaintiff has increased the passenger rate to three cents per mile and has not afforded any better service while so doing. And the Defendants further allege that the *Defendant* is transporting all persons who buy 2000 mile tickets at two cents per mile, while requiring travelers who do not buy such mileage books to pay three cents a mile, and is thereby materially decreasing the amount of travel. The Defendants aver that the increase in travel at the rate of two cents a mile, except in abnormal years and in times of panic, will not cause any loss to Plaintiff or any other trunk line in the State of Arkansas, as the increased travel on account of the reduced rate will compensate for the loss in rate, and if the Plaintiff gives said two cent passenger rate a fair test, as it has not done, the same will prove to be true. The Defendants further allege that neither the Plaintiff nor these Defendants are able to state the exact effect of the two cent passenger rate, and there has been no fair test of it under the principles established by the Supreme Court of the United States, as it is a matter of prophecy
383 and not of fact as to the effect of same, and, according to the decisions of that Honorable Court, in such a case the Plaintiff is not entitled to a temporary or permanent injunction until it has fairly tested said rate and found the same confiscatory so long a length of time that the future can be foretold by its past operation.

## III.

If in the better judgment of the Court, it is found that Plaintiff's violation of the spirit of the injunction, does not entitle the Defendants to its dissolution, then the Defendants allege that those they represent are entitled to have the injunction continued only upon terms which would be equitable to the Plaintiff and to the interests represented by the Commission, said terms being that the Plaintiff be enjoined from enforcing its existing rates, where shown to be exorbitant and unreasonable, and that it be enjoined to put into force fair and reasonable rates pending the determination of this litigation over the rates enjoined by it.

## IV.

The- Defendants allege that the Plaintiff has a plain and adequate remedy against any rate established by the Commission which is not reasonable and compensatory and should not be entitled to seek a remedy in a Court of Equity until it has exhausted its efforts to obtain a reasonable and compensatory tariff under the existing law, which affords it ample and complete redress against any injustice in the freight rates established by the Commission. That it is made the duty of the Commission—

"to hear all complaints made by any person, firm or corpora-
384 tion against any such tariff or charges so approved (by it); to hear the parties to the controversy in person or by attor-

ney, or both, and may take testimony orally and in writing, and regulate the argument thereon and conduct the investigation of such complaints in such manner as to the Commisison may seem best to arrive at the truth, and when any changes are made in the tariff notice thereof shall be given to the person or corporation to be affected thereby."

And it is further made the duty of the Commission in changing or fixing the rates, to take into consideration the character or nature of the service to be performed, the entire earnings of the railroad, the expense of operating same and the expense and value thereof. And the Defendants assert the facts to be that when the first tariff was established by the Commission, in 1900, that it assured the Plaintiff and all other railroads affected by it that, if said tariff did not produce a fair profit, the Commission, upon a showing so made, would readjust it so as to produce, if possible, for the Plaintiff, a fair profit upon its investment. And such has been the attitude of the Commission from then until the present time, and is still the attitude of the Commission. That several small line railroads have applied to the Commisison for relief against the existing rates, and, where the showing has been made of the justice of the application, the Commission has granted the same. That the Plaintiff has not presented any complaint to the Commission, alleging that any rate, or the tariff as a whole, established by it was not compensatory and asking for an increase of any rate or of the tariff as a whole.

385 That the Commission recognizes now, as it has always done, no tariff, whether promulgated by a railroad or a Commission, as perfect, and that all tariffs should be changed from time to time to meet changed conditions in order to do justice to the railroads or shipper, as the case may be, and this the Commission has at all times been ready to do whenever satisfactory evidence should be offered to it showing the justice of and necessity for same.

The Defendants assert that the temporary injunction should not be continued until the Plaintiff has availed itself of its legal right to obtain redress of its alleged grievance, in so far as the freight rates are concerned, before the Commission, and alleges it is contrary to the principles of equity to entertain a suit where full and adequate remedy at law is open to the Plaintiff; that it is contrary to the comity which federal courts extend to state tribunals to grant relief in said federal courts against state regulations promulgated under state laws, until the Plaintiff has sought its constitutional right in the tribunals where the alleged unconstitutional regulation is attempted to be enforced.

The Defendants allege that they are called upon to defend in this court the rates of their predecessors and maintained by themselves, with a few changes as called for from time to time, without having had an opportunity to hear the complaint of the Plaintiff and pass upon its justice.

Wherefore, the Defendants pray that the injunction be discontinued or its operation suspended until the Plaintiff applies for redress before the Commission and gives it an opportunity to pass upon the matters which are alleged in Plaintiff's complaint.

386

V.

The Defendants allege that the Plaintiff's case is predicated upon the relative cost of intrastate over interstate traffic, and that the method of computing intrastate traffic is one upon which railroad accountants differ. The General Auditor of the Plaintiff, in his affidavit filed in this case, has testified:

"There is a diversity of opinion among railroad officials and the accountants who deal with the accounts of railroad corporations as to how expenses should be divided between the two classes of service, intrastate and interstate. For operating purposes the train mile, car mile and ton mile are often used as units to determine the division of freight service and freight cost."

Said Auditor asserts that the revenue basis is the proper one, but competent and equally skilled accountants assert that it is not the true basis but the ton mile basis should control. This difference of opinion is one of the issues to be determined in this suit, and if the ton basis is established to be the proper basis, then, under the evidence submitted by the Plaintiff as to its gross earnings, operating expenses and value of its property, the Commission's tariff is providing it a large revenue and affording a fair compensation upon its investment. That it is contrary to the principles of equity that a temporary injunction should change the status quo where the matter to be litigated is gravely doubtful and upon such gravely doubtful contention the Plaintiff's whole case is predicated. When an injunction is granted against a rate fixed by law as vio-

387 lative of constitutional right, the invalidating facts must be proved to the satisfaction of the Court and not merely rest upon a difference of opinion among expert accountants.

VI.

If the injunction in whole, or modified so as to require the Plaintiff to do equity while this litigation is pending by establishing reasonable rates, is continued, then the Defendants pray that it be further modified so as to afford the interests they represent adequate relief, in the event that the Defendants are ultimately successful, in the following particulars:

(*a*) The bond required of the Plaintiff is wholly inadequate to cover the losses to the interests represented by this Commission, to-wit: The shippers and passengers of the State. And the Defendants allege the facts to be, taking the increased rate of 33⅓% on passenger traffic, established by the railroads, and applying said increase to the passenger traffic of the six months for which the Plaintiff furnished statistics, the increased revenue to the Plaintiff on the passenger business would amount to $557,694.80 per annum. From this gross sum should be deducted the amount of travel that the Plaintiff still permits to be had at two cents a mile, the exact amount of which is not known to these Defendants. Taking the statistics for the six months freight business furnished by the Plaintiff and applying to it the increase of 75% (which is really less than the true increase) an increased revenue of $960,375.24 is produced. From this should

be deducted the loss of business to the Plaintiff from its destruction of the various industries that are not now, under its high
388 tariff, shipping the commodities, which they would otherwise have shipped. The Defendants allege that these calculations, based upon the statistics of the Plaintiff, show that a bond of $200,000.00 is wholly inadequate to protect the people who are paying the extortionate and unreasonable rates, in the event that the Plaintiff does not finally prevail in this case, and that such bond should be required as will protect such interests.

(*b*) That the injunction herein requires the Plaintiff shall keep a correct account showing, as respects every carriage of passengers and freight, the difference between the tariffs actually charged and that which would have been charged had the rates inhibited been applied, showing the particular carriage in question and the stations between which the same occurred and the name of the person affected, so far as may be practicable, and that Plaintiff keep a record of the same subject to the order of the Court, and conditioned to refund the excess should the injunction not be finally sustained. These defendants allege that said requirement is not ample to secure the shippers and passengers, and pray that, should the injunction be continued, the plaintiff be required to furnish to each passenger and to each shipper a certificate or coupon showing the excess payment over the rates enjoined, so that said passenger or shipper would have prima facie evidence of the amount due him from the plaintiff should the Plaintiff not ultimately succeed herein.

And these Defendants further assert, upon information and belief, that the Plaintiff is not keeping such an account as is required by the injunction, and pray that it be required to file an account
389 showing the excess of freight and passenger fares collected by it over the rates enjoined, and from whom such freight and passenger fares have been collected, to the end that the rights of all parties interested may be protected.

And these Defendants pray for all further relief which the Court may find in equity and good conscience they and those they represent are entitled to receive.

390 UNITED STATES OF AMERICA,
*Western Division of the*
*Eastern District of Arkansas:*

Be it remembered, That at a Circuit Court of the United States of America, in and for the Western Division of the Eastern District of Arkansas, begun and holden on Monday, the 5th day of April, Anno Domini, One Thousand Nine Hundred and Nine, at the United States Court Room, in the City of Little Rock, Arkansas, the Honorable Jacob Treiber Judge presiding and holding said Court, the following proceedings were had, to-wit: June 1st, 1909:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

The Court being now sufficiently advised as to what disposition to make of the motion to modify the temporary injunction heretofore granted in this case, and which was submitted at a previous day of this term.

It is ordered, adjudged and decreed that, in addition to the conditions upon which the temporary injunction was granted herein, the following conditions be and they are hereby prescribed by the Court:

That from the affidavits and evidence submitted, the Court finds that the tariff of freight charges put into effect by the said Railway Company since the granting of the temporary injunction is unreasonable, and, therefore:

It is ordered that the freight rates pending this action, to be charged by the said railway company shall be so arranged as to produce a net increase of thirty three and one third per cent (33⅓%) of the revenue produced by Standard Freight Distance Tariff (No. 3) Number Three, put into effect by the Defendants, State Railroad Commissioners, and in force at the time the temporary injunction was granted; and that the same be put into effect not
391-421 later than June Seventh (7th) 1909, and continue in force until the further order of the Court with leave to either party to apply to the Court for a modification of said tariff, if it shall be found that it does not conform to the order of the Court in respect to the aforesaid increase in the revenue of the said Railway Company.

And thereupon come the Plaintiffs and file a tariff of freight rates which both parties believe conform to the order of the Court, and said tariff is ordered to be filed marked Exhibit "A" to the decree modifying the temporary injunction and made a part of the record in this cause.

It is further ordered that the security given by the said Railway Company upon the granting of the preliminary injunction herein shall in no wise be affected by this order, but shall remain liable in the same manner for the rates charged under the tariff promulgated under this order of Court as if this order had been embodied in the order granting the preliminary injunction; and a failure to comply

with the schedule herein filed shall be cause for dissolution of the temporary injunction.

(Signed) JACOB TREIBER, *Judge.*

Which Exhibit "A" is as follows:
(Omitted in printing per stipulation.)

422 And on the same day the following opinion of Court was filed:

In the Circuit Court of the United States for the Western Division of the Eastern District of Arkansas.

In re ARKANSAS RAILROAD RATES.

John M. Moore, Buzbee & Hicks, Reid & McDonough and B. R. Davidson, for Complainants.

Hal L. Norwood, Attorney General, Joseph M. Hill, James H. Harrod and William F. Kirby, for Defendants.

On Motion for Modification of Preliminary Injunctions.

TREIBER, *D. J.:*

Upon application for a temporary injunction made by the railroads of this State, and heard by Judge Van Deventer, one of the Circuit Judges of this Circuit, preliminary injunctions were granted restraining the enforcement of the intrastate rates then prescribed by the Railroad Commission of the State of Arkansas, for the transportation of freight and the two cents a mile passenger Act of the General Assembly of the State of Arkansas, approved February 9, 1907, the contention on the part of Complainants being that they were unreasonable, non-compensatory and confiscatory. At that hearing the learned Judge found from the evidence submitted that the additional cost of intrastate traffic exceeds that of the interstate of the complaining roads one hundred per cent on freight, and fifteen per cent on passenger traffic, and applying this rule to the earnings of the roads and their values decided that, "the rates
423 in question are non-compensatory and unreasonable, and that their enforcement, although not so intended, is nothing other than a taking of the property of the railroad companies without due compensation, which is confiscation." The opinion on that hearing will be found in 163 Fed. 141.

The State Railroad Commission now applies for a modification of these temporary injunctions, alleging, that, "Since the granting of the preliminary injunction the railroad companies have established freight and passenger rates on all intrastate business, which are unreasonable and exorbitant and are destroying many of the industries of the State." It is charged that the passenger rate has been raised to three cents a mile, and the freight tariffs put into effect, increased those prescribed by the Commission and in force

at the time the temporary injunctions were granted, as follows: 50% on grain; on cotton 140%; on packing house products 100%; on coal 35%; on brick, stone and sand 75%; on lumber 107%, and other various lines of merchandise, about 75%; that the average increase on the principal commodities of the State on a revenue producing basis is over 77%, which rates it is claimed are unreasonable, extortionate and oppressive to the shippers and consumers of the State. It is, therefore, asked that the preliminary injunction be modified so as to prevent this injustice.

That a preliminary injunction may be modified at any time whenever the ends of justice require it is beyond question. Not only may it be done by the trial court, but upon appeal by the appellate tribunal. Denver and Rio Grande R. Co., vs. United States, 124
424 Fed. 156, 59 C. C. A. 579. Judge Sanborn, who delivered the opinion of the Court in that case said that, "a preliminary injunction may be modified when by such modification the injury or inconvenience of one or more of the litigants may be decreased without increasing the danger of loss to their opponents." And, accordingly, he modified the temporary injunction which had been granted by the lower Court. There can be no doubt that a temporary injunction can not be claimed as an absolute right, but is within the sound discretion of the Court, that discretion of course, to be controlled by the established principles of equity jurisprudence. Shubert vs. Woodward, 167 Fed. 47, — C. C. A. —. In the head note of that case, prepared by the Court, it is said, "the specific performance of contracts and the issuance of injunction are not matters of right; they rest not in the arbitrary or whimsical will, but in the judicial discretion of the Court, informed and guided by the established principles, rules and practice in equity, which are advisory rather than mandatory;" see also New York City vs. Pine 185 U. S. 93, 22 Sup. Ct. 592, 46 L. Ed. 820. Kansas vs. Colorado 206 U. S. 46, 27 Sup. Ct. 655, 51 L. Ed. 956.

Granting or refusing a preliminary injunction proper regard must be had for the comparative injury which will be sustained by the defendant if the injunction were granted, and by complainant if it were refused, and in order to prevent great injury to the Defendant when the complainant is prima facie entitled to a temporary injunction, the Court, in the exercise of its discretion, frequently resorts to the expediency of imposing terms and conditions upon the parties at whose instance it proposes to act. Russell vs. Farley, 105 U.
425 U. 433, 438, 442, 26 L. Ed. 1060; Myers vs. Block, 120 U. S. 206, 214, 7 S. Ct. 529, 30 L. Ed. 644; Ewing vs. Filley, 43 Pa. St. 384, 387; Denver & Rio Grande R. Co. vs. United States 142 Fed. 625, 73 C. C. A. 621; Vogel vs. Warsing, 146 Fed. 449, 77 C. C. A. 109; McElroy vs. Kansas City, 21 Fed. 257, 264, 263 (C. C.); McCaul vs. Braham, 16 Fed. 37, 42 (C. C.); Spring Valley Water Co. vs. San Francisco, 165 Fed. 667 (C. C.); Macon R. R. Co. vs. Gibson, 85 Ga. 1, 11 S. E. 442; Careton vs. Rugg 149 Mass. 550; Kerr on Injunction (2nd Am. Ed. 30); Spelling or Injunction, p. 1031-1033. The authorities cited by Counsel for Complainants

all refer to permanent, and not preliminary injunctions and for this reason are not applicable to this proceeding.

In Denver & Rio Grande R. Co. vs. United States, supra, it was said that, "The purpose of a preliminary injunction is to protect and preserve the rights of all the litigants with the least injury to each until the controversy between them can be tried and finally decided."

In Spring Valley Water Co. vs. San Francisco, supra, the question before the Court was the terms upon which a preliminary injunction should be granted against the enforcement of an ordinance fixing water rates to be charged by Complainant. Judge Farrington, in a very exhaustive and learned opinion held that,

"This Court can not control the discretion of the supervisors; it can not substitute its judgment for theirs. The power and duty of fixing water rates is cast by the Constitution on that board and not on this Court. The law no where provides an appeal to this Court from an ordinance adopted by the Board of Supervisors, nor does it clothe this tribunal with any authority to review, revise, cor-
426 rect or send back to that body for reconsideration an ordinance establishing the compensation to be collected for water. * * * It would seem, therefore, that the Court is limited to the determination of a single question, namely, is the ordinance confiscatory?"

And coming to the question of a preliminary injunction the learned Judge says: "It is an abuse of judicial discretion to issue an injunction which will permit one party to obtain any advantage by acting, when the hands of the adverse party are tied by the writ."

From these authorities it may be stated that a Court, when called upon to grant a preliminary injunction, may impose such terms, on granting it, as will protect the rights of the defendant as well as those of the complaining party, and if, after the temporary injunction has been granted, and before a final hearing while it is in force, it is shown to the Court that great injustice is being done by reason thereof, that the acts of the plaintiff are unjust, oppressive and unmindful of the rights of the defendant, the Court may modify it by imposing terms which will prevent such injustice.

This leaves for determination another very important matter. Can the Court, for the purpose of requiring the complainant, who obtained the preliminary injunction, to do equity and preventing the imposition of extortionate rates for the carriage of freight and passengers, fix maximum rates beyond which complainants must not go during the pendency of the litigation, and make a compliance with these rates a condition upon which the temporary injunction will be continued? That the making of carrier's rates is a
427 legislative act and not judicial is frankly conceded by Counsel for the Defendant, and for this reason Courts are powerless to make them. Upon final hearing the Court must, if it is shown that the Commission rates are compensatory, within the meaning of the law, dissolve the preliminary injunction or make it perpetual if they are found to be non-compensatory, and therefore confiscatory.

The authorities are not only numerous but harmonious on this subject. A few of the leading and late cases is all that is necessary to cite on the subject. Reagan vs. Farmer's Loan & Trust Co. 154 U. S. 362, 400, 14 S. Ct. 1054, 38 L. Ed. 1014; Interstate Commerce Commission vs. Ry. Co. 167 U. S. 479, 499, 505, 17 S. Ct. 896, 42 L. Ed. 242; Prentiss vs. Atlantic Coast Line, 211 U. S. 210, 226. But when the application is for a temporary injunction the rule is different. As was said in Spring Valley Water Co. vs. San Francisco, supra:

"While it appears that the ordinance in question is probably confiscatory and therefore invalid, the fact that complainant will suffer irreparable injury unless an injunction issues is not decisive. The Court owes equal consideration to both parties; it must not issue an injunction which will do more harm to one party than good to the other; it should so preserve the matters in dispute as to protect each party as far as possible from harm. We have no means of knowing the plans of the company, whether it will raise the rates for the remainder of the fiscal year to the full amount of what is alleged to be reasonable—that is, so as to realize an income of more than $3,000.00 net—or whether it will be content with something less. If the ordinance is finally adjudged valid, any collections made in excess of the rates specified therein must
428 be repaid. Such repayment can be secured by a proper bond; but if the ordinance is adjudged confiscatory and therefore invalid, there is no practicable remedy for the consumer, who, under the necessity of agreeing to the terms offered by the company or foregoing the use of water, contracts to pay and does pay more than is just. His injury is irreparable. It is not sufficient to say that Courts will enjoin the unreasonable charges, or that this Court will promptly dissolve the injunction, if, pending the suit, complainant abuses the process of the Court. Whether the rates so fixed by the company are reasonable or unreasonable is a question of fact which no court would presume to decide without a hearing, and such a hearing may be long and expensive. Most consumers will consider water of any quality or price cheaper than litigation. Neither conception of the status quo is satisfactory. Neither, if maintained, will afford adequate protection but to one party. If the ordinance is confiscatory, complainant is entitled to an additional sum which will make its compensation just and reasonable. This sum will be lost to complainant if the injunction is denied. On the other hand, if the ordinance is confiscatory and the injunction is granted as prayed for, if complainant exacts a compensation in excess of what is just, the excess will be lost to San Francisco and its inhabitants. Equity, however, has no peculiar concern for the status quo, except that its preservation usually, if not always, accomplishes that which is the object of a preliminary injunction; that object is to preserve the fund, the property, the right or other thing in dispute, from waste, destruction or disturbance until the rights and equities of the contending parties can be finally considered and determined. Notwithstanding
429 the fact that the ordinance is probably confiscatory, and that its enforcement should be restrained pending suit in order

to save complainant from irreparable injury, and interlocutory injunction, the effect of which is to give complainant the authority, practically without limit, to fix prices at which it will sell water, must be denied for the following reasons." He then proceeds to state the reasons which it is unnecessary to repeat here.

The effect of the preliminary injunctions is to leave the State without any regulating freight rates (it is otherwise as to the passenger rates as the statute in force at the time of the enactment of the Act of 1907 limiting them to three cents a mile is undoubtedly effective if the later Act is void. Railway Co. vs. State, 86 Ark. 363) and leaves the railroads without any limitation, so far as the laws of the State of Arkansas are concerned, to make them what they deem proper until the final determination of these causes. Assuming from the figures presented by the Complainants, and as found by Judge Van Devanter, that the rates enjoined are confiscatory or at least not sufficiently remunerative, the injunction, if the evidence at the final hearing is the same, would have to be made perpetual. In that event the rates collected during the pendency of these actions, no matter how excessive and unreasonable, and until the Commission can make new rates, rates sufficient to enable the roads to earn a reasonable compensation, will be wholly lost to the shippers. It is true, the preliminary injunction specially provided that, "Nothing recited in this order shall operate to prevent the said Railroad Commission of the State of Arkansas from establishing and enforcing any reasonable, compensatory and lawful rates, in place of those whose enforcement is hereby in-
430 hibited." But it is not very probable, nay almost certain that any rates which may be proposed by the Commission, if less than those rates put in effect by the Complainants, which they claim are as low as they can make them, will cause further litigation, as supplementary bills would be filed to enjoin them as confiscatory. Of course, the Court could refuse to grant the injunction if the rates were not shown to be confiscatory, but in order to do that the Court would necessarily have to determine what rates were compensatory and just, and in all likelihood from evidence identical with that submitted at this hearing. As the Railroad Commission contends, and no doubt every member thereof believes, that the rates now enjoined were compensatory or if not that a very slight increase would make them so, the probabilities are that a number of suits would have to be filed by each of the railroads until a tariff would be prepared which would justify the Court, acting upon the basis of apportionment of expense made in this case, and which will not be disturbed before there is a final hearing, if then, to refuse a preliminary injunction. In the meantime the rates, although they may be unjust and oppressive, would be collected.

Therefore, to prevent not only a multiplicity of suits, but to require complainants who seek equity do equity, this Court is justified in prescribing such maximum rates as may be just to the railroad as well as the public. In Spring Valley Water Company vs.

San Francisco, supra, Judge Farrington found that complainant would probably be entitled to a gross income of $266,675.60 in excess of that afforded by the rates fixed by the supervisors, and thereupon he held that complainant was entitled to so much relief
431 but no more and granted the preliminary injunction upon that condition.

It is true that in the San Francisco Water Company case there were only a few rates to be fixed while in these cases hundreds of different rates must be determined. This may necessitate a great deal more labor and may require the assistance of a special master, if the parties are unable to reach an agreement under the directions and instructions of the Court, if the Court finds that the rates put in force by the railroad companies since the granting of the preliminary injunctions are so exorbitant as to be unjust and oppressive. But this ought not to prevent the Court from doing justice and preventing a wrong. The difference is only one of degree and not of principle. If it appears from the evidence that the rates now in force are unreasonable, enabling Complainants to increase their earnings on intrastate rates to a much greater extent than is necessary to enable them to make a reasonable return on their investment, great damage will necessarily be sustained by the public who pay these rates, for some of which there can be no redress, even if the injunction should be dissolved. For the Court to refuse to act in such a case would be an injustice which no Court of equity should ever be guilty of. The bond executed by the railroad companies and the provisions made by the orders granting the preliminary injunctions, providing for an ascertainment of the damages, will only become effective if, upon final hearing, the injunctions are dissolved, but if it should appear upon that hearing that the rates while compensatory to some extent are still not sufficient to enable complainants to earn as much as in the opinion of the Court they are lawfully entitled to, the injunction would have to
432 be made perpetual, although a small increase of the rates from five to ten per cent would be sufficient to have made the rates compensatory within the meaning of the law. In such a case no recovery could be had by the Defendants, even if it should appear that the increase in the rates during the pendency of the temporary injunction exceeded one hundred per cent. And even if the injunction should upon final hearing be dissolved, the only damages which the law would permit to be recovered would be the difference between the rates paid under the increased tariff schedules and what would have been paid under the rates enjoined. In the meantime industries may have been prostrated and wholesale houses driven from the State, because, owing to the high rates in force during the pendency of these proceedings, they are unable to maintain their trade in competition with others located outside of the State and enjoying the benefits of lower interstate rates.

At the hearing of this application a great deal of testimony was introducced tending to show not only the extent of the increase of rates since the preliminary injunctions have been granted, but it was also shown that interstate rates from points outside of this

State on business competitive with that of the business men of this State have not been increased. It appears from these affidavits that some branches of business have been practically suspended so far as intrastate business is concerned by reason of the fact that the lower rates given to competitors doing business in other states prevented them from being able to deliver to retail dealers in parts of this State their articles of manufacture at the same prices. It is true the railroads claim, and no doubt justly, that although the new intrastate rates have been in force for over five months, and no
433 changes in interstate tariffs have yet been made, they will soon put them in effect and they will be as high as those now in force on intrastate business; they claim that the changing of these tariffs requires a great deal of time; that the last few months have been the busiest of the year, and that under the interstate commerce law, before new interstate rates can become effective, they must be filed with the Interstate Commerce Commission thirty days. The Court has no doubt that these statements are true, and that these complainants do not intend to discriminate against the people of this State whose welfare is necessary to their own existence; still the injury has been, and is still, being inflicted. While these facts would not be sufficient to justify this Court in declaring the rates exorbitant and unjust, they are circumstances which would be taken into consideration, not so much for the purpose of determining whether their present tariff is exorbitant as for the purpose of determining the propriety of the Court, sitting as a Court of equity, to exercise its power to prevent injustice to and oppression of the people of the State if the proofs show that it is being done.

This hearing was had on ex parte affidavits, testimony which can never be said to be conducive to obtaining exact facts, still as the most important testimony is based upon documentary evidence, the tariffs in force at the different times, and the income and expenditures of the roads, it is comparatively easy to ascertain the effect of these new rates.

On the part of the Railroad Commission comparative statements of the freight rates in force when the bill was filed and those
434 put in since the granting of the preliminary injunctions, and which are conceded to be correct, were introduced. These indicate that some rates have been raised over 200 per cent, and the average increase in the freight rates on a revenue basis, it is claimed, exceeds 77 per cent. On the other hand it is claimed by the railroad companies that some of the rates of the Commission were absurdly low, and that the increase of the new rates, as shown by the earnings for the month of November, 1908, the first month the new rates went into effect (for one of the roads it is based on the earnings for the months of November and December, 1907) the increase is as follows:

St. L. I. M. & S. Ry. Co., 41.80%.
St. L. & S. W. Ry. Co., 41.59%.
C. R. I. & P. Ry. Co., 24.95%.
St. L. & S. F. Ry. Co., 17.77%.
K. C. Southern Ry., 38.31%.

or an average of the five roads of 36.75%. These calculations are based on the actual sums collected, compared with what would have been collected upon the basis of the rates enjoined. No doubt this is the most satisfactory, if not the only correct basis, for ascertaining, on a revenue basis, the actual increase of the rates, especially as these actions are based solely upon the ground that the Commission rates were so low as not to earn anything on the investment of complainants. But, can it be said that the business of one, or even two months, especially the first, after the new increased rates went into effect, is a proper criterion for the ascertainment of these facts. It is urged that during the winter months the rates which were raised the highest, fruit and vegetables, on which the average raise is from one hundred to two hundred per cent; grapes nearly three
435 hundred per cent; seeds from one hundred fifty to two hundred per cent; lumber, the largest tonnage commodity of the State, over one hundred per cecnt, do not move extensively during the months of November or December; and in addition thereto it is claimed, and so shown by the affidavits of a number of merchants, that immediately after notice had been given of the new rates, and for the several weeks before they went into effect, a great many merchants purchased all their goods on which the increase of rates was material, and had them shipped to their places of business, so as to obtain the benefit of the lower rates. These statements seem reasonable and fair; but, in any event, it is hardly reasonable, in view of the large variety of products in this State to take the business of any one or two months for the proper standard for the year's business. That is fully shown by the fact that the revenue increase on a percentage basis of the different roads varies greatly; while the St. L. I. M. & S. R. R. Co., and the St. Louis Southwestern Ry. Co., report an increase of nearly 42%, the St. L. & S. F. Ry. Co., shows an increase of only 17.77%, and the Rock Island Railway an increase of less than 25%. No doubt the fact that the industries, as well as the products, mineral, forest and agricultural, along the line of the latter roads are different from those of the other roads, accounts for this difference. The fact that 40% of the entire tonnage of the intrastate business of the State is that of lumber and forest materials, for which the tariff has been raised over 100%, is of itself sufficient to show that the business for the months of November and December would hardly be proper tests for the business of the railroads of the State for the year, for there are hardly any
436 months during the year in which there is less building material used than during those months. In addition to this, it must not be overlooked that the rates are not raised horizontally, but run from 3% to over 200%. Defendants have submitted some calculations based on a large number of freight bills, paid during the five months the rates have been in force. These show an average increase on a revenue basis of over 77%. But they can not be accepted as a proper test for several reasons. It has been shown that these bills constitute but a little over 1% of the freight earnings during that time, and there is nothing to show that these bills cover those rates which have been but slightly raised, say from 3% to 20%,

as well as those which were increased greatly. The probabilities are that shippers would pay but little attention to small increases and furnish only such bills as indicated what they considered excessive rates. Taking the two tariff sheets, those in force at the time the injunction was granted, and those now in operation, with the percentages of increases as figured out by the experts of Complainants, and admitted by defendants to be correct, it is reasonable to say that the increase will exceed on a revenue basis considerably over 50%.

On behalf of the complainants it is also claimed that these large increases are based on the Commission rates which were much lower than the rates in force before the Commission was created, and the tariff then in force is offered in evidence to show that the present rates are but slightly, if any, in excess of those then in force. The tariff sheet offered is that of the St. Louis, Iron Mountain & Southern Railway Co. 1508-A, but it is shown that that tariff was only
437 nominally in effect; that the real tariff was Number 3315, called the "Jobber's Tariff" on which most of the freight traffic was carried, and in addition to this, there were special rates for almost every commodity in the State and that only a few of the small shippers who were ignorant of the tariff schedules were charged rates under 1508-A; that the Commission tariffs were but slightly lower than tariff Number 3315, and higher than many of the special tariffs in force at that time.

As to the special tariffs, the Court is satisfied from the evidence that they were made very low, in many instances below the cost of carriage, for the purpose of aiding in the establishment of new industries along the lines of railroads, and by these means build up the country, and thus, indirectly, increase the business and earnings of the trade. Such rates, which were not illegal at the time, can not be considered as a fair test for the purpose of determining what would be compensatory rates. That the Commission did make material reductions, even from the "Jobber's Tariff," No. 3315, has been fully established, but it is doubtful whether they amounted to as much as twenty per cent, although the Commission in its first report, claimed credit for having made reductions exceeding thirty per cent. But in considering this claim of the Commission, the Court is satisfied that in making it they were influenced by the fact that many of the large shippers who had theretofore enjoyed special rates, and which were lost by the acts of the Commission, which prohibited discriminations, had attacked the acts of the Commission and were urging the repeal of the statute creating it. A twenty per cent reduction is a liberal estimate for the tariff of the Commission.

On the part of the Defendants it is also urged that these
438 rates had been in force for eight years without any complaint on the part of the railroads, or any effort to restrain them, and for this reason it is claimed a strong presumption arises that they were not only not confiscatory, but were just and fair. It is true that in the absence of any proof, such acts of the railroads would raise a strong presumption that the rates were compensatory, a presumption as strong as that rates made by legislative authority are

fair and reasonable; still, it is only a presumption and may be rebutted. For that purpose it has been shown that the Commission rates were only submitted to under vigorous and continuous protests, and after it had been fully established by fair trial that these rates were confiscatory did the railroad companies feel justified in invoking the aid of the Courts to prevent what they consider a great injustice to them. In addition to that, it has been shown that since then there has been a continual increase in the operating expenses of the railroads in this State. The taxes have been more than doubled since the Commission first established its tariff; the cost of materials necessary for the operation of the trains and maintenance of the tracks, has increased largely; wages of all employés have been raised very materially; the legislation of the State, while no doubt prompted by the best motives, for the purpose of protecting the lives and property of its citizens, has greatly increased the operating expenses of all railroads in this State. The fellow servant rule of the common law has been abolished; railroads are made liable for all losses sustained by fires caused by sparks from locomotives, regardless of any question of diligence or negligence; the hours of labor of some of their employés have been shortened by statute; additional
439 brakemen are required for freight trains; every locomotive is required to be provided with powerful electric headlights; many new stations have been established; in some of the cities through which the roads run, they have been required to erect viaducts over some of the streets to prevent injury to persons using these streets; heavy penalties have been prescribed to secure prompt payment of wages of employés; and many other matters deemed necessary for the protection of property and the lives and comfort of the public are now prescribed by statute which were not required eight years ago. All of these add very much to the financial burden of these companies. These facts must, of course, be taken into consideration for the purposes of determining what rates are compensatory. As stated by this Court in Kansas City Southern Railway Company vs. Board of Railroad Commissioners, 106 Fed. 353, 358 (affirmed in 187 U. S. 617), in speaking of such additional expenses necessarily incurred by reason of the enactment of such laws by the different states and perhaps in consideration of these additional burdens imposed on railroads, it (the State) may allow a greater charge for the transportation of passengers as well as freight through its territory than neighboring states in which no such burdens are imposed."

That the large increase in their business caused by the development of the natural resources of the State, as well as the rapid growth of its population; the use of improved machinery and rolling stock; the improved condition of the road beds after they are used for a number of years, enable the companies to carry freight, as well as passengers at a lower rate than formerly can not be doubted, but proofs now before the Court would hardly justify a finding that there has not been some increase in the cost of the operation
440 of trains in this State within the last few years, since the Commission rates went into effect, increases which were gradual but continuous.

Giving due weight to these facts, the next inquiry to be made is

what rates would enable them to earn reasonable returns on their investments? So far as the passenger rates are concerned, it is, of course, easy to ascertain the increase, as the rate was raised from two cents to three cents a mile, an increase of fifty per cent; but, it is claimed that in view of the reduced rates received from the sale of mileage books, and the reductions usually offered to the public as excursion rates, when it is sought to attract large crowds for certain occasions, usually of a public nature, and reduced rates furnished to ministers of the Gospel, the actual increase in the gross receipts on passenger rates is only about thirty-five per cent.

A three cent a mile rate in view of the fact that, comparatively speaking, this State is but sparsely settled and that there are no large cities in it, is not so unreasonable that the Court would feel justified upon the showing made by the roads, indicating a considerable loss on its intrastate passenger traffic, while the two cents a mile rate was in force, to disturb it while these proceedings are pending. Besides it is well settled that for the purpose of determining whether rates are confiscatory or not, all sources of revenue must be considered. Minnesota & St. Louis R. R. Co. vs. Minnesota, 186 U. S. 257, 22 S. Ct. 900, 46 L. Ed. 1151; Seaboard Air Line Co. vs. Florida, 203 U. S. 261, 27 S. Ct. 109, 51 L. Ed. 175; Atlantic Coast Line R. R. Co. vs. North Carolina Corporation Commission, 206 U. S. 1, 27 S. Ct. 585, 51 L. Ed. 933.

441 The increased earnings from one class of traffic will, therefore, justify a corresponding decrease in another class, if the net earnings from all sources are compensatory. For this reason, if the net earnings on passenger traffic are larger, that fact would be considered in determining whether the freight tariffs fixed by the complainants are too high, and also aid in determining what they should be. It is true that lower passenger rates are felt more generally, and for this reason are more fully appreciated by the large majority of the public than lower freight rates, which are not felt so readily by the consumer, the same as the collection of direct and indirect taxes. But, so far as the interests of the public at large are concerned, it is of much more importance to them to enjoy the benefit of the lower freight rates than passenger rates, provided the latter are not excessive or unreasonable. High freight tariffs not only directly affect the prices of commodities to the consumer, but may seriously cripple, if not totally destroy, manufacturing industries, and the business of wholesale dealers, if higher than those charged from competitive points outside of the State, as it is the price at the place of delivery which will control the trade. As the injunction against the enforcement of the two cents a mile passenger rate as being confiscatory and therefore violative of the provisions of the national constitution, leaves the three cents a mile statute, St. L. I. M. & S. Ry. Co. v. State, 86 Ark., 343 (Sec. 6611, Kirby's Digest of the Statutes of Arkansas) in full force, and this rate has been put in operation by the railroads since the granting of the tem-
442 porary injunction, this change, therefore, adds to the net earnings of the complainants at least thirty-five per cent without any corresponding increase of expenditures. Whether, the

railroad companies should not be charged with a fifty per cent increase in these rates, in view of the fact that the reduction below three cents a mile is voluntary on their part, and not in pursuance of any act of the legislature or the Commission, need not be determined at this time, although in view of the decisions of the Supreme Court, it is very doubtful whether the railroads, if they exercise this power, can be heard to complain if by reason thereof their earnings are not compensatory. In Lake Shore, etc. R. R. Co. vs. Smith, 173 U. S. 684, 696, 19 S. Ct. 565, 43 L. Ed. 858, it was held that the State had not the power to enact such legislation without violating the national constitution, and in Knoxville vs. Knoxville Water Co., 212 U. S. 1, 29 S. Ct. 148, it was expressly held that if the company sees proper to make reductions in special cases when not required to do so by law, the decrease, by reason of such reduction can not be considered by the Courts in determining the reasonableness of the rates fixed by law. The Court there said:

"The Company, it is true, might, if it chooses, allow such a discount (a discount of 5% for prompt payments) from the ordinance rates, but the ordinance required no discount from the rate established by it, and the company, therefore, was bound to offer none. If it stood upon the letter of the ordinance, as it had the right to do, and exacted from the consumers the full charge prescribed by the ordinance, the amount which would have been realized would
443 have been over four thousand dollars more than that found by the master."

But, as this case is not now before the Court for final determination and in view of the fact that the public is the beneficiary of these reduced, special rates, they being general and uniform, and the further fact that in this motion to modify the injunction the Court is asked to require a reduction of passenger rates, it is unnecessary at this time, to determine that question, but for the purpose of ascertaining the earnings of complainants, the Court will charge them with an increase of thirty five per cent.

As to what constitutes a reasonable rate must depend upon the facts of each case, and can not be determined without reference to the interests of the public. Covington & Lexington Turnpike Co. vs. Sandford, 164 U. S. 378, 17 S. Ct. 198, 41 L. Ed. 560; Smyth vs. Ames, 169 U. S. 545, 18 S. Ct. 418, 42 L. Ed. 819; Reagan vs. Farmer's Loan & Trust Co., supra; San Diego Land Co., vs. National City, 174 U. S. 739, 755, 19 S. Ct. 804, 43 L. Ed. 1154; Chicago & Northwestern R. R. Co. vs. Dey 35 Fed. 866, 878.

In Covington, etc. Turnpike Co. vs. Sandford, the Court said:

"It can not be said that a corporation is entitled of right, and without reference to the interests of the public, to realize a given per cent upon its capital stock."

This was quoted with approval in Smyth vs. Ames, and the Court there added:

"It can not, therefore, be admitted that a railroad corporation maintaining a highway under authority of the state, may fix its rates with a view solely to its own interests and ignore the
444 rights of the public. But the rights of the public would be ignored if rates of transportation of persons or property on a

railroad are exacted without reference to the fair value of the property used for the public or the fair value of the services rendered, but in order simply that the corporation may meet operating expenses, pay interest on its obligations, and declare a dividend to its stockholders."

Another matter which is entitled to consideration is the fact which has been brought out at this hearing, that the St. Louis, Iron Mountain & Southern Railway Co. and the Chicago, Rock Island & Pacific Ry. Co., have, within the last few years, and since the establishment of the Commission rates, constructed extensive branch lines through new and unsettled sections of the State; that these lines were constructed at great expense, owing to the fact that the greater part of these branches runs through a swampy country, some of it subject to overflows, which necessitated high embankments; that these roads were built principally to serve as feeders for the main line, and at the same time enable these roads to obtain shorter lines for that part of its interstate traffic, which merely passed through the State. These are matters which must be taken into consideration in determining what would be proper net earnings on the investments. It would hardly be proper for the Courts to say that such roads are entitled to as great a compensation, on their investments, from intrastate business as the ordinary roads built for the accommodation of the intrastate as well as the interstate business. As is well known some of the Pacific Roads traverse the desert for hundreds of miles through a strip of territory where there is practically no intrastate business, either freight or passenger.
445 Would it be proper, in such cases, to hold that the road should have the right to charge for its intrastate traffic in that section tariff rates high enough to enable it to earn a certain, fixed percentage on its investment? Would not in such a case, the rates have to be so high as to be confiscatory of the property of the residents of that State? Must the public guaranty the railroads a certain income on their investment, regardless of the condition of the country traversed, or whether bad judgment was exercised in the selection of the route? We do not think so. New lines or branches to increase the business of the trunk line, or the exercise of bad judgment in the building of a railroad are matters to be considered in determining what rates would be fair and just to the corporation as well as the public. That the railroads are entitled to reasonable profits on their investments, and the public to reasonable rates, or, to express it differently, that the rights of the public and railroad companies are reciprocal, is the correct rule of law.

In Reagan vs. Farmer's Loan & Trust Co., supra, Mr. Justice Brewer, speaking for the Court, in the concluding part of the opinion, said:

"It is unnecessary to decide, and we do not wish to be understood as laying down as an absolute rule, that in every case a failure to produce some profit to those who have invested their money in the building of a road is conclusive that the tariff is unjust and unreasonable. And yet justice demands that every one should receive some compensation for the use of his money or property, if

it be possible without prejudice to the rights of others. There
446 may be circumstances which would justify such a tariff; there may have been extravagance and a needless expenditure of money; there may be waste in the management of the road; enormous salaries, unjust discrimination as between individual shippers, resulting in general loss. The construction may have been at a time when material and labor were at the highest price, so that the actual cost far exceeds the present value; the road may have been unwisely built, in localities where there is not sufficient business to sustain a road. Doubtless too, there are many other matters affecting the rights of the community in which the road is built as well as the rights of those who have built the road." 154 U. S. 412.

In San Diego, etc. Co. vs. Jasper, 189 U. S. 439, 446, 23 S. Ct. 571, 47 L. Ed. 892, it was held,

"If a plant is built, as probably this was, for a larger area than it finds itself able to supply, or, apart from that, if it does not, as yet, have the customers contemplated, neither justice or the Constitution requires that, say, two-thirds of the contemplated number should pay a full return."

Nor is it required that the particular rate of compensation must in all cases and in all parts of the Country be the same. Wilcox vs. Consolidated Gas Co., 212 U. S. 19, 29 S. Ct. 192.

Guided by these principles, the Court is of the opinion
447 that rates which will enable the complainant to earn six per cent on their investment, if fairly entitled thereto by prevailing conditions, would be reasonable, especially in view of the fact that a large part of the money used in the construction of these roads was obtained from loans secured by mortgages, and these loans only bear from four to five per cent interest per annum, thus leaving a larger return for the stock holder, who, of course, is secured, and in case of insolvency of the company would be postponed until the mortgage bond holders are paid in full. For these reasons, the risk of the investment of the stockholder being greater than that of the bondholders, he is entitled to a higher rate of interest on his investment. In determining what rates would be just and reasonable, the Court is relieved of passing upon conflicting evidence for the purpose of determining the value of the investment. Complainants in their bills, only ask for compensatory rates on the value of the roads, as determined by the State Board of Railroad Assessors for the purpose of taxation. The assessments in this State are conceded to be upon the basis of fifty per cent of the actual value of the property and they therefore ask to be permitted to earn fair dividends on double the amount their roads are assessed for taxes. (This does not apply to the branch line of the Rock Island, lately constructed, and which is assessed at a nominal value.) For the purpose of determining how much of that amount should be taken into consideration for the intrastate traffic calculations were made by expert accountants under the direction of Judge Van Deventer and the calculations adopted by him for the purpose of passing
448 upon the motions for preliminary injunctions are now adopted.

While the revenues of the roads, and especially the increased earnings since the new rates, pending this litigation, have been put into effect, vary somewhat, it is impossible to make different rates for each road. The fact that in most of the larger cities of the State two or more of the roads compete for business, and therefore must carry freight at the same rates would prevent making different rates, and the tariffs prepared by the roads themselves are practically uniform.

The values of the roads for the intrastate traffic, as ascertained by the accountants and adopted by Judge Van Deventer, are as follows:—

| | |
|---|---|
| St. L. I. M. & S. Ry. Co..... | $12,880,982.44 |
| St. L. & S. W. Ry. Co..... | 4,774,880.82 |
| C. R. I. & P. Ry. Co..... | 5,200,422.39 |
| St. L. & S. F. Ry. Co..... | 3,519,791.41 |

The earnings of these roads for the last six months of the year 1907, calculated on a revenue basis, allowing for the greater cost of intrastate business, one hundred per cent on freight, and fifteen per cent on passenger traffic more than for interstate business, as determined by Judge Van Deventer in these cases, are as follows:

449

| Name of road. | Gross frt. e'rn'gs. | Frt. exp. | Gross pass. e'r'gs. | Pass. expenses. | Net loss. |
|---|---|---|---|---|---|
| St. L. I. M. & S. Ry. Co. ..... | $640,248.17 | $800,041.29 | $836,542.20 | $865,423.66 | $188,674.58 |
| St. L. & S. W. Ry. Co..... | ..... | ..... | ..... | ..... | 43,319.22 |
| C. R. I. & P. Ry. Co. ..... | 210,813.57 | 372,913.48 | 253,395.52 | 220,750.00 | 129,454.39 |
| St. L. & S. F. Ry. Co. ..... | 139,002.89 | 218,917.65 | 187,173.87 | 176,493.67 | 69,234.57 |

NOTE.—The returns of the St. L. & S. F. Ry. Co., were only for four months and in order to make them uniform with the others this table shows the earnings and expenditures for six months. 50% has been added and is included in the above. The returns of the St. L. & S. W. Ry. Co. include the earnings for the entire year ending June 30, 1908.

450 In addition to these earnings each of the roads also showed the receipt of considerable sums from what is called "Miscellaneous Earnings," which are not included in the above tables. These earnings come principally from mail and express, but there is nothing in the evidence to show whether these items caused a net profit or not, as the auditors testified that it is impossible to divide them between intra- and interstate business. These earnings were as follows, and constitute the percentages of the entire business of the roads as shown by the figures on the following table:

451 *Miscellaneous Earnings.*

| Name of road. | Gross frt. e'rn'gs. | Percentage. | Gross pass. e'r'gs. | Percentage. | Total gross earnings. |
|---|---|---|---|---|---|
| St. L. I. M. & S. Ry. Co. ..... | $122,814.41 | 2.51% | $373,785.47 | 21.01% | $496,599.88 |
| C. R. I. & P. Ry. Co. ..... | 19,033.43 | 1.48% | 78,940.50 | 11.29% | 97,940.50 |
| St. L. & S. W. Ry. Co. ..... ..... | 46,228.88 | 1.43% | 154,285.75 | 17.14% | 200,514.63 |

NOTE.—The St. L. & S. F. Ry. Co. did not include this item in its statement, but it would probably average the same proportion to the entire business as that of the other roads.

452 For the purpose of these proceedings, the Court is of the opinion that an increase of 33⅓% on the tariff of freight rates in force at the time these injunctions were granted, the increase to be calculated upon a revenue basis, will enable complainants to earn a reasonable compensation when added to the increased passenger rates, and at the same time prevent the exaction of unjust and unreasonable rates from the public. Calculating the increase of revenue upon that basis, the net earnings for a year, assuming that the business will be the same as it has been, will be as follows:

| Road. | Incrs. in frt. e'r'gs. | Incrs. in pass. e'r'gs. | Total. | Net income. |
|---|---|---|---|---|
| St. L. I. M. & S. Ry. Co. ..... | $426,833.12 | $585,579.40 | $1,012,412.52 | $635,063.36 |
| St. L. & S. W. Ry. Co. ..... ..... | 116,112.53 | 154,158.42 | 270,270.95 | 226,951.73 |
| C. R. I. & P. Ry. Co. ..... | 140,542.38 | 177,376,85 | 317,919.23 | 59,010.45 |
| St. L. & S. F. Ry. Co. ..... | 92,668.59 | 131,021.45 | 223,690.04 | 85,220.90 |

PAGE BOUND VERTICAL IN BOOK

The net income will allow the companies a profit on their respective investments, as follows:

| | |
|---|---|
| St. L. I. M. & S. Ry. Co | over 5% |
| St. L. & S. W. Ry. Co | " 4.8% |
| C. R. I. & P. Ry. Co., a little less than | 1½% |
| St. L. & S. F. Ry. Co. about | 2½% |

These figures indicate that some of the roads would earn but a very small dividend on their investment so far as the intrastate traffic is concerned, but it is impossible, for the reasons hereinbefore stated, to provide the same earnings for roads whose conditions differ so widely as these do. The St. Louis, Iron Mountain & Southern Co., which does the largest proportionate intrastate business, will earn over five per cent on its investment. In view of the fact that it has built two very extensive branches lately through a country
453 having but few inhabitants and no industries, lines intended primarily for its through interstate business, so as to enable it to have a short line from the west to the Gulf of Mexico, this is a very reasonable and fair compensation. The St. Louis South Western Ry. Co., which does the much largest proportionate intrastate business, will earn nearly 5% on the basis of its earnings for the year ending June 30, 1908, which included the first six months of the year 1908, when confessedly traffic was the smallest. Lumber which is its largest tonnage, was practically not moving at all during that time. At the final hearing, the evidence will, no doubt, show what should be considered as earnings for ordinary times. The St. Louis & San Francisco Ry. Co., although it has a large mileage in the State, does but a comparatively small intrastate business, as shown by its statement hereinbefore set out. Its gross earnings on both passenger and freight traffic being only about nine per cent of its valuation. The earnings of the Chicago, Rock Island & Pacific Ry. Co., seem to be the smallest in proportion to its investment, but a new branch line of 147 miles is included at a valuation of $3,000,000.00, although assessed at less than $300,000.00, by reason of the fact that it was but recently built through a swampy section of the State, has been but a short time in operation and was intended principally for its through interstate business. A computation of the earnings of each of the roads from its intrastate business, as compared with its valuation, as shown by their statements, will
454 show practically the same differences:

| Road. | Net loss for year. | Percentage of loss on capital invested in intrastate traffic. |
|---|---|---|
| St. L. I. M. & S. Ry. Co. | $377,349.16 | About 2.9% |
| St. L. S. W. Ry. Co. | 43,319.22 | " .9% |
| C. R. I. & P. Ry. Co. | 258,908.78 | " 5% |
| St. L. & S. F. Ry. Co. | 138,469.14 | " 3.9% |

As the country traversed by these roads is being rapidly settled, and new industries and manufacturing plants are springing up along these lines, the intrastate business will, in all likelihood, increase rapidly. In any event, unless different rates should be made for each road, according to its location, cost of building, judgment in selection of the line, it is impossible to fix any rates which will enable each of the roads to earn the same dividend. The tariffs which they have put in effect are the same for all of the roads, and for the reasons hereinbefore stated, it would be impracticable to do otherwise.

As these suits will necessarily require considerable time before the final decrees can be rendered, either party may at any time apply to the Court for a modification of this order, if, after a fair trial, it is found that the rates are unjust to either party. The Railroad Commission, the Court is informed, has prepared a freight tariff, which, in its opinion, would increase the net revenue of these roads from freight traffic thirty three and one third per cent. Copies of these schedules should be furnished immediately to the complainants, and the Court has no doubt that if these tariff sheets are found
455 to be inaccurate and will not produce such an increase in revenue, the parties can agree among themselves to make such changes as will bring about that result. Should they be unable to do so, the Court will refer the matter to a Special Master for the purpose of preparing such tariff rates.

A decree modifying the injunctions now in force, in conformity with the views herein expressed may be prepared by the parties and submitted to the Court.

Endorsed on back thereof: Filed June 1, 1909. W. P. Feild, Clerk.

456 And on June 2, 1909, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and files herein its replication to answer:

Which replication to answer is as follows:

United States Circuit Court, Western Division of the Eastern District of Arkansas.

In Chancery.

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Complainant,
versus
ROBERT P. ALLEN et al., Defendants.

This replicant, St. Louis Southwestern Railway Company, saving and reserving to *himself* all and all manner of advantages of exception which may be had and taken to the manifold errors, uncertainties and insufficiencies of the answer of the Defendants, Robert P. Allen, John W. Crockett and John E. Hampton, for replication thereunto saith that *he* doth and will aver, maintain and prove *his* said bill to be true, certain and sufficient in the law to be answered unto by the said Defendant-, and that the answer of the said Defendant- is very uncertain, evasive, and insufficient in law to be replied unto by this replicant; without that, that any
457 other matter or thing in the said answer contained, material or effectual in the law to be replied unto, confessed or avoided, traversed or denied, is true; all of which matters and things this replicant is ready to aver, maintain and prove as this Honorable Court shall direct and humbly prays as in and by *his* said bill *he* hath already prayed.

MOORE, SMITH & MOORE,
*Solicitors for Complainant.*

Endorsed on back thereof: Filed June 2, 1909. W. P. Feild, Clerk.

And on June 23, 1909, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

On this day come the parties to the said case, and it is thereupon ordered that Complainant execute a bond to the United States of America in the penal sum of Three Hundred Thousand Dollars, without additional sureties, conditioned that it shall, on and after July 1st, 1909, issue to each person purchasing a ticket or paying cash fare upon the train, from one point in the State of Arkansas to another point in the same State, and confined exclusively to intrastate travel, a certificate or coupon showing the amount paid by such passenger for such ticket, and the date thereof; and to every shipper

or consignee when paying freight on any commodity shipped from one part of the State of Arkansas to another part, and
458 which is wholly the subject of intrastate traffic, a receipt or freight bill showing the amount charged for the carriage of such freight, and also endorsed on the same bill the amount or rate which would have been charged had the inhibited rate continued in force; which receipt or coupon or freight bill shall be prima facie evidence of the amount paid and the date of payment.

The Complainant shall keep a correct account, showing as respects the carriage of freight and passengers the difference between the amount actually charged and that which would have been charged had the inhibited rates been applied, and further conditioned that if it should eventually be decided that so much of this order as inhibits the enforcement of the rates prescribed by the Railroad Commission of Arkansas in Distance Tariff No. 3, and the two cents per mile passenger rate prescribed by the Statutes of 1907, should not have been made, that the Complainant shall refund to the owners and holders of the certificates issue- by it the excess charges as shown by the same, provided, however, that such certificate as to the amounts and dates shall only be prima facie evidence of these facts.

Such bond shall be in addition to the bond heretofore executed and not in lieu of it.

(Signed) JACOB TREIBER, *Judge.*

And on June 30th, 1909, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
459 ROBERT P. ALLEN et al.

The Complainant Railway Company shall submit to the examination and inspection of the Railroad Commission, and its counsels and its experts and accountants, all its books records, accounts, vouchers, reports, payrolls, receipts, contracts and any other documents or writings relating to its intrastate business in the State of Arkansas, kept either in its general office, or in any station upon reasonable notice to the General Auditor of the Complainant, or the person in charge of the Auditor's office, and at such examination the Complainant may be present by its employees.

The information obtained by the Defendant Commission under this order shall not be divulged for any other purpose than the defense of these suits.

It is further ordered that should any employee of the Commission or any person obtaining information by reason of these proceedings, divulge information obtained hereunder otherwise than herein provided, or conduct himself in an improper or obnoxious manner, the Special Master shall report the same to the Court, in order that the Court may inflict punishment on him as for contempt, and

also disbar him from further employment in the examination or investigation herein provided.

That if for the purpose of ascertaining any facts relevant to the issues involved in this action, it is necessary to examine books, reports or other papers in which interstate business, as well as intrastate matters are kept, Defendant Commission, their agents and employees shall have access to such books, reports and papers
460 in the same manner as is provided herein for those relating to intrastate business alone.

That in all matters referred to the Master in Chancery herein, in which the parties are unable to agree, the Master is authorized to determine the matters in dispute.

(Signed) JACOB TREIBER, *Judge.*

And on July 2, 1909, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

On this day come the parties hereto, the cause being at issue and ask the appointment of a Commissioner to take testimony herein, it being agreed that same may be taken upon oral interrogatories, and that the testimony taken in this case and also of that in the St. Louis, Iron Mountain & Southern Railway Company vs. Robert P. Allen, et al., pending herein may be used in each of these cases as though same were consolidated and heard together as far as applicable.

And the Court being advised that the testimony can not be produced in the usual time, it is therefore considered and ordered that P. C. Dooley, Standing Master of this Court, be and he is directed to take said testimony with full power to compel the attendance of all witnesses and require the examination of all books, papers, writing, accounts, vouchers and other documents necessary;
461 And that the Plaintiff shall have sixty days, if necessary, in which to produce its testimony before said Master, beginning October 1st, 1909; that the Defendants shall produce their testimony in Sixty days, beginning at the end of said sixty days allowed Plaintiff, or when the Plaintiff's testimony is finished, if it shall conclude before the expiration of said sixty days; and that each party shall have thirty days after the finishing of the taking of testimony in chief for the production of evidence in reply or rebuttal, and this order having been made on June —, 1909, but not entered, it is ordered by the Court that it be entered now for then.

(Signed) JACOB TREIBER, *Judge.*

And on July 5, 1909, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Comes the Complainant, by John M. Moore, Esq., its Solicitor and files herein its additional bond for Three Hundred Thousand Dollars ($300,000.00), as required by order of Court, dated June 23, 1909, and said bond having been examined by the Judge of this Court, the same is approved.

Which Bond is as follows:

Know all men by these presents, That St. Louis South-
462 western Railway Company is held and firmly bound unto the United States of America in the penal sum of Three Hundred Thousand Dollars ($300,000.00), for the payment of which it hereby binds itself, its successors and assigns.

The conditions of this obligation are such that:

Whereas, in a suit of the above bounden, (a corporation), against Robert P. Allen, John W. Crockett and John E. Hampton, Railroad Commission of the State of Arkansas, and Henry Leigh and George McLean, an order of temporary injunction was issued enjoining and restraining the Defendant Railroad Commissioners of the State of Arkansas, from enforcing certain freight and passenger rates in said State; and,

Whereas, it was subsequently ordered in said proceeding,

"That Complainant execute a bond to the United States of America in the penal sum of Three Hundred Thousand Dollars $300,000.00) signed by itself without additional sureties, conditioned that it shall, on and after July 1, 1909, issue to each person purchasing a ticket, or paying cash fare upon the train from one point in the State of Arkansas, to another point in the same State, and confined exclusively to intrastate travel, a certificate or coupon showing the amount paid by such passenger for such ticket and the date thereof; and to every shipper or consignee when paying freight on any commodity shipped from one part of the State of Arkansas
463 to another part, and which is wholly the subject of intrastate traffic, a receipt or freight bill, showing the amount charged for the carriage of such freight, and also endorsed on the same bill the amount or rate which would have been charged had the inhibited rate continued in force; which receipt or coupon or freight bill shall be prima facie evidence of the amount paid and the date of payment. The Complainant shall keep a correct account, showing as respects the carriage of freight and passengers, the difference between the amount actually charged and that which would have been charged had the inhibited rates been applied, and further conditioned that if it should eventually be decided that so much of this order as inhibits enforcement of the rates prescribed by the Railroad Commission of the State of Arkansas in Distance Tariff No. 3, and the two cent per mile passenger rate prescribed by the Statute of 1907, should not have been made, that the Complainant shall refund

to the owners and holders of the certificates issued by it the excess charges as shown by the same, provided, however, that such certificate as to the amounts and dates shall only be prima facie evidence of these facts," *and,*

Now, Therefore, if the said St. Louis Southwestern Railway Company shall comply with and perform each and all of the terms, conditions and provisions above set forth, and shall issue the certificates or coupons to passengers, receipts or freight bills to shippers and consignees, and keep the accounts as required by said order to be kept, and make the payments or refunds as therein provided
464 to be made, if it should be eventually decided that so much of said order of injunction as inhibits the enforcement of said inhibited rates should not have been made, then this obligation shall be null and void, otherwise to remain in full force and effect.

In witness whereof, the said St. Louis Southwestern Railway Company has caused these presents to be executed this the 1st day of July, 1909.

ST. LOUIS SOUTHWESTERN
RAILWAY COMPANY,
By F. H. BRITTON, *Vice-President.*

Endorsed on back thereof: Filed July 5, 1909, W. P. Feild, Clerk. By W. Presley Feild, D. C.

465 UNITED STATES OF AMERICA,
*Western Division of the*
*Eastern District of Arkansas:*

Be it remembered, That at a Circuit Court of the United States of America, in and for the Western Division of the Eastern District of Arkansas, begun and holden on Monday, the 4th day of April, Anno Domini, One Thousand Nine Hundred and Ten, at the United States Court Room, in the City of Little Rock, Arkansas, the Honorable Jacob Treiber Judge presiding and holding said Court, the following proceedings were had, to-wit: June 10th, 1910.

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Now on this day comes the Complainant, St. Louis Southwestern Railway Company, by its Solicitor, John M. Moore, Esq., and the Defendants Robert P. Allen, and others, by their Solicitors, William F. Kirby, Esq., and the application of P. C. Dooley, Master herein, for the payment to him of the sum of Four Hundred and Sixty Nine Dollars and Ten Cents ($469.10) for money disbursed by him as necessary expense of the Master to date in relation to the hearing herein and that he be allowed and paid the sum of Two Thousand Dollars, ($2000.00), as a partial payment on account of services as Master, coming on for hearing and upon consideration thereof,

It is considered, ordered and adjudged that the Master be and he is allowed the sum of Four Hundred and Sixty Nine Dollars and Ten Cents, ($469.10) for his expenses to date; and the sum of Two Thousand Dollars ($2000.00) as partial compensation on account of his services as Master,

That the Complainants, St. Louis, Iron Mountain & South-
466 ern Railway Company and St. Louis Southwestern Railway Company pay one half of said sum—$1234.55—and that the Defendants, Robert P. Allen, et al., pay one half thereof—$1234.-55—which said sums shall be taxed by the Clerk of this court as costs in this case.

(Signed) JACOB TREIBER, *Judge.*

And on July 5th, 1910, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Now on this day come the parties to said cause by their respective Solicitors, and it is ordered that the taking of testimony in rebuttal on the part of the Plaintiff be postponed until the 26th day of September, 1910.

And on September 29, 1910, the following proceedings were had to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al., Railroad Commissioners, &c.

P. C. Dooley, the Standing Master in Chancery who was directed to take the proofs in these causes having died, and there still being some evidence to be taken herein, it is ordered by the Court that Charles M. Rice, Esq., be and is hereby appointed Special Examiner to take the proofs offered in the above entitled causes, with all
467 the powers of and subject to the directions given by the Court to the said P. C. Dooley, Esq., in these causes.

(Signed) JACOB TREIBER, *Judge.*

And on October 1, 1910, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al., Railroad Commissioners, &c.

Comes Charles M. Rice, Esq., heretofore appointed Special Examiner to take the proofs offered in the above entitled causes, and files herein his oath as such Special Examiner, which is as follows:

UNITED STATES OF AMERICA,
*Eastern District of Missouri:*

I, Charles M. Rice, do solemnly swear, that I will support the Constitution and laws of the United States and that I will faithfully discharge the duties of Special Examiner, in the causes of St. Louis, Iron Mountain & Southern Railway Company vs. Robert P. Allen, et al., State Board of Railroad Commissioners of Arkansas, No. 1637, and St. Louis Southwestern Railway Company against same Defendants, No. 1636, pending in the Circuit Court of the United States for the Western Division of the Eastern District of Arkansas, to which position I have been appointed by the said Court.

(Signed) CHARLES M. RICE.

468 Subscribed and sworn to before me this 30th day of September, A. D., 1910.

[SEAL OF SAID COURT.]

JAMES R. GRAY,
*Clerk of the Circuit Court of the Eastern District of Missouri.*

Which said oath is on file in this office.

And on October 12, 1910, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Comes the Defendant Railroad Commission of Arkansas, by Joseph M. Hill, William F. Kirby and James H. Harrod, Esqs., its Solicitors, and files herein its motion to modify the order heretofore entered herein permitting the Complainant to charge three cents a mile on passenger traffic, and to restrain it from charging more than two cents per mile on intrastate passenger traffic.

Which motion to modify the Injunction is as follows:

In the United States Circuit Court for the Eastern District of Arkansas.

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Plaintiff,
v.
ROBERT P. ALLEN et al.

Comes W. A. Falconer, Chairman, Robert P. Allen, and
469 John W. Crockett, Commissioners, constituting the Railroad Commission of the State of Arkansas, Defendants herein, and under leave of Court heretofore granted and move this Honorable Court for a change in the rates in force by the Plaintiff Railroad pending this litigation, say:

That at the hearing heretofore had this Honorable Court found the freight rates promulgated by the Plaintiff Railroad to be unreasonable, and pursuant to a suggestion made by the Court the Traffic Officials of various Railroads, including the Plaintiff Railroad and the Railroad Commissioners conferred over the construction of a tariff, which would yield to Plaintiff Railroad approximately thirty three and one third per cent more revenue than Distance Tariff No. 3, the enforcement of which had been enjoined by Honorable Willis Van Devanter, United States Circuit Judge. That a tariff was agreed upon and put in force on June 1, 1909, known as the "Court Tariff." Under the operation of said tariff, Plaintiff Railroad has increased its State freight revenue — per cent, so these Defendants are informed and believe.

That at the hearing aforesaid this Honorable Court declined to interfere with the three cent passenger rate which had been put in force by the Plaintiff Railroad, and the Plaintiff Railroad has charged three cents per mile passenger rate from that time until the present time, and is still charging the same.

That in sustaining its case the theory upon which the Plaintiff seeks to prove that freight and passenger rates in force were confis-
catory is known as the "Revenue Theory," and by a vast
470 preponderance of the testimony already taken in the case it is established that whatever value that theory may have elsewhere, so far as applied to the conditions in Arkansas its application as a factor to divide the intrastate and interstate expenses is without relation to the subject, owing to the rate conditions prevailing in the State of Arkansas.

The State rates and interstate rates are such that it is impossible to measure the expenses by the revenue received from the traffic with even a remote approximation to accuracy. That the State has carefully examined the expenses of the Plaintiff Railroad in the State of Arkansas, and has localized, so far as possible, all expenses between State and interstate traffic, and where it is possible to localize those expenses, has used the most appropriate factor to approximate the same, taking the factor in each instance most nearly

representing actual conditions. In this way the State has been able to demonstrate that the contentions of the Plaintiff made in ex parte affidavits submitted to Judge Van Devanter that the State passenger traffic cost fifteen to fifty per cent more than interstate passenger traffic, in proportion to revenue, was wholly without foundation in fact. On the contrary, the facts are that for the six months ended December 31, 1907, when the two cent passenger fare was in force, the Plaintiff Railroad was making a return upon its property devoted to intrastate passenger business (dividing such property according to the railroad's formula of so dividing it) of 5.79%; and suffering a loss on the interstate passenger business of .66%. That during said period the revenue per passenger mile on State traffic was $.01993; and the revenue per passenger
471 mile in interstate traffic was $.01719.

It was further shown that on the total State business Plaintiff Railroad was earning 9.16% return upon its property (dividing its property according to the Railroad's formula of dividing same).

That owing to the increased freight earnings under the Court Tariff over Standard Distance Tariff No. 3, and owing to the increase in the passenger earnings over said period of from two to three cents, the rates, passenger and freight, now being earned by the Plaintiff Railroad are unreasonable, unlawful and burdensome to the people of the State.

Reference is made to a petition filed in these cases, in the case of J. J. Carle vs. Chicago, Rock Island & Pacific Railway, and to the case of Wilbur F. Boyle vs. the St. Louis & San Francisco Railroad, wherein it is shown that said Railroads have been operating for the past fifteen months under a two and one half cents passenger rate, and are seeking now to impose a three cent passenger rate in the State of Arkansas, on all intrastate passengers. That for the reasons set forth in the petition of the Railroad Commission in said cases, said Commission conceives it is its duty to oppose the three cent passenger rate being put in force by said roads, and in view of the fact that said roads are making less return upon their property devoted to said State traffic, it would be inequitable and unjust to prevent them charging three cents while the Plaintiff Railroad is charging three cents.

In view of the facts developed in said hearing, as hereinbefore set forth, the Railroad Commission prays this Honorable
472 Court to modify the order heretofore made, permitting the Plaintiff Railroad to charge three cents per mile on passenger traffic and restrain it from charging more than two cents per mile on interstate passenger traffic.

JOSEPH M. HILL,
WILLIAM F. KIRBY,
JAMES H. HARROD,
*Attorneys for the Railroad Commission.*

Endorsed on back: Filed Oct. 12, 1910. W. P. Feild, Clerk.

And on October 13, 1910, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and filed herein its Response to the motion filed herein, on October 11, 1910.

Which response to motion is as follows:

In the United States Circuit Court for the Eastern District of Arkansas.

No. 1636. In Chancery.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Plaintiff,
v.
ROBERT P. ALLEN et al., Defendants.

473 *Response by Complainant to Defendant's Motion to Modify the Injunctions in said Cause.*

Complainant in response to Defendant's aforesaid application denies that it has earned or is earning a greater amount of revenue from its passenger traffic, or a sufficient amount to enable it to realize a net revenue of six per cent per annum on said business, or to amount to reasonable or adequate compensation for the service performed by it conducting said traffic.

It further denies that it is earning a net revenue equal to six per cent per annum or reasonable and adequate compensation on its freight business under the Court Tariff.

It denies that under the operation of said tariff it has increased its State Freight revenue more than above that allowed by the Arkansas Commission.

For further response Complainant represents that all of the testimony in chief on the part of the Complainant in support of its views as to the relative expense of conducting state and interstate traffic, and the manner in which same should be divided between said classes of traffic, upon which the Honorable Willis Van Devanter, Circuit Judge, acted in granting the preliminary injunction in said proceeding and all the testimony in chief on the part of the Defendants, contesting the aforesaid views and methods of apportionment of expense as between state and interstate traffic, and in support of other views and methods entertained by them, has also taken and Complainant is now engaged in taking its testimony in rebuttal, and it believes will complete same before the end of the current month.

That the effect of said motion as entertained by the Court
474 would be to arrest the taking of testimony during the hearing thereof and require the Court to hear the present application on ex parte statements, or to investigate and hear argument on the effect of the testimony that has been taken as aforesaid, notwithstanding the fact that the Complainant is in the midst of taking its testimony in rebuttal and expects to take additional testimony that will be relevant and material in support of its contention and in opposition to the contentions of the Defendants, and that this cause will be ready for submission in a few weeks and would then have to be re-argued and re-heard by the Court, which Complainant verily believes and alleges would operate as a great hardship upon it and as a great burden upon the Court and Counsel and would not conduce to the end of justice.

Wherefore Complainant prays that Defendants' motion to reopen the question upon which the temporary injunction was granted and to modify said injunction on an interlocutory hearing at this stage of the case and on a part only of the testimony material to its determination be denied.

MOORE, SMITH & MOORE,
*Attorneys for Respondent.*

Endorsed on back thereof. Filed Oct. 13, 1910. W. P. Feild, Clerk.

475 UNITED STATES OF AMERICA,
*Western Division of the*
*Eastern District of Arkansas:*

Be it remembered, That at a Circuit Court of the United States of America, in and for the Western Division of the Eastern District of Arkansas, begun and holden on Monday, the 17th day of October, Anno Domini, One Thousand Nine Hundred and Ten, at the United States Court Room, in the City of Little Rock, Arkansas, the Honorable Jacob Treiber Judge presiding and holding said Court, the following proceedings were had, to-wit: January 2nd, 1911:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Comes the Complainant, by John M. Moore, Esq., its Solicitor, and come the Defendants, by James H. Harrod, Esq., their Solicitor and this cause having been set down for final hearing on this date and it appearing to the Court that Senior Counsel for the Defendants is unavoidably detained and can not reach the hearing, it is ordered by the Court, by agreement of parties, that the hearing herein be continued until tomorrow morning.

And on January 3, 1911, the following proceedings were had, to-wit:

476 No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, JOHN W. CROCKETT and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas, Henry Leigh & George L. McLean.

Comes the Complainant, by John M. Moore, Esq., its Solicitor, and come the Defendants by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors; and this cause now coming on for final hearing upon the bill, exhibits thereto, answer, replication and all pleadings and proof in the case together with all depositions and exhibits thereto taken before the Master or otherwise, thereupon the Court proceeds to hear the evidence and argument of Counsel as well on the part of Defendants as of the Complainant, and the hearing hereof not being concluded the same is continued until tomorrow morning.

And on January 4, 1911, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, JOHN W. CROCKETT and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants, by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on yesterday the same is now resumed, and the
477 hearing hereof not being concluded the same is continued until tomorrow morning at half past nine o'clock.

And on January 5, 1911, the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, JOHN W. CROCKETT and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants, by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on yesterday, the same is now resumed, and the hearing

hereof not being concluded, the same is continued until tomorrow morning at half past nine o'clock.

And on January 6th, 1911, the following proceedings were had to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, JOHN W. CROCKETT and JOHN E. HAMPTON, Railroad Commissioners of the State of Arkansas.

Comes the Complainant, by Moore, Smith & Moore, its Solicitors, and come the Defendants, by Joseph M. Hill and James H.
478 Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on yesterday the same is now resumed; and the trial hereof not being concluded, the same is continued until to-morrow morning at half past nine o'clock.

And on the same day the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN et al.

Comes Charles M. Rice, Esq., Special Examiner herein, and asks the Court for an allowance for his services and expenses in these causes, and come the parties by their respective Solicitors, and the Court being well and sufficiently advised in the premises,

It is considered, ordered and adjudged by the Court that Charles M. Rice, be and he is hereby allowed the sum of Five Hundred Dollars ($500.00) as his compensation for his services as Special Examiner, and the further sum of Forty Three Dollars and Twenty Five Cents ($43.25) for expenses incurred by him in the performance of his duties as such Special Examiner, and that the Complainants, St. Louis Southwestern Railway Company, and St. Louis, Iron Mountain & Southern Railway Company pay one half of said sum ($271.63) and that the Defendants Robert P. Allen, et al., pay one half thereof, ($271.62) which said sum shall be taxed by the Clerk of this Court as costs in these causes when finally determined.

479 And on January 7th, the following proceedings were had, to-wit:—

No. 1636.

ST. LOUIS, SOUTHWESTERN RAILWAY COMPANY,
v.
ROBERT P. ALLEN, JOHN W. CROCKETT AND JOHN E. HAMPTON,
Railroad Commissioners of the State of Arkansas.

Comes the Complainant by Moore, Smith & Moore, Esqs., their Solicitors, and come the Defendants, by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on yesterday the same is now resumed; and the hearing hereof not being concluded the same is continued until Monday afternoon at half past one o'clock.

And on January 9th, 1911, the following proceedings were had, to-wit:—

No. 1635

ST. LOUIS, SOUTHWESTERN RAILWAY COMPANY,
v.
ROBERT P. ALLEN, JOHN W. CROCKETT AND JOHN E. HAMPTON,
Railroad Commissioners of the State of Arkansas.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants, by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on Saturday, the same is now resumed; and the hearing hereof not being concluded, the same is continued until Mon-
480 day morning, January 16th, 1911, at half past nine o'clock.

And on the same day, the following proceedings were had, to-wit:—

No. 1636.

ST. LOUIS, SOUTHWESTERN RAILWAY COMPANY,
v.
ROBERT P. ALLEN, JOHN W. CROCKETT AND JOHN E. HAMPTON,
Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and it being made to appear to the Court that the term of office of John W. Crockett and John E. Hampton, Railroad Commissioners of the State of Arkansas, Defendants herein has expired and that under the laws of the State of Arkansas, William F. McKnight and George W. Bellamy have been elected to succeed said John W. Crockett and John E. Hampton, as Railroad Commissioners of the State of Arkansas, and have qualified and are now acting as such.

It is now ordered by the Court by consent of the parties hereto, that the names of William F. McKnight and George W. Bellamy be

substituted for that of John W. Crockett and John E. Hampton and that this cause abate as to said Hampton and Crockett and progress in the names of William F. McKnight and George W. Bellamy, substituted as Defendants aforesaid.

481 And on January 16, 1911, the following proceedings were had, to-wit:—

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY

v.

ROBERT P. ALLEN, WILLIAM F. MCKNIGHT, and GEORGE W. BELLAMY, Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants, by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on January 9th, 1911, is now resumed; and the hearing hereof not being concluded, the same is continued until tomorrow morning at half past nine o'clock.

And on January 17th, the following proceedings were had, to-wit:—

No. 1636.

ST. LOUIS, SOUTHWESTERN RAILWAY COMPANY.

v.

ROBERT P. ALLEN, WILLIAM F. MCKNIGHT, and GEORGE W. BELLAMY, Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on yesterday, the same is now resumed; and the hearing hereof not being concluded, the same is continued until
482 tomorrow morning at half past nine o'clock.

And on January 18, 1911, the following proceedings were had, to-wit:—

No. 1636

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY

v.

ROBERT P. ALLEN, WILLIAM F. MCKNIGHT AND GEORGE W. BELLAMY, Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants, by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on yesterday the same is now resumed; and the hearing

hereof not being concluded the same is continued until tomorrow morning at half past nine o'clock.

And on January 19, 1911, the following proceedings were had, to-wit:—

No. 1633.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY.
v.
ROBERT P. ALLEN, WILLIAM F. MCKNIGHT AND GEORGE W. BELLAMY, Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants, by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the trial hereof not being
483 concluded on yesterday the same is now resumed; and the hearing hereof not being concluded the same is continued until tomorrow morning at half past nine o'clock.

And on January 20, 1911, the following proceedings were had, to-wit:—

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY,
v.
ROBERT P. ALLEN, WILLIAM F. MCKNIGHT AND GEORGE W. BELLAMY, Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs., its Solicitors, and come the Defendants, by Joseph M. Hill and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on yesterday, the same is now resumed; and the hearing hereof not being concluded the same is continued until tomorrow morning at half past nine o'clock.

And on January 21st, 1911, the following proceedings were hed, to-wit:—

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY,
v.
ROBERT P. ALLEN, WILLIAM F. MCKNIGHT AND GEORGE W. BELLAMY, Railroad Commissioners of the State of Arkansas, et al.

Comes the Complainant, by Moore, Smith & Moore, Esqs.,
484 Solicitors, and come the Defendants, by Joseph M. Hlil and James H. Harrod, Esqs., their Solicitors, and the hearing hereof not being concluded on yesterday the same is now resumed; and the Court having heard the evidence and argument of Counsel and not being well and sufficiently advised as to what judgment to render herein takes time to consider of its judgment.

At the final hearing the following testimony was introduced by both Complainant and Defendants.

For testimony see folio — of record on appeal to U. S. Sup. Ct. case St. Louis, Iron Mt. & So. Ry. Co. v. Robert P. Allen et al., &c., which is by stipulation of consent and order of Court to be used in this cause.

485 UNITED STATES OF AMERICA,
*Western Division of the*
*Eastern District of Arkansas:*

Be it remembered, that at a Circuit Court of the United States of America, in and for the Western Division of the Eastern District of Arkansas, begun and holden on Monday, the Third day of April, Anno Domini, One Thousand Nine Hundred and Eleven, at the United States Court Room, in the City of Little Rock, Arkansas, the Honorable Jacob Treiber, Judge presiding and holding said Court, the following proceedings were had, to-wit: May 11, 1911:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY and WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas, and Henry Leigh and George McLean.

Now on this day comes the Complainant by its Solicitors, Moore, Smith & Moore, Esqs., and also come the Defendants, by their Solicitors, Joseph M. Hill and James H. Harrod, Esqs., and thereupon said cause having been argued and submitted upon the evidence, and stipulations on file and of record in said cause, and having been taken under advisement at a former term of this Court and the Court being well and sufficiently advised in the premises

It is accordingly ordered and decreed that the Defendants, Robert P. Allen, George W. Bellamy and William F. McKnight, as Railroad Commissioners of the State of Arkansas, and Henry Leigh and George McLean and each of them, their agents, employees and successors as well as all other persons, patrons of Complainant, either in the shipment of freight or as passengers, or as passengers be-
486 tween stations on Complainant's road in the State of Arkansas, are hereby perpetually enjoined from enforcing or attempting directly or indirectly, by any suit, or in any manner whatsoever, to enforce against the Complainant, its officers, agents, employees or servants any of the provisions of Standard Freight Distance Tariff No. 3 and amendments thereto adopted prior to the institution of this action, prescribing the rate or rates for the transportation of classes and commodities or any provision in said tariff whereby any of said rates shall be continued in force, or from enforcing or attempting, directly or indirectly, by suit or in any other manner whatsoever, to enforce against Complainant, its officers, agents or

servants, any of the provisions of an Act of the General Assembly of the State of Arkansas, entitled, "An Act to Amend Section 6611 of Kirby's Digest of the Statutes of the State of Arkansas, By Fixing Passenger Rates in this State, and For Other Purposes," approved February 9, 1907, or to enforce the provisions of any other Act or Acts of the Legislature of said State, providing penalties for non-compliance by Complainant with the provisions and requirements of said Standard Freight Distance Tariff No. 3, and amendments thereto as aforesaid, or the Act of the Legislature of the State of Arkansas, fixing passenger rates in said State.

It is further ordered that the costs incurred by Complainant and Defendants, respectively, in procuring the attendance of witnesses before the Master and in payment of the fees of stenographers in the recording of said testimony, be borne by the Complainant and the Defendants, Robert P. Allen, George W. Bellamy and Wil-
487 liam F. McKnight, and that neither party recover from the other therefor; that all remaining costs including Master's fees, the Complainant pay one-fourth and the Defendants, Robert P. Allen, George W. Bellamy and William F. McKnight, Railroad Commissioners aforesaid, pay one-half, the other one-fourth to be paid by Complainant in case No. 1637, the payment of said costs to be recovered by execution to be issued by the Clerk of this Court upon application of any party in interest.

It is further ordered that the Bond for injunction filed by the Complainant herein be released and the Sureties thereon discharged from liability.

And the Court hereby retains and reserves unto itself jurisdiction of the subject matter of this suit and of all parties hereto, to the end that such other and further orders and decrees may be made herein as may become necessary by reason of any changed conditions as to the facts, equities or rights that may hereafter take place or arise.

(Signed) JACOB TREIBER, *Judge.*

And on the same day the following opinion of Court was filed:

By stipulation of counsel and order of Court, the opinion of Court here referred to is found at page 5957, in record on appeal from this Court to the Supreme Court of the United States in case of St. Louis, Iron Mountain and Southern Railway Co. vs. Robert P. Allen et al., &c., No. 1637.

488 And on June 26, 1911, the following proceedings were had, to-wit:—

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY and WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas, and Henry Leigh and George McLean.

Come the parties by their respective Solicitors and file stipulations as follows:—

"It is here agreed and stipulated between Counsel representing all the parties in these causes, that the testimony in the two cases were taken together and that the same was heard and submitted on the combined testimony as one case; and it is further agreed that the transcript of the testimony and opinion of the Court transmitted by the Clerk of this Court to the Supreme Court of the United tSates in the case of St. Louis, Iron Mountain & Southern Railway Company vs. Robert P. Allen, George W. Bellamy, and William F. McKnight, Railroad Commissioners of the State of Arkansas, shall be treated and considered in all respects as the transcript and record of the testimony taken in the case of St. Louis Southwestern Railway Company vs. Robert P. Allen et al., and that said transcript and testimony and opinion of the Court so transmitted shall be used, considered and treated as the record in the above cases.

(Signed) MOORE, SMITH & MOORE.
*Counsel for Plaintiff.*

489 JOSEPH M. HILL,
*Counsel for Defendants.*"

It is accordingly ordered that the Clerk in making up the transcript of the record in these causes, make it up in conformity with the above stipulation.

(Signed) JACOB TREIBER, *Judge.*

And on the same day the following proceedings were had, to-wit:—

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY and WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas.

Now on this day the Defendants here applying for an appeal to the Supreme Court of the United States from the final decree in this cause, the Complainant being present by its Solicitor and the Court purposing to grant said appeal, as the Defendants are entitled thereto, and desiring to preserve the status quo pending the determination of said appeal in the Supreme Court of the United States,

It is accordingly ordered that the Court Tariff heretofore put in

force under the orders of this Court during the pendency of this proceeding be continued and in force during the pendency of this appeal.

(Signed) JACOB TREIBER, *Judge.*

And on the same day the following proceedings were had to-wit:—

490 No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY and WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas, and Henry Leigh and George L. McLean.

In this cause come all parties by their Counsel and it appearing to the Court that Henry Leigh and George L. McLean, Defendants, have been invited to join in the prayer for appeal herein and have declined to do so, it is by the Court by consent of the said Henry Leigh and George L. McLean, and by consent of all parties to this cause ordered that said Henry Leigh and George L. McLean are severed from this cause and from the appeal prayed herein.

(Signed) JACOB TREIBER, *Judge.*

And on the same day the following proceedings were had, to-wit:

No. 1636.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY
v.
ROBERT P. ALLEN, GEORGE W. BELLAMY and WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas.

Now on this day come the Defendants Robert P. Allen, George W. Bellamy and William F. McKnight, Railroad Commissioners of the State of Arkansas, and file herein their assignment of errors, and present a petition for an appeal to the Supreme Court
491 of the United States from the final decree herein, and also present a bond in the sum of Five Hundred Dollars ($500.00) conditioned as required by law with good and approved security.

It is ordered by the Court that the petition for an appeal, assignment of errors and appeal bond be made a part of the record, and that the appeal be allowed and bond approved; and it is ordered that a certified transcript of the record and all proceedings herein be transmitted to the Supreme Court of the United States; and it further being made to appear to the Judge that the Clerk of this Court will be unable owing to the size of the record, to prepare a transcript within thirty days from the date of signing the citation; it is therefore ordered that the time for filing the transcript with the

Clerk of the Supreme Court of the United States be enlarged until the Second day of October, 1911.

Dated this 26th day of June, 1911.

(Signed) JACOB TREIBER, *Judge.*

Which assignment of errors is as follows:—

492 In the United States Circuit Court, Eastern District of Arkansas, Western Division.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Plaintiff,

vs.

ROBERT P. ALLEN, GEORGE W. BELLAMY and WILLIAM F. McKNIGHT, Railroad Commissioners of the State of Arkansas, Defendants.

*Assignment of Errors.*

Now comes Robert P. Allen, George W. Bellamy, William F. McKnight, constituting the Railroad Commission of the State of Arkansas, Defendants in the above entitled cause and aver that in the record and proceedings herein that there has been manifest errors committed in this, to-wit:

1st. The Court erred in not sustaining the motion to dissolve the temporary injunction herein, which motion was filed and considered by the Court prior to taking the testimony herein, on the ground therein set forth that the complainant had filed this bill in equity in the United States Circuit Court, asking relief against freight rates promulgated by the predecessors of the present Railroad Commissioners, without first praying relief from the Commission, which was authorized and required by law to grant relief against unreasonable, unremunerative or confiscatory freight rates.

2nd. The Court erred in not dismissing the bill of Plaintiff on final hearing because the evidence showed that the freight rates embraced in Standard Distance Freight Tariff No. 3, sought to be injoined herein, had been in force with only minor changes made from time to time and those not materially affecting the revenue of the Plaintiff, for a period of six years prior to the filing of the suit herein, and the complainant did not before filing this suit apply to the Railroad Commission for relief against any of said freight rates as unjust, unreasonable, unremunerative or confiscatory; when the evidence showed that the scheme of freight rates embraced in said tariff were originally put in force in the year 1900, subsequently re-enacted in 1903, and when put in force the Railroad Commission stated and declared to the Plaintiff and other carriers affected thereby that if on fair test of said rates, in whole or in part, they proved to be unjust, unreasonable, unremunerative
493 or confiscatory, that relief would be granted by the Commission upon proper showing of such facts.

3rd. The Court erred in not dismissing the bill on final hearing because the evidence shows that since 1900 the general scheme of

freight rates sought to be injoined herein has been in force under order of the Railroad Commission and the whole body of freight rates sought to be injoined, save and except minor changes made from time to time which did not materially affect the revenue of the plaintiff, had been in force since 1903 and the plaintiff and other carriers had acquiesced for said period of time in said scheme of freight rates, which were embraced in Standard Distance Freight Tariff No. 3, complained of in the bill herein.

4th. The Court erred in finding, as stated in the opinion of the Court, that the evidence showed an increased cost of operation for ten years prior to the filing of this suit, and that rates that had been remunerative ten years prior to its filing would no longer be so on account of increased cost of operation, and on such account that there was no acquiescence in the plaintiff in submitting to the schedule of freight rates; when the evidence shows that the increased efficiency of locomotives, cars and tracks and other similar causes had rendered the cost of carrying freight less than at the beginning of the ten years period referred to by the court and less than at any prior period.

5th. The Court erred in holding that the reduction by the Legislature of passenger rates from three cents to two cents per mile was an excuse for the complainant to seek relief in the Federal Court prior to applying to the Railroad Commission for relief therein against the freight rates, because under the law the Railroad Commission is authorized, upon proper showing, to increase the freight rates so as to compensate the plaintiff for its loss in passenger rates, if any loss occurred on account of said Legislative reduction of the passenger rates.

6th. The Court erred in its decree in adjudging and decreeing that the freight rates in Standard Distance Tariff No. 3 and passenger rates fixed by the General Assembly of 1907 were confiscatory and would not afford complainant fair and reasonable return upon its property, and erred in decreeing that a compliance with said freight and passenger rates would be taking the property of the complainant without due process of law, because the evidence shows that said freight and passenger rates are reasonable and compensatory and that they do afford the complainant a fair and reasonable return upon the value of its property invested in intrastate traffic.

494 7th. The Court erred in making perpetual the temporary injunctions heretofore granted in this casue and injoining these defendants from enforcing Standard Distance Freight Tariff No. 3, or any rate or schedule therein, and from enforcing the passenger Rate Act of 1907 and particularly erred in injoining any rates in said Standard Freight Distance Tariff No. 3, as many, if not all, of said rates are reasonable, just and compensatory.

8th. The Court erred in not dismissing plaintiffs' bill because plaintiff failed to establish by clear and decisive evidence that the intrastate freight and passenger rates sought to be injoined were confiscatory and in holding upon the evidence offered by the plaintiff that said rates were confiscatory when said evidence was based wholly on opinion testimony without sufficient data upon which an intelli-

gent opinion could be based and said evidence was not of that decisive and clear character which is required to satisfy a court that rates promulgated by a state were confiscatory.

9th. The Court erred in not dismissing the plaintiffs' bill because the plaintiff had not overcome the presumption that the rates established by the State were reasonable and compensatory by a preponderance of the testimony.

10th. The Court erred in not dismissing the bill of plaintiff because the preponderance of the testimony established the fact that the freight and passenger rates sought to be injoined were compensatory and earning the complainant a fair return on its property.

11th. The Court erred in sustaining the plaintiffs' bill upon the evidence offered by the plaintiff, when it was shown in the evidence that better testimony than that offered was obtainable by the plaintiff in the form of detailed statements of revenue derived from local and through freight trains, and detailed statements of the expenses of local and through freight trains and the amount of state and interstate traffic carried respectively on the local and through freight trains; That the plaintiff instead of resorting to the best evidence to ascertain the relative cost of state and interstate traffic produced only opinion testimony, which was of insufficient probative force to overcome the presumption of the validity of the rates established by the State when better and more reliable testimony could have been produced by the plaintiff and was in its possession and control.

12th. The Court erred in holding the passenger rates to be confiscatory when the evidence shows that the complainant voluntarily made passenger rates equal and less than those fixed by the State and the plaintiff carried a large volume of passenger traffic on rates voluntarily made by it and other carriers on rates as low
495 as, and in many cases, lower than, those fixed by the State herein complained of.

13th. The Court erred in holding the freight rates to be confiscatory when the evidence shows that the complainant voluntarily made freight rates equal and less than those fixed by the State, and the plaintiff carried a large volume of freight traffic on rates voluntarily made by it and other carries on rates as low as, and in many instances, lower than, those fixed by the State herein complained of.

14th. The Court erred in finding that the period of six months ended December 31st, 1907, fairly represented the earnings and expenses of the plaintiff, and further erred in not holding that the revenue and expense of October, 1907, fairly represents one-sixth of said period.

15th. The Court erred in not charging the plaintiff with a fair annual rental for the use of the Bunch elevator, when the evidence shows that said property had a fair rental value of $20,000 per year and the plaintiff only charged $1.00 to its tenant per year rental therefor.

16th. The Court erred in holding that the division of expense

apportioned to Arkansas by the plaintiff for the repairs of tools and machinery was fair.

17th. The Court erred in not deducting from operating expenses the fine of $10,000.00 and costs imposed on the plaintiff for illegally giving free passes to members of the Legislature.

18th. The Court erred in charging the expense of the Memphis Terminals and the portion of plaintiff's road in Tennessee to the expenses incurred in Arkansas.

19th. The Court erred in charging all the expense of the Fort Smith Terminals to the Arkansas expenses.

20th. The Court erred, in sustaining as proper, salaries paid by the plaintiff to lobbyists, and salaries and fees paid attorneys outside of Arkansas.

21st. The Court erred in charging any part of the expense incurred for the leased line known as the Paragould trackage to intrastate traffic when the evidence shows such expense to be incurred wholly for interstate traffic.

22nd. The Court erred in charging the rental of the Van Buren Bridge to the Arkansas expense, particularly any part thereof to the intrastate expense.

23rd. The Court erred in holding the plaintiff road was efficicently operated.

24th. The Court erred in apportioning the property of the plaintiff in the state between the intrastate and interstate traffic on the revenue basis in order to ascertain the proportion of said property used in intrastate business.

25th. The Court erred in the bases adopted for apportioning expense between intrastate and interstate traffic.

496 26th. The Court erred in apportioning the miscellaneous expenses on the revenue basis.

27th. The Court erred in declaring in the opinion that the State contended for a division of property and expenses on the "ton mile basis".

28th. The Court erred in finding that the intrastate freight rates were only 50% higher than the interstate rates, when the undisputed evidence showed that the revenue per ton per mile under Standard Distance Freight Tariff No. 3 produced 98% more revenue per ton per mile on the Iron Mountain Railway Company than the interstate traffic produced per ton per mile and on the St. Louis-Southwestern Railway Company, 141% more per ton per mile.

29th. The Court erred in using the revenue basis for dividing any expenses and particularly without allowing for the excess of at least 50% which the Court found the State revenue was higher than the interstate revenue; the evidence shows that by using the revenue as a factor without making allowances for the difference between the two that the state expenses are burdened unduly in proportion to the excess of the State revenue over the interstate revenue.

30th. The Court erred in not adopting as a whole the plan of division of expense presented by the State, which said basis of division was sustained by preponderance of the testimony as being

the best basis for fairly apportioning the expense between intrastate and interstate traffic.

31st. The Court erred in not accepting the results of the statistics obtained from the test months which were put in evidence by the complainant. The evidence shows that October, 1907 was a fairly representative month of the six months period introduced in evidence by the Iron Mountain Railway Company; that October, 1908 was fairly representative month between state and interstate traffic on the St. Louis-Southwestern and further the evidence shows that the plaintiff was estopped from questioning that said months are fairly representative for the purposes used by the State.

32nd. The Court erred in charging to interstate business only 40% of the expense of the local trains when the evidence shows that on the Iron Mountain it should be about 73% and on the St. Louis-Southwestern about 68% of the expense of the local trains is chargeable to interstate freight business and said finding of 40% was not supported by the evidence.

33rd. The Court erred in dividing Maintenance of way expenses on a revenue basis and particularly in not making allowances for the difference between the intrastate and interstate revenue when using the revenue as a factor in dividing said expense.

34th. The Court erred in its division of expense between
497 local and through trains in charging 50% extra to yard locomotives as against the local train and 75% additional for local locomotive mileage when the evidence shows much lower percentage should be used to equalize them.

35th. The Court erred in the division of the expense of the Maintenance of Equipment of freight cars in charging 25% extra to the local trains for starting and stopping and 13½% for terminals handling when the evidence shows that much lower percentage should be charged for said causes. The Court also erred in this item in estimating that the through trains stop every thirty five miles as against five miles to the local trains: The Court also erred in this item in not charging transstate and interstate traffic with the cost of starting and stopping freight cars and in making different allowance for interstate and intrastate traffic, when the evidence shows that this is an element of expense from the physical starting and stopping of freight cars unconnected with the class of traffic carried in said cars.

36th. The Court erred in not apportioning general expenses according to the plan adopted by the State:—The Court particularly erred in charging all of these expenses on the basis of the supervision in Maintenance of Equipment and Transportation only, whereas, the evidence shows a proper share of such expenses should be charged to the Maintenance of Way and all of the other expenses.

37th. The Court erred in dividing the item of Hire of Equipment on the revenue basis and erred in charging an additional 30% to local traffic when the evidence shows there is no relation between the revenue and said item of expense and there is no evidence to show that 30% or any other percentage should be added to local traffic for this item of expense.

38th. The Court erred in the basis adopted for apportioning station expenses.

39th. The Court erred in finding various omissions from the expenses apportioned to the State in the State's plan of dividing expenses between intrastate and interstate traffic and particularly erred in finding that the dead weight on local trains exceeded the dead weight on through trains 14%, and particularly in finding that for all such alleged omission that 8½% should be charged to the local trains, when the evidence fails to show any basis for such alleged omissions or such percentages as found by the Court.

40th. The Court erred in the basis adopted for apportioning fuel and locomotive expenses and in the basis adopted for "other train expenses".

41st. The Court erred in charging the State passenger traffic with 10% greater than the interstate passenger traffic, when the preponderance of the testimony shows interstate traffic is the most expensive.

498 42nd. The Court erred in holding that the St. Louis-Southwestern freight and passenger traffic was more expensive than the Iron Mountain's freight and passenger traffic.

43rd. The Court erred in finding the extra expense of intrastate traffic over the interstate freight traffic on the Iron Mountain Road was 210% and on the St. Louis-Southwestern 250%, when the evidence shows that at the outside the extra expense of such freight traffic is less than the greater percentage of the revenue per ton per mile of the intrastate over the interstate revenue.

44th. The Court erred in holding that the plaintiff was entitled to earn 6% interest on the value of its property and 1.5% surplus and that a return of less than 7½% on the value of its property devoted to the intrastate traffic was confiscatory.

45th. The Court erred in not holding a return on the plaintiffs' investment equal to the rate of interest prevailing on Railroad securities was compensatory, which rates of interest the evidence shows to have been a little less than 4½% on Railroad securities in Arkansas.

46th. The Court erred in retaining jurisdiction of this cause for any other purpose than to permit these defendants to show a changed situation which might relieve them of the injunction.

Wherefore for the errors aforesaid, and each and every of them and many more apparent in the face of the record, the defendants Robert P. Allen, George W. Bellamy and William McKnight, Railroad Commissioners of the State of Arkansas, pray for a reversal of the decree aforesaid and that the Court be directed to enter a decree dismissing plaintiffs' Bill of Complaint and such other relief as equity and good conscience will show the defendants entitled to receive.

JOS. M. HILL.
JAMES H. HARROD,
*Solicitors for Said Defendant Railroad Commissioners.*

Dated this June 26th, 1911.

Endorsed: Filed June 26th, 1911. W. P. Feild, Clerk.

Which Prayer for Appeal is as follows:

499 In the United States Circuit Court, Eastern District of Arkansas, Western Division.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Plaintiff,
vs.
ROBERT P. ALLEN, GEORGE W. BELLAMY, WILLIAM P. MCKNIGHT, Railroad Commisisoners of the State of Arkansas, Defendants.

*Prayer for Appeal.*

Now comes Robert P. Allen, George W. Bellamy, William F. McKnight, Railroad Commissioners of the State of Arkansas, defendants in the above entitled cause, conceiving themselves to be aggrieved by the decision herein rendered on the 3rd day of May, 1911, wherein the Court made perpetual the temporary injunction hereinbefore issued and found, adjudged and decreed that the freight rates embraced in Standard Distance Freight Tariff No. 3, and intrastate passenger rates enacted by the Act of the General Assembly of Arkansas of 1907, were confiscatory and the keeping of the same in force was taking the property of the plaintiff without due process of law; and prays an appeal from the said final decree of the Circuit Court of the United States for the reasons specified in the Assignment of Errors, which is filed herewith, and prays that this appeal may be allowed and a transcript of the record, proceedings and papers upon which said decree was made, duly authenticated, be sent to the Supreme Court of the United States.

JOS. M. HILL,
JAMES H. HARROD,
*Attorneys for Defendants.*

Dated this 26th day of June, 1911.

The petition for appeal is hereby granted and the appeal allowed, this 26th day of June, 1911.

JACOB TRIEBER,
*District Judge, Presiding in Circuit Court.*

500 Endorsed: Filed June 26th, 1911. W. P. Feild, Clerk.

Which Bond for Appeal is as follows:

501 In the United States Circuit Court, Eastern District of Arkansas, Western Division.

ST. LOUIS-SOUTHWESTERN RAILWAY COMPANY, Plaintiff,
vs.
ROBERT P. ALLEN, GEORGE W. BELLAMY, WILLIAM P. MCKNIGHT, Railroad Commisisoners of the State of Arkansas, Defendants.

*Bond for Appeal.*

Know all men by these presents:

That we, Robert P. Allen, George W. Bellamy, and William F. McKnight, as principals, and John W. Crockett as sureties, are held and firmly bound unto the St. Louis Southwestern Railway Company in the sum of Five Hundred ($500.00.) Dollars to be paid unto the said St. Louis Southwestern Railway Company, its successors and assigns; to which said payment well and truly to be made we bind ourselves, our heirs, executors and administrators, jointly and severally by these presents; this obligation is upon this condition:

Whereas, the above named Robert P. Allen, George W. Bellamy, and William F. McKnight have prosecuted their appeal to the Supreme Court of the United States to reverse the decree rendered in the above entitled cause by the Circuit Court of the United States for the Eastern District of Arkansas, Western Division thereof; Now if the above named Robert P. Allen, George W. Bellamy, and William F. McKnight shall prosecute their said appeal to effect, and answer all costs if they shall fail to make good their plea, then this obligation to be void, otherwise to remain in full force and virtue.

Given under our hands and seals this 26th day of June, 1911.

R. P. ALLEN.
GEO. W. BELLAMY.
W. F. McKNIGHT.
JNO. W. CROCKETT.

The above bond is hereby approved and ordered to be filed and made part of the record.

ROBERT P. ALLEN et al., Railroad Commissioners, Appellants,
v.
THE ST. LOUIS SOUTHWESTERN RAILWAY COMPANY, Appellees.

*Stipulation.*

It is stipulated by counsel that the following parts of the record in the above entitled cause be not printed:

1. Exhibit A to the complaint, being Standard Freight Distance Tariff No. 3, found at pages 43-99 of the record.

It is further stipulated that either party may cause twenty-five copies of this exhibit to be filed with the printed record and treated as a part thereof.

2. Exhibit A to the decree herein, being "Court Tariff" found at pages 372-421.

It is further stipulated that either party may cause twenty-five copies of this exhibit to be filed with the printed record and treated as a part thereof.

3. The affidavits presented to Judge Van Devanter for preliminary injunction shall be omitted, with the right to either party to hereafter publish any part of the same that may be desired by such party and either party may use any part of said affidavit in their brief with the same effect as if it were printed, said affidavits being found at pages 138-369.

4. Any part of the record omitted from being printed under this stipulation may, by either party be hereafter printed or otherwise treated as a part of the record.

5. If either party shall file any of the exhibits or use any
507 part of the affidavits presented to Judge Van Devanter or any other matter herein referred to, in their brief in said case, they shall notify opposing counsel thereof at least twenty days prior to the date the case is set for submission.

## MOTION.

---

Come now Robert P. Allen, George W. Bellamy, and William F. McKnight, Railroad Commissioners of the State of Arkansas, appellants herein,

by Joseph M. Hill, special counsel for the State, employed under acts of the General Assembly of the State of Arkansas directing the Railroad Commission to defend these and similar suits, and move this honorable court to advance these causes upon its docket and set them down for hearing on the second Monday of January, 1912, or as soon after that day as suits the convenience of the court, and for cause thereof say:

## I.

On September 3, 1908, five trunk-line railroads operating within the State of Arkansas applied to the Honorable Willis Van Devanter, then one of the circuit judges of the Eighth Judicial Circuit, for preliminary injunctions against the Railroad Commission of the State of Arkansas and other parties named therein, seeking to enjoin the enforcement of the act of the General Assembly of Arkansas, approved February 7, 1907, providing a maximum passenger rate of 2 cents per mile for railroads over eighty-five miles in length, and from the enforcement by the Railroad Commission of Standard Freight Distance Tariff No. 3, a tariff fixing freight rates on all intrastate shipments moving in Arkansas.

Judge Van Devanter, after hearing, granted the preliminary injunctions. His opinion is reported at 163 Federal Reporter, 141.

Judge Trieber, sitting for the Circuit Court of

the Eastern District of Arkansas, subsequently granted similar preliminary injunctions in suits of all other railroads operating within the State of Arkansas, with the possible exception of a few small lines. The Railroad Commission of Arkansas, created under an amendment to the Constitution authorizing its being, and pursuant to statutes passed executing said amendment, is authorized and empowered to fix and regulate freight rates on all intrastate freight traffic.

Pursuant to said authority, the Railroad Commission of Arkansas, in the year 1900, put in force a general system of freight rates. An injunction was granted against those rates operating on two or more lines, the legislative authority seeming to have conferred upon the Commission only power to fix rates upon single lines. This defect in the creating law was amended in 1903, and immediately thereafter the Railroad Commission reenacted the system of rates promulgated in 1900. These rates, with a few minor changes, were in force from 1903, and upon single lines from 1900, until the injunctions against them in 1908. They were reissued in form known as "Standard Distance Freight Tariff No. 3." No application was made to the Railroad Commission prior to the application to Judge Van Devanter for a reduction of any of the rates in said Standard Distance Freight Tariff No. 3.

The General Assembly of Arkansas convened in January, following the injunctions issued in Sep-

tember, 1908, and an act was passed by it, which was approved January 28, 1909, empowering and directing the Railroad Commission to make defense to the aforesaid suits and appropriating money for the employment of counsel and accountants and defraying the expense of such defense and authorizing the Governor and Attorney General to select special counsel, who should, in conjunction with the Attorney General, be entrustetd with the defense of said suits brought against the Railroad Commission.

After the injunctions were granted by Judges Van Devanter and Trieber the railroad companies operating in the State of Arkansas put in force a schedule of freight and passenger rates in place of those enjoined. Shortly after the defense of said suits was authorized and directed by the General Assembly the Railroad Commission filed a motion in the circuit court to dissolve or modify the injunctions on the ground, *inter alia,* that the rates promulgated by the railroads were unreasonable and discriminatory, and that it was inequitable for the railroads to maintain unreasonable and discriminatory rates while the State-made rates were under injunctions.

The court found that the freight rates promulgated by the railroads were unreasonable and ordered the injunctions dissolved unless the railroads within a short time should promulgate reasonable rates and determined that rates producing revenue exceeding 33 1-3 per cent over the rev-

enue produced by the Standard Freight Distance Tariff No. 3 would be unreasonable.

The outcome of this decision was the "Court Tariff," which materially reduced freight rates put in force by the railroads and materially increased the freight rates promulgated in said Standard Distance Tariff No. 3. This "Court Tariff" was made effective for all intrastate traffic on all railroads which had secured injunctions, which, as stated, were all the railroads in the State of Arkansas with the possible exception of a few insignificant lines.

The decision on this motion is reported in 168 Federal Reporter, 720.

This decision left in force the injunctions against the legislatively-fixed passenger rates and the Commission-fixed freight rates, and substituted in lieu of the Commission-fixed freight rates the "Court Tariff." Subsequently all these cases were put at issue, but only two were tried. By stipulation of counsel and orders of court, testimony taken in these cases may be used in the other cases so far as applicable, and the other cases were continued pending final decision in these cases. On the 3d day of May, 1911, Judge Trieber, sitting in the circuit court, made perpetual the injunctions granted by Judge Van Devanter in these cases, and orders of court were made continuing the other cases, continuing the injunctions therein, and continuing in force the "Court Tariff" until the final decision in these cases.

On the 30th of June, 1911, the General Assembly of Arkansas appropriated money for the appeal of these cases to this honorable court, and on the 6th day of October, 1911, transcripts of the record in each of these cases were filed in this court, and the transcripts are now in the process of being printed.

The said perpetual injunctions restrained the Railroad Commission from enforcing any rate in Standard Distance Tariff No. 3, and restrained said Commission and all other parties, including the railroads themselves, from enforcing the act of the General Assembly of 1907, fixing passenger rates at 2 cents per mile. The act of the General Assembly regulating passenger rates and the acts of the Railroad Commission under constitutional and statutory provisions regulating freight rates are by said injunctions held inoperative and unconstitutional. This decision reaches all the freight and passenger rates in force in the State of Arkansas under authority of said State, and renders inoperative and void all State regulation of passenger and freight rates pending the hearing of these appeals. These appeals do not serve as a supersedeas and none of the laws of the State of Arkansas regulating passenger and freight rates are now enforceable.

The early hearing and determination of these cases by this honorable court is therefore a matter of vital interest and importance to the State of Arkansas, its officers and citizens, and all persons

who move freight within said State or who travel upon the railroads therein.

## II.

The laws of the State of Arkansas provide for the assessment of railroad properties according to their true value, and provide for an equal and uniform assessment of all property. The amount of revenue received from the railroads through their freight and passenger rates is one of the elements of value to be considered in assessing railroad property for taxation. Owing to the injunctions herein restraining freight and passenger rates fixed by the State and the substitution of other rates in place of those fixed by the State, it is very difficult for the assessing authorities of the State of Arkansas to determine and fix the true value of the railroad properties within the State. The injunction bonds given at the time of the temporary injunctions provided for refunding to shippers and passengers the excess charge over the State-made rates in case the injunctions should be finally dissolved. This revenue, which will run into millions of dollars annually, is held in abeyance until it is finally decided whether it belongs to the railroads or to the shippers and passengers, and leaves uncertain and indeterminable the real amount of revenue received by the railroad companies pending the final decision of these cases, and leaves their proper taxation uncertain.

## III.

Cases from Missouri, Minnesota, and other States involving in many respects questions involved in these cases are now pending on the docket of this honorable court, and the questions which are to be decided herein are not vital to the State of Arkansas alone, but to many other States of the Union.

Wherefore, the premises considered, the appellants move the court to advance these cases and set them down for hearing on the second Monday of January, 1912, or as soon thereafter as the convenience of the court will permit.

JOS. M. HILL,
*Special Counsel for the State of Arkansas.*

Service of this motion by delivering a copy thereof is acknowledged, and service of notice of the filing and presentation of this motion on October 23 is acknowledged. Time of service of copy of motion and of notice of presentation are waived and consent given to the presentation of the motion on October 23.

Given under my hand this 12th day of October, 1911.

J. M. MOORE,
*Solicitor for the Appellees.*

Appellees concur in the request to advance these causes and in so much of the statements contained

in the foregoing application as relate to the character of the subject-matter of the litigation, the importance of the issue involved, and the need for the speedy termination thereof.

## ABSTRACT AND BRIEF FOR APPELLANTS.

---

### A CONCISE STATEMENT OF THE CASE.

NOTE.—All references in this abstract and brief are to the top pages of the printed record, unless specific reference is made to the indented pages which refer to the original record. All references are to the record in Case No. 813, Robert P. Allen *et al.* v. St. Louis, Iron Mountain & Southern Railroad, as that case contains all the evidence. Where the record in No. 814, Robert P. Allen v. St. Louis Southwestern Railway Company is referred to, it will be specifically mentioned as page in Record No. 814.

## THE PLEADINGS.

*The Complaint.*

On the 18th of July, 1908, the St. Louis, Iron Mountain & Southern Railroad and the St. Louis Southwestern Railroad Company and several other railroads (not parties to this appeal), operating in Arkansas, filed bills of complaint in equity in the United States Circuit Court for the Eastern District of Arkansas, against Robert P. Allen and other members of the Arkansas Railroad Commission, and several individual citizens of the State, who have passed out of the cases. These complaints allege the creation, under constitutional amendment and statute, of the Railroad Commission, and the investiture of it with power to regulate passenger and freight rates on all intrastate traffic; and the provisions of the statutes providing various penalties to attach for failure to comply with the orders of the Railroad Commission.

The Bills aver that in 1904 the Railroad Commission put in force Freight Distance Tariff No. 2, prescribing freight rates and charges applicable to all classes and commodities between all stations in said State, on all railroads operated therein, subject to the Western Classification as adjusted to the traffic in said State by the Commission. That the rates therein promulgated, and certain amendments from time to time, continued in force until June 4, 1908, when Standard Freight Distance Tariff No. 3 was made effective. This tariff cancelled Tariff No. 2, and said Tariff No. 3 contained many of the rates and regulations contained in No. 2, and the changes and amendments since No. 2 was issued, and other changes and rates on classes and commodities, and was adopted in June, 1908. The Bills allege that all of the charges and rates prescribed in said Tariff No. 3, as well as in the preceding Tariff No. 2 aforesaid, were unreasonable, unjust, oppressive, discriminative, confiscatory and void, both in respect to said order as a whole and in respect to each and every rate, charge, tariff, schedule, classification, rule and regulation separately (R. pp. 2-6). The Iron Mountain Company alleges that its railroad equipment, property and franchises in use in Arkansas represented an investment of $40,906,572.00 (R. p. 5). The St. Louis Southwestern alleges that its investment represented $16,023,090.00 (R. p. 3, R. p. 814). The Bills allege that each plaintiff has exercised as great degree of economy in the use and operation of its railroad as was compatible with the interest of the public and with safe and efficient service to the public, and it only employed such officers, agents and employees, and expended such amounts in the maintenance and repair of its roadbed, tracks and stations and for new equipment of engines, cars and other appliances as were necessary to the operation of its road and the maintenance of said property, with due regard to its preservation and with safety to the public. That no unreasonable salaries or wages have been, or are now being, paid to any of its officers or employees (R. p. 2). The Bills allege in detail that various

specific freight rates are unreasonable and confiscatory (R. p. 4-8). Then the Bills allege that the roads are engaged in interstate commerce, and that the local rates of the several States through which they pass enter to a very large extent and have a controlling influence on the through rates charged on interstate shipments. The Bills allege that the State rates interfere with interstate rates; on a theory that interstate rates are made up of the sum, or a percentage of the sum, of the various intermediate local rates of each State through which the road passes (R. p. 8). As these allegations are unsustained, further attention to them will not be paid. The Bills also make an attack on the joint rates promulgated by the Commission (R. pp. 9, 10), but there is no evidence to sustain it and further reference thereto is omitted. The Bills then allege that on February 9, 1907, the General Assembly of Arkansas passed an act fixing the maximum rate of two cents per mile on all roads over 85 miles in length, and then allege that the Railroad Commission had adopted and promulgated the passenger rates as prescribed by the General Assembly, and charges that the revenue produced from such passenger rates was less than the expenses of the operation of the passenger service (R. pp. 11-13). The Bills allege that while freight and passenger rates have been reduced, the expenses of maintaining and operating each road have been increased, and many new burdens placed upon them by law, and that the earnings are insufficient to pay operating expenses and an adequate return on the property invested in the intrastate traffic (R. pp. 13, 14). There are other allegations in the Bills (R. pp. 14-21); some of matters not afterwards pressed, and others in amplification of those just mentioned.

*The Answer.*

The Railroad Commission on the 25th of July, 1908, filed its answer. The answer admits what may be termed the historical allegations of the complaint, and denies specifically the force and effect of the rates of which the plaintiffs complain; and denies that there are any unreasonable, unjust, oppressive, discriminatory or confiscatory rates, and denies that as a whole the system of rates is confiscatory; it denies the effect of various provisions of the statute complained of, wherein it was alleged the plaintiffs were denied due process of law in the promulgation of freight and passenger rates.

It admits the issuance of Standard Freight Distance Tariff but avers that said Tariff No. 3 was substantially similar to No. 2, adopted in 1904, and that No. 2 was a repetition in substance of the first Standard Freight Distance Tariff which was adopted on the 10th of April, 1900. It alleges that at different times during the history of the Commission technical questions were raised as to whether certain items were properly adjusted and it was necessary to dispose of such matters by rulings or construction. This being unsatisfactory, when Standard Freight Distance Tariff No. 3 was issued the Commission gave notice to all interested roads that it

would, at a meeting to be held on June 4, 1908, take up the question of adopting this tariff as a whole, and it was so adopted, thus disposing of many inadvertent discrepancies which had crept into the compilations previously issued; but the Commission states that there was no substantial difference between the freight rates promulgated in Standard Distance Tariff No. 3 and those in effect since April 10, 1900. The defendants deny that any of their rates are unreasonable, and deny that the plaintiff roads exercised economy in the use and operation of their property. The defendants deny that the plaintiffs practiced reasonable economy in the operation and maintenance of their roads, and allege that if the roads were properly and economically conducted that the revenue received from the rates promulgated by the Commission would yield a profit of 15 per cent on the property invested. The defendant Commission alleges that the condition of the commercial affairs of the country in 1907 was such as to furnish no criterion for other years; that if it is true that the earnings and expenses of the roads were the amounts alleged in the Bills for the year 1907, that such sums should not be taken as a criterion of the expenses and revenues of the roads in normal times, and set forth with some particularity the well-known panic of 1907, which caused such a serious stagnation and loss to railroad business. The defendants deny the allegations in regard to local rates affecting or interfering with interstate commerce, and deny specifically the various allegations as to the different rates, rulings or orders of the Commission being unreasonable or confiscatory. Defendants deny that the Act fixing the passenger rate at two cents worked any detriment to the plaintiff railroads; they aver that the traffic has so increased since the passage of said Act that the plaintiff railroads were not in any manner injured thereby, and that said rate produced sufficient revenue from the passenger traffic to leave considerable profit unless the plaintiff roads were unreasonable and extravagant in their management and operation and demanded profit on fictitious values. Defendants deny that the freight and passenger revenue will not produce sufficient to pay all of the expenses of passenger traffic and leave an adequate return on the property invested in it. All the other material allegations of the Bills are specifically denied (R. pp. 22-37 and in R. 814, 22-35).

*The Temporary Injunction.*

On the 3d of September, 1908, Hon. Willis VanDeventer, one of the Circuit Judges of the Eighth Judicial Circuit, granted a temporary injunction against all the rates in Standard Distance Freight Tariff No. 3, and against the passenger rates rates prescribed in the Act of the General Assembly (R. pp. 38, 39). Judge VanDeventer's opinion is found beginning at page 38 of record No. 814 and at page 40 in record 813. Judge VanDeventer stated that the proof disclosed the revenues actually derived by each railroad upon the application of these rates from its business in the State, and the revenues from

each class of traffic are so stated as to show separately the earnings from intrastate freight, interstate freight, intrastate passenger and interstate passenger traffic, and also disclosed the value of the property employed by the road in the traffic within the State, the taxes paid thereon, and the actual cost of conducting the freight traffic and the actual cost of conducting the passenger traffic. He stated that the first question for consideration was "How shall this cost be apportioned between the intrastate and the interstate traffic?" He further stated that the proof made it quite plain that the production of a given amount of revenue was attended with greater cost for intrastate business than for interstate business. In this case he found that the additional cost was at least 100 per cent on freight traffic, and 15 per cent on passenger traffic. Then he says (R. p. 41): "Undoubtedly these differences furnish a standard by which to apportion the total cost between the traffic which is intrastate and that which is interstate. Other standards are suggested, but the proofs indicate that none of them are as satisfactory or accurate as is the difference in cost in its relation to the revenue. That standard must therefore be applied, and this may be done in this way, taking the freight and passenger traffic separately: Increase the intrastate earnings by the ascertained percentage representing the difference in cost, threby ascertaining what would have been earned by the same actual expenditure in conducting the intrastate traffic, had it been attended with the same relative cost as the interstate traffic; then add the intrastate earnings as so increased, to the interstate earnings, thereby ascertaining what would have been earned by the actual expenditure in conducting both the intrastate and the interstate traffic, had they been attended with the same relative cost; then ascertain what proportion of this total represents the intrastate earnings, as so increased, and then ascertain the corresponding proportion of the total cost of the intrastate and the interstate traffic."

*Motion to Dissolve.*

On February 18, 1909, the defendants, the Railroad Commission, filed a motion to dissolve or modify the injunction, and alleged, among other matters, the following (R. pp. 56, 57): "These defendant assert that the filing of the bill in equity herein, seeking a temporary and permanent injunction, bound said plaintiff to do equity, as it was seeking relief in a court of equity, and, when said temporary injunction was granted restraining the enforcement of the passenger and freight rates upon the ground that said rates were unreasonable and confiscatory, the said plaintiff was bound by the principles of equity jurisprudence, to put in force, if it exercised its power, only reasonable rates, and it was not at liberty to avail itself of the injunction against the rates established under the law and put in force unreasonable rates. In violation of this settled principle of equity jurisprudence, the plaintiff has, since the rates established by the Commission and the General Assembly were temporarily enjoined, estab-

lished freight and passenger rates of all intrastate shipments, and said freight and passenger rates are unreasonable and exorbitant, and are destroying many of the industries of the State. And said plaintiff is maintaining interstate rates so low that the same amounts to a discrimination against the business and industries of the State of Arkansas. That it discriminates in favor of longer hauls of interstate shipments, under similar and like circumstances, against shorter hauls of intrastate shipment to the great detriment of the shippers and consumers of the State of Arkansas.

The tariff put in by the railroads since that injunction upon the leading articles of commerce in the State is an unreasonable increase. On grain there is an increase of 50 per cent over the Commission rates; on cotton 140 per cent over the Commission rates; on packing house products, 100 per cent; on coal, 35 per cent, on brick, stone and sand, 75 per cent; on lumber, 107 per cent; and on the various lines of merchandise, about 75 per cent. There is an average increase on the principal commodities of the State of 77 per cent over the Commission rate, which these defendants aver is unreasonable, extortionate and oppressive to the shippers of the State."

Defendants also allege that after the injunction was granted restraining the two-cent passenger rate, the plaintiff roads increased their passenger rates to three cents a mile and did not afford any better service while so doing, and alleged further that the plaintiff roads transport all persons who buy 2,000-mile tickets at two cents a mile while occasional travelers who do not buy such mileage books are charged three cents a mile, thereby materially decreasing the amount of travel.

The court found that the tariff put in by the railroads after the injunctions were obtained was unreasonable, and ordered that the freight rates, pending the hearing of these cases, to be charged by the railroads should not produce more than 33 1/3 per cent increase in revenue over that produced by Standard Distance Freight Tariff No. 3, and ordered that a tariff so formed be put into effect not later than June 7, 1909, on penalty of the dissolution of the temporary injunction (R. p. 65).

The defendant Commission set forth in said motion this:

IV.

*Premature Suit.*

"The defendants allege that the plaintiff has a plain and adequate remedy against any rate established by the Commission which is not reasonable and compensatory and should not be entitled to seek a remedy in a court of equity until it has exhausted its efforts to obtain a reasonable and compensatory tariff under the existing law, which affords it ample and complete redress against any injustice in the freight rates established by the Commission. That it is made the duty of the Commission—

"to hear all complaints made by any person, firm or corporation against any such tarii or charges so approved (by it); to hear the parties to the controversy in person or by attorney, or both, and may take testimony orally and in writing, and regulate the argument thereon and conduct the investigation of such complaints in such manner as to the Commission may seem best to arrive at the truth, and when any changes are made in the tariff notice thereof shall be given to the person or corporation to be affected thereby."

And it is further made the duty of the Commission in changing or fixing the rates, to take into consideration the character or nature of the service to be performed, the entire earnings of the railroad, the expense of operating same and the expense and value thereof. And the defendants assert the facts to be that when the first tariff was established by the Commission, in 1900, that it assured the plaintiff and all other railroads affected by it that, if said tariff did not produce a fair profit, the Commission, upon a showing so made, would readjust it so as to produce, if possible, for the plaintiff, a fair profit upon its investment. And such has been the attitude of the Commission from then until the present time, and is still the attitude of the Commission. That several small line railroads have applied to the Commission for relief against the existing rates, and, where the showing has been made of the justice of the application, the Commission has granted the same. That the plaintiff has not presented any complaint to the Commission, alleging that any rate, or the tariff as a whole, established by it was not compensatory and asking for an increase of any rate or of the tariff as a whole. That the Commission recognizes now, as it has always done, that no tariff, whether promulgated by a railroad or a Commission, is perfect, and that all tariffs should be changed from time to time to meet changed conditions in order to do justice to the railroads or shipper, as the case may be, and this the Commission has at all times been ready to do whenever satisfactory evidence should be offered to it showing the justice of and necessity for same.

The defendants assert that the temporary injunction should not be continued until the plaintiff has availed itself of its legal right to obtain redress of its alleged grievance, in so far as the freight rates are concerned, before the Commission, and alleges it is contrary to the principles of equity to entertain a suit where full and adequate remedy at law is open to the plaintiff; that it is contrary to the comity which Federal Courts extend to State tribunals to grant relief in said Federal Courts against State regulations promulgated under State laws, until the plaintiff has sought its constitutional right in the tribunals where the alleged unconstitutional regulation is attempted to be enforced.

The defendants allege that they are called upon to defend in this court the rates of their predecessors and maintained by themselves,

with a few changes as called for from time to time, without having had an opportunity to hear the complaint of the plaintiff and pass upon its justice.

Wherefore, the defendants pray that the injunction be discontinued or its operation suspended until the plaintiff applies for redress before the Commission and gives it an opportunity to pass upon the matters which are alleged in plaintiff's complaint."

The court held said paragraph to be insufficient and struck it out and (R. p. 62) subsequently on the hearing on the merits the same matter was renewed and again overruled by the court, and the first three assignments of error are predicated thereupon.

Judge Trieber's opinion on the motion to dissolve is found beginning on page 66 of the record.

## A STATEMENT OF THE EVIDENCE.

It is difficult to give a concise statement of the evidence because the testimony is so voluminous and so many questions are discussed by so many witnesses from so many angles that a brief statement of it is practically impossible. A statement of the character and purport of the testimony on the various issues may be of some service to the court.

The defendants present many matters in defense of the suit, which will be discussed later and in different connections. Your attention will now be directed solely to the central controversy of the case, which was the division of the property between State and interstate traffic, and the apportionment of the expense between State and interstate and miscellaneous traffic.

*Plaintiff's Evidence on the Revenue Theory.*

The plaintiffs contended that the revenue from each of its three sources of income, freight, passenger and miscellaneous, should be separately ascertained (and this was done), then subdivide the freight revenue into intrastate and interstate, and subdivide the passenger revenue into intrastate and interstate (and all this was done). They contended that miscellaneous, principally mail and express expense, is incapable of division. Having the revenues thus separated, the proportion of each to the whole is used as a factor to divide expenses and property with this exception: The common expenses between freight and passenger are divided on the train mileage basis, the inaccuracy and injustice of which will be hereafter discussed. A proportion of expenses and property is set aside, representing the percentage of miscellaneous revenue to the whole property and expenses. When the results are thus obtained then the plaintiffs contend that there must be added to the intrastate expenses, passenger and freight, a given percentage representing the increased cost of intrastate passenger and freight traffic over interstate. Thus, Judge

VanDeventer found 15 per cent should be added as representing the extra cost of intrastate passenger, and 100 per cent as representing the cost of intrastate freight traffic. The result thus obtained is the revenue basis contended for by the plaintiff in these cases. The evidence to support that revenue theory was opinion evidence of three classes.

The witnesses for the railroads thus reason: (a) That the revenue from State and interstate traffic is ascertainable, and in this case for a given time was ascertained, and the expenses were ascertainable, and for a given time were ascertained; but, unlike the revenue, the expenses were not susceptible of division between intrastate and interstate. Therefore, to separate them, some arbitrary basis must of necessity be adopted, and that the basis most nearly correct, that which contains less fault than any other basis suggested should be adopted; and this they believe to be the revenue theory. They say that various bases have been suggested and found inadequate, the principal other one being the ton-mile and passenger-mile basis. Many reasons were given by the plaintiffs' witnesses why these bases were uncertain, unreliable and unfair; and the revenue basis was advocated as affording the best solution of the difficulty and was supported as reaching an approximately true result. It is passing strange that the revenue basis, which the plaintiffs' witnesses extol, is not used in the division between passenger and freight of common expenses. In lieu of it at that point is the train mileage basis. The large sums which this change of base burden the State will be hereafter shown.

(b) Many witnesses, chiefly operating officials of different railroads, testified that there was an extra cost incurred in earning a given amount of revenue in intrastate traffic over earning the given amount of revenue in interstate traffic. Various opinions as to the extent of this extra cost, both as to passenger and freight traffic, were given. They ranged from 25 per cent to 50 per cent on passenger traffic, and from 100 to 800 per cent on freight traffic. The principal reasons assigned were two: (1) That all intrastate traffic has two terminal expenses within the State, while the interstate traffic has but one, and much of it, the transtate traffic, has none; (2) that the local trains, both freight and passenger, were much more expensive to operate than through trains, and that the local trains, particularly local freight trains, were principally engaged in hauling intrastate traffic.

*Extra Cost.*

(c) Much opinion evidence was adduced to the effect that there was a relation between intrastate and interstate rates, both freight and passenger, and that the freight rates were largely based on the cost of the service and that there was a relation existing between State rates and interstate rates, which relation was based on classification;

*Relation of Rates.*

and there was a corresponding relation of one interstate rate to another intrastate rate on the same class or commodity.

## THE STATE'S SIDE OF THESE CONTENTIONS.

*State's Evidence on Revenue Theory.*

(a) That the revenue derived from each class of traffic was not a proper factor with which to divide either property or expenses; that it was contrary to all accounting principles to use the gross income as a factor to ascertain expenses or the value of property; and, furthermore, that the revenue received from intrastate and interstate rates did not represent, in any way, the expense of either traffic; and that a division of the property on such lines would not afford any criterion of the property devoted to such respective uses. It was furthermore contended that as the revenue from intrastate traffic was so much more per ton per mile than interstate traffic that this theory assigned to the State a larger proportion of property and expenses than the facts justified, and the higher the State rate was made the more property and more expenses would be assigned to the State, which is an unreal and fictitious method of ascertaining the property devoted to intrastate traffic and the expenses incurred therein.

*Extra Cost.*

(b) The State's witnesses admit that there was some extra cost in intrastate freight traffic, but express opinions that it costs more to earn a given amount of revenue in interstate passenger traffic than to earn the same amount of revenue in the intrastate passenger traffic. The reason that intrastate freight traffic was more expensive than interstate traffic was because the intrastate traffic represented the short haul, while the interstate represented the long haul. More of the short haul freight was carried upon local trains than upon through trains, and local trains are the more expensive kind of trains; but it was contended that the greater revenue received for the short haul more than compensated for the greater expense incurred in it. The statistics filed by the railroads show that the intrastate revenue per ton per mile was 98 per cent more than the interstate revenue per ton per mile on the Iron Mountain, and 141 per cent more on the St. Louis Southwestern, and it was contended that this more than counterbalanced the increased cost of intrastate freight traffic. In regard to the terminal handling within the State; it was admitted that as a general proposition it is true that for intrastate freight there are two handlings in the State and for interstate one, and frequently as to much of the interstate, the transstate, none; that these conditions did not exist in Arkansas. Cotton, cottonseed, grain and lumber constitute much over a majority of the freight traffic of Arkansas, and all cotton traffic was interstate and every bale of cotton has three terminal handlings within the State. Practically all grain was interstate,

and it was a very large movement, and most of it, except the transstate grain, had three terminal handlings within the State. Lumber, the largest single commodity moving on the roads in Arkansas, being about 35 per cent of the tonnage of the Iron Mountain road, was mostly handled three times within the State, and it was largely interstate traffic. Much of the transstate freight, like grain and the large movement to Texas, had handling at every division point in Arkansas, which were about 100 miles apart, and there would usually be two or three divisional handlings within the State, the cost of which would be almost, if not quite, as much as a terminal handling. Memphis, Tennessee, is the eastern terminus of the Iron Mountain road, and it has about one mile and a half track therein in addition to trackage rights over the bridge. All the expenses of the road in Tennessee were charged as if Memphis was situated in Arkansas, on the theory that these terminals served Arkansas.

On the opposite side of the State, on the Oklahoma line, is the city of Fort Smith, a jobbing and manufacturing point of 25,000 population.

The tracks of the Iron Mountain road follow a bend of the Arkansas River in entering the city of Fort Smith, and thereby go through a few miles of Oklahoma. This makes all the Fort Smith traffic, as well as all the Memphis traffic, interstate, and all of it has at least two terminal handlings in Arkansas so far as expenses go, and all transstate traffic passing through either of these gateways have one handling in the State in addition to the divisional handlings every 100 miles. Therefore, it was contended that the general proposition as to two terminals for intrastate, as against one or none for interstate, did not apply to this State. As to the local train, it was shown from statistics furnished by the Iron Mountain Railroad Company for October, 1907, and on the St. Louis Southwestern for October, 1908, which were put in evidence by the railroads as fairly representing the business of those roads as between intrastate and interstate traffic, that the load of the local train was largely made up of short hauls of interstate freight. On the Iron Mountain the load of the local trains was 71 per cent interstate as against 29 per cent intrastate, and on the St. Louis Southwestern it was 68 per cent interstate, as against 32 per cent intrastate. Therefore, it was contended that the expense of the local train should be apportioned in proportion to the respective load it carried, interstate and intrastate, and that the opinions of the witnesses on behalf of the plaintiffs who have testified that the great expense on intrastate freight traffic was due to the fact that the local trains principally handled intrastate freight, was based on conditions not existing in Arkansas, and therefore was unreliable and should be given no weight in the face of existing conditions.

(c) The evidence on behalf of the State as to the rates being

based on the cost of the service and the relation between the State and interstate rates may be classified as of two kinds: (1) *Opinion and* (2) *Demonstrative Evidence.*

*Relation of Rates.*

(1) The plaintiffs and the State each introduced much testimony of rate experts as to the effect given to cost of the service in the making of rates, particularly in the making of interstate rates, and the relation of one rate to another. Unquestionably the great preponderance of this evidence tended to show that the rates on interstate traffic prevailing in Arkansas were not based on cost of service, but were based largely, if not entirely, upon competitive and commercial conditions, and that the revenues received from the rates so made did not represent the cost of the service. Much of this was obtained by admission of plaintiffs' witnesses and much more by the State's witnesses. It was shown that the principal commodities in Arkansas were moved on interstate rates made on other considerations than the cost of service. As to the relation of State and interstate rates, much evidence was given that there was absolutely no such thing, if a cost of service relation was considered; that the only relation that existed between interstate and intrastate rates was a trade, or commercial relation, which more or less obtained in all systems of rates to preserve a parity or equipoise between one trade center and another. This was a relation based on commercial and competitive conditions, and not based on any relation of one rate to another, so far as the cost of hauling any given commodity was concerned. It was also in testimony from numerous witnesses that the classification made by classification committees did not preserve a relation between rates, as each State and each interstate tariff usually contained many exceptions to the Western Classification, and the great volume of commodity rates carried the given commodity out of the classification; and, hence, it was impossible for the classification to have preserved any relation between rates. Furthermore, it was shown that the classification did not preserve any parity of the class rates, and was in itself inconsistent and in many instances absurd. The Arkansas Commission Tariff under which the intrastate revenue was produced was a graduated distance tariff. It was claimed by the witnesses for the railroad to be not scientific and out of harmony with itself and did not preserve the ratio between rates which should be preserved.

(2) The State went deeper into this question than the production of rate experts, and put in evidence the system of rates upon all of the great commodities moved through, into and out of the State, thereby showing the rates upon which the great bulk of the interstate revenue was earned. Many of these leading rates, like lumber, cotton, cottonseed and its products, grain, coal and others were shown to be zone rates. For instance, there was a lumber rate from a zone composing all the territory south of the Arkansas River extending to the Gulf of Mexico, to St. Louis, for 18 cents a hundred pounds; a car of

lumber shipped from Little Rock to St. Louis would move on an 18-cent rate with a similar car from Lake Charles, Louisiana, 400 miles south of it, on the same rate. Grain moving into Arkansas, and through Arkansas to the seaport, was shown to move under tariffs which had zones extending from points several hundred miles apart, upon which the same rates were charged to Arkansas and points beyond. Cotton moved in zones both at the beginning and end of the movement. Some of the zones were 100 miles apart in Arkansas and Louisiana and several hundred miles apart in the east, thus the element of distance being disregarded at each end of the haul. There are zones in class rates, which are more stable than any other rates, and such rates represent large traffic. For instance, there is a zone rate on classes from Pittsburg, Pa., territory to Texas common points, the tonnage passing through Arkansas on each of the plaintiffs' roads. This Pittsburg territory extends as far north as Toronto, Canada, and the Texas common points are 2,600 in number and 600 miles apart. For instance, a shipment from Toronto to the farthest Texas common point would be hauled at least 1,000 miles further than a shipment from Pittsburg to the nearest Texas point, and yet the revenue is the same, and that revenue divided according to its mileage in Arkansas with the whole mileage of the haul on the road, and then used as a factor to divide the expenses.

Many of these rates are illustrated by maps attached as exhibits 38 to 43.

In addition to showing that the great commodities of the State moved upon interstate rates which did not represent the cost of the service, the State went deeper still and showed that even these rates were again unequal through the divisions with other roads. The division sheets with other roads affect the revenue received on the same haul. For instance, the shipments of lumber from Little Rock and Lake Charles, Louisiana, to St. Louis. For each the shipper would pay 18 cents per hundred, although one was hauled 400 miles further than the other, but the difference in revenue was even more marked when a shipment was received from another road. Say that the car hauled from Lake Charles was carried to Alexandria, Louisiana, over another road, which would be given, say, 6 cents of the 18-cent rate; then the Iron Mountain would take it from Alexandria to St. Louis for 12 cents and at Little Rock, after hauling it two or three hundred miles, would pick up a similar car and haul it into St. Louis and get 18 cents for it, and the revenue from these two cars are used as proper factors to divide the expense between State and interstate traffic.

Again, lumber received at a point where there are tap lines and a similar shipment from the same place by an individual bear different revenue for identically the same service, the tap line getting from two to seven cents, according to its favor, out of the 18-cent rate, while the car received at the same place from a sawmill with no tap

line attachment would produce 18 cents revenue for the haul. On the other hand, with a few exceptions, all of the intrastate traffic was moved upon a graduated scale, which represented, more or less accurately, an increasing rate for increasing distances. In regard to the classification, it was shown that the Western Classification, which governed part of the traffic moving into Arkansas, was full of exceptions made by every State which promulgated rates, and exceptions were found in every interstate tariff that was issued, and the great mass of commodity rates, upon which the greater volume of traffic moved, were not affected by the classification at all, which only applied to the ten rates known as the Class Rates. Furthermore, it was shown that the classifications were largely affected by commercial and competitive conditions, and in many instances were absurd, and not reflective of any relation of one class with another. The purport of the great mass of testimony along these lines was to prove that there was absolutely no relation between State and interstate rates based upon the cost of service, or based upon anything else, and that there was no relation between rates themselves in different tariffs or any definite or fixed relation of one rate to another, and that revenue produced from these rates was not reflective, in any degree whatsoever, of either the cost of the service or the relation of State traffic to interstate traffic, or the expense of either, nor did it remotely touch the use of the property devoted to either class of traffic.

## THE STATE'S PLAN OF SEPARATING EXPENSES.

In addition to endeavoring to meet the plaintiffs' case on each proposition, the State undertook to prove that the expenses of the intrastate and interstate traffic could be apportioned, with a fair degree of accuracy, between intrastate and interstate traffic by using factors common in railroad accounting, and the result would be a fair approximation of the actual expense incurred in each class of traffic. In order to limit the controversial ground, the State accepted without approval, the plaintiffs' use of the train mileage basis for division of maintenance-of-way and other common expenses between freight and passenger; and likewise accepted, without approval, the plaintiffs' use of the revenue basis for division of property and taxes, and also its use to divide some minor expense accounts difficult of allocation.

The fundamental claim of the plaintiffs is the extra cost of intrastate over interstate traffic, and it was to ascertain all elements of extra cost and allocate them that caused the State to attempt a plan of separating expenses between State and interstate traffic. The State endeavored, in order to accomplish this, to put the maximum allowance in each instance in favor of the interstate as against the intrastate traffic, so that when the maximum allowances were made upon every

item of extra expense which was ascribed by the witnesses for the railroads as attaching to intrastate traffic, it could be ascertained accurately whether the extra revenue per ton per mile of State over interstate compensated for the maximum allowance of extra cost in intrastate freight traffic. In dividing interstate and intrastate passenger traffic, the same plan was adopted. When the State worked out its division of expense for two purposes; one, to demonstrate that it was unnecessary to resort to an arbitrary basis to divide these expenses when a practical basis, closely approximating actual results could be obtained; and, secondly, to show that after making maximum allowances against the intrastate, still the extra cost of the said business was less than the extra revenue derived from it; almost, if not every, witness introduced by the State who testified as to the allowances made by the State, was positive that too much had been allowed in favor of the interstate over intrastate traffic. In making this apportionment factors in common use by the railroads were principally employed; the car mile; the train mile; the engine mile and the ton mile were the principal bases used, each in its proper place. Only one factor was used which was not common in railroad use, and that should be common in railroad accounting because it is common in all other large business enterprises, and that is the proper manner of distributing general or overhead expenses. These were, pursuant to a sound and generally accepted accounting principle, distributed over each class of expense in proportion that each bore to the whole. Thus, the president's salary would be distributed over Maintenance of Way, Maintenance of Equipment, Transportation, Traffic, etc., in the proportion that each of those classes of expenses bore to the whole. This principle is so common, and so thoroughly sound, that it finds use in every line of business except railroad business, and it is as applicable there as it is elsewhere. With this exception, in the distribution of expenses, there is no adoption of any factor other than those in every day use in railroad accounting and railroad operation. In order to make this division of expenses, it was necessary to locate the items of extra expense of the intrastate over the interstate. As heretofore stated, the principal items were the extra terminal handlings, and the fact that most of the intrastate traffic was carried in local trains. During the Missouri Rate litigation, there was prepared for use in that case, and also in this case, complete statistics of operation on the St. Louis Southwestern Railway for the month of October, 1908. Its officers testified that the test was fairly made; that the statistics were fairly gathered and were carefully compiled, and the result of the operations of that month would be fairly representative of the business of that road for several years, and would be fairly representative of the intrastate and interstate traffic at any time, as interstate and intrastate traffic moved hand in hand during the year, and any one month would fairly represent the relations of one class of

the traffic to the other for a series of years. It was further testified that it was a normal month of a normal year. The expenses of this month were worked out in great detail, and the State's accountants accepted them without addition or change, and used them as a basis for dividing the expense on that road. The Iron Mountain officials, in anticipation of a request from the State in this case for similar statistics, prepared and gave to the State the result, generally, of operations for the month of October, 1907, and they testified that that month fairly represented the intrastate and interstate traffic on that road. The Iron Mountain had not made a statement of the expenses of local and through trains, as had the St. Louis Southwestern, and it became necessary for the State to do so, and prepare the statistics in detail for this month, as had been done by the other road for the month of October, 1908. The State's accountants did much work in supplementing the statistics of the Iron Mountain for October, 1907. The result of the statistics of those two months were such that they were able to separate the expenses of the local and through freight trains.

*Freight Division.*

The work of separation of expenses between intrastate and interstate freight traffic must begin with separating the expenses of the local and through trains. When this is obtained for a given period, then it was possible to work out, with a fair degree of accuracy, the actual expenses between the two classes of traffic for said period. To illustrate: Maintenance of way, the first item of expense, was divided on a basis of car miles and engine miles for each local and through train run during the said month. Engine mileage was reduced to car mileage on a basis of two and a half times for an engine mile for one freight car mile, which was the maximum amount which the testimony indicated was the injury to the way by the engine over the car. In Maintenance of Equipment, the locomotives were divided between yard locomotives and road locomotives. Maximum allowance was made for yard switching for yard locomotives to provide for the extra maintenance resulting from the character of the service, as compared with the service rendered by the road locomotive in pulling trains between stations, and maximum allowance was also made against local locomotives on account of extra switching done by each at stations where no yard locomotive was maintained. In apportioning the expenses between freight cars, a maximum allowance was made for the injuries resulting from stopping and starting and terminal handling which were incident to local trains over through trains; and thus on through the various items making up these expenses an allowance was made wherever the evidence showed it should be.

Owing to the method in which the books of the company were kept, it was impossible to definitely locate Traffic Expenses between State and interstate, and the basis adopted by the railroads, the

revenue basis, was used for this item, although it unduly burdened the State. The station expenses were divided between train service and those which were not train service, and those which were not train service were divided between intrastate and interstate on the basis of the number of tons of each class of traffic handled. The State assumed that each intrastate ton was handled twice and each interstate once. Yard expenses which were incurred in assembling and distributing cars were apportioned on the basis of the number of cars hauled in and out of the terminals. These expenses are usually identical, irrespective of the class of service. Wherever it was not identical allowance was made for it. For instance, with the St. Louis Southwestern, Little Rock is the terminal exclusively for local trains, it was so treated. Fuel and locomotive expense were capable of actual ascertainment, and the actual figures were used. Wages of train crews were capable of actual ascertainment, and actual wages of the crews on the local and through trains were definitely located and properly charged to each. Other train expenses which were incurred by the train, such as stock killed on the right-of-way, watching crossings, signaling, etc., were divided between local trains and through trains on the train mile basis. Losses and damages were actually ascertained between intrastate and interstate, and divided directly according to actual expenditure. After the train cost was actually ascertained and the proper allowances made for the cost of each train, that is, local and through, and the local train charged with all of the extra cost which could be definitely located, and it is believed that all of it, and more, was located, then the expense of each is divided in the proportion of the traffic each carried, intrastate and interstate. In other words, the expense of the local train is ascertained. It is found to contain, for illustration, 70 per cent interstate and 30 per cent intrastate, and the expense of that train was divided in that proportion. The through train, is found to contain 95 per cent interstate and 5 per cent intrastate, and its expense was divided in that proportion; on the basis of the ton mile carried by each train of each class of traffic.

*Passenger Division.*

On the passenger division of expenses the same principles were applied, and with these differences in the facts: On the St. Louis Southwestern road it was testified by its officers, and shown by time-cards by them put in evidence, that that road carried no through passenger train in Arkansas. All of the trains in the State were local. On the St. Louis, Iron Mountain & Southern Railroad, as shown by the testimony of its officials in exhibit 46 in this case, there were eight through trains, one of which was a fast mail and carried practically no passengers, and 48 local trains. It was undisputed that the seven through trains largely carried interstate passengers, and carried some intrastate passengers, and the 48 local trains were made up indiscriminately of intrastate and interstate passengers. It was further

shown that the records of the auditor's office would not show whether a passenger during any given period in the past had ridden in a local train or in one of the seven or eight through trains, therefore it was impossible on that road to make a separation of the local and through trains, and as there was no such division of trains on the St. Louis Southwestern road, it was of course impossible to separate the passenger traffic between the local and the through trains. Therefore, the separation in the passenger side of the case is between the classes of cars; that is, passenger cars, Pullman cars, baggage, mail and express. This is definitely worked out on the same principles which have been used in working out the freight problems. The result of this plan of working out the expense was to show that on the St. Louis Southwestern, applying the earnings to its property used in that traffic, according to its own division of property, that there was a return on the intrastate freight of 13.99 per cent; on the intrastate passenger of 5.79 per cent, or a total on intrastate freight and passenger of 9.16 per cent on property invested in intrastate freight and passenger business, and a total return on all property, including intrastate, interstate and miscellaneous, of 12.83 per cent. (Exhibit V.) On the St. Louis, Iron Mountain & Southern (Exhibit Q) is shown intrastate freight, 10.33 per cent; intrastate passenger, 5.31 per cent; total intrastate freight and passenger, 7.69 per cent return upon the property invested in intrastate freight and passenger business. This shows a total return of 7½ per cent on all property on all business, including intrastate, interstate and miscellaneous.

In these calculations the State did not attempt any other basis for dividing the property than that used by the plaintiffs, the revenue basis. Hereinafter we seek to show that the revenue basis unjustly burdens the State in using it as a factor with which to divide the property, but the exhibits merely use the plaintiffs' apportionment of the property to State purposes to show that upon it a compensatory return is being earned. The same is true of the use of the train mile as the factor with which to divide common expenses between passenger and freight traffic. The railroads so divided them and the State used the sums so divided to work out the problem it was attempting to solve.

## THE PLAINTIFFS' CASE IN REBUTTAL.

Plaintiffs contested some of the details of the accountants' work on the October, 1907, statistics, contending that the subtraction of the local train expense from the total train expense was unreliable in that one was made up from the books of the company and the other was from the wheel reports. The difference would be what is termed the lapovers. The plaintiffs contend that the lapovers from September into October would not, necessarily, offset the lapovers from October into November, while the defendants contended that

one would offset the other, and that the difference was a neglible quantity. The plaintiffs contend that the statistics of one month was not a fair test of the six months period, and particularly that October was not. In this the plaintiffs' witnesses in rebuttal were in direct conflict with the plaintiffs' witnesses in chief, who had testified that one month was a fair test of the relative business between State and interstate, and they had also testified that the two different months of which statistics had been put in by the railroads were fairly representative months. There is much testimony on this point, principally of the plaintiffs' in rebuttal against the plaintiffs' in chief. It was also contended by the railroads that there was a congestion in October, 1907, rendering statistics of that month unreliable, and thus it was also in conflict with its previous testimony on this subject; all of this will be pointed out in detail when this matter is considered in another connection. Meeting the issues presented by the plaintiffs' plan of separating the State and interstate business, broadly, the plaintiffs took the position that no solution of the problem had been worked out by the State in the plan presented by it. This was chiefly testimony of operating officials of different railroads who contended that the bases adopted by the State were unreliable when used for the purposes used by the State, and that the results attained through the use of these bases afforded no approximation of the true result sought to be obtained. Then the detail of the State's plan was attacked. Almost every basis used was criticised. The various allowances which were called arbitraries, representing the extra expense of the local trains, were criticised, and their sufficiency, in many instances, denied. More often the attack was made upon the ground that there was not sufficient data upon which to base the allowances for such extra items of expense. In the criticism of the State's bases for separating expenses, the critical opinions of the railroad officials were carried back to the railroads' own bases used in separating passenger and freight expenses, and in separating the expenses of Arkansas from other parts of the Iron Mountain system where the expenses were pooled. This attack was made upon the train mile basis, which is the basis used by the railroads in their original case when separating the expenses of the passenger and freight traffic as the beginning point in which to separate their expenses on the revenue basis in order to apply the respective revenues to each class, and also upon the car mile basis for separating expenses of maintenance-of-equipment between Arkansas and other States forming the Missouri Pacific system.

Repairs of cars, one of the largest items of expense, of all the cars in the Missouri Pacific system, including the Iron Mountain, were pooled; and a proportion assigned to Arkansas by taking the car miles of the cars in Arkansas as representing the proportion of the total expense incurred in Arkansas. The State's accountants accepted the amount thus assigned to Arkansas, and subdi-

vided it between the local and through trains on the freight side of the problems on the car mile basis, and on the passenger side of the problem divided it between coach, baggage and mail cars on the car mile basis. Consequently, we have the anomalous position of the rear guard attacking the advance. If the attack of the plaintiffs in rebuttal against the State's use of the car mile and train mile for the purposes above indicated is sound, necessarily the attack reaches back and destroys the whole computation made by the railroads on the revenue basis, as these factors were used before the revenue basis was applied, and the revenue basis when applied was bottomed on a division of expenses by the car mile and train mile. The plaintiffs also contended in their testimony in rebuttal that several of the bases used by the State were improperly used for that particular purpose, and that other bases should be used in lieu thereof; for instance, the distribution of expenses for maintenance-of-way was made over the whole system according to the overhead plan adopted by the State accountants for distributing general expenses. In this way they treated the maintenance-of-way expense as a general expense. The accountants on both sides made an error in regard to the expenses of passengers carried in Pullmans. The railroad accountants, in attempting to correct an error made by the State's accountants, fell into an error themselves on this subject. Both errors were carefully and conscientiously corrected by the accountants on each side. This called for a revision of the statistics on each side, but the error thus made affects the return on the property only a fraction of one per cent, and is hardly worth considering, but it called for a reapportionment of the expense on the passenger side between the passenger coaches, the Pullman coaches, the baggage, mail and express cars, and including the cafe and observation cars and the baggage cars used by the Pullman passengers, rendering the detail of the distribution somewhat more complicated, while not changing the principle, or the result materially, but, in fact, emphasizing the correctness of the principle employed, as it enabled the accountants on each side to agree as to how each of the errors could be corrected in redistribution of the expenses on broader lines and in more detail. Much of the testimony in rebuttal and surrebuttal was devoted to operating questions. The State's accountants had used a table prepared by Wellington in his work on "Railway Location," in which he had worked out the causes for injuries to freight cars, giving the percentage for each cause. The plaintiffs, in rebuttal, admitted the authority of Wellington's work at the time it was first written, but contended that the table prepared, while continued in later editions, had been prepared for the first edition which was issued at the time that freight cars were equipped with handbrakes and link and pin couplers, and that under modern equipment the percentages should be much higher. On the other hand, the State, in surrebuttal, introduced much expert testimony to show that

the change in equipment would have the opposite tendency, and that the percentages given by Wellington were much too high under modern equipment. It was also contended by the witnesses for the plaintiffs in rebuttal that the allowance for switching made by the local trains was insufficient, and that there was no data upon which such allowances could be accurately based. In surrebuttal of this the State produced numerous trainmen, familiar with operation, who testified that the allowances gave the locals too much, and were too high, and that the basis for the extra mileage incurred was readily ascertainable. It was also contended that the allowance made for the locomotives, as causing two and one-half times more injury to the way than freight cars, was insufficient, and that the basis was unreliable; while the State, in surrebuttal, produced experts who testified that the allowances made in the original exhibits were too high. Various other matters of similar character were gone into in rebuttal and surrebuttal. The result of the plaintiffs' case in rebuttal was summarized in the Iron Mountain exhibit No. 56, which exhibit follows, along general lines, the State's plan of separating the expenses between intrastate and interstate, but changed the bases in many instances, and changed the allowances made by the State to conform to the testimony introduced by the plaintiffs, and produced a return upon the property very much less than that produced in the State's exhibit. In the trial in the lower court this exhibit was termed a caricature of the State's plan of dividing expenses, and when the evidence is considered, it is believed that this is an apt characterization of it, unless a "distortion" of the State's plan would be found to be a more appropriate term.

## THE DEFENDANTS' CASE IN SURREBUTTAL.

The general nature of the testimony of the State in surrebuttal has already been given in stating the nature of the plaintiffs' case in rebuttal, and it would be a repetition to summarize it further. Generally speaking, it may be said that the State's case in surrebuttal showed this: That the original exhibits filed by the State were made upon maximum allowances against the intrastate traffic, and each allowance was justified as an extreme one against the intrastate traffic; and tended to justify the basis used in each case. In fact, the physical side of the case was much more thoroughly gone into in surrebuttal than in the case in chief. As heretofore explained, the State's plan of dividing expenses was worked out for the purpose of showing that the expense could be divided on fair bases, and, therefore resort to an arbitrary method was not necessary; and, secondly, to demonstrate that the extra cost of intrastate over interstate traffic could be properly located and accounted for, instead of being left to opinion evidence, which varied so greatly as to be a strong indication of itself of its own unreliability. When the plaintiffs in rebuttal of this

attacked the soundness of the bases and the correctness of the allowances made, and the plan adopted in working out the various allowances, the State then developed full justification for all that had been done in the original case, and showed by a decided preponderance of the testimony that the allowances made in the original exhibits were excessive in favor of the interstate traffic, and that on an accounting between the two they should be materially reduced in order to arrive at a fairly accurate division of the expenses between these classes of traffic. This testimony will be gone into more in detail in another connection.

## OPINION OF THE TRIAL COURT ON THE BASES ADOPTED.

The court said:

> "The straight revenue theory, as advanced by the learned counsel and accountants of the railroads, is clearly wrong, as none of them takes into consideration the increased rates charged for the intrastate traffic. No further proof of the fallacy of this theory is required than the examples and calculations of the accountants for the railroad in the exhibits filed with their testimony."

The Court quotes Mr. Nay's statement, which was similar to Mr. Kimball's hereafter set out (187 Fed. 321-322). The Court says:

> "But to ascertain the cost of the different items of expense it is impossible to adopt either theory to the exclusion of the others in all matters. For some items the revenue theory will necessarily have to be adopted, while in others the ton mileage, car mileage or train mileage are the only bases which will enable the Court to determine from the evidence in these cases how the different items of expenditures should be apportioned. (187 Fed. 324.)
>
> * * * * * * * * *
>
> "On the other hand, the accountants for the State offered in evidence schedules which they claim are based on facts as they appeared from the records of the railroads when such were obtainable, and on the experience of men long in the railroad service when factors had to be adopted arbitrarily. The scheme for obtaining these facts is new, never having been used by any accountants in any of the numerous rate suits which have heretofore been before the courts. It was devised by Mr. Wharton, a member of the firm of Haskins & Sells, expert accountants of national reputation (p. 331).
>
> * * * * * * * * *
>
> "But, in the opinion of the Court, the scheme itself furnishes the best method of solving this problem that has been called to the attention of the Court, depending, of course, upon the cor-

rectness of the numerous factors necessary to obtain accurate results (p. 332). To determine these important issues under consideration, the Court intends to adopt their schemes and ascertain in that manner, in connection with all the other testimony in these cases, the difference of the cost of the intrastate as compared with the through business, and it is of the opinion that in this way it will reach conclusions as nearly accurate as from the evidence is possible."

Hereafter we think we will be able to demonstrate that the Court made palpable errors which caused him to reach the conclusion he did, but he was evidently following the right path, in part at least, in the plan adopted by him to reach the conclusions. This subject is mentioned here only to complete the statement of the case under the rules, in order that the assignments of error which follows may be the better understood.

## ASSIGNMENT OF ERRORS.

Now comes Robert P. Allen, George W. Bellamy, William F. McKnight, constituting the Railroad Commission of the State of Arkansas, defendants in the above entitled cause, and aver that in the record and proceedings herein that there has been manifest errors committed in this, towit:

1st. The Court erred in not sustaining the motion to dissolve the temporary injunction herein, which motion was filed and considered by the Court prior to taking the testimony herein, on the ground therein set forth that the complainant had filed this bill in equity in the United States Circuit Court, asking relief against freight rates promulgated by the predecessors of the present Railroad Commissioners, without first praying relief from the Commission, which was authorized and required by law to grant relief against unreasonable, unremunerative or confiscatory freight rates.

2d. The Court erred in not dismissing the bill of plaintiff on final hearing because the evidence showed that the freight rates embraced in Standard Distance Freight Tariff No. 3, sought to be enjoined herein, had been in force with only minor changes made from time to time and those not materially affecting the revenue of the plaintiff, for a period of six years prior to the filing of the suit herein, and the complainant did not before filing this suit apply to the Railroad Commission for relief against any of said freight rates as unjust, unreasonable, unremunerative or confiscatory; when the evidence showed that the scheme of freight rates embraced in said tariff were originally put in force in the year 1900, subsequently re-enacted in 1903, and when put in force the Railroad Commission stated and declared to the plaintiff and other carriers affected thereby that if on fair test of said rates, in whole or in part, they proved to be unjust, unreasonable, unremunerative or confiscatory, that relief would be granted by the Commission upon proper showing of such facts.

3d. The Court erred in not dismissing the bill on final hearing because the evidence shows that since 1900 the general scheme of freight rates sought to be enjoined herein has been in force under order of the Railroad Commission and the whole body of freight rates sought to be enjoined, save and except minor changes made from time to time which did not materially affect the revenue of the plaintiff, had been in force since 1903 and the plaintiff and other carriers had acquiesced for said period of time in said scheme of freight rates, which were embraced in Standard Distance Freight Tariff No. 3, complained of in the bill herein.

4th. The Court erred in finding, as stated in the opinion of the Court, that the evidence showed an increased cost of operation for ten years prior to the filing of this suit, and that rates that had been remunerative ten years prior to its filing would no longer be so on account of increased cost of operation, and on such account that there was no acquiescence in the plaintiff in submitting to the schedule of freight rates; when the evidence shows that the increased efficiency of locomotives, cars and tracks and other similar causes had rendered the cost of carrying freight less than at the beginning of the ten years' period referred to by the Court and less than at any prior period.

5th. The Court erred in holding that the reduction by the Legislature of passenger rates from three cents to two cents per mile was an excuse for the complainant to seek relief in the Federal Court prior to applying to the Railroad Commission for relief therein against the freight rates, because under the law the Railroad Commission is authorized, upon proper showing, to increase the freight rates so as to compensate the plaintiff for its loss in passenger rates, if any loss occurred on account of said legislative reduction of the passenger rates.

6th. The Court erred in its decree in adjudging and decreeing that the freight rates in Standard Distance Tariff No. 3 and passenger rates fixed by the General Assembly of 1907 were confiscatory and would not afford complainant fair and reasonable return upon its property, and erred in decreeing that a compliance with said freight and passenger rates would be taking the property of the complainant without due process of law, because the evidence shows that said freight and passenger rates are reasonable and compensatory and that they do afford the complainant a fair and reasonable return upon the value of its property invested in intrastate traffic.

7th. The Court erred in making perpetual the temporary injunctions heretofore granted in this cause and enjoining these defendants from enforcing Standard Distance Freight Tariff No. 3, or any rate or schedule therein, and from enforcing the Passenger Rate Act of 1907, and particularly erred in enjoining any rates in said Standard Freight Distance Tariff No. 3, as many, if not all, of said rates are reasonable, just and compensatory.

8th. The Court erred in not dismissing plaintiff's bill because plaintiff failed to establish by clear and decisive evidence that the intrastate freight and passenger rates sought to be enjoined were confiscatory and in holding upon the evidence offered by the plaintiff that said rates were confiscatory when said evidence was based wholly on opinion testimony without sufficient data upon which an intelligent opinion could be based and said evidence was not of that decisive and clear character which is required to satisfy a court that rates promulgated by a State were confiscatory.

9th. The Court erred in not dismissing the plaintiff's bill because the plaintiff had not overcome the presumption that the rates established by the State were reasonable and compensatory by a preponderance of the testimony.

10th. The Court erred in not dismissing the bill of plaintiff because the preponderance of the testimony established the fact that the freight and passenger rates sought to be enjoined were compensatory and earning the complainant a fair return on its property.

11th. The Court erred in sustaining the plaintiff's bill upon the evidence offered by the plaintiff, when it was shown in the evidence that better testimony than that offered was obtainable by the plaintiff in the form of detailed statements of revenue derived from local and through freight trains, and detailed statements of the expenses of local and through freight trains and the amount of State and interstate traffic carried respectively on the local and through freight trains; that the plaintiff instead of resorting to the best evidence to ascertain the relative cost of State and interstate traffic produced only opinion testimony, which was of insufficient probative force to overcome the presumption of the validity of the rates established by the State when better and more reliable testimony could have been produced by the plaintiff and was in its possession and control.

12th. The Court erred in holding the passenger rates to be confiscatory when the evidence shows that the complainant voluntarily made passenger rates equal and less than those fixed by the State and the plaintiff carried a large volume of passenger traffic on rates voluntarily made by it and other carriers on rates as low as, and in many cases, lower than, those fixed by the State herein complained of.

13th. The Court erred in holding the freight rates to be confiscatory when the evidence shows that the complainant voluntarily made freight rates equal and less than those fixed by the State, and the plaintiff carried a large volume of freight traffic on rates voluntarily made by it and other carriers on rates as low as, and in many instances, lower than, those fixed by the State herein complained of.

14th. The Court erred in finding that the period of six months ended December 31, 1907, fairly represented the earnings and expenses of the plaintiff, and further erred in not holding that the revenue and expense of October, 1907, fairly represents one-sixth of said period.

15th. The Court erred in not charging the plaintiff with a fair annual rental for the use of the Bunch elevator, when the evidence shows that said property had a fair rental value of $20,000 per year and the plaintiff only charged $1.00 to its tenant per year rental therefor.

16th. The Court erred in holding that the division of expense apportioned to Arkansas by the plaintiff for the repairs of tools and machinery was fair.

17th. The Court erred in not deducting from operating expenses the fine of $10,000.00 and costs imposed on the plaintiff for illegally giving free passes to members of the Legislature.

18th. The Court erred in charging the expense of the Memphis terminals and the portion of plaintiff's road in Tennessee to the expenses incurred in Arkansas.

19th. The Court erred in charging all the expense of the Fort Smith terminals to the Arkansas expenses.

20th. The Court erred, in sustaining as proper, salaries paid by the plaintiff to lobbyists, and salaries and fees paid attorneys outside of Arkansas.

21st. The Court erred in charging any part of the expense incurred for the leased line known as the Paragould trackage to intrastate traffic when the evidence shows such expense to be incurred wholly for interstate traffic.

22d. The Court erred in charging the rental of the Van Buren bridge to the Arkansas expense, particularly any part thereof to the intrastate expense.

23d. The Court erred in holding the plaintiff road was efficiently operated.

24th. The Court erred in apportioning the property of the plaintiff in the State between the intrastate and interstate traffic on the revenue basis in order to ascertain the proportion of said property used in intrastate business.

25th. The Court erred in the bases adopted for apportioning expense between intrastate and interstate traffic.

26th. The Court erred in apportioning the miscellaneous expenses on the revenue basis.

27th. The Court erred in declaring in the opinion that the State contended for a division of property and expenses on the "ton mile basis."

28th. The Court erred in finding that the intrastate freight rates were only 50 per cent higher than the interstate rates, when the undisputed evidence showed that the revenue per ton mile under Standard Distance Freight Tariff No. 3 produced 98 per cent more revenue per ton per mile on the Iron Mountain Railway Company than the interstate traffic produced per ton per mile and on the St. Louis Southwestern Railway Company, 141 per cent more per ton per mile.

29th. The Court erred in using the revenue basis for dividing any expenses and particularly without allowing for the excess of at least 50 per cent which the Court found the State revenue was higher than the interstate revenue; the evidence shows that by using the revenue as a factor without making allowances for the difference between the two that the State expenses are burdened unduly in proportion to the excess of the State revenue over the interstate revenue.

30th. The Court erred in not adopting as a whole the plan of division of expense presented by the State, which said basis of division was sustained by preponderance of the testimony as being the best basis for fairly apportioning the expense between intrastate and interstate traffic.

31st. The Court erred in not accepting the results of the statistics obtained from the test months which were put in evidence by the complainant. The evidence shows that October, 1907, was a fairly representative month of the six months' period introduced in evidence by the Iron Mountain Railway Company; that October, 1908, was a fairly representative month between State and interstate traffic on the St. Louis Southwestern and further the evidence shows that the plaintiff was estopped from questioning that said months are fairly representative for the purposes used by the State.

32d. The Court erred in charging to interstate business only 40 per cent of the expense of the local trains when the evidence shows that on the Iron Mountain it should be about 72 per cent and on the St. Louis Southwestern about 68 per cent of the expense of the local trains is chargeable to interstate freight business and said finding of 40 per cent was not supported by the evidence.

33d. The Court erred in dividing maintenance of way expenses on the revenue basis and particularly in not making allowances for the difference between the intrastate and interstate revenue when using the revenue as a factor in dividing said expense.

34th. The Court erred in its division of expense between local and through trains in charging 50 per cent extra to yard locomotives as against the local train and 75 per cent additional for local locomotive mileage when the evidence shows much lower percentage should be used to equalize them.

35th. The Court erred in the division of the expense of the maintenance of equipment of freight cars in charging 25 per cent extra to the local trains for starting and stopping and 13½ per cent for terminals handling when the evidence shows that much lower percentage should be charged for said causes. The Court also erred in this item in estimating that the through trains stop every 35 miles as against five miles to the local trains. The Court also erred in this item in not charging transstate and interstate traffic with the cost of starting and stopping freight cars and in making different allowance for interstate and intrastate traffic, when the evidence

shows that this is an element of expense from the physical starting and stopping of freight cars unconnected with the class of traffic carried in said cars.

36th. The Court erred in not apportioning general expenses according to the plan adopted by the State:—The Court particularly erred in charging all of these expenses on the basis of the supervision in maintenance of equipment and transportation only, whereas, the evidence shows a proper share of such expenses should be charged to the maintenance of way and all of the other expenses.

37th. The Court erred in dividing the item of hire of equipment on the revenue basis and erred in charging an additional 30 per cent to local traffic when the evidence shows there is no relation between the revenue and said item of expense, and there is no evidence to show that 30 per cent or any other percentage should be added to local traffic for this item of expense.

38th. The Court erred in the basis adopted for apportioning station expenses.

39th. The Court erred in finding various omissions from the expenses apportioned to the State in the State's plan of dividing expenses between intrastate and interstate traffic and particularly erred in finding that the dead weight on local trains exceeded the dead weight on through trains 14 per cent, and particularly in finding that for all such alleged omission that 8½ per cent should be charged to the local trains, when the evidence fails to show any basis for such alleged omissions or such percentages as found by the Court.

40th. The Court erred in the basis adopted for apportioning fuel and locomotive expenses and in the basis adopted for "other train expenses."

41st. The Court erred in charging the State passenger traffic with 10 per cent greater than the interstate passenger traffic, when the preponderance of the testimony shows interstate traffic is the most expensive.

42d. The Court erred in holding that the St. Louis Southwestern freight and passenger traffic was more expensive than the Iron Mountain's freight and passenger traffic.

43d. The Court erred in finding the extra expense of intrastate traffic over the interstate freight traffic on the Iron Mountain Road was 210 per cent, and on the St. Louis Southwestern 250 per cent, when the evidence shows that, at the outside, the extra expense of such freight traffic is less than the greater percentage of the revenue per ton per mile of the intrastate over the interstate revenue.

44th. The Court erred in holding that the plaintiff was entitled to earn 6 per cent interest on the value of its property and 1.5 per cent surplus and that a return of less than 7½ per cent on the value of its property devoted to the intrastate traffic was confiscatory.

45th. The Court erred in not holding a return on the plaintiff's investment equal to the rate of interest prevailing on railroad securi-

ties was compensatory, which rates of interest the evidence shows to have been a little less than 4½ per cent on railroad securities in Arkansas.

46th. The Court erred in retaining jurisdiction of this cause for any other purpose than to permit these defendants to show a changed situation which might relieve them of the injunction.

Wherefore for the errors aforesaid, and each and every of them and many more apparent in the face of the record, the defendants, Robert P. Allen, George W. Bellamy and William McKnight, Railroad Commissioners of the State of Arkansas, pray for a reversal of the decree aforesaid and that the Court be directed to enter a decree dismissing plaintiff's bill of complaint and such other relief as equity and good conscience will show the defendants entitled to receive.

## ARGUMENT.

The argument of the case will necessarily be principally of facts. There was no reference to a master in this case. The Circuit Court, heard the cast directly, without the intervention of a master. In the case of Knoxville v. Knoxville Water Co., 212 U. S. 1, on page 8, Mr. Justice Moody, speaking for the court, said:

"There can be at this day no doubt, on the one hand, that the courts on constitutional grounds, may exercise the power of refusing to enforce legislation, nor, on the other hand, that that power ought to be exercised only in the clearest cases. The constitutional invalidity should be manifest, and where that invalidity rests upon disputed questions of fact, the invalidating facts must be proved to the satisfaction of the court. In view of the character of the judicial power invoked in such cases it is not tolerable that its exercise should rest securely upon the findings of a master, even though they be confirmed by the trial court. The power is best safeguarded against abuse by preserving to this court complete freedom in dealing with the facts of each case. Nothing less than this is demanded by the respect due from the judicial to the legislative authority. It must not be understood that the findings of a master, confirmed by the trial court, are without weight, or that they will not as a practical question, sometimes be regarded as conclusive. All that is intended to be said is that in a case of this character this court will not fetter its discretion or judgment by any artificial rules as to the weight of the master's findings, however useful and well settled these rules may be in ordinary litigation."

In view of the duty now devolved upon this Court, we can but serve it by trying to bring some order out of the chaos of a voluminous record.

Instead of presenting what each witness has testified, we will attempt to present the subjects discussed and present the opposing

testimony upon each subject. Many witnesses testified upon many subjects, but the subjects can and should be grouped in order.

Before proceedings with the facts on the lines indicated, there are some questions of law and of law and fact, which should be discussed.

## INTERFERENCE WITH INTERSTATE COMMERCE.

Confronting Arkansas and the other States is the theory that as a matter of fact—not of law—a system of rates, freight and passenger, promulgated by the State, and effective only on intrastate freight and passenger traffic, may be void as an interference with interstate commerce.

This theory was presented unsuccessfully before Judge Brewer in Ames against Union Pacific Railway Company, 64 Fed. 165, afterwards reported in this court as Smyth against Ames, 169 U. S. 466. Judge Brewer said:

> "Neither can I understand how the reduction of local rates, as a matter of law, interferes with interstate rates. It is true the companies may, for their own convenience, to secure business, or for any other reason, rearrange their interstate rates, and make them conform to the local rates prescribed by the statute; but surely there is no legal compulsion. The statute of the State does not work a change in interstate rates, any more than an act of Congress prescribing interstate rates will legally work a change in local rates. Railroad companies can not plead their own convenience, or the effects of competition between themselves and other companies, in restraint of the otherwise undeniable power of the State."

So far as our investigation has led us, the theory mentioned found no judicial approval until Judge Sanborn's decision of the Minnesota Rate Case. The opinion of so eminent a jurist, his premier position in the judiciary of the Eighth Circuit, and the strength with which his conclusion is stated, requires more than passing notice to the subject.

The question is purely academic so far as the present record is concerned, for if the touch-stone used by Judge Sanborn be applied to the facts in this case, the system of rates promulgated by the Arkansas Commission will not be found, as a matter of fact, to be an interference with interstate commerce. The State in this case could safely lay the facts in this record before Judge Sanborn and expect a favorable decision, but the subject is not academic to the future conduct of the State of Arkansas and its agency, the Railroad Commission. The action of each will necessarily be controlled by what this court says on this subject in this case.

Judge Trieber, in his decision in this case, held that facts found by Judge Sanborn in the Minnesota case were not to be found in this case, and his conclusion was not applicable to the facts here. The same decision was reached in Louisville & Nashville Railroad Com-

pany v. Siler (186 Fed. 176). Notwithstanding the favorable decision, as to the facts in this record, it is felt that the underlying proposition in Judge Sanborn's opinion should be carefully scrutinized.

This, as we understand the opinion, is the predicate for the conclusion which he reached:

> "The State may regulate its intrastate commerce so far only as the exercise of its power does not substantially burden or regulate or discriminate against interstate commerce, but no farther." Shepard v. Northern Pacific Ry. Co., 184 Fed., pp. 769-795.

Can the converse of this be true? May Congress regulate interstate commerce so far only as the exercise of its power does not substantially burden or regulate or discriminate against intrastate commerce?

The powers of the General Government and the powers of the State in the regulation of interstate and intrastate commerce are respectively identical, and unless both the proposition as stated by Judge Sanborn and its converse are true, neither can be true; and it is submitted that these authorities demonstrate it.

In Gibbons v. Ogden, 9 Wheaton, page 1, the respective powers of the State and National governments over commerce—using the term in its most comprehensive sense—were defined. Chief Justice Marshall, speaking for the court, at page 197, said:

> "If, as has always been understood, the sovereignty of Congress, though limited to specific objects, is plenary as to those objects, the power over commerce with foreign Nations, and among the several States, is vested in Congress as absolutely as it would be in a single government, having in its constitution the same restrictions on the exercise of the power as are found in the Constitution of the United States."

Referring to the power of the State, he said, at page 195:

> "The completely internal commerce of the State, then, may be considered as reserved for the State itself."

Again, at page 203, he said:

> "They [referring to 'inspection laws'] form a portion of that immense mass of legislation which embraces everything within the territory of a State not surrendered to the General Government; all of which can be most advantageously exercised by the States themselves. Inspection laws, quarantine laws for regulating the internal commerce of a State, and those which respect turnpike roads, ferries, etc., are component parts of this mass.
>
> "And no direct general power over these objects is granted to Congress; and, consequently, they remain subject to State legislation."

The great Chief Justice evidently foresaw that such a question as this might arise.

He clearly forecasted such a situation as the one now presented:

> "So, if a State, in passing laws on subjects acknowledged to be within its control, and with a view to those subjects, shall adopt a measure of the same character with one which Congress may adopt, it does not derive its authority from the particular power which has been granted, but from some other, which remains with the State, and may be exercised by the same means. All experience shows that the same measures, or measures scarcely distinguishable from each other, may flow from distinct powers; but this does not prove that the powers themselves are identical. Although the means used in their execution may sometimes approach each other so nearly as to be confounded, there are other situations in which they are sufficiently distinct to establish their individuality.
>
> "In our complex system, presenting the rare and difficult scheme of one general government, whose action extends over the whole, but which possesses only certain enumerated powers, and of numerous State Governments, which retain and exercise all powers not delegated to the Union, contests respecting power must arise. Were it even otherwise, the measures taken by the respective governments to execute their acknowledged powers, would often be of the same description, and might, sometimes, interfere. This, however, does not prove that the one is exercising, or has a right to exercise, the powers of the other" (p. 204).

In Cooley v. Board of Port Wardens, 12 Howard, page 300, the controversy over the concurrent powers of the State and the National governments, in the silence of Congress, which had been presented by Mr. Webster and Mr. Oakly in Gibbons v. Ogden and then left undecided, was there determined. Mr. Justice Curtis, page 320, said:

> "It is the opinion of a majority of the court that the mere grant to Congress of the power to regulate commerce, did not deprive the States of power to regulate pilots, and that although Congress has legislated on this subject, its legislation manifests an intention, with a single exception, not to regulate this subject, but to leave its regulation to the several States."

As interstate and intrastate commerce are each accurately determinable and each exclusively in the power of one or the other government, this concurrent power, in the silence of Congress, is not especially important in this discussion, but still it is pertinent because Congress has expressly left to the States the regulation of intrastate commerce. It is contained in a proviso of the Interstate Commerce Act of 1887, (Chap. 104, page 529):

> "Provided, however, that the provisions of this Act shall not apply to transportation of passengers or property or to the

receiving, delivering, storage, or handling of property wholly within one State and not shipped to or from a foreign country from or to any State or Territory as aforesaid."

Thus it is seen that even if the regulation of intrastate freight or passenger traffic are within the power of Congress the Congress has elected to be silent as to its exercise.

In Peik v. Chicago, etc., Ry. Co., 94 U. S. 164, 177, the Court said:

> "As to the effect of the statute as a regulation of interstate commerce. The law is confined to State commerce or such interstate commerce as directly affects the people of Wisconsin. Until Congress acts in reference to the relations of this company to interstate commerce, it is certainly within the power of Wisconsin to regulate its fares, etc., so far as they are of domestic concern. With the people of Wisconsin this company has domestic relations. Incidentally these may reach beyond the State. But certainly, until Congress undertakes to legislate for those who are without the State, Wisconsin may provide for those within, even though it may indirectly affect those without."

In Sands v. Manistee River Improvement Co., 123 U. S. 288, the Court said:

> "The internal commerce of a State—that is, the commerce which is wholly confined within its limits—is as much under its control as foreign or interstate commerce is under the control of the general government."

In L., N. O. & T. Ry. v. Miss., 133 U. S. 588, this court said:

> "It has often been held in this court, and there can be no doubt about it, that there is a commerce wholly within the State itself not subject to the constitutional provision, and the distinction between commerce among the States and the other class of commerce, between the citizens of the single State, and conducted within its limits exclusively, is one which has been fully recognized by this court, although it may not be always easy, where the lines approach each other, to distinguish one from the other."

In Covington & C. Bridge Co. v. Ky., 154 U. S. 204, the Court said:

> "The adjudications of this court with respect to the power of the States over the general subject of commerce are divisible into three classes. First, those in which the power of the State is exclusive; second, those in which the States may act in the absence of legislation by Congress; third, those in which the action of Congress is exclusive and the States can not interfere at all.
>
> "The first class, including all those wherein the States have plenary power, and Congress has no right to interfere, concern

the strictly internal commerce of the States, and while the regulations of the State may affect interstate commerce indirectly, their bearing upon it is so remote that it can not be termed in any just sense an interference. Under this power, the States may authorize the construction of highways, turnpikes, railways, and canals between points in the same State, and regulate the tolls for the use of the same."

Again the Court said, *supra:*

"Congress has no power to interfere with police regulations relating exclusively to the internal trade of the States."

Then the court construes the second class, those which may be termed concurrent jurisdiction, where the States may act in the absence of Congressional action; it is believed that the State power of regulating intrastate railroad rates is not a concurrent power, but if it be considered as such, then the expressed withdrawal of such exercise by Congress would leave the State supreme in controlling such regulation.

Then the Court passes to a consideration of the third power; that in which the action of Congress is exclusive and the State can not interfere at all. It can not be stated more strongly nor more broadly than in the above-given quotations from Chief Justice Marshall.

In the Employers' Liability Cases, 207 U. S. 463, the Court said:

"The act, then, being addressed to all common carriers engaged in interstate commerce, and imposing a liability upon them in favor of any of their employees, without qualification or restriction as to the business in which the carriers or their employees may be engaged at the time of the injury, of necessity includes subjects wholly outside the power of Congress to regulate commerce."

Again, the Court said:

"As the act thus includes many subjects wholly beyond the powers to regulate commerce, and depends for its sanction upon that authority, it results that the act is repugnant to the Constitution, and can not be enforced unless there be merit to the propositions advanced to show that the statute may be saved."

The Court disposes of another contention, as follows:

"It remains only to consider the contention that we have previously quoted, that the act is constitutional although it embraces subjects not within the power of Congress to regulate commerce, because one who engages in interstate commerce thereby submits all his business concerns to the regulating power of Congress. To state the proposition is to refute it. It assumes that because one engages in interstate commerce he thereby endows Congress with power not delegated to it by the Constitution; in other words, with the right to legislate concerning matters of purely State concern. It rests upon a conception that the Constitution destroyed that freedom of com-

merce which it was its purpose to preserve, since it treats the right to engage in interstate commerce as a privilege which can not be availed of except upon such conditions as Congress may prescribe, even although the conditions would be otherwise beyond the power of Congress.

"It is apparent that if the contentions were well founded it would extend the power of Congress to every conceivable subject, however inherently local, would obliterate all limitations of power imposed by the Constitution and would destroy the authority of the States as to all conceivable matters which, from the beginning, have been, and must continue to be under their control so long as the Constitution endures."

In Mo. Pac. Railway Co. v. Larabee Flour Mills Co., 211 U. S. 612, the Court said:

"But the main contention on the part of the Missouri Pacific runs along an entirely different line. It is that the Missouri Pacific and the Santa Fe are common carriers engaged in interstate commerce, and as such are subject to the control of Congress and therefore in these respects not amenable to the power of the State. It appears from the findings that about three-fifths of the flour of the milling company is shipped out of the State, while the other two-fifths is shipped to points within the State. In addition to hauling of empty cars from the Santa Fe tracks to the mill was, if commerce at all, commerce within the State. The road was therefore engaged in both interstate commerce and that within the State. In the former, they are subject to the regulation of Congress; in the latter, to that of the State; and, to enforce the proper relation between Congress and the State, the full control of each over the commerce subject to its dominion must be preserved. Fairbanks v. U. S., 181 U. S. 283. How the separateness of control is to be accomplished, it is unnecessary to determine."

It is not difficult to determine the separateness in these cases. In fact, it has been accurately determined. In the warp and woof of our complicated industrial development, our commerce, interstate and intrastate, move side by side. They are drawn by the same locomotive, handled by the same employees, carried in the same train, and ofttimes in the same car. The passenger from Little Rock to Texarkana sits side by side with the passenger from St. Louis to Dallas, and the tourist from the East to California travels in the same seat with the farmer from his station to his county town. Yet there is no difficulty in separating the commerce. Each package and each car of freight has its own bill of lading. Each passenger has his ticket. The revenues of the company are made up from shipments of freight and passenger fares. The records of the company show definitely, accurately, and precisely, whether each pound

of freight is intrastate or interstate, and the passenger fares are separated definitely, even to the farthing.

The able accountants, representing the State and the raliroads in this case, have gone through the records of the railroad offices containing the record of revenue of intrastate and interstate for a given period. These revenues are the basis of this suit, and their separation into the two classes, intrastate and interstate, have been made to a nicety, and there is no dispute over them. Therefore, the separateness of the traffic is not a feature of this case.

The character of the traffic being fixed, then, under the principles above-quoted, the power regulating each character becomes a known quantity. As soon as a given shipment of freight is ascertained and it is found to be intrastate, it is moved under the intrastate tariff, and this is framed by the Railroad Commission acting under the Constitution and the laws of the State of Arkansas. As soon as an interstate shipment is ascertained, it is moved under a tariff promulgated by the railroad shipping it, and filed with the Interstate Commerce Commission, and subject to the regulations of that Commission.

As soon as a person becomes a passenger he purchases a ticket, and it fixes absolutely whether he is an intrastate passenger or an interstate passenger. Or, if he fail to buy his ticket and pays his fare to the conductor, his fare fixes his character as certainly as the ticket would fix it. The report of the ticket and the cash payment definitely determine the tariff under which each passenger has been carried.

There is no confusion of the powers in such cases as these. There is no converging of the lines. Each line runs parallel throughout its course, with the other. The full force of the contract of shipment as determinative of whether the shipment was intrastate or interstate was considered in Gulf, C. & S. Ry. Co. v. Texas, 204 U. S. 403. It was further held in that case that there was no difference between a passenger contract and a freight contract as determinative of whether the commerce was intrastate or interstate. It seems clear that, when the commerce is accurately differentiated as it is here, and the character of the traffic determined absolutely and its class definitely ascertained, the power of regulation over that class being accurately defined in the authorities quoted heretofore, there can be no room for a question as to the power of regulation applicable to each.

The power of the State to regulate internal, or as it is more commonly called, intrastate, commerce, is as exclusively in the State as if there were no other government existing, so far as this question is concerned—of course, over all State and National regulation, the guarantees of the Federal Constitution against the taking of property without due process, impairment of the obligations of contract, etc., exist supremely; but assuming that no other provision of the Constitution is violated, the commerce clause is no more violated by State regulation of internal or intrastate commerce, than if there

were no Federal Government, and the State alone were the sovereign power.

On the other hand, owing to the Commerce Clause, the Congress may regulate interstate commerce wherever it goes as completely and as exclusively as if there were no State governments whatsoever. If, in the exercise of these two distinct powers over the two distinct classes of commerce, there comes an impingement, it is one of those results which naturally follow from our dual system of Government; but the power of each government can not be abridged because in the due exercise of it, an indirect effect may be had upon the regulation of the other government in its own sphere. These are the indirect and incidental interferences so often referred to, that can not be avoided, nor remedied, and must be endured by those who may suffer from them, but they do not constitute a direct interference with the power of the other, which the Constitution equally guards.

Therefore, we submit that the power of the State over its internal commerce can no more be hampered by its incidental and indirect effect on interstate commerce than the power of Congress over interstate commerce can be hampered by the State regulation of intrastate commerce.

## INTERFERENCE WITH INTERSTATE RATES.

So far as we can recall the testimony, there can be a claim of the intrastate rates interfering with the interstate rates in only four instances, out of the many thousand rates in controversy, and each of those will be examined in order to ascertain whether it is an interference within the meaning of Judge Sanborn's decision, if it be accepted as sound. Mr. Charles L. Stone, Passenger Traffic Manager of the Missouri Pacific and the Iron Mountain railways, testified that when the local rate in Arkansas was reduced from three cents to two cents a mile, that the passenger traffic department immediately began to work on interstate tariffs, and put them into effect as soon as possible, using the two-cent rate as the basis in the State of Arkansas. After the injunction was granted by Judge VanDeventer, the rates were put back to three cents and the interstate was readjusted upon that basis (R. p. 266). Mr. Stone claims that when the rate per mile in Arkansas was reduced by the Legislature from three cents to two cents, that it had the effect of making various reductions between border points into the State of Arkansas, numerous intsances of which he gave (R. p. 270), and that these reductions had the effect of reducing interstate rates between the territory which he outlined upon the map attached to the testimony as exhibit 24. He was asked when the rates were put back to three cents a mile, if he increased the interstate rates correspondingly, and he said that his road did so where it was upon its line, but in the territory indicated there were several other lines interested, and the other roads

had to join in a corresponding advance (R. p. 271). He said California rates were not affected very much by the change in Arkansas; that that was a rate fixed by competition, and based upon the rates fixed by another road (R. p. 271). He says, with some exceptions which he mentioned, there was no change in the transcontinental rates by reason of the reduction to the two-cent fare in Arkansas (R. p. 272), and of these, the homeseekers and excursion rates are about one and one-half cents per mile (R. p. 272), and the other transcontinental rates are about two cents per mile; and there is also a colonist rate, the figures of which he does not give, but which is presumably lower than any of the others. He was asked if all the interstate passenger traffic crossing Arkansas was not at the rate of about one and one-half cents a mile, and said he thought not, but said he could not give the exact figures, and stated that in his opinion it would average about two cents per mile (R. pp. 273, 274). On redirect, he took back the broad statement that the average interstate rate was about two cents per mile, and stated that he thought that was only true of special rates, homeseekers' rates, excursion rates, etc. (R. p. 275). Then the statistics of the case were shown to him as prepared by Mr. Johnson, the statistician of his road, and it was shown that the interstate passenger rate was 1.865 (R. p. 276). We have gone somewhat tediously into Mr. Stone's testimony because we believe it reduces the proposition that State passenger rates interfere (in its legal sense), with interstate rates to an absurdity. The average interstate rate through Arkansas is less than two cents. Many of these rates were one and one-half cents, or less, yet it is claimed that because Arkansas reduces its rate from three cents to two cents that interstate rates were interfered with by that fact, when their level was less than the reduced State rate. Mr. Stone gives numerous examples of a reduction of rates from a point close to the border to a point within the State made by the railroads immediately after the reduction by the Legislature of the passenger rates to two cents. This was evidently done because a passenger might get off at the station nearest the line and buy another ticket; but there was no compulsion, other than the convenience of the railroad in making these rates; there was not even competition to compel them, and where competition existed, the rates are much under the level of those established by the State; yet, because the State established a rate higher than the average interstate rate, it is seriously argued by this witness that this is an interference with interstate commerce.

2. Much testimony has been given touching the sugar rate. It will be somewhat tedious to refer to it by pages, and as there is really no controversy over the facts, it can be stated in such a way that the court will grasp it without turning to the record. There was a rate on sugar from New Orleans to Helena, Arkansas, of ten cents per cwt. The ten-cent rate also extended to Memphis, Tennessee. There was a rate from New Orleans to Texarkana, Arkansas,

of 26 cents, and to Fort Smith of 26 or 27 cents. The merchants in Fort Smith and Texarkana complained of this rate to the Railroad Commission. Merchants at Helena also appealed to the Commission for a reduction of the sugar rate in Arkansas. Three hundred miles was the longest mileage upon which the Arkansas Commission fixed rates, as that distance was supposed to cover the longest haul possible within the State. The Railroad Commission, after investigating the matter, concluded that if the railroads could haul sugar from New Orleans to Memphis for 10 cents, a distance of about 600 miles, that they could haul sugar for 300 miles in Arkansas for 13 cents. One of the Railroad Commissioners testified that one of the reasons in fixing this rate was to enable the people of Texarkana and Fort Smith to get a reasonable sugar rate, and that the rates that were in force to both places were, in the opinion of the Commission, unreasonable. The Commission could not regulate the rate from New Orleans and could only regulate the rate within the State, and this the Commission did, and only this, reduced the sugar rate from 15 cents, which it had been theretofore to a maximum of 13 cents for a 300-mile haul in Arkansas. The result was that sugar could be shipped from New Orleans to Helena for 10 cents, and reshipped from there to Texarkana or Fort Smith for 13 cents, making a rate of 23 cents to those points, or several cents per cwt. less than the rate made by the railroads. The railroads could then have done one of several things: They could have raised their rates to Helena, or they could have let the rates stay as they were to Texarkana and Fort Smith, and allowed sugar to be shipped via Helena to Fort Smith and Texarkana for 23 cents, or, they could have reduced the rate from New Orleans to Texarkana and Fort Smith. That was a situation wholly within their hands. The only interference, if interference it could be called, with any interstate rate, was in enabling shippers at Helena to avail themselves of the interstate rate to that point, and a State rate to Fort Smith and Texarkana. If the railroads objected to this course, all that was necessary for them to do was to raise their rate to Helena, or lower it to the other points. Either their rate to Helena was too low, or the Fort Smith and Texarkana rates were too high. The Arkansas rate could not be questioned as unreasonable, for it was higher than the rate for the haul from New Orleans to Helena and Memphis, a haul of about double its length. It may have worked an interference with the discriminative rate in favor of Helena and Memphis against Fort Smith and Texarkana, but it did not interfere with any legal or moral right of the railroads.

3. It was in testimony from Judge Wallace, one of the Railroad Commissioners, that in 1900, when the Commission Tariff was first put into effect, that it caused a material reduction in the rates in Washington and Benton counties, Arkansas. There are only small towns in those counties. The Government census shows that Rogers

and Fayetteville are the principal ones, of about 2,500 and 5,000 respectively. These towns had been buying their goods from Springfield, Missouri, although Fort Smith, Arkansas, a jobbing center of about equal importance, was nearer to them, owing to the railroad rates being lower from Springfield to those towns. When a graduated distance tariff was put into effect it enabled Fort Smith to reach that territory, though its shorter distance giving it better rates. In that way the interstate commerce to Springfield was disturbed; in other words, the railroads had been favoring Springfield by giving it a lower rate than the other jobbing center nearer to this territory, and equitable rates were put into effect, and that favoritism was disturbed thereby, and interstate commerce was interfered with.

4. Mr. J. D. Watson, Assistant General Freight Agent of St. L. S. W. R. Co., put into evidence exhibit 51, which shows a decrease in rates in certain territory south of Pine Bluff, between April, 1900, and September, 1900, owing to Standard Distance Tariff No. 1, which became effective April 10, 1900.

These are rates from Memphis, Tennessee, to about 33 stations on the lines of the road south of Pine Bluff.

Owing to the rates from Pine Bluff and Little Rock, both jobbing towns, to these points being fixed by the Standard Distance Tariff, and the differentials between Memphis, St. Louis and Kansas City and Little Rock being fixed, as shown in exhibit 50, at definite sums, the Memphis rate to these 33 points had to be lowered in order to meet competition from Little Rock and Pine Bluff. This was also a situation wholly in the control of the railroads. They made their differentials from one city over another to preserve a trade balance—or, more properly speaking, a railroad-carrying balance between them. These differentials may or may not be good policy; much can be said for and against them, but it is sufficient here to say that they were absolutely voluntary on the part of the railroads, and to promote their own traffic. If they did not wish to preserve these balances, then they could or not, as they pleased, put in rates to these points complained of. If these rates put in were compensatory, they have lost nothing; if they are not compensatory, then it was bad management to put in rates to carry traffic at a loss. The fact that they put them in September 6, 1900, and continue them to this date is fairly good evidence that they are compensatory. Mr. Watson explained fully that it was all "up to the railroad" to meet or not meet a competitive rate. If the railroad thought it good business to make the lower rate, it did so; or, if it did not, it could refuse to meet it and carry the freight at a compensatory rate, or not carry it at all. This is one of the rights of the railroads, which they freely exercise, and no rate made by the Arkansas Commission, has or can affect that right.

It doubtless will occur that any system of rates promulgated by a railroad, an association of railroads, or a State Commission, will

have an effect produced on other systems of rates promulgated by any other rate-making body, whenever the rates touch or connect. Precedent alone has an effect, and competition and commercial conditions a controlling effect, but the interferences or influence or control of one set of rates over another set is produced by the precedent, the competition or the trade conditions.

Had these rates complained of been promulgated voluntarily by another railroad, the effect would have been exactly as claimed the Commission-made rates affected the Memphis rate. The only difference is that the Commission-made rates were on a distance scale and there was no playing of favorites.

## DIVIDING THE PROPERTY ON THE REVENUE BASIS.

Meeting the plaintiffs at the threshold of the case is the necessity of dividing the property in the State of Arkansas between the intrastate and the interstate traffic. This is done in the exhibits filed by the railroads upon a straight revenue basis. To illustrate, if 20 per cent of all the revenue in Arkansas was from intrastate business, 20 per cent of the property in Arkansas would be assigned to intrastate business, and the remainder assigned to interstate and miscellaneous. Assuming the miscellaneous to be 10 per cent, that would leave 70 per cent assigned to interstate traffic. In exhibit No. 5, filed by the Iron Mountain railroad, it is shown that its intrastate freight revenue was 13.377 mills per ton per mile, and the interstate freight revenue was 6.750 per mills per ton mile, figured during the six months ending December 30, 1907, the period of inquiry in these cases; and the St. Louis Southwestern is 20.945 per ton per mile for intrastate, and 8.665 for the interstate. In round numbers, the Iron Mountain intrastate freight revenue is 100 per cent. more than the interstate, and the St. Louis Southwestern 140 per cent. more. For facility in analyzing the proposition the Iron Mountain figures alone will be used. Exhibit No. 5 also shows that the total intrastate freight revenue was 13.41 per cent, and the interstate freight revenue was 86.59 per cent of all freight revenue, and that the intrastate ton miles was 7.25 per cent, and the interstate ton miles were 92.75 per cent of the total tons mile. To put the proposition in other words, it was this: The ton miles represented the use made by the intrastate traffic of the railroad; this was 7 per cent of the whole; while the earnings from that 7 per cent represented 13 per cent of the total earnings from freight traffic. The revenue from the intrastate traffic being nearly double that of the interstate traffic, on the Iron Mountain, and much over double on the St. Louis Southwestern Railway, almost doubles in the one case and much over doubles in the other the amount of property assigned to the State for doing an equal amount of business. The amount of extra cost of intrastate traffic comes up as a matter of expense. For

illustration, if the extra cost of intrastate freight traffic was one hundred per cent, and the revenue is 100 per cent more, then the extra cost is taken care of by the amount of revenue over the interstate equaling to the extra cost. When the revenue from the intrastate traffic is used to divide the property, it is assigning double the amount to the State in the Iron Mountain case, and thereby the State is twice mulcted, once in dividing the property, and again in dividing the expense. Conceding that it is right to so divide the expense, and that the extra amount assigned to the State on account of the higher revenue only compensates for the extra cost of the intrastate traffic, yet, if that extra cost does not exceed 100 per cent, then when the same factor is used to divide the property, 200 per cent has been charged to the State. This is manifestly unfair unless the extra expense is 200 per cent, and, if so, then the extra cost should not be added in pursuance of testimony of the operating officials who give it as their opinion that there is an extra cost of 100 to 800 per cent. These questions were not before Judge VanDeventer. The revenue per ton per mile, either State or interstate, was not put before him. He merely found the extra expense to be 100 per cent for the intrastate freight, and there was no evidence before him that that was cared for by the excess in the revenue when used as a factor to divide expenses. Judge Trieber said, at page 325, 187 Fed.:

> "Whether the ton mile, car mile, train mile, or revenue basis is adopted to arrive at correct results, it is necessary to ascertain the relation of the tariff rates charged for the interstate business and those charged for the intrastate business; for, if the latter are sufficiently high to make up the difference in cost found to exist between the two, then that difference has been fully provided for, and to make any additional allowance therefor would be doubling the cost, and to that extent doing an injustice to the State."

Judge Trieber finds, for the reasons stated in his opinion, that intrastate freight revenue per ton per mile is as above-stated, yet, as a matter of fact, that the intrastate tariffs were only 50 per cent higher than the tariff rates for the interstate traffic per ton per mile (*Id.* p. 330). Why the learned judge rejected the actual statistics and adopted the rates as a test, is something we are unable to understand, and it will be discussed hereafter. Be it as it may, whether we accept the statistics of the revenue on the Iron Mountain, that it is 100 per cent higher for the intrastate than the interstate business and 140 per cent on the St. Louis Southwestern, or accept Judge Trieber's theory that the rates were only 50 per cent higher, still, a grave injustice is done to the State in using the revenue with which to divide the property, whether the higher percentage be 50 or 100, or 140, the injustice is plain, its degree only uncertain. Suppose a railroad in Arkansas was valued at $1,000,000.00, and it was wholly a freight-

carrying road: Its annual expenses were $500,000.00. Twenty per cent of its revenue was from intrastate traffic, and 80 per cent from interstate traffic. Ten per cent of the ton miles was intrastate and 90 per cent interstate. If the ton miles are used as a basis to divide the property and expenses, 10 per cent or $100,000.00 would be set aside as the proportion of the property used by the intrastate traffic. Using the same factor to divide the expense, $50,000.00 would be set aside as representing the expenses of intrastate traffic. If the testimony convinces the court that it cost twice as much to earn a dollar in intrastate traffic as it does in interstate traffic, then another $50,000.00 should be added to the expense thus ascertained, making the total intrastate expense $100,000.00, and interstate expense $400,000.00. This 10 per cent of the ton miles, however, owing to the rate per ton per mile being twice as high for the intrastate as the interstate, has earned 20 per cent of the revenue. If the revenue is used as the factor, then $200,000.00 is set aside as the proportion of the property devoted to intrastate traffic, instead of $100,000.00 if the ton mile is used; and $100,000.00 is set apart as the expenses of the intrastate traffic. If the intrastate traffic cost twice as much as the interstate traffic, then the correct amount has been set apart as the intrastate expenses. The higher rate has taken care of the added cost, but the other side of the equation has not been cared for. Two hundred thousand dollars of property has been set aside to the intrastate traffic by reason of the double amount of revenue earned in that traffic over the interstate. Whatever may be the solution or the proper adjustment of the expenses between intrastate and interstate traffic, the solution of the division of property has not been reached in applying the revenue as the basis therefor. The actual figures in these cases are practically the same as those given in the illustration above. The intrastate ton one mile was 7 + per cent, the interstate being 93—, while that of the interstate revenue derived from that 7 per cent was 13 per cent. Putting it in other words, the State freight business in volume is 7 per cent of the total, and in revenue 13 per cent of the total. Thirteen per cent of the property is assigned to intrastate business, while it only represents 7 per cent of its use. Mr. McPherson used the apt expression that the revenue does not represent the use, but the result of use. The result of use here is that owing to the higher State rate, 7 per cent of the volume of the traffic has earned 13 per cent of the revenue, and 13 per cent of the property is set aside as representing the intrastate property while, as a matter of fact, only 7 per cent of it was used. What is the proper factor to divide the property by is a question of great difficulty. It is not for the State in this case to work out that problem; it has tried to work out a good many problems for the railroad herein, but has not attempted to work out this one, but has attempted merely to show the absolute inaccuracy and injustice of adopting the plan presented by the railroads. When we demonstrate that to be

wrong their case necessarily fails. The learned experts who testified on behalf of the railroad in their case in chief as to the revenue being the proper basis, Messrs. McPherson, Nay and Doddridge, gave but scant attention to the problem of dividing the property. Their attention seemed to be wholly directed to the problem of dividing the expenses and except in a few passing remarks including property with expenses, there was absolutely no argument made by them in favor of the revenue theory of dividing the property. They offer many criticisms of the ton mile theory of dividing the expenses. Much of it, if not all of it, the State may heartily agree to, and it tried to meet all the valid objections against the ton-mile theory, in its plan of division and only used it to divide train expenses, after the expenses of the two classes of trains had been equalized; and that was the use to which some of these learned witnesses for the railroads have said was a proper use of the ton mile.

Mr. McPherson, at pages 307-320, discusses many objections to the ton-mile basis, all of which go to its use for dividing expenses. None of his criticism of it is applicable if it be used as a basis with which to divide the property. It would seem more logical to use it as a basis for dividing the property than to divide the expenses, for the expenses do not result from the ton mile. As Mr. McPherson says it represents the cost between stations, and does not represent the cost of terminals, and many other costs which he enumerates. These must be cared for in other ways, upon some such plan as that adopted by the State in this case, which properly allocates each item of the expenses; but the ton mile represents ultimately the use of the railroad by its freight traffic. The passenger miles represent the passenger use of a railroad. If the ton mile was used to represent the use of the property, it would be a fairly accurate factor, probably more so than any other factor that could be used for this purpose. It would represent exactly the use of the property by the freight traffic. It might be that some station property would not be represented in this, but the station property, so far as freight traffic is concerned, is purely auxiliary to the ton miles of freight carried. We submit, for the consideration of the court, that the ton mile might be a fair basis upon which to divide the property. Certainly it is true that the revenue basis where the revenue for the intrastate is so much greater than that for the interstate as it is in this case, and where the revenue represents double the amount of the use of the property as represented in ton miles, it can not be a fair factor with which to divide the property between the State and interstate traffic.

The railroads are practically without evidence to support the revenue basis as the proper one for dividing property, and the State has, with many witnesses, pointed out and, we believe, proved its unreliability. The expense basis has been suggested by some of the State's witnesses, but it, too, has been criticised, while others have pointed out the ton mile as the logical basis. It is not the duty of

the State to find a basis; the burden is on the railroads to produce one which satisfies the court clearly that it fairly divides the property between the State and interstate traffic.

Surely it can not be said that a basis which, owing to the fact that the State revenue is 98 per cent higher per ton per mile than the interstate, is a fair basis when it automatically sets apart to State traffic 98 per cent more property than it would set apart if intrastate and interstate revenue were the same; and when it is shown that the intrastate traffic only amounts to 7 per cent of the whole traffic, then it becomes indubitably certain that a formula that assigns for the use of 7 per cent of the freight traffic, 13 per cent of the property which is 98 per cent more than would be assigned if the revenue of the two classes of traffic were even, is unquestionably wrong.

## SUIT PREMATURELY BROUGHT.

In the motion to dissolve the injunction, the defendants set forth in paragraph 4 reasons why these suits should not be maintained until after an application to the Railroad Commission had been fruitless. This paragraph was stricken out of the motion without an opinion from the Court, but at the hearing on the merits the question was again presented to the Court and decided against the State, for the reasons given by Judge Trieber in his opinion, at pages 306, 307, in 187 Fed. Reporter. His ruling thereon is made the basis for the first three assignments of error. Judge Trieber quotes an excerpt from the testimony of Mr. Hampton, one of the Railroad Commissioners, to the effect that all the reductions made by the Commission were after public hearings, to which the railroads were invited, and which they attended and most always against their protest and objection. But this was said concerning the few reductions made by the Commission from the promulgation of the Standard Distance Tariff, April 10, 1900, till it was enjoined by Judge Vandeventer, September 3, 1908. Mr. Hampton and Mr. Swaim fully explained each of these reductions and their trifling effect upon the revenue as a whole. There were joint rates made in 1900, but these were declared invalid on account of lack of power in the Commission, which was given to it by the Legislature of 1903, and the joint rates re-enacted.

Exhibit "B" gives all the changes subsequent thereto. A glance over it will suffice to show how trivial were the changes, considering such a vast body of rates existing from 1900 to 1908.

When it is remembered that the intrastate freight revenue produced from this tariff for six months was $640,248.17 (exhibit "5"), it will readily be seen that all these changes could not have affected it appreciably. The evidence is undisputed that from a revenue standpoint these changes were wholly immaterial. Necessarily such minor changes should be made in any comprehensive system of rates. Exhibit "D" shows the granting of many orders on the request of the

PAGES

railroads and the denial of many complaints of individuals seeking relief against the railroads.

The history of the promulgation of the first tariff is derived from the testimony of Judge Wallace, a distinguished jurist of the State, a member of the first Commission and once its chairman. (R. pp. 875-896.)

Briefly stated, the system was put in after long conferences with the railroad traffic officials and after many increases and changes from a tentative tariff had been made at their instance. The railroads were told that the system was an experiment, the Commission believed a good one, but if it worked harshly and proved noncompensatory the railroads were assured the Commission would correct it and make such changes as were needed to correct any errors or injustice in it. Judge Wallace served on the Commission several years after this, and tells of the great reform the Commission rates worked in abolishing special rates and favoritism of localities and persons; and he attributed much of the succeeding prosperity of the railroads to them; and so far as he knew the railroads were fairly well satisfied with them; they came back with no request for relief. Mr. Hampton, who served from the time Judge Wallace retired until the injunctions were granted, testified that the railroads asked no relief of the Commission, and he, too, was led to believe that the general scheme of rates was satisfactory and compensatory. Judge Wallace, Mr. Hampton, Mr. Allen and Mr. Crockett, the succeeding members, all testified that the Commission would have granted relief to the railroads at any time they applied therefor and satisfied them that the rates were too low or unreasonable or unjust. Instances were given, and the record as shown in exhibit "D" prove them, where, upon proper showing, relief was granted railroads, such as increasing the oil rate, applying the tariff to roads desiring it and denying petitions of complaining citizens, etc. And the Commission refused to reduce the passenger fare from 3 cents to 2½ cents per mile.

All of this testimony is undisputed, directly or indirectly.

The procedure before the Commission is judicial. Any person or corporation may object to any tariff approved by the Commission and a hearing after notice shall be had; they shall hear the parties in person or by attorney or both; may take testimony, administer oaths and regulate arguments and conduct investigations in such a manner as to arrive at the truth. It is further made the duty of the Commission, in fixing or changing rates, to take into consideration the character or nature of the service to be performed, the entire earnings of the roads, the expense of operating the same and the revenue and value thereof. All of this is set out in paragraph 4 (R. pp. 58, 59), heretofore quoted.

We submit that the principle of Prentiss v. Atlantic Coast Line Co., 211 U. S. 210, should apply here.

BLURRED PAG

Rates are legislative work, not judicial, whether made by Commission or Court; and whether they are constitutional or void is a mere matter of fact—not of law. The railroads can not be denied the right to try these facts before a court of their choosing which has jurisdiction. But before resort should be had to the courts, the complainants must make it "absolutely certain that the officials of the State would try to establish and enforce an unconstitutional rule." The comity which the judiciary extends to the legislative department calls for this, and *a fortiori*, the comity which a Federal Court extends to State legislation insists upon this action.

This is not a case of "keeping a previous watch upon the bodies that make laws, and using every effort and all the machinery available to prevent unconstitutional laws from being passed." The Legislature has wisely relieved the carriers of that unsatisfactory remedy and provided a forum and judicial procedure to work out this delicate legislative function of rate-making.

The Virginia Constitution went one step further than ours in giving an appeal from the Commission to the Supreme Court of Appeals, but the Court of Appeals, when hearing such appeal, would be performing a legislative function, and it is the fact that the State has provided a forum for final legislative action and provided process and procedure for adjusting rates equitably that the Federal Courts fail to interfere until the State tribunals evince a determination—after such hearing—to inflict confiscatory rates upon its carriers; and then resort to the Federal Court is right and proper.

Save alone an appeal to the appellate court the laws of Arkansas safeguard the railroads as fully against unconstitutional enactment as the laws of Virginia. In the Prentiss case the railroads went before the Commission with their evidence, but failed to exercise their final right in the State tribunals by appealing to the Court of Appeals. They were denied a hearing in the Federal Court until they exercised their right or attempted to do so. In this case they presented no petition to the Commission, they offered no evidence there. They failed to take the primary step for relief in the State tribunal and should they not be denied hearing in the Federal tribunal sitting in equity until they exhaust the remedy provided by the laws of Arkansas?

What was said in the Prentiss case is equally true here:

"It seems to us only a just recognition of the solicitude with which their rights were safeguarded that they should make sure that the State, in its final legislative action, would not respect what they think their rights to be, before resorting to the courts of the United States"

The facts here present much stronger equities than the Virginia case. Those were new rates, and resort to the final remedy in the State tribunal was required. These were old rates, long acquiesced in, and put in after the roads had been consulted and were largely

instrumental in framing them and under solemn promise that any injustice in them would be corrected. The good faith of the promise is not questioned; that the successors of the Commissioners who made it were ready to redeem it was undisputed; that their actions showed judicial fairness in disposing of other issues, for and against the roads, was undenied.

The passenger rates had been taken out of their jurisdiction, but the power to increase freight rates to compensate for any loss on passenger rates was unquestionably with them, and would have been exercised on petition and proper showing; is established.

Judge Trieber says that the Prentiss case is fully explained in Willcox v. Gas Co., 212 U. S. 19. True, and, it may be added, emphasized. The action there was leveled against two acts of the Legislature of New York, and not against a system of rates made after hearing by a body clothed with power and required by law to alter them, after hearing, to make them compensatory, and provided with machinery to determine the questions judicially, and more effectually than a court, whose duties forbid an exhaustive examination into details so necessary to make reasonable rates.

It is respectfully submitted that these plaintiffs have not accorded to the State, which protects their property and furnishes them a tribunal to correct what they claim are noncompensatory rates, with decent respect when they ignore this tribunal and bring to the Federal Courts matters which properly should be adjusted there.

## QUANTUM OF PROOF NECESSARY TO SUSTAIN AN ATTACK ON THE CONSTITUTIONALITY OF THE RATES.

We contend that the evidence on part of the plaintiffs fails to meet the heavy burden of proof which this court has laid upon those seeking to invalidate as unconstitutional State enactments.

In San Diego v. National City, 174 U. S. 739, on page 759, the Court said:

> "Judicial interference should never occur unless the case presents, clearly and beyond all doubt, such a flagrant attack upon the rights of property under the guise of regulations as to compel the Court to say that the rates prescribed will necessarily have the effect to deny just compensation for private property taken for the public use."

In the case of the City of Knoxville v. The Knoxville Water Company, 212 U. S. p. 1 (these excerpts are to be found at pages 8 and 16 and 17), the Court said:

> "There can be at this day no doubt, on the one hand, that the Courts on constitutional grounds may exercise the power of refusing to enforce legislation, nor, on the other hand, that that power ought to be exercised only in the clearest cases. The con-

BLURRED PA

stitutional invalidity should be manifest, and where that validity rests upon disputed questions of fact, the invalidating facts must be proved to the satisfaction of the Court."

The opinion continued, as follows:

"Disregarding for the moment all the errors which were committed in the Court below, the decision of this cause may be rested upon a broader ground, which is clearly indicated by the previous judgments of this Court. The jurisdiction which is invoked here ought, and as has been said, is to be exercised only in the clearest cases. If a company of this kind chooses to decline to observe an ordinance of this nature and prefers rather to go into Court with the claim that the ordinance is unconstitutional, it must be prepared to show to the satisfaction of the Court that the ordinance would necessarily be so confiscatory in its effect as to violate the Constitution of the United States."

In *Ex parte Young*, 209 U. S. 123, the Court said:

"To this it may be answered, in the first place, that no injunction ought to be granted unless in a case reasonably free from doubt. We think such rule is, and will be followed by all the Judges of the Federal Court."

The presumption of the validity of State-made rates is strengthened by the long time in which these have been in force. In Judge VanDeventer's opinion, rendered when granting the temporary injunction in this case, he said:

"True, some of the rates in question have been in force in substantially their present form for a considerale time, but enough of influence is accorded to this fact when it is made a reason for requiring stronger and more persuasive proof of inadequacy than otherwise would be required." (R. p. 42.)

[In passing it may be noted that on the hearing before Judge Vandeventer it was not developed that all the freight rates, except a few minor changes, had been in force eight years, and that the passenger rates had been in force fifteen months, and the average interstate revenue from passenger traffic through Arkansas was less than the two-cent rate complained of.]

The proof of the inadequacy of the freight rates should be very persuasive in this particular case in the light of their history. The history of these rates as developed in the record shows this: The Railroad Commission was organized in 1900. It began to work upon the rate situation shortly after its organization. And the Commissioners spent some six months or longer in investigating the situation before they took any affirmative action to establish a system of intrastate freight rates.

They finally promulgated a tentative system of rates and invited the railroads of the State to a conference with them to consider this tentative system of rates, which they had drawn up.

That conference lasted some three or four months, and the rate situation was thoroughly reviewed. This tentative system was changed and almost universally raised, at the request of the various representatives of the railroads who were in conference with the Commission, who attempted to show them where this rate or that rate should be higher than set forth in the tentative system which they had been invited to consider.

After many concessions had been made by the Commission, after the railroads had been heard fully, and their opinions given great weight and effect in the schedule of rates prepared, the first Standard Distance Tariff of class and commodity rates was issued in the year 1900.

At the time of its promulgation the Commission notified the railroads, more particularly the two now before the Court (it is shown that their representatives were in constant conference with the Commission throughout this period), that this system of rates which they were then putting into force was an experiment; that the Commission could not tell and the railroads could not tell, until it was tried, whether it was compensatory or not; but the Commission believed from all the information before it and by a careful comparison with the rates prevailing in other States similarly situated to Arkansas, that it would be a fair scale and just to the railroads; it told the railroads that if it proved noncompensatory; if their anticipations of it were not realized, for them to bring the matter back before the Commission and they would readjust the rates. (See Judge Wallace's testimony, R. pp. 875-896.)

The first tariff put in the distance schedule on one line and also on the joint lines.

The railroads contended that the Commission did not have a right to make joint rates and they brought an injunction suit, and their contention was sustained that the act investing the power to make the rates did not allow the Commission to make joint rates over two railroads.

The Legislature of 1903 passed an act giving the Commission this power.

Then the Commission adopted joint rates on a basis of 80 per cent of the sum of the locals. When the joint rates were made they likewise were made after conference, suggestions and advice from the railroad traffic officials. (Testimony of Hampton, pages 800-810.) Therefore, the whole rate situation was put in force after the passage of the act of 1903; but the substantial part of it, the part which really tells the story, has been in effect from 1900 until the injunction granted by Judge VanDeventer in the summer of 1908.

It is in evidence here that during that time there were changes; however, there had been no substantial change as a revenue-producing factor from 1900 until 1908, when the rates were enjoined.

Some attack was made in argument and on cross examination of

the Commissioners as to the constant orders which had been made upon complaint of shippers and others; and there was put in evidence, and it is here as exhibit "D," not only the petitions which had been granted, which tended to reduce the rate by a change from class to commodity rates, which is exhibit "B," but the various acts of the Commission which denied action against them; exhibit "D."

There was a petition before the Commission to put in a 2½-cent passenger rate. There was much more involved in that to the railroads than all of the reductions which had taken place in the seven years; and the Commission declined to grant the petition of a large body of citizens who asked them to put in force a 2½-cent passenger rate.

When you consider the evidence which seeks to strike down a system of rates, you must consider this long period of time in which the railroads operated under them. You must consider the fact that they were told it was an experiment, and that if they found it unremunerative, then to come back to the Commission and they would adjust it; and you find in the proceedings of the Commission herein every evidence of judicial fairness.

When you consider those facts, this acquiescence becomes a strong factor. It has passed beyond mere test of rates to see if they were reasonable. It has passed into an acquiescence after eight years' operation under the rates put in force by the State.

Instead of going back to the Commission to show that these rates were unremunerative, the railroads go to the courts.

This Court will apply the principles announced in the cases we have quoted and require of these plaintiffs the clearest and most decisive proof of the fact that the State-made rates work confiscation, before they will be invalidated, and will further raise a strong presumption of their validity based on the carriers' acquiescence in their continuance. Weighing the evidence in the balance with these requirements upon one side of the scale, we contend that the evidence of the plaintiffs utterly fails to balance with them, and insist that this is apparent from an examination of the exhibits in this case, without the necessity of the Court going through the detail of the evidence. We do not take the law to be that the Court must strike an account between the railroads and the State, as would a Master in Chancery stating an account in the winding up of a partnership business.

Furthermore, the plaintiffs are asking the court to give a weight to opinion evidence to which it is not entitled and which has not heretofore been accorded to it.

*Opinion Evidence Insufficient.*

In Chicago, Milwaukee & St. Paul Ry. Co. v. Tompkins, 176 U. S. 167, objection was made to the opinion testimony there introduced. The testimony there objected to was the opinion evidence of several experts as to the relative cost of doing local and through business.

There the Court reviewed the well-known facts in the movement of local and through trains and the obviously greater cost of the movement of the local train, and properly held that the opinion of experts familiar with railroad business is competent testimony, and can not be disregarded simply because it can not demonstrate by figures the difference in the cost of the operation of such trains. Such expert testimony gives the Court the benefit of the experience and observation of a witness familiar with the operation of such trains and the attendant cost of the operations of each, and from such opinion evidence a reliable, if not accurate, percentage of difference could be determined.

Much of such testimony was introduced in this case, leading up to the proposition that the intrastate traffic is chiefly carried on the local train, which is the more expensive train, and is the vehicle for the intrastate traffic, while the interstate traffic is carried on the through train, more economically operated. It was competent for the State, in order to meet it, to show by men versed on the subject that the estimates were over-high; or it was competent to show, as was done, that conditions in Arkansas did not square with the conditions which the experts introduced by the railroads say are the prevailing conditions as to intrastate and interstate traffic, and concerning which they testified:

It was shown in this case that the local freight train, instead of being a vehicle of intrastate traffic, was more nearly the vehicle of interstate traffic. Upon the one road its load being 72 per cent interstate freight and upon the other 68 per cent. The competency of expert testimony as to the comparative cost of the two trains is not for a moment questioned; but this class of opinion testimony is a small part of the opinion testimony necessary in order for the plaintiffs to establish their case.

The plaintiffs' experts say the ton-mile and passenger-mile theories, presented in other cases, are unsound, and they say in surrebuttal that the plan of separating the expenses worked out by the State is unreliable and impracticable.

The railroads predicated their case in chief, and from that position they have not wavered, that the revenue basis is the best basis yet found. They admit that it is an arbitrary basis and admit that many objections can be taken to it in individual cases and many instances may be cited where it will not be perfect; but on the whole they say it is the best basis yet found. They admit that it is not in common use as a factor in railroad operation and accounting and admit that it originated in rate litigation and in State regulation of railroads.

They offer no other basis for the division of property. They do try to patch up in their surrebuttal testimony a division of expenses on the plan of the State exhibits, which effort upon their part is so

BLURRED

plainly a caricature of the State plan that it has not been given serious consideration, either by them or the State.

Before they can determine upon what property they are entitled to a return, which is compensatory, they must segregate that property from the mass of property in the State and say: "This is property devoted to intrastate traffic upon which we are having no adequate return." Until they find some basis for that, they have no case. Until they segregate their expenses and say, "Thus much is intrastate expense, and thus much interstate expense," they have no method of determining whether the revenue from intrastate business is compensatory or confiscatory. After they find a basis, which they say is the revenue basis, to separate the property and separate the expense, then they ask that to the intrastate expense thus separated there be added a given per cent on account of extra cost of intrastate traffic, and to that proposition they adduced competent testimony to sustain it, and the State introduced competent testimony to rebut their evidence upon it; but before this feature could possibly be reached, the basis of separating property and expense must be determined. They must establish their basis both as to property and expenses before they get the benefit of their legitimate opinion evidence, as to the extra cost of operation; until they divide the expense, so that to the intrastate expense so divided the extra cost may be applied, they have no sum to which to attribute the extra cost.

Therefore, the railroads are in this position: The revenue theory of dividing the property and expense must be sustained wholly upon opinion evidence before the opinion evidence as to what is the extra cost of doing intrastate freight and passenger traffic is reached, which extra cost must be added to the expense already segregated to the intrastate freight and passenger traffic. Of this revenue theory, Judge Trieber said, in deciding this case, "is clearly wrong," and he quotes from the Tompkins case, 176 U. S. 176, where this Court condemns it. (Yet Judge Trieber, while rejecting it as a whole, uses it for some of the largest items of expense.)

Is this subject matter of opinion evidence like the opinion evidence in the Tompkins case, which can be safely relied upon? No witness claims that his judgment of the revenue theory is based upon experience or observation of its use; for it has not been used until these rate cases arose.

Heretofore a separation between State and intrastate traffic has not been needed and has not been made, and therefore the testimony can not be justified as the result of the witnesses' observation and experience in this line of work. If it belongs to the domain of science, then it is the science of accountancy, and, with the exception of Mr. Nay, they have offered no opinion evidence from any one who qualifies himself as expert in accountancy.

Messrs. Johnson and Kimbell, the able accountants who represented the railroads in statistical matters in this case, did not become

AGES

opinion witnesses in favor of the revenue theory, however much they may have agreed to it as evidenced by the compilation of their statistics upon it. Neither Mr. McPherson or Mr. Doddridge qualified themselves as versed in the science of accounting, and in fact their training shows that they are not versed in it. They have always been railroad officials in the operating department.

On the other hand, Messrs. Ludlam, Hillman, Whitehead, Wharton, Hamilton, Willmering and Fitzgerald were all accountants and men who had given special study to these very problems and unqualifiedly condemn the revenue theory for a division of either property or expense and gave their reasons therefor.

In the examination of witnesses for the plaintiffs, and the cross examination of the State's witnesses, it was plainly indicated that the plaintiffs' position was that only experienced railroad officials were competent to testify as to the basis of dividing property and expense, and that it was not a proposition which accountants would be qualified to speak; but this is wholly a question outside of railroad operation; they confuse the experience of operating officials as to knowledge of local and through trains, with knowledge of a proper basis for dividing property and expenses between State and interstate traffic, and none of them have to do with this problem in operating trains, and none claim that they have.

The State contended that a knowledge of the rate situation was necessary to give value to opinion evidence as to the revenue basis, because the rates produce the revenue, and without knowledge of the rates, and the relation of one to the other, the element of cost and of profit entering into each, that the witness would have no qualification to speak of the use of the revenue from the rates without an intimate and accurate knowledge of the rates themselves.

It seems incomprehensible to us that a railroad official like Mr. McPherson, who is experienced in the operating department of railroad work, should pose as an expert on the use of the revenue which was derived from two classes of rates, intrastate and interstate, both of which he was unfamiliar with, and which he repeatedly declined to discuss, owing to his professed lack of knowledge of rates and rate questions.

Mr. Nay's experience was entirely in the auditing department, and he said that he had only such knowledge of rates as would come to him from his work in the auditing department of his road.

Mr. Doddridge did not show any familiarity with the rate situation, and his railroad experience was wholly operating, and he stated that while he was general manager, rate matters were in charge of a traffic manager.

The rate experts introduced by the defendant, Flippin, Perkins and Watson, did not discuss the revenue basis for dividing either property or expenses. They discussed the rates—the subject with which they were familiar.

BLURRED

The rate experts introduced by the State, Bragg, Lincoln and Bee, met the rate experts of the other side upon their own ground and discussed the rates. On cross examination, Mr. Lincoln discussed extra cost and Mr. Bee, from his knowledge of the rate situation, discussed, and condemned, the revenue theory, predicating his condemnation of it entirely upon his knowledge of interstate and intrastate rates and their lack of relation to each other, and the further fact that the cost of the service only incidentally entered into their making.

Therefore, it may be safely stated that the plaintiffs were overwhelmed by the preponderance of the evidence as to the value of the revenue theory, taking the term "preponderance" in its best sense, not of numbers only but of testimony from witnesses best qualified to speak, least interested, and giving the most cogent reasons for their views.

But our position goes farther than this: Had the State introduced no testimony on this subject, we contend that the evidence introduced by the plaintiffs to sustain the revenue theory is not such evidence as is sufficient to overcome the presumption of the validity of the rates made by the State.

In Sturgis v. Clough, 1 Wallace, 269, the Court said: "The charge for demurrage allowed by him (the commissioner) was not justified by the evidence, although there was testimony to support it, such as can always be obtained when friendly experts are called to give opinion."

In "The Conquerer," 166 U. S. 110, the Court said: "The mere opinion of witnesses unfortified by any *data* as to what the earnings would probably have been, is usually regarded as too uncertain and conjectural to form a proper basis for estimation, though in a few cases they seem to have been received."

If, in a civil litigation between private parties, opinion evidence as to profits is too uncertain and conjectural to be the basis of a money judgment, *a fortiori*, opinion evidence as to a theory of division of property and expenses which theory may prove a loss in a given part of a prosperous business, is too uncertain and conjectural to invalidate State legislation regulating that part of the business.

The opinion of this Court upon expert evidence to sustain a theory was written down by Mr. Justice Lamar in Bene v. Jeantet, 129 U. S. 683. That was a suit for infringement of patent. The plaintiffs introduced as a chemical expert one Keith. The defendants introduced one Marchand, who had made practical tests. The case hinged on the testimony of these two witnesses. The Court said:

> "But the testimony of Marchand relates to facts declared to be within his knowledge and experience; whilst that of Keith is largely the assertion of a theory and the presentation of argument showing that the facts testified to by Marchand can not exist."

* * * * * * * * *

AGES

"We think the complainants did not make out a case of infringement. There is not a preponderance of evidence in their favor."

The Court of Appeals of the Ninth Circuit said:

"More weight is given to the testimony of a witness based upon facts within his knowledge and experience than to the testimony of a witness which is 'largely the assertion of a theory." Overweight C. Elevator Co. v. I. O. Redmen, 94 Fed. 155.

The only difference between the class of testimony condemned in that case and the one at bar is this: The testimony condemned was largely the assertion of a theory, while the testimony sought to sustain plaintiffs here is wholly the assertion of a theory.

It has, from its intrinsic character, no such weight of itself sufficient to invalidate State legislation, when such legislation is only invalidated by clear and decisive evidence which convinces the Court beyond doubt that under the guise of regulation the State is working confiscation.

## THE EXHIBITS ALONE SHOW THAT THE PLAINTIFFS FAIL.

The exhibits give the statistical facts of the case. There are many conflicts in bases and theories to support this method or that method, but the accountants representing the respective sides have been enabled to put in exhibits on each side, the mathematical accuracy of which is not questioned. Some errors, of course, were made, but those were detected and corrected before the case closed. The exhibits of the plaintiffs are numbered from 1 to 60, the exhibits of the defendants are lettered. The exhibits begin at page 2290.

Exhibit "47" (R. p. 2431), filed by the Iron Mountain Railroad Company, shows that four years prior to obtaining the injunction herein that it paid annually a 10 per cent dividend upon its stock, and its stock had increased during that period from (in round numbers) twenty-five millions to forty-four millions and the 10 per cent dividend was paid on all of it. Exhibit "48" (R. p. 2432) shows that in addition to paying this dividend of 10 per cent on its stock, it paid in 1907, $5,692,152.00, and in 1906, $5,455,877.19 in taxes, rentals, interest on bonds and sundry accounts. Mr. F. P. Johnson, accountant for the Iron Mountain, testified that the dividends were paid on the lines in this suit, and no other, as the subsidiary lines were not included either in the suit or in the payment of dividends. (R. p. 362.)

Mr. McPherson testified that from 1901 to 1908 the Iron Mountain spent in Arkansas in improvements to increase the efficiency of train service the sum of $8,684,411.00, principally in reduction of grades.

BLURRED

He also testified that the company during those years purchased 323 locomotives and 6,680 freight cars at a cost of $9,660,372.00 (R. pp. 331, 332).

Mr. Johnson has properly prepared exhibit "47," but, as shown by the report of the Interstate Commerce Commission, the Iron Mountain really earned a dividend of 14 per cent in 1906, but owing to a rule of the Commission that dividends are not credited to stock issued during the year, it made the 10 per cent dividend amount to 14 per cent for that year by not crediting it to the stock represented by the new line constructed. (Report 1906, p. 701.) Batesville is an old town on White River, served for many years by a branch line from the main line at Newport; this line was extended through the Ozark Mountains to Missouri and northwestern connections. The line in Arkansas is known as the White River Branch, and is the most expensive and less profitable part of the line. It runs through a sparsely settled country, very illy developed, and is but a link in a line from the Northwest to the Gulf. On the other side of the State is a low grade line from Helena to McGehee, completed about the same time. The record is full of references to their new lines, and it is apparent that they did not earn any profits, but the whole system earned 10 per cent, and, excluding them, the whole system earned 14 per cent. The next year, 1907, while freshly burdened with these new lines, a 10 per cent dividend is earned and declared.

Exhibit "2" shows that the total mileage of the Iron Mountain Railroad Company was 2,599.15, of which 1,355.09 were in Arkansas. That is, 52 per cent of it is in Arkansas. Statements 3 and 4, exhibit "3," shows the proportions of the various expense accounts divided between Arkansas and the rest of the Iron Mountain railroad, and it will be seen that in the four principal accounts, Arkansas is charged with 54 per cent, 55 per cent, 53 per cent and 53 per cent respectively of the expense of those particular accounts as against the rest of the road.

Exhibit "6" (R. p. 2313), another of the Iron Mountain exhibits, shows these statistics:

| | |
|---|---|
| Average number of passengers per train mile on the Iron Mountain as a whole | 47 |
| On the Iron Mountain in Arkansas | 49 |
| Average revenue per passenger per mile on the Iron Mountain as a whole | 1.908 |
| On the Iron Mountain in Arkansas | 1.903 |
| Average number of tons per train mile, Iron Mountain as a whole | 385.58 |
| Iron Mountain in Arkansas | 407.41 |
| Average revenue per ton mile Iron Mountain as a whole | 7.26 |
| Iron Mountain in Arkansas | 7.23 |
| Density of traffic, Iron Mountain as a whole | 472,738 |
| Iron Mountain in Arkansas | 487,910 |

AGES

Exhibit 6 also shows percentage of expenses to earnings, Iron Mountain as a whole..... 74.24
Iron Mountain in Arkansas..... 73.88

This is explained by Mr. F. P. Johnson (R. pp. 39-52) to mean that for every $100.00 earned $74.24 was expenses, on the whole line, and in Arkansas for every $100.00 earned, the expenses were $73.88. Exhibit "32" (R. p. 2397), filed by Mr. McPherson, covering six months, ending December 31, 1907, shows the percentage of expenses on the Missouri Pacific system, $73.99; Iron Mountain, in Arkansas for that period, $71.19. This table also shows both revenue and expenses per mile, and shows the net revenue per mile on the Missouri Pacific is $951.38, and the net revenue per mile on the Iron Mountain in Arkansas, $1,421.40.

Exhibit "Z" (R. p. 2569), one of the defendants' exhibits, is a comparison of the revenue to expenses per train mile for the years ended June 30, 1897 and 1907, shown by the Interstate Commerce Commission Report for those years. For the year ended June 30, 1907, the operating revenue was $2.17; operating expenses, $1.36 net revenue, 81 cents; for the year ending June 30, 1897, operating revenue, $1.45; operating expenses, 97 cents; net revenue, 48 cents; and the net increase in the ten years, 33 cents per train mile, or an increase of 69 per cent. The same exhibit shows an increase on the St. Louis Southwestern of 163 per cent. It also shows that for the entire United States the net increase was 58 per cent, and in Group 8, in which Arkansas is situated, it was 85 per cent.

Exhibit No. "5" (R. p. 2327) shows the freight revenue per ton per mile interstate, 6.750; intrastate, 13.877 mills; passenger revenue per passenger mile, interstate, 1.865; intrastate, 1.903 mills.

Exhibit "8," as corrected by exhibit "8-A" (R. p. 2390), shows the Iron Mountain in Arkansas for the year ending June 30, 1907, earning a net profit after paying operating expenses, taxes and rentals upon all of its property in Arkansas (at the agreed valuation, double the State assessment) of 9.89 per cent, or, after the correction as shown in exhibit "8-A," of 9.97 per cent, practically 10 per cent return upon its property, as well as 10 per cent dividends upon the stock.

Exhibit "3" shows for six months ending December 31, 1907, it is earning a net return on its property in Arkansas of 7.44 per cent, and after correction in exhibit "3-A" (R. p. 2317-8), a return of 7.50 per cent from all business.

The evidence in this record is full of the effect of the panic of 1907. It is not necessary to have evidence upon it, because that is part of the history of the times of which the Court takes cognizance. It began in October, but its effect on the railroad traffic, particularly the revenue, was felt later. This easily accounted for the reduction of the return upon the property in the last half of 1907, as com-

pared with the fiscal year ended June 30, 1907, to 7.50 per cent instead of 10 per cent.

Exhibit "45" (R. p. 2411) shows the gross earnings of the Iron Mountain since 1900 per mile of road. It shows a larger earning the World's Fair year than any other period, and after those years, 1904, $8,760.00; 1905, $8,391.00; 1906, $9,254.00; 1907, $9,566.00, and the first half of 1908, plainly the result of the panic, the worst half of any six months' operations given in the statement, being $3,619.00.

These statistics prove the Iron Mountain was a prosperous road. It was earning a good return upon its property even when suffering from the panic during a part of 1907, earning 7½ per cent on its investment in Arkansas, and paying 10 per cent dividend on its stock; and for the year ending June 30, 1907, before the panic affected it, making 10 per cent upon its property invested in the State, as well as 10 per cent dividends upon its stock. These statistics further prove that the proportion of the road in Arkansas, 52 per cent in mileage, is bearing about 54 per cent of all the expenses of the road; and yet the ratio of expenses to earnings was less than on the balance of the road, and less than on the entire Missouri Pacific system. Its passenger and freight traffic in Arkansas is denser than on the rest of the road, which probably accounts for the fact that the ratio of expenses to earnings is less in Arkansas than the balance of the system.

Mr. McPherson, Assistant to the General Manager of the Iron Mountain, testified at great length and in much detail as to the falling off in freight revenue from 1897 to 1908 and of the increase in material, labor and taxes. He put in a graphic chart, exhibit No. 30, illustrating his evidence as applied to the Iron Mountain. On the line designated thereon as "Transportation" he explained to mean freight revenue. (R. pp. 739, 380.) It rose in 1897, and fell from 1898 to 1901, remained level 1901-2-3 and rose considerably in 1904 and fell in 1905, 1906 and rose slightly in 1907. In his cross examination his attention was called to the established fact that there had been no material change in the intrastate freight rates in Arkansas since 1900, and, assuming that to be true, he was asked if his descending line of freight revenue did not represent a decrease in interstate revenue, and he reluctantly assented to this. (R. pp. 381-2.) As exhibit "B" (R. p. 2500), heretofore referred to, and the testimony of Mr. Swaim, and of members of the Commission, shows it to be a fact that there was no appreciable reduction in the intrastate freight rates during that period the conclusion is irresistible that if the road was losing money in the last few years, owing to the increased legal burdens and the increased price of material, labor, etc., and if its revenue was decreasing, the loss is in interstate revenue, not intrastate; but the difficulty with his argument is that the road is not losing money, but making money.

Exhibit "Z" (R. p. 2569) shows that notwithstanding this increase in the cost of material, labor, taxes, etc., that the net revenue per mile of road has increased 69 per cent in a ten-year period. Mr. McPherson's chart does not deal with the passenger side of the question; but, as the statistics just quoted show, the intrastate passenger revenue per mile to be more than the interstate revenue, there can be no contention made that the supposed losses could be due to a reduction in intrastate passenger rates. Attention is again called to the fact that the intrastate freight revenue per ton per mile is double that of the interstate freight revenue per ton per mile. Therefore, to make any showing whatsoever on the loss on the intrastate business in this case, it is necessary to show enormous expenses against the intrastate traffic as compared with the interstate. Those expenses on the passenger side must wipe out the increased intrastate revenue in passenger traffic, and on the freight side must wipe out the 100 per cent greater intrastate revenue than interstate, and after wiping out the increased intrastate income, the expense must be so great as to reduce the return upon the property to a level below that which would be compensatory. As shown by these statistics, the expenses in Arkansas as a whole are less in proportion to revenue than the balance of the road. Arkansas is paying more on the expenses than its mileage calls for, and the statistics show the net revenue per mile of road in Arkansas much greater than in the system. Therefore it recurs that the intrastate expenses as against the interstate must be enormous, when such prosperity is shown on the whole business in the State. In face of this it can not be argued for a moment that while the Iron Mountain system as a whole is prosperous, that the Iron Mountain in Arkansas is not, because the statistics prove it to be the most prosperous part of the road. Necessarily the plaintiffs' whole case must rest on proving enormous intrastate expenses in Arkansas, notwithstanding its prosperity and notwithstanding less expense generally in Arkansas than the balance of the line, and notwithstanding more revenue per mile than on the rest of the system. This remarkable proposition is what the plaintiffs must prove in order to make out their case. They made no separation of expenses between State and interstate further than a separation upon the revenue theory; they made no separation of expenses between the local and the through trains, the end to which all of their arguments go to prove ground for the enormous expense of intrastate over interstate traffic. This remarkable proposition is sought to be sustained merely by opinion evidence to the effect that the expenses could and should be divided between the intrastate and interstate traffic in proportion to the revenue received from each respectively, and when so divided mere opinion testimony to the effect that to the intrastate expense thus found there should be added various amounts, ranging from 100 to 800 per cent, for intrastate freight, and 25 to 50 per cent for intrastate passengers. The chief reasons for this additional expense are two: First, the theory that

all intrastate traffic has two terminal expenses in the State and part of the interstate has none, while the remainder has one; second, but principally that the local trains, both freight and passenger, are a great burden upon a road, and they are the vehicles of the intrastate traffic. This is the most expensive train that is run, and the opinion was generally expressed by those witnesses with whom plaintiffs sought to make their case that the local train was a vehicle devoted practically to intrastate traffic, especially the local freight train was a vehicle of intrastate freight, and so much interstate freight as found its way upon it was trifling and negligible in quantity. A brief summary of the evidence upon which the State relies upon these points, much of which was brought out in the cross examination of the plantiffs' witnesses, and supplemented by much testimony on its part is, first, as to the terminal expenses on passenger traffic; on the eastern side of Arkansas is Memphis. It is considered by the railroad companies in this case as situated in Arkansas. It is a city where much of the commerce of Arkansas is transacted. In the extreme western part of the State is the second largest city in it, Fort Smith, which, by the accident of the lines of the Iron Mountain crossing the State line between Van Buren and Fort Smith, makes all of its traffic interstate, and it is so treated by the railroads in their exhibits. Therefore all of the passenger traffic through these two gateways is interstate, and has two terminal expenses charged to Arkansas, and all of the transstate passing through these stations has at least one terminal expense in Arkansas. Little Rock is the largest city in the State. The Iron Mountain lines radiate out of it as the spokes from a hub. It is shown without dispute, particularly in the testimony of Maurice Wright (R. pp. 2265-6), that the great body of interstate passenger traffic, with the exception of a small portion of it, which goes through on through trains, comes into Little Rock and is there transferred to other trains; with the exception of a half a dozen through trains, all of the interstate travel will have a terminal handling at Little Rock, Newport, Texarkana and other junction points, and much, if not most, of the transstate travel will have at least one terminal in the State. This situation is wholly different from that testified to by the learned experts for the plaintiffs, who base their opinion on the general proposition, which is not applicable to Arkansas. Secondly, as to local passenger trains: The St. Louis Southwestern put in exhibit "25," and it shows that all of its passenger trains in Arkansas were local trains. It carried no through trains. All of its interstate as well as its intrastate passenger traffic was carried on these very expensive local trains. The Iron Mountain put in exhibit "46" (R. p. 2412), which shows that it carried eight through trains, and of them one is a fast mail (with scarcely any passengers, as shown in the evidence), and 48 are local trains.

Exhibit No. 3, paragraph A (R. p. 2292), shows on the Iron Mountain 47 per cent of passenger revenue is from intrastate, 32 per

cent from interstate and 21 per cent from miscellaneous. Statement 3 of exhibit "3" (R. p. 2302) shows that there was carried during this period 1,702,490 passengers. It is apparent that these seven through trains carried a small proportion of the interstate passengers. It was in evidence that some intrastate passengers were carried on these trains. It is plain that the local passenger train was not an item of extra expense peculiar to the intrastate passenger traffic as it was necessarily used indiscriminately by both classes of passenger traffic. It was also shown that these through passenger trains were the most expensive trains that the railroad carried, and that they carried less passengers per train than many of the local trains. As these trains were less patronized than many locals, and principally made up of interstate passengers, although not exclusively so, and the local trains carried the great bulk of both classes of traffic, it must be apparent that the interstate passenger traffic is the more expensive, and yet the revenue per passenger mile is 3.48 per cent more for the intrastate. Next, as to local and through freight trains: The local freight train, the "beast of burden," as some of the witnesses aptly called it, is the great and controlling reason usually given for the enormous expense attributed to intrastate traffic. In fact, many of the witnesses seem to regard the local train as synonymous with intrastate freight traffic. Page after page is filled with explanations of the enormous expenses of the local freight compared with the through train. Every witness offered by the plaintiffs, with the exception of Mr. Doddridge, said more or less emphatically that practically all of the load of the local train was intrastate freight, which it peddled out from station to station, and with unanimity referred to whatever interstate freight it carried as negligible in quantity. Principally upon this point they conclude their testimony with the statement that the extra expense of intrastate freight traffic is from 100 to 800 per cent more than interstate, usually about one, two or three hundred per cent more. The St. Louis Southwestern, under the supervision of its assistant auditor, Mr. Kimball, made a test of the performance of the local and through trains for the month of October, 1908. It was done for the purpose of being used in evidence in the Missouri Rate Case and this rate case. Mr. Doddridge, formerly General Manager of each of these railroads, was an expert witness for the railroads in both the Missouri case and this case, and he requested this test to be made for the uses aforesaid. Mr. Kimball testified it was carefully and thoroughly made; the result of this test month is given in statistics shown in exhibits "19" and "20" (R. p. 2375-7). They show that the local freight trains carried 1,084,580 ton miles of intrastate freight, which was 78 per cent of all the intrastate freight carried by that road for that month, and it carried 2,236,361 ton miles of interstate freight, which was 8 per cent of all the interstate freight carried by that road

during that month, but this shows the load on the local trains contained 1,151,781 ton miles more of interstate than of intrastate freight, and 22 per cent of the intrastate freight was carried on the through trains. Exhibit "26" (R. p. 2391) was put in evidence by the Iron Mountain. It shows the transstate, intrastate and interstate freight hauled by it for the month of October, 1907. The Iron Mountain did not work up the performance of the local and through trains as the St. Louis Southwestern did for October, 1908, but the State's accountants took this exhibit and worked up from the records of the Iron Mountain a statement similar to exhibits "19" and "20" of the St. Louis Southwestern. This is exhibit "I" (R. p. 2516), offered by the State. It shows the freight carried by the local trains was composed of 71.49 per cent interstate, and 28.51 intrastate on the Iron Mountain. Only 5.59 per cent of the intrastate freight was carried on the through trains, as against 22 per cent the St. Louis Southwestern, but on both roads, the bulk of the heavy expense of the local train was chargeable to interstate traffic, in the one case 68 per cent, and in the other 72 per cent. At first the accuracy of exhibit "I" was questioned, but that was practically abandoned, although attacks were made upon the system under which it was worked up, which will be considered at length in another connection. We feel that we can safely say that the court will be thoroughly satisfied of its accuracy, and that October was a normal month of the six months' period is established by statistics that are undisputed, although there is quite a conflict between plaintiffs' witnesses as to their opinion of the normality. The State in its plan of separating the expenses, after allowing for extra expense of intrastate traffic on account of two terminals, and all other items which are located in the testimony of the witnesses on each side of the case, divide the expense of each train between intrastate and interstate freight traffic in proportion to the load carried by each of each class of traffic. The passenger train expense is apportioned between passenger, mail and express and passenger between interstate and intrastate. It disposes of the two terminal propositions against itself by charging all of the State traffic with two and the interstate traffic with one, although there is a considerable amount of interstate freight traffic which receives two handlings. All of the traffic in and out of Fort Smith and Memphis receives two terminal handlings, and all of this is interstate traffic. Much of the cotton, grain and lumber traffic, each large interstate movements, receives two and three handlings.

The State adopted the plan of dividing these expenses for the purposes heretofore explained, to demonstrate that the expenses could be divided on practical lines by the use of factors common in railroad accounting and operation, instead of upon an arbitrary basis; and, second, to show that when all of the extra expenses are charged up to the State, after making maximum allowances in every instance where there was a difference of cost, that the intrastate expense was

less per ton per mile than would be compensated by the higher intrastate revenue per ton per mile. The plan of dividing these expenses was supported by many witnesses, who are just as well qualified to speak upon the subject as those who testified against it. They were more in number, and, as we believe we can demonstrate, more of them in position to speak authoritatively upon the subjects testified by them than those offered by the railroads. For these reasons, we think we can confidently assert that the exhibits of the State are supported by a preponderance of the testimony.

Exhibit "O," which shows the results of the application of this plan, gives a percentage of net earnings on the valuation of all the property invested in Arkansas, and shows it made for the six months period 7½ per cent return on all of its property invested in all classes of business, subdivided as follows:

| | |
|---|---|
| On intrastate freight | 10.93 |
| Intrastate passenger | 5.21 |
| All intrastate traffic | 7.69* |
| Interstate freight | 9.84 |
| Interstate passenger (loss), (red) | 3.44 |
| Total interstate business | 8.23 |
| Mail business | .04 |
| Express business (loss), (red) | 9.61 |

This loss on express surprised some of the railroad experts.

Exhibit "36" (R. p. 2404) shows the contract under which the express business was carried on the Iron Mountain. Judge Trieber (187 Fed. 351) explains this contract fully. In consideration of the Missouri Pacific Railroad Company, which was the owner of the entire capital stock of the Iron Mountain, giving the Pacific Express Company the exclusive control of the express business on the lines controlled by it, the Missouri Pacific received $3,400,000.00 of the express company's capital stock, or 40 per cent of the entire capital stock. This was paid without any consideration than that it were to have the exclusive express contract on the Missouri Pacific lines. It was further provided that the capital stock should not be increased above $6,000,000.00 without the consent of the railroad company. It is also proved that the Missouri Pacific has received ever since this contract was made an annual dividend of 6 per cent on the stock, amounting to $144,000.00 annually. Judge Trieber gave the Iron Mountain, the Arkansas portion of it, credit for its proportion of the annual dividend for 1907. That contract readily accounts for why the railroad is carrying the express business at a loss, as the loss of the railroad was fully compensated, or more, in the express company's dividends, in which it so generously shared. When the chapter on train mileage division of common expenses between pas-

*The error in Pullman passengers, hereafter explained, reduces this figure to 7.09 per cent.

senger and freight is considered, another, and probably more definite, reason will be seen why the mail and express, as well as intrastate passenger, is unduly burdened.

Exhibit "U," which is an exhibit of the St. Louis Southwestern corresponding with "O" on the Iron Mountain, just given, shows that the St. Louis Southwestern was making a net earning on all its property invested in Arkansas of 12.83 per cent, divided as follows:

| | |
|---|---|
| Intrastate freight | 13.99 per cent |
| Intrastate passenger | 5.79 per cent |
| Total intrastate | 9.16 per cent |
| Interstate freight | 15.00 per cent |
| Interstate passenger | .66 per cent |
| Total | 14.38 per cent |
| Mail business (red) | 11.85 per cent |
| Express business | 1.28 per cent |

The express business here where no deal between the express company and the railroad company is in evidence, widely differs in result from the Iron Mountain, where there is such a deal proved. The State's testimony also shows (R. p. 2065) that the extra cost of intrastate freight over intrastate freight traffic is 86 per cent. As heretofore shown in these statistics, the intrastate freight revenue is 98 and a fraction per cent over the interstate, and so long as the extra intrastate freight expense is less than the extra intrastate revenue, there can be no argument that these rates were confiscatory; because it is undisputed that upon both roads, upon all the business, they were earning a return which is more than compensatory, towit: 7½ per cent in the last six months of 1907, and 10 per cent for the fiscal year ending June 30, 1907, and on the St. Louis Southwestern road is 12.83 per cent.

Another theory closely allied to the theory that the local train carries only intrastate freight is that the interstate freight is largely package freight, L. C. L., and is usually peddled out on local trains. It goes without saying that L. C. L. is the most expensive freight handled, and, when handled on a local train, of course is still more expensive.

The exhibits in this case do not generally separate car load and less than car load freight, but there are two exhibits where they are separated.

In the October, 1907, statement of the Iron Mountain, exhibit "26," the car load and less than car load are separated, and any accountant can work out their percentages, and the same is true of the January, 1909, statement on the St. Louis Southwestern.

Mr. Nay testified that of the total intrastate tons handled, a greater percentage is less than car load than in the case of the intrastate business, and therefore a basis which charged two station expenses to intrastate for one for interstate was unfair.

Then he was given these two exhibits to figure out whether such

was the case, and no one will question the accuracy of a mathematical computation of the Comptroller of the Rock Island System.

He shows that in January, 1909, exhibit "A," prepared by the assistant auditor of the St. Louis Southwestern Railway Company, shows 13 per cent of the interstate tonnage was L. C. L. and 12 per cent of the intrastate tonnage was L. C. L. And on the Iron Mountain a showing, exhibit "26," filed by that road, that 7 per cent of the interstate tonnage was L. C. L. and 6 per cent of the intrastate was L. C. L. (R. p. 2059.)

These exhibits prove:

The Iron Mountain as a whole is a prosperous road, making large annual dividends to its stockholders.

That Arkansas is 52 per cent of the road in mileage and bears 54 per cent of its expenses, and its traffic is denser—both freight and passenger—and is conducted at a less ratio of expense than the rest of the road.

That for the year ending June 30, 1907, it earned on its Arkansas business a return of 9.97 per cent upon its property, and in the last six months of 1907 it earned 7½ per cent on all its property in Arkansas.

(And in this connection attention is called to the statement of Mr. Nay that "the slump" in revenue on his road, due to panic of 1907, began in November. (R. p. 2075.) That the St. Louis Southwestern Railway was earning on all its Arkansas business 12.83 per cent.

That the average revenue per ton mile is almost as much in Arkansas as on the rest of the line—7.23 mills v. 7.26 mills.

That the usual double expense for terminals of interstate versus intrastate traffic in Arkansas, owing to the interstate character of Memphis and Fort Smith traffic and the extra terminals for all cotton, much grain and lumber, and the system of passenger transfers at junction points, is much modified, if not nonexistent. While this is not shown in the exhibits—to which this chapter is directed—these facts are undisputed—although the extent of the modification of the general proposition is disputed; and they should be borne in mind while considering the exhibits.

That the heavy expense of the local freight trains is attributable chiefly to the interstate traffic, 68 per cent on one road and 72 per cent on the other; while 22 per cent of the intrastate freight on one road is carried on the though train and 5 per cent on the other road, thereby further reducing the costs of intrastate freight usually attributed to it as borne wholly on the local freight.

That there is upon one road no through passenger trains and upon the other comparatively few, and the interstate and intrastate passenger traffic is indiscriminately carried on the local trains.

That the freight revenue is 98.18 per cent more per ton per mile for intrastate than interstate on one road and on the other 141 per cent more; and the passenger revenue is also greater on intrastate than interstate traffic.

That there is proportionately more L. C. L. (the most expensive freight handled) interstate than intrastate.

If these roads were not prosperous, these statistics might avail nothing to show that the intrastate traffic was compensatory; but in view of their prosperity and the higher State rates and the nonexistence of most, of not all, the factors which usually render intrastate traffic the more expensive, it is impossible for the condition to exist on these roads in the face of these established facts; that the intrastate traffic is moving under rates so low and expenses so heavy that they are earning these large returns despite the heavy drains of the intrastate, from the interstate traffic. If this be so, then it is time for the Interstate Commerce Commission to look into a system of interstate rates which are so high that they can carry this load and yet earn for the roads respectively 10 and 12 per cent on the business in the State after paying the great losses from the intrastate, through the interstate revenue.

Mr. Nay was confronted with the fact that as a witness for his road before the Interstate Commerce Commission, asking for an advance in rates, he presented the whole expenses without separating the intrastate and charging it with one hundred to eight hundred per cent extra cost and deducting that from the total expenses when he was making estimates asking for an advance in interstate rates.

His road runs through twelve States and he says the intrastate traffic amounts to 20 per cent of the whole, and in Arkansas, Oklahoma, Nebraska, and partially in Minnesota, he had for rate cases on those States worked out a separation, on the revenue basis, of State and interstate traffic, showing an increased expense of intrastate.

He admits that such statements would have had a considerable effect on his statement of expenses which he put before the Commission. It is due to Mr. Nay to say that he gives several pages of explanation of why he did not so make up his statements. (R. pp. 2035-2039.)

The fact remains that if these enormous State expenses are true, they should be presented to the Interstate Commerce Commission, so that it may adjust interstate rates to a lower basis while the courts are enjoining States' commissions from enforcing rates which are confiscatory by reason of these great expenses incident to the traffic in the States.

These statistics, however, would be a potent answer to the contention, if made before the Interstate Commerce Commission, that the interstate rates were too high, as compared with the revenue derived from State rates, if the condition in Arkansas was under investigation.

It is respectfully submitted that the statistics in these exhibits are sufficient alone to end the railroads' case when the rules of evidence heretofore applied in similar cases are applied to this case.

## RATE OF RETURN ON THE PROPERTY.

Before proceeding to a discussion of the facts, we desire to call attention to a question of law, or probably one of mixed law and fact which may necessarily arise in the case. That is: What rate of return upon the property is sufficient to save the tariff of rates producing it from being confiscatory?

The Constitution of Arkansas, adopted in 1874 provides: "When no interest is agreed upon, the rate shall be 6 per centum per annum." Article 19, section 13.

In Reagan v. Farmers' Loan & Trust Company, 154 U. S. 362, the Court said:

> "It is unnecessary to decide, and we do not wish to be understood as laying down as an absolute rule, that in every case a failure to produce some profit to those who have invested their money in the building of a road is conclusive that the tariff is unjust and unreasonable. And yet justice demands that every one should receive some compensation for the use of his money or property, if it be possible without prejudice to the rights of others."

In Covington & L. Turnpike Road Co. v. Sanford, 164 U. S. 164, the Court said:

> "If the establishing of new lines of transportation should cause a dimunition in the tolls collected, that is not, in itself, a sufficient reason why the corporation, operating the road, should be allowed to maintain rates that would be unjust to those who must or do use its property. The public can not properly be subjected to unreasonable rates in order simply that stockholders may earn dividends. * * * If a corporation can not maintain such a highway and earn dividends for stockholders, it is a misfortune for it and them, which the Constitution does not require to be remedied by imposing unjust burdens upon the public. So that the right of the public to use the plaintiff's turnpike upon payment of such tolls as, in view of the nature and value of the service rendered by the company are reasonable, is an element in the general inquiry whether the rates established by law are unjust and unreasonable. That inquiry also involves other considerations, such, for instance, as the reasonable cost of maintaining the road in good condition for public use, and the amount that may have been really and necessarily invested in the enterprise. In short, each case must depend upon its special facts; and when a court, without assuming itself to prescribe rates, is required to determine whether the rates prescribed by the Legislature for a corporation controlling a public highway are, as an entirety, so unjust as to destroy the value of its property for all the purposes for which it was acquired, its duty is to take into consideration the interests both of the

public and of the owner of the property, together with all other circumstances that are fairly to be considered in determining whether the Legislature has, under the guise of regulating rates, exceeded its constitutional authority, and practically deprived the owner of the property without due process of law."

In Stanislaus County v. San Joaquin & King's River C. & O. Co., 192 U. S. 201, the Court said:

"It is not confiscation, nor a taking of property without due process of law, nor a denial of the equal protection of the laws, to fix water rates so as to give an income of 6 per cent upon the then value of the property actually used for the purpose of supplying water as provided by law, even though the company had, prior thereto, been allowed to fix rates that would secure to it 1½ per cent a month income upon the capital invested in the undertaking. If not hampered by an unalterable contract, providing that a certain compensation should always be received, we think that a law which reduces the compensation theretofore allowed to 6 per cent upon the present value of the property used for the public is not unconstitutional. There is nothing in the nature of confiscation about it."

In Willcox v. Consolidated Gas Company, 212 U. S. 19, the Court approved the decision of the Court of Appeals of New York on the rate of return upon gas property, which held that rates which would permit a return of 6 per cent would be enough to avoid the charge of confiscation.

In Knoxville Water Co. v. City of Knoxville, 212 U. S., the Court said that the net income shown from the evidence in that case would be substantially 6 per cent, or 4 per cent after the allowance of 2 per cent for depreciation, and that it could not clearly know if the revenue would not exceed that return, and did not feel called upon to determine whether the reduction of the income to that point would or would not amount to confiscation.

In railroad accounting depreciation is annually struck off under rules of the Interstate Commerce Commission, so the question of depreciation is not in these cases.

The rate of return is dependent upon the locality and upon the current rate of interest in the locality in the particular business before the Court. This is fully discussed in Beale & Wyman on Railroad Rate Regulation, sections 394-402. In section 394, the authors say what constitutes a fair rate of return must obviously be determined by circumstances. "The current rate of return for enterprises of a similar character is submitted to be a true basis for fixing the percentage." The authors take this quotation from the opinion of Judge Pardee in L. & N. Ry. Co. v. Brown, 123 Fed. 946:

"I think it will be conceded that since the rates are reasonable and not unjustly discriminatory, the company is entitled to earn some amount; and it seems reasonable and clear to me that if

entitled to earn something under the above conditions, it is entitled to earn under the same conditions a compensatory amount equal at least to the usual and legal rate of interest in the locality in which the railroad is situated."

In section 401, of Beale & Wyman, is the statement of the proposition, sustained by many authorities, that a risky enterprise is entitled to a larger return than a sound investment.

In San Diego Land & T. Co. v. Jasper, 189 U. S. 439, the Court said:

> "If the plant is built, as probably this was, for a larger area than it finds itself able to supply, or apart from that, if it does not as yet, have the customers contemplated, neither justice nor the Constitution require that, say, two-thirds of the contemplated number should pay full return."

This last principle is particularly applicable here. It is in evidence that the Iron Mountain Railroad recently completed two extensions —the White River Branch and the M., L. & H. Branch—each as a short line for their interstate traffic and each through sparsely-settled country, which will require years of development to make either an individually paying proposition, and yet with these encumbrances upon the Arkansas business, the one road was earning on all business in the State, according to its own statistics, 7½ per cent in the last half of the year 1907, and the other road over 12 in the last half of the year 1907, and the Iron Mountain for the fiscal year ending June 30, 1907, instead of making 7½ per cent as it did for the last half of that year, was making 9.97 per cent return upon all its business in Arkansas.

If the return had been much under these figures with the two new and expensively constructed lines, it would not be right to make the customers of the balance of the line pay the full return upon the whole line, including these expensive branches, under the principle decided in the San Diego case. But, passing that question for the moment, and coming back to the main proposition of what return should be allowed upon the whole property:

These tables are instructive, and it seems to us, controlling; they are of the Iron Mountain statistics; it is not necessary to encumber the argument with the statistics concerning the St. L. S. W. Ry. Co. While it has not been a dividend-paying road like the Iron Mountain, yet, its statistics here show its earnings are more than the Iron Mountain. Hence, if we establish that the return on the Iron Mountain is compensatory, it follows without argument that the larger return of the St. L. S. W. Ry. is compensatory.

The first of these tables gives the capital stock, dividends paid and the bond interest paid on the Iron Mountain for each fiscal year from 1899 to 1907, inclusive, as taken from the Interstate Commerce Commission's report of statistics of railroads. The page of the report is given in each instance:

BLURRED

## ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY.

Capital stock, dividends paid, bond interest paid, for years indicated. Taken from Interstate Commerce Commission's annual report of statistics of railways.

| Year Ended June 30 | CAPITAL STOCK | | DIVIDENDS PAID | | | BOND INTEREST PAID | | |
|---|---|---|---|---|---|---|---|---|
| | Amount | See Interstate Commerce Report, page | Rate | Amount | See Interstate Commerce Report, page | Rate | Amount | See Interstate Commerce Report, page |
| 1899 | $25,795,055 | 661 | .... | $..... | .... | 4.80% | $2,311,226 | 575 |
| 1900 | 25,795,055 | 641 | 2% | 515,746 | 559 | 4.60% | 3,082,440 | 559 |
| 1901 | 25,795,710 | 643 | 6% | 1,547,243 | 561 | 4.57% | 3,120,377 | 561 |
| 1902 | 25,795,710 | 651 | 6% | 1,547,283 | 570 | 4.62% | 3,259,409 | 570 |
| 1903 | 25,795,710 | 659 | 10% | 2,578,832 | 574 | 4.62% | 3,462,817 | 574 |
| 1904 | 25,795,710 | 659 | 10% | 2,578,832 | 578 | 4.51% | 4,110,620 | 578 |
| 1905 | 29,397,374 | 675 | 10% | 2,578,832 | 588 | 4.50% | 4,432,575 | 588 |
| 1906 | *44,397,374 | 701 | 14% | *4,114,588 | 614 | 4.49% | 4,651,040 | 614 |
| 1907 | 44,397,374 | 731 | 10% | 4,438,992 | 643 | 4.47% | 4,785,797 | 643 |

The stock issue increase in 1905 and 1906 aggregates $19,000,000 over 1904. This represents the White River Division and M. H. & L. line construction.

The next table, taken likewise from the Interstate Commerce Commission's annual reports, gives rate of bond interest paid by railroads in Group 8, and by the Iron Mountain Railroad for each fiscal year from 1899 to 1907, inclusive. Group 8 is that large group of States in which Arkansas is situated under the Interstate Commerce Commission's classification.

## RATES OF BOND INTEREST PAID BY RAILROADS IN GROUP 8 AND BY THE IRON MOUNTAIN RAILROAD.

| Year Ended June 30 | RATE OF INTEREST PAID | | Taken from Interstate Commerce Report. See page |
|---|---|---|---|
| | Group 8, per cent | Iron Mountain, per cent | |
| 1899 | 4.29 | 4.8 | 575 |
| 1900 | 4.14 | 4.6 | 559 |
| 1901 | 4.47 | 4.57 | 561 |
| 1902 | 4.03 | 4.62 | 570 |
| 1903 | 4.08 | 4.62 | 574 |
| 1904 | 4.11 | 4.51 | 598 |
| 1905 | 4.16 | 4.50 | 588 |
| 1906 | 4.10 | 4.49 | 614 |
| 1907 | 4.09 | 4.47 | 643 |

*The railroad company, in exhibit 47, reports the 1906 dividend as 10 per cent, but the Interstate Commerce Commission shows the dividend rate to be 14 per cent, and states that this is calculated on basis of the stock issue *less stock issued during the year.*

PAGES

It will be seen from the table that for eight years the interest has fluctuated from 4.47 to 4.8 per cent paid upon the bonds of the Iron Mountain road, and it will be noticed that its rate per cent is a trifle higher than that paid by other roads in Group 8, it ranging from 4.03 per cent to 4.47 per cent. Attention is especially called to the fact that there was a small decline in the rate of interest from 1905 on the roads in Group 8, and from 1902 on the Iron Mountain. But the interest has been reasonably stable at about 4¼ per cent for the roads in Group 8, and about 4½ per cent on the Iron Mountain.

One of the best discussions that may be found on the rate of return upon the property is the very exhaustive one in Steenerson v. Great Northern Railway Company, 69 Minn. 353, same case 72 Northwestern Reporter, 713.

> In that case the Court said: "It is not material how the property has been split up into different rights, interests and claims. For the purpose of fixing the rates, the holders of all these stand in the shoes of the sole owner of the property unincumbered."

In Omaha v. Omaha Water Company, 218 U. S. 180, this Court evidently had the same thought in mind when pointing the difference between the value of a plant under an option to purchase, and its value in regard to returns on the property in rate regulation. In speaking of the former value, the Court said:

> "But it did not limit the value to the bare bones of the plant, its physical property as well as its lands, its machinery, its water pipes or settling reservoirs, nor what it would take to reproduce each of its physical features."

Clearly, it must be held that in fixing the rate of return upon the property, when considered as to whether the rate is confiscatory, its physical features—its "bare bones"—are the test; and that seems to have been the view of the court in the Knoxville Water Company case and the Willcox Gas case.

In the Steenerson case, the amount of interest paid upon the bonded indebtedness was a dominant factor in determining what was a reasonable return to save it from the charge of confiscation.

The Court concluded:

> "It is not necessary here to determine just what rate of annual income on the cost of reproducing all of the road except the terminals is the least which the court would uphold before declaring the rates fixed by the Commission confiscatory, but we are of the opinion that in such times as existed in 1894, an income of 5 per cent per annum on such cost is certainly not unreasonably low or confiscatory, and that is as far as it is necessary to go in this case."

Judge Trieber, in deciding this case, held that the earnings should yield 6 per cent return on the property, and in addition thereto, 1½ per cent for a surplus should be made, thus holding that a return of

less than 7½ per cent to be confiscatory. 187 Federal Reporter, pp. 347-349. The learned Judge in that opinion, lays much stress upon the recent decision of the Interstate Commerce Commission in their investigation of the "Advances of Rates" in both Eastern and Western cases. The Commission held that the sum remaining after payment of fixed charges, including as a fixed charge the dividend upon the preferred stock, should be equivalent to between 7 and 8 per cent upon the common stock, or 6 per cent upon the common stock, and carry 1½ per cent as surplus, or 5 per cent on common stock, and carry 2½ per cent to surplus. In other words, an earning of 7½ per cent upon the property.

But the question before the Interstate Commerce Commission was entirely different from the one before this Court. There the roads were seeking an advance of rates and it was the duty of the Commission to allow rates to be made high enough to produce reasonable returns upon the property, and to guard against unprosperous years, providing such rates were not oppressive. That is a very different question from determining whether the rates established by law are subject to the charge of confiscation in not producing sufficient return upon the investment. One is a question of reasonableness of the rates and reasonableness of return compared with rates, and the other a question of confiscation pure and simple.

It would be right and proper for the Interstate Commerce Commission to consider rates to be reasonable which would be far above a limit of confiscation. For instance, if this Court would hold that rates, producing a return only under 6 per cent were confiscatory, and the railroad companies showed the Commission that they could earn 10 per cent upon their investment and not have a system of rates which would be oppressive or be unreasonable in themselves and in line with rates on other roads similarly situated, there could be no valid objection to the Interstate Commerce Commission holding them entitled to rates producing a 10 per cent return upon their property. If the rates were of themselves proper and just to the traffic, it would be reasonable to allow a return upon property far above the line of confiscation.

We can not present a better answer to the ruling of Judge Trieber upon this point than to quote from the decision of Judge Trieber when this case was before him on the motion to dissolve the injunction. 168 Fed. Rep. 720.

After quoting authorities upon the subject, the learned Judge said:

> "Another matter which is entitled to consideration is the fact which has been brought out at this hearing, that the St. Louis, Iron Mountain & Southern Railway Company, and the Chicago, Rock Island & Pacific Railway Company have, within the last few years, and since the establishment of the Commission rates, constructed extensive branch lines through new and unsettled sections of the State; that these lines were constructed at great

expense, owing to the fact that the greater part of these branches run through swampy country, some of it subject to overflows, which necessitated high embankments; that these roads were built principally to serve as feeders for the main line, and at the same time enable these roads to obtain shorter lines for that part of its interstate traffic which merely passed through the State. These are matters which must be taken into consideration in determining what would be proper net earnings on the investments. It would hardly be proper for the courts to say that such roads are entitled to as great a compensation on their investments from intrastate business as the ordinary roads built for the accommodation of the intrastate as well as the interstate business. As is well known, some of the Pacific roads traverse the desert for hundreds of miles through a strip of territory where there is practically no intrastate business, either freight or passenger. Would it be proper, in such cases, to hold that the road should have the right to charge for its intrastate traffic in that section, tariff rates high enough to enable it to earn a certain, fixed percentage on its investment? Would not, in such a case, the rates have to be so high as to be confiscatory of the property of the residents of that State? Must the public guarantee the railroads a certain income on their investment, regardless of the condition of the country traversed, or whether bad judgment was exercised in the selection of the route? We do not think so. New lines or branches to increase the business of the main line, or the exercise of bad judgment in the building of a railroad, are matters to be considered in determining what rates would be fair and just to the corporation as well as the public. That the railroads are entitled to reasonable profits on their investments, and the public to reasonable rates, or, to express it differently, that the rights of the public and railroad companies are reciprocal, is the correct rule of law."

Then follow quotations from decisions of this Court, after which Judge Trieber resumes his opinion, as follows:

"Guided by these principles, the Court is of the opinion that rates which will enable the complainants to earn 6 per cent on their investment, if fairly entitled thereto by prevailing conditions, would be reasonable, especially in view of the fact that a large part of the money used in the construction of these roads was obtained from loans secured by mortgage, and these loans only bear 4 to 5 per cent interest per annum, thus leaving a larger return for the stockholder, who, of course, is unsecured, and in case of insolvency of the company, would be postponed until the mortgage bondholders are paid in full. For these reasons, the risk of the investment of the stockholder being greater than that of the bondholders, he is entitled to a higher rate of interest on his investment. In determining what rates

would be just and reasonable, the court is relieved of passing upon conflicting evidence for the purpose of determining the value of the investment. Complainants, in their bills, only ask for compensatory rates on the values of the roads as determined by the State Board of Railroad Assessors,, for the purpose of taxation. The assessments in this State are conceded to be upon the basis of 50 per cent of the actual value of the property, and they therefore ask to be permitted to earn fair dividends on double the amount their roads are assessed for taxes."

Judge Sanborn, in Minnesota Rate Case (Shepard v. Northern Pac. Ry. Co., 184 Fed. Rep. 765, on pp. 815, 816), held that 7 per cent per annum should be earned on railroad property to save the rates from being confiscatory.

Judge Sanborn says to deprive them of such a return would prevent advances and tend to compel reduction in the wages and salaries of the employees, and it would tend to prevent extensions of their lines. The contrary of these facts are found in the history of the Iron Mountain.

Mr. McPherson's chart, exhibit 30, shows on the Iron Mountain road in Arkansas, that train labor advanced from 100 in 1897 to 137 in 1907-1908, and shop labor advanced from 100 in 1897 to 123 in 1907-1908.

Mr. McPherson testified that during 1907, that there was an increase of wages on the Iron Mountain of 6.7 per cent. (R. p. 288.)

We have heretofore referred to the testimony of Mr. McPherson wherein he showed that for improvements in grade, alignment and other work of improvement, the Iron Mountain had expended from 1901 to 1908, the sum of $8,684,411 in Arkansas (R. p. 331).

The Interstate Commerce Commission reports, from which the foregoing table is compiled, shows increase in capital stock of the Iron Mountain in 1906 to $44,397,374 from $29,397,374, the increase representing the construction of the branch lines referred to, the White River branch and the Memphis, Helena and Louisiana.

Therefore, it is apparent that this road has been meeting with a return on its Arkansas business sufficient to make the development and improvement, and increase materially its wage level, which Judge Sanborn says it should have in order to carry out these beneficent purposes. Whether that return has been 1 per cent or 10 per cent, the desired result has been obtained, and the stockholders have not suffered for they have received with regularity their dividends, and increasing dividends, so that, commencing with 2 per cent in 1900, then 6 per cent in 1901 and 1902, and 10 per cent up to and including our period of inquiry.

Judge Trieber says that in addition to 6 per cent earned when everything is prosperous, an allowance of 1.5 per cent additional for surplus should be made; evidently to carry over lean years. But the Iron Mountain has had no lean years since 1901, when it commenced

paying its stockholders 6 per cent, and then in 1903 commenced paying 10 per cent. If lean years were to come, certainly a surplus should have been set aside from the 10 per cent dividends which were paid for five years before the injunctions were granted in these cases. Judge Trieber refers to the falling off in the dividends in 1908 and 1909 to 5 per cent, and 4 per cent (exhibit 47), respectively, as not being due to the increased net revenue resulting from the granting of the injunction (187 Fed. Rep. 348). What occurred since the granting of the temporary injunction was not in issue, and the issue was of the condition of the road at the time those injunctions were granted. The pleadings and evidence of the plaintiff pointed to the last half of 1907 as the period when the rates were confiscatory. However, it is not far to look for the drop in the dividends; the record is full of the blighting panic of 1907 and 1908. It is for such panics that careful management should save a surplus from overfull dividends and not seek to increase rates whenever a panic arises. They should have good dividends, but the earnings of prosperous years should not all go in dividends so that in lean years, the shippers and passengers must bear the hard times and the carriers be exempt. For instance, suppose instead of paying 10 per cent dividends for the last five years, only 7½ per cent had been paid, and 2½ per cent carried forward as surplus, there would have been on hand when the panic of 1907 and 1908 fell upon the road, the sum of $4,072,569, which spread over the next two years when 4 and 5 per cent were paid, would have more than paid the 7½ per cent for each of those years, and still had a surplus for the next lean years.

But what occurred during this litigation is not the test, still, these facts points forcibly to the argument we are making that these overfull earnings should not have been paid out in dividends without a surplus being held for unprosperous years. Suppose, one year the road makes 20 per cent, and pays it all out in dividends, and the next year makes nothing; can it have an injunction against the rates which produced one year 20 per cent, and the next year nothing?

This, however, wanders from the main thought, but the wandering only follows naturally an analysis of the right to a surplus over a return on the property. That is a question of railway economics. The stockholders of this road preferred overfull dividends in prosperous years, and lean ones during the panic, whereas, reasonable dividends of 7½ per cent could have been paid during the prosperous years and the panic also. Some other road might pay less dividends than 7½ per cent and prefer to fatten the stock; all these questions are beside the main issue; and that is simply if this road has during the period of inquiry, which it selected—the last half of 1907—paid a compensatory rate of interest upon its property invested in Arkansas traffic under the rates permitted by the laws of Arkansas.

It is not a question here of what the stockholders are entitled to

nor the bondholders. It is a question of what the property is entitled to earn, and, as aptly stated by the Minnesota Court for the purpose of fixing the rates, there is but a sole owner, although the property may be split up into various interests; ownership may be in first and second mortgage bonds, preferred stock, common stock, etc., but the law looks not to these liens or claims; it looks to the sole owner of the property, and says he shall have a compensative return upon it.

You have before you the property itself irrespective of its ownership. The prevailing rate of interest in this section of the Union in railroad securities is 4¼ per cent and upon Iron Mountain 4½ per cent. This is the test of the safety of the investment. This is the prevailing rate of interest upon money invested in railroad property in Arkansas. Suppose that there were no bonds upon the road, and the property earned 4½ per cent interest to its stockholders, and that is shown to be the prevailing rate of interest in Arkansas for railroad bond securities; and as the owner without incumbrance on his property would be as secure in his investment as the owner of a bond secured by mortgage on the property, it would necessarily follow that 4½ per cent would save the return from being confiscatory under the authorities heretofore quoted.

The capital stock represents the control of the railroad. A large part of the real ownership is represented in the bonds. When the bondholders are satisfied to accept 4½ per cent on their property invested in railroads in Arkansas, then it seems that the Court should say that if the whole property produces a return of 4½ per cent, it is not confiscatory. This property is so arranged that it pays interest upon a large bonded indebtedness, and also 10 per cent dividends upon the stock, but that is a mere detail of arrangement of the ownership of the property, and is useful evidence here merely to show that the rates are compensatory as a whole.

What this Court has before it is the rate of interest upon the property as an entity, irrespective of what are the interests into which its ownership is split, shall pay, and if it pays a rate of interest that is usual in such enterprises in the section of the country where the enterprise is situated, then it is spared from the charge of confiscation.

Applying such a test to the evidence in this record, we submit that by no possibility can 6 per cent return be held to be confiscatory. It is the legal rate in Arkansas and that is sometimes held to be one of the tests. In the Stanislaus County case it was expressly adjudicated in regard to an enterprise not near so stable as this railroad property that 6 per cent was not confiscatory, and in the Steenerson case, it was expressly stated that 5 per cent was not confiscatory in regard to railroad property, and this Court held 6 per cent not confiscation of gas property.

When the element of safety and stability in the investment is considered, this road presents an exceptionally secure investment. Excepting its recent branches, it is an old road. The main trunks of it are the Cairo & Fulton road, and the Little Rock and Fort Smith road, old "land-grant railroads," whose history are well known.

The road has materially helped to develop Arkansas, and Arkansas in turn has enriched it. Mr. McPherson says it is the best road west of the Mississippi River (R. p. 432). The statistics quoted show its freight and passenger traffic denser than in Group 8, and also show that immense sums have been spent in the last eight years improving the road. Its interest rate is low and its dividends high. The State increased in population as shown by the last Federal Census, 20 per cent, keeping even pace with the balance of the Union. Vast sums have been spent in the two new branches, which are to carry traffic to the Gulf on low-grade lines, and the opening of the Panama Canal will increase their tonnage enormously. There is no record of default in interest, nor in recent years in dividends.

The railroad's exhibits show return in June, 1907, on its Arkansas business of 9.97 per cent, and in December, 1907, after the panic cut into its revenues, of 7.50 per cent on all of its Arkansas business.

While some complaint has been made of new laws, like the three-brakesmen law, electric headlight law, and a few others of kindred nature, yet, they are all in line with modern regulation for safety and better operation, and no law is referred to which injures in the least the safety of the investment. The Courts of Arkansas have been as sound even as this Court in preserving inviolate vested rights and due process of law. From every standpoint, the owners of this property have a safe investment; one not liable to encounter business risks and venturesome chances.

The question before you does not take the broad scope of rate of return presented to the Interstate Commerce Commission, which, as a rate-regulating body, can so regulate rates as to provide for lean years and fat years, and adjust rights of stockholders, common or preferred, and shippers and passengers; that body looks to a stable adjustment of rates for years; this body looks to the narrow question as to whether for the period complained of the rates yielded a return on the property which is sufficient to be treated as regulation, and not confiscation in the guise of regulation.

The owner of the property unencumbered has as safe security—and safer—than the holder of a mortgage upon it. There may be some vice inherent in the mortgage or priorities between mortgagees may arise. The owner encounters no such risks. Under the laws of Arkansas, liens and judgments prevail over mortgages of railroad property just as they prevail over owners. If this property was owned unincumbered, the owner would have all the stability of the investment which a mortgagee enjoys. If investors seek investments in mortgages on this property, and are content with 4½ per

cent interest on their investment, the owner should not be permitted to say that a rate of return equal to the investers' return is confiscatory.

It is earnestly presented for your consideration, that if the rate of return is found equal (and it will be shown to be much more), to the interest rate on the bonds of the road, which rate has long prevailed, that such long continued rate should fix the limit of compensation; and certainly, a rate equal to the legal rate of the State where the property is situated—6 per cent—is free of confiscation.

## AN ANALYSIS OF SMYTHE v. AMES, 169 U. S. 466.

Several judges have referred to Smythe v. Ames, 169 U. S. 466, as an authority to support the revenue theory of dividing expenses between State and interstate traffic. It is far from being an authority for it, as an analysas of the opinion will show when read in the light of the testimony and exhibits in the case. We have had the benefit of the printed record in the case, and find in it double paging, one printed in black ink and the other stamped in red ink. Presuming the latter are correct, references are to the stamped red ink numbering of the pages.

There were numerous railroads involved in the case and each road presented separately its exhibits.

Mr. William Randall, ticket auditor of the Burlington & Missouri Railroad, of Nebraska, was introduced by that railroad company.

On page 541 he stated that the earnings of his company were $1,883,036.59 for the year 1902.

Then he was asked what were the operating expenses on its business and he answered that the operating expenses, including taxes, amounted to $972,000 (in round numbers).

He was asked the cost per ton per mile on intrastate business. He said the average cost is the only thing they could get at; that they can not get at the actual cost and that the average cost was 1.091 mills and the earnings on intrastate traffic was 2.039 (see pages 541-4).

On cross examination he said that the amount of earnings given were made up from the waybills.

He testified he did not personally make these calculations.

There is something in that to which Mr. Justice Harlan called attention in his decision.

He was asked how he apportioned the expenses and he stated it was impossible to apportion them and that all you could do was to estimate the apportionment, as it could not be separated, and he had not discovered any better method than to make an approximation of expenses based on experience (pages 558-9).

He was asked how he made his calculations per ton per mile on

Nebraska business and he stated he did it by dividing the cost by the number of tons carried every mile.

In other words, he took the $972,000 and divided that by the number of tons hauled.

At page 568 he was asked on what basis and he replied he found the earnings in Nebraska was 21.27 per cent of all the earnings and he applied this 21.27 per cent to all the expenses.

That is the revenue basis as it appeared in that case, only to disappear.

He reasoned thus: "That if that business consisted of 21.27 per cent of all the earnings, that it was reasonable to tax it 21.27 per cent of the expenses. I could not see any other way of assigning the expense to the business the termini of which was in Nebraska (page 569).

That he did not make an examination to find out mathematically the amount of business done in the State. That he reached his figures of $1,853,036.59 as the whole business done in Nebraska, by taking two months in the year 1892, June and September, being good representative months, and found the whole business for those months and all that business which had its termini in Nebraska amounted to 21.27 per cent of the whole earnings in June and September, and he applied the 21.27 per cent to the whole earnings and arrived at the sum stated by him, as the earnings made on the business with its termini in Nebraska for the year. That he took the waybills as a basis for the freight carried in Nebraska for those two months (pages 569-70). The same percentage, 21.27, was applied to get at the other items of cost as well as taxes (pages 573-74).

He stated it was impossible to make an exact apportionment of cost between passenger and freight, and in his calculation he assigned 70 per cent to freight and 30 per cent to passenger. This was based on experience of railroad men.

In apportioning the cost of operating expenses between freight and passenger business, he did not make an apportionment upon the income of the two classes of business; that the apportionment made by him he did not think was far from the apportionment made on revenue from said classes respectively. He did not use the earnings on the passenger business to obtain the proportion of expenses assigned to that business.

On cross examination Mr. Randall seriously shook the competency of his testimony as to the figures put in by him, as he had no personal knowledge of them; they were prepared by a force of clerks under his direction, but not under his supervision. He was recalled by the railroad companies and asked if he had verified the figures he had put in by personal examination since he had put them into evidence, and he said he had. He was asked to state as to the correctness of the figures he had given when he testified before, and he answered:

"The figures I gave when I testified before are perfectly correct, except on operating expenses; that should be $1,221,742.84 on strictly Nebraska business."

There is no explanation asked as to whether this was a clerical mistake, or whether he changed the basis, or how he arrived at the latter figures. It will be noticed that it is a difference of a quarter of a million dollars.

So far as we have been able to gather from the record in this case, this is the only witness who framed his tables on the revenue basis in that case.

Mr. Andrew S. Van Kuran, auditor for the receivers of the Union Pacific, testified, his testimony beginning at page 617. He gave the freight earnings per ton per mile, estimated that they amounted to about 15 per cent of the total earnings; from that estimate the cost per ton per mile on the local or intrastate business; then gave the freight operating expenses, inclusive of taxes, and the cost per ton per mile, exclusive and inclusive of the taxes, and obtained the ratio of the expenses to the earnings upon all business in the State, making 54.36 per cent without the taxes and 58 per cent including the taxes.

He obtained his revenue figures from the waybills, having the revenue ascertained therefrom under his direction, and he found that the total operating expenses to the total earnings were 58 per cent; that is, of every hundred dollars, $58 were spent for operation. Then he estimated the passenger earnings at 30 per cent; the actual figures given were only of the freight earnings. That railroad men proportioned the freight and passenger business on train mile basis, which gives it 70 per cent to 30 per cent (page 620).

(Mr. Randall said he just estimated his, but the others made a calculation on the train mileage and seem to have reached the same result.)

The Government required his company to make a separate showing of the earnings east of Cheyenne, and from those earnings he deducted a proportionate amount of the mileage represented by the distance from Cheyenne to the Nebraska State line, which was forty-three miles, and the remainder represented the earnings of Nebraska, and upon these bases obtained his earnings per ton per mile. That he (Mr. Van Kuren) was unable to say what proportion of the traffic carried over his road originated and ended within the State. Thus it is seen the Union Pacific, which is the principal road in that litigation, made no effortt o use the "revenue basis" to sustain their contentions and put in no exhibit based thereupon.

In fact, it is seen in the decision of Judge Brewer and the decision of this Court, that the calculations were made upon an entirely different basis, which will be noted later.

When the court came to consider the case, it largely relied upon an exhibit put in evidence by Mr. Dilsworth.

The only reference in either Judge Brewer's opinion or in the

ED PAGES

opinion of the Supreme Court, which shows any consideration to Mr. Randall's calculations, is in the latter.

It seems that the counsel for the State based an argument upon this testimony of Mr. Randall; that is, upon the calculations as first made by Mr. Randall, and Justice Harlan called attention to the fact that he corrected his figures of the apportionment of operating expenses from $972,000 to $1,221,000 (speaking in round figures).

When you turn to the exhibits in that case, you will find that the theory upon which the case was really decided:

On exhibit 4 (it is referred to on page 529), you will find that in the first column is given the number of tons hauled locally, and that in the next column shows the average amount received for each ton handled. Those figures were derived from the waybills.

The third column is the total amount received for tons hauled locally and those also were derived from the waybills.

The next is the total amount of reduction caused by H. R. 33.

The next is the amount received from passenger business.

Then follows exhibit 19, which follows the same plan.

The next exhibit, No. 20, likewise following the same plan, except the last column is the percentage of expenses to earnings.

You will see from page 533 this is the percentage of all earnings on all business done on the entire road.

The next table, at page 536, adds 10 per cent to the percentage of all expenses to earnings on all business in the State, and thereby obtains a factor by adding this 10 per cent based on the minimum amount given by Mr. Dilworth, as the extra cost on all intrastate business.

The next table deals with the legislative reductions.

The decision was based upon those tables making up the ratio of cost, and when the ratio of cost was obtained, and then adding the 10 per cent to represent the added cost of State over interstate business, this being the amount admitted by the State's accountant to be the minimum, and the percentage thus obtained represented the ratio of expense to earnings on the intrastate business.

Therefore it is plain that the revenue basis as presented here was not the factor determining this case but the bases of division made up as above stated, on a totally different theory.

Another significant fact found in the record of that case is that the revenue per ton per mile upon which the calculations were based was the same in intrastate as in interstate traffic.

The railroad exhibits show the revenue from State and interstate revenue jointly. They did not get the revenue, apparently, from the State waybills and the interstate waybills, as has been done in this case, but they took the revenue on all business. So that made the ton per mile revenue the same on State as it was on interstate business.

In the trial before Judge Trieber we had the tables analyzed by the accountants, who demonstrated this to be a fact.

When they come to measure the extra cost in that case, they started on a level basis; that the revenue per ton per mile, State and interstate, was the same. We know it is not true here, because we know the revenue per ton per mile on State traffic is almost (98.18 per cent) double that on interstate. So there is 100 per cent difference in the basis to start in, without adding extra cost, whereas, in Smythe v. Ames such was not the case, or if true in fact, was not developed in the evidence, and the statistics were based on uniformity of revenue, intrastate and interstate, per ton per mile.

## C., M. & ST. P. RY. CO. v. TOMPKINS, 176 U. S. 167, ON THE REVENUE BASIS.

Whatever construction may have been put on Smythe v. Ames, there can be no misconstruction placed on the opinion by Justice Brewer in the Tompkins case in its unqualified rejection of the revenue basis of dividing property and expenses between State and interstate traffic on the gross earnings or revenue basis.

There is a statement of the finding of fact made by the lower court That is on page 170.

It is shown in paragraph 4 of the finding that the trial court divided the property on the gross earnings basis between State and interstate traffic. The figures on each road are given and the percentage of gross earnings to total earnings, and the trial court made a division of the property upon the gross earnings basis, in order to get a valuation upon which to obtain a return on the property.

This Court, through Mr. Justice Brewer, said:

> "We are of opinion that neither the findings made by the court, nor such facts as are stated in its opinion, are sufficient to warrant a conclusion upon the question whether the rates prescribed by the defendants were unreasonable or not, and we are also of opinion that the process by which the court came to its conclusion is not one which can be relied upon. The Court proceeded upon the theory that a comparison of the actual gross receipts of the company from its South Dakota local business with those which it would have received if the rates prescribed by the defendants had been in force was sufficient to determine the question of the reasonableness of these latter rates, and instituted such comparison with respect to the four years preceding the commencement of this suit. Now, it is obvious that the amount of gross receipts from any business does not of itself determine whether such business is profitable or not. The question of expenses incurred in producing those receipts must be always taken into account, and only by striking the balance between the two can it be determined that the business is profita-

ble. The gross receipts may be large, but if the expenses are larger, surely the business is not profitable. It can not be said that the rates which a Legislature prescribes are reasonable if the railroad company charging only those rates finds the necessary expenses of carrying on its business greater than its receipts.

"In the light of these general and obvious propositions, we proceed to examine the computation and reasoning of the court. For reasons which will be apparent hereafter we do not stop to inquire whether its findings are correct deductions from the testimony, but take them as they are stated. It may be premised that the books of the plaintiff, showing its business for the four years, were examined, and so much as was deemed necessary admitted in evidence. From those books was disclosed with mathematical accuracy the gross receipts of the company on all its business in all the States during each of the four years and the actual cost of doing that business during each of those years; also the gross receipts from the business done in South Dakota, and separately the amount which was received in that State from interstate business and that from local. If the schedule of rates prescribed by the defendants had been in force during the four years, and the same amount of business had been done by the company, the reduction in gross receipts from the passenger business would have been 15 per cent and from the freight business 17 per cent. Of course, the cost of doing the business would be substantially the same. The Court found the value of the plaintiff's property in South Dakota to be $10,000,000, although, according to the testimony, it was bonded for over $19,000.00. It held that it was not fair to consider that sum, $10,000,000, the value of the property employed in doing local business; for it was also used in doing local interstate business; and that the true way to determine the value of the property which could be regarded as employed in local business was by dividing the total value of $10,000,000 in the same proportion that existed between the amount of gross receipts from interstate business and that from local business, each of which amounts was, as we have seen, accurately shown by the testimony. Upon that basis of division it found that the value of the company's property employed in local business was for the first year, $2,200,000; the second year, $2,600,000; the third year, $2,100,000; and the last year, $1,900,000; and also that the gross receipts from local business were for the first year, 18.5 per cent of the valuation; for the second year, 12.7 per cent; for the third year, 15.6 per cent; and for the last year, 16.3 per cent. In other words, for these several years the company received as compensation for doing its local business the per cent named of the real value of the property used in doing that business. Then, proceeding on the supposition that

BLURRED PA

the defendant's schedule had been in force and the rates reduced as therein prescribed during these four years, it divided the valuation of $10,000,000 on the like proportion of the receipts from interstate business to the receipts from local business as thus diminished, and upon such division found that the valuation of the plaintiff's property engaged in local business would have been for the first year, $1,900,000; for the second year, $2,300,000; for the third year, $1,800,000; and the last year, $1,600,000; and upon such basis that the gross receipts from local business would have amounted to 18 per cent of the value of the property for the first year, 12.1 for the second, 15.3 for the third, and 16.2 for the last. Upon this it held that the difference between the per cent of receipts in the two cases was slight, and that there was no change in what may rightfully be called the earning capacity of the property sufficient to justify a declaration that the reduced rates prescribed were unreasonable. In other words, it was of the opinion that the earning capacity was so slightly reduced that it could not be affirmed that the new rates were unreasonable.

"But that there was some fallacy in this reasoning would seem to be suggested by the fact that, although the defendants' schedule would have reduced the actual receipts 15 per cent on the passenger and 17 per cent on the freight business, the earning capacity for the last year was diminished only 1/10 of 1 per cent. Such a result indicates that there is something wrong in the process by which the conclusion is reached. That there was, can be made apparent by further computations, and in them we will take even numbers as more easy of comprehension. Suppose the total value of the property in South Dakota was $10,000,000, and the total receipts both from interstate and local business were $1,000,000, one-half from each. Then, according to the method pursued by the trial court, the value of the property used in earning local receipts would be $5,000,000, and the per cent of receipts to value would be 10 per cent. The interstate receipts being unchanged, let the local receipts by a proposed schedule be reduced to one-fifth of what they had been, so that instead of receiving $500,000, the company only receives $100,000. The total receipts for interstate and local business being then $600,000, the valuation of $10,000,000, divided between the two, would give to the property engaged in earning interstate receipts in round numbers $8,333,000, and to that engaged in earning local receipts $1,667,000. But if $1,667,000 worth of property earns $100,000 it earns 6 per cent. In other words, although the actual receipts from local business are only one-fifth of what they were, the earning capacity is three-fifths of what it was. And, turning to the other side of the problem, it appears that if the value of the property

engaged in interstate business is to be taken as $8,333,000 and it earned $500,000, its earning capacity was the same as that employed in local business—6 per cent. So that, although the rates for interstate business be undisturbed, the process by which the trial court reached its conclusion discloses the same reduction in the earning capacity of the property employed in interstate business as in that employed in local business, in which the rates are reduced.

"Again, in another way, the error of the Court's computation is manifested. The testimony discloses that the operating expenses of the entire system during each of the four years were over 60 per cent of the gross receipts. If the cost of doing local business in South Dakota was the same as that of doing the total business of the company, then the net earnings of that local business would not exceed 40 per cent of the gross receipts. Reduce the gross receipts 15 per cent—and the reduction by the defendants' rates was 15 per cent on passenger and 17 per cent on freight business—it would leave only 25 per cent of the gross earnings, to be applied to the payment of the interest on bonds and dividends on stock. But the testimony shows that the cost of doing local business is much greater than that of doing through business. If it should be 85 per cent of the gross receipts (and there was testimony tending to show that it was as much if not more), then a reduction of 15 per cent in the gross receipts would leave the property earning nothing more than expenses of operaion. These computations show that the method which the court pursued was erroneous, and that without a finding as to the cost of doing the local business it was impossible to determine whether the reduced rates prescribed by the defendants were unreasonable or not." Chicago, M. & St. P. R. Co. v. Tompkins, 176 U. S. 168.

The revenue theory, which was tried out in the Tompkins case, and thus emphatically rejected is reasserted, not even in disguised form, in this case, when its application is even worse than in the illustrations made by Mr. Justice Brewer.

At the expense of some repetition, as this matter is presented in another connection, yet in this connection we want the attention of the Court to these facts:

The railroad's exhibit No. 5 shows that the State freight revenue per ton per mile was 13.37 mills; and that the interstate freight revenue was 6.75 mills per ton per mile, during the six months under inquiry.

Exhibit 5 also shows that the total State freight revenue was 13 per cent and that the interstate revenue was 87 per cent of all freight revenue. And that the State tons one mile were 7 per cent and the interstate tons one mile were 93 per cent of the total tons one mile.

As the value of the property assigned by the railroads to State

BLURRED PA

traffic was divided between State and interstate business on the basis of the revenue, this would assign to the State freight business a property valuation of 13 per cent of the property and would assign to the interstate freight business a property valuation of 87 per cent.

That is, the State freight business in volume is 7 per cent of the total and has assigned to it 13 per cent of the property upon which it is required to earn a fair return.

The value of the property devoted to the State use is ascertained by the railroads on this revenue basis; that is, 7 per cent of the ton miles which represent the State use of the common property is not used as a factor to ascertain the State's proportion of the property.

But the revenue derived from the ton miles is used to segregate the State property from the interstate, resulting in charging 7 per cent of the traffic with the use of 13 per cent of the property.

The practical application of the revenue basis for dividing expenses is shown in exhibits here made by Mr. Kimbell, Assistant Auditor of the St. Louis Southwestern Railway Company, of actual conditions more striking than in Judge Brewer's illustrations above quoted.

At the request of the State, Mr. Kimbell put in exhibit "A," giving statistics which he had worked up on his road for January, 1909, showing the transtate, interstate and intrastate freight handled for that month and the amount received per ton per mile for each class of traffic.

It will be remembered that Judge VanDeventer granted the injunction herein against the Commission freight tariff on September 5, 1908, and since that time the Commission has made no freight rates.

The railroads having a free hand put in, in October or November, 1908, both interstate and intrastate tariffs and all the freight in Arkansas until June 7, 1909, when the "Court Tariff" became effective, was hauled upon tariffs of their own making. The statement showed an increase per ton per mile of 9.4 per cent intrastate and 96.1 per cent interstate over the rates existing when its intrastate tariff was enjoined. (R. p. 769, 770). (These are the rates Judge Trieber declared unreasonable on the motion to dissolve the injunction.) Mr. Kimbell was requested to calculate the effect on the actual expenses assigned to the State, on the revenue basis, assuming that these increases had occurred to the revenue in the last six months of 1907. In other words, to take the expenses assigned to State traffic as found in his exhibit for that period, according to the revenue then existing and what they would have been had the revenue increased for that period as it did for January, 1909. (R. p. 771.)

In compliance with that request, he put in exhibit "E."

His exhibit 33 shows intrastate freight revenue for last six months of 1907 on $173,064.45. Had the increase of January, 1909, been in effect on the freight it would have been $339,380.07, and expenses assigned to that traffic of $89,227.26, the percentage being 9.64; according to an application of the increase of January, 1909, applied

to this period the intrastate revenue would have been $339,380.07 and interstate expense $148,796.46, or 16.26 per cent.

In other words, had the revenue, State and interstate, been increased for the six months' period as it was actually increased during January, 1909, for moving exactly the same commodities on exactly the same expenses, the greater increase of State rates would have increased the expenses assigned to the State from $89,000 to $148,000, without a single actual increase of one dollar of expense. Surely, as Justice Brewer says, "such a result indicates that there is something wrong in the process by which the conclusion is reached."

## THE EVIDENCE ON THE REVENUE THEORY.

*Explanation and Application of the Revenue Theory.*

The railroads predicate their case on the revenue theory of dividing property and expenses between State and interstate, and it will be useful at the threshold of the case to understand exactly what the railroads consider the revenue theory to be. In a question to Mr. McPherson, Assistant to the General Manager of the Iron Mountain Railroad, one of the chief witnesses for the railroads, by the counsel for the railroads, it was thus stated: "In compiling exhibit 3, I understand that the auditing department ascertained all the expenses chargeable to the State of Arkansas, for both intrastate and interstate and miscellaneous traffic, on the basis of actual expenditures, as far as possible, and then assigned to the intrastate traffic a portion of the total expenses of the State of Arkansas, based upon the percentage of the intrastate revenue to the total revenue." (R. p. 304.) To state the proposition concretely, the revenues of a railroad are ascertainable quanities. The books of the railroad company show the sources from which every cent is received, interstate, intrastate and miscellaneous; every cent paid to a railroad for shipping freight or for passenger fare, or for express, or from mail contracts, or from rents, or whatsoever other source of revenue, is definitely located. In this case they have been located accurately for the period of the inquiry, which was the last six months of the year 1907. The railroad selected that period to present in detail their revenues and expenses, and the accountants for the State have carefully gone over their calculations, and wherever errors were discovered they have pointed out, and the final exhibits have their approval, as substantially accurate as to the actual revenues received by the railroads during the period of inquiry. Likewise the expenses incurred in the State of Arkansas have been accurately ascertained. The division of them between freight and passenger is the subject of another chapter. There is no controversy in this case over the value of the railroad property. That was settled by a stipulation, which reads as follows:

BLURRED

"It is agreed by counsel for defendant in this case that the assessments introduced in evidence at the hearing of the applications for injunctions in these cases before Judge VanDeventer, and which are set out in the exhibits filed by the accounting officials of the respective complainants, in the evidence taken before the Master in these cases, were made upon the basis of 50 per cent of the value of the property; and that said assessments, multiplied by two, respectively, represent the value of the property for the purposes of this case." (R. p. 653.) There is some difference of opinion among the accountants and the witnesses on the opposite sides of the case as to the proper crediting of revenue received. There is a wide difference as to the proper distribution of expenses between State and interstate, and a wide difference as to a division of the property between State and interstate, but the actual revenues and the sources from which the same were received, the actual expenditures and the actual value of the property, are not matters of controversy. Primarily, the court must find a method of dividing the property between State, interstate and miscellaneous traffic and between freight and passenger. There is controversy in this case as to some part of the property, and as to whether certain expenses charged here to the State of Arkansas should be charged. For instance, the Iron Mountain Railroad rents from the St. Louis Southwestern Railroad the use of its tracks from Paragould, Arkansas, to the Thebes Bridge, on the Mississippi River. Thirty-six miles of that track is in Arkansas. For its use the Iron Mountain Railroad pays in round figures about $35,000 a year, and bears its proportion of the maintenance-of-way on a car-mile basis. This track is used exclusively for interstate freight traffic. The Iron Mountain has agreed in its contract of lease that it will not run passenger trains, or stop its freight trains, for any local business on this line. There is some controversy, or rather difference of opinion, among the witnesses as to the purpose of this contract, Mr. McPherson contending that it serves the purpose of a double track to relieve the congestion of traffic of the main line from St. Louis south, but he admits in his testimony, and that fact is well brought out by other witnesses, that one of the purposes was to carry the interstate freight on a low-grade line, instead of hauling it over the high grades in and about DeSoto, Missouri, a point between St. Louis and the Arkansas line, on the main line. Be the purpose what it may, it is an established and admitted fact that this track, at an expense of $35,000, is used exclusively for interstate freight; yet, in the statistics of the case relied upon by the railroad, that $35,000 is charged as an expense to Arkansas, and is divided between all business of the State as if it were an expense existing generally; in other words, the intrastate freight and passenger traffic and the mail and express traffic are charged with the same proportion of this as they are with any other expense incurred in the opera-

*Agreed Valuation of the Property.*

PAGES

tion of the road in Arkansas. Memphis, situated on the east bank of the Mississippi River, immediately opposite the State of Arkansas, is entered by the Iron Mountain road, there being about a mile and a half of trackage in Tennessee, and expensive terminals in the city of Memphis. All the expenses of Memphis, including the salary of attorneys attending to the Tennessee business of the road, are charged to Arkansas, and this expense divided between the various classes of traffic, just exactly like the terminal expenses of Little Rock and the expenses of the legal department of the State of Arkansas are divided between the various classes of traffic. On the western side of the State is the city of Fort Smith, situate on the Oklahoma border. There are expensive terminals in Fort Smith, and these terminals serve both Arkansas and Oklahoma, but all the expense of Fort Smith is charged to Arkansas except the legal department located there, which is divided between Arkansas and Oklahoma, on a mileage basis. These matters are mentioned in this connection, not to present them in argument at this time, but to explain that while the expenses are ascertainable quantities and there is no controversy over them, or over the value of the property in this case, yet there are controversies over the division of the property; what property is properly chargeable to the State; over the apportionment of the expenses; and, as to many items of expense—whether they are proper charges at all.

The least matter of difficulty is to ascertain the revenues of the railroad, and to divide them between intrastate and interstate traffic. While this traffic is commingled and handled interchangeably, yet it is indellibly impressed with its true character from the time the railroads assume it. The instant it receives a shipment of freight its origin and destination are known, and its character as State or interstate fixed, and the same is true of a passenger; he is either an intrastate or an interstate passenger from the moment the relation begins. Most of the passenger trains carry mail and express. Some of this has origin and destination within the State. Some of it is transstate, passing through the State without having its origin or destination within the State, while other has origin and destination in this State, and other origin or destination in another State. But all of this traffic passes upon the tracks alike, is handled upon the tracks alike, and there is no change in the handling on account of passing the State line. After obtaining the revenue derived from all sources in the State of Arkansas, the railroads proceed to divide the property and the expense on this revenue basis, and to do this, they take the percentage which the revenue of each class, divided between interstate passenger, intrastate passenger, interstate freight, intrastate freight and miscellaneous freight and miscellaneous passenger, bears to the whole as the factor to find the property devoted to, and expense incurred by, each of said respective classes of traffic. This puts concretely an example of their methods, disregarding, for simplicity, the freight and passenger subdivisions. Suppose the revenue from a railroad to be

BLURRED P

one million dollars from all sources. Of this, one hundred thousand was for mail, express and other miscellaneous traffic; $200,000 was from intrastate freight and passenger traffic, and $700,000 from interstate freight and passenger traffic; the proportion of intrastate revenue would be 20 per cent, miscellaneous 10 per cent, interstate 70 per cent. Suppose the expense of conducting the whole traffic for the year would amount to $500,000; then, under the revenue basis of dividing the expenses, 20 per cent of that expense would be assigned to intrastate, 70 per cent to the interstate and 10 per cent to the miscellaneous. Suppose the property of the railroad was valued at $40,000,000, the amount assigned to intrastate traffic would be 20 per cent, or $8,000,000; to the miscellaneous 10 per cent, or $4,000,000, and to the interstate 70 per cent, or $28,000,000. This is the application of the revenue theory before reaching the extra cost of the intrastate traffic, which will be presented at some length hereafter, which is, briefly stated: Various railroad operating officials testified that it cost from 100 to 800 per cent more, varying in accordance with the opinions of the different officials, as to the increased per cent to operate intrastate freight over interstate freight traffic. Then, after the expenses are divided, as above outlined, and the proper per cent assigned to intrastate freight business, 100 per cent is added then to that sum, or 200, or 600, or 800, according to the theory adopted as to the amount that it will cost. Similarly as to the intrastate passenger, the increased cost varying from 25 per cent to 50 per cent

Mr. R. E. Kimbell, Assistant Auditor of the St. Louis Southwestern Railway Company, an accomplished accountant and a representative of his company in this case in the preparation of statistics, was asked the effect of an increase of State rates without a corresponding increase of interstate rates on the expense assigned to the State under the revenue theory. He answered correctly the effect, and at the request of counsel for the State, worked out the following example, which is exhibit No. 23: Assuming the entire revenue from freight in the State is $100,000 and the entire freight expense of the State $70,000, interstate freight revenue $85,000, intrastate freight revenue $15,000; then calculate the amount of expense chargeable to State business, and the amount of expense chargeable to interstate business, and then assume intrastate rates are increased 33⅓ per cent. Then make the same calculation of what amount is chargeable to State business and what to interstate, assuming the $70,000 expense account would remain stationary, and that the interstate rates would remain stationary; also make a calculation under the rule followed in granting the preliminary injunction in this case—assume 100 per cent more cost for State freight operation than interstate freight operation:

GES

## ANSWER TO JUDGE HILL'S EXAMPLE.

| Item. | Per Cent. | Amount on Straight Rev. Basis. | Amount Under Judge VanDeventer's Theory of 100 Per Cent Extra Cost for State Business. |
|---|---|---|---|
| State freight revenue..... | 15 | $15,000.00 | |
| Interstate freight revenue.. | 85 | 85,000.00 | |
| | 100 | $100,000.00 | |
| State freight expenses..... | 15 | $10,500.00 | $18,200.00— 26% |
| Interstate freight expenses. | 85 | 59,500.00 | 51,800.00— 74% |
| | 100 | $70,000.00 | $70,000.00—100% |

STATE FREIGHT REVENUE INCREASED 33⅓ PER CENT WITH NO CORRESPONDING INCREASE IN INTERSTATE REVENUE.

| | | | |
|---|---|---|---|
| State freight revenue..... | 19 | $20,000.00 | |
| Interstate freight revenue.. | 81 | 85,000.00 | |
| | 100 | $105,000.00 | |
| State freight expenses..... | 19 | $13,300.00 | $22,400.00— 32% |
| Interstate freight expenses. | 81 | 56,700.00 | 47,600.00— 68% |
| | 100 | $70,000.00 | $70,000.00—100% |

FORMULA FOR ADDING 100 PER CENT EXTRA COST.

| 100% | 115 | 100 | | |
| 19% × 2 = 38 = | 32% | Difference | 13% + |
| 81% | 81 = | 68 | " | 13% = |
| 100% | 119 | 100% | | |

Exhibit 23.

To explain this problem without following it in detail, it is this: On the assumed hypothesis the expense assignable to the State freight business would be $10,500.00; if the State rates were increased 33⅓ per cent and the interstate rates were not increased, the division of the same expense would assign to the State of Arkansas $13,300, or an increase of $2,800, without any real increase whatsoever, but an increase due solely to the methods adopted for dividing this expense, which would be an unreal expense against the State of $2,800, merely

BLURRED

because the State rates were increased 33⅓ per cent. Assuming the correctness of 100 per cent extra cost for State business over interstate, instead of $10,500 there would be assigned to the State business $18,200, and when the rates were increased 33⅓ per cent then the 100 per cent extra cost for State business would assign to the State $22,400.00, an increase of $4,200, as against an increase of $2,800 merely due to the methods adopted; and, in fact, there being no increase of State expenses whatsoever.

Mr. Frank Nay, Comptroller of the Rock Island System, another accomplished accountant and the chief witness for the railroads upon all accounting subjects, in his carefully-prepared essay on the revenue basis, which he read, contended that a similar calculation to the one which Mr. Kimbell prepared, at the request of the State's counsel, refuted an argument which he heard advanced against the revenue basis, that it was like traveling in a circle, and that when the revenue of intrastate traffic is doubled, the operating expenses also doubled and the end was just the same as in the beginning. And then he made his calculation to demonstrate that it did not thus work. His calculation using differently-assumed totals was exactly the same as Mr. Kimbell's. It will be found on pages 634, 635. On cross examination, his attention was called to Mr. Kimbell's exhibit No. 23, and he said that it is the same as his illustration and that was worked out correctly. (R. p. 655.)

While somewhat a digression, yet it may assist the court to call attention to actual conditions shown to have existed in this case which made this example of the operation of the revenue theory a practical one and not a mere theoretical one, as is contended by the witnesses for the railroads. They say that such a condition as assumed in exhibit 23, an increase in State rates without a corresponding increase in interstate, is impractical and not consistent with railroad practice. After the temporary injunctions were granted in this case by Judge VanDeventer, the railroads who secured the injunctions put in voluntary intrastate freight tariffs. These tariffs went into effect November 2, 1908. In February, 1909, the State filed a motion in the Federal Court to dissolve or modify the injunctions on the ground that the railroads had taken advantage of the injunctions to inflict unreasonable and discriminatory rates on the people of Arkansas. This came to a decision in April, 1909. The Circuit Court held that the rates were unreasonable and at least 50 per cent higher than the Standard Distance Freight Tariff, which had been the tariff in force for the past eight years for all intrastate freight traffic. In the testimony of Mr. Flippen, the General Traffic Manager of the Iron Mountain, he said that the increase of interstate rates was 10 to 15 per cent when the State rates were increased. (R. p. 263.) Mr. Perkins, the General Freight Agent of the Iron Mountain, testified they were increased 10 per cent. There is an exhibit to the testimony of Mr. Kimbell, when he produced as a wit-

PAGES

ness for the State, in which was shown that in January, 1909, the month during which the railroads made both the intrastate and interstate rates, that the interstate revenue of his road, the St. Louis Southwestern, increased 9 per cent, and the intrastate revenue was increased 96 per cent per ton per mile (R. pp. 769, 770) set forth in exhibit "A.") Subsequently, Mr. Kimbell, after a careful examination, testified that the increase of 96 per cent of the State revenue was not due wholly to the increase of State rates, but was due in a large measure to the shifting of commodities, and that the actual increase of rates was 48 per cent. There was no showing by him, although it was requested, of whether the 9 per cent interstate increase was entirely due to the increase of rates, or was likewise due to both increase of rates and shifting of commodities. Mr. Perkins, one of the witnesses for the Iron Mountain on rate matters, testified that there was no shifting of commodities as between State and interstate business in January, 1909. (R. p. 1632.)

Thus it is seen in actual practice that if at any time following November 2, 1908, and before the railroad rates were annulled by order of Judge Trieber, the State and interstate expense had been separated under the revenue theory, there would have been a tremendous increase of the State expenses by reason of the great increase of the intrastate rates and revenues over the interstate rates and revenues without in fact a single dollar of actual increase. Surely such a basis can not be a sound one.

The discussion of the revenue theory calls for its division into its component parts. The theoretical side of it is the opinion evidence of gentlemen learned upon the subject as to its being a proper factor for this purpose. This is opposed by the opinion evidence of men learned upon the subject, who contend that is not a proper factor. Opinion evidence is weighed from the standing of the men, their experience, their observation, their learning upon the given subjects, their character, and the cogency of their reasoning. We will divide this discussion into three parts: (1) The theoretical side of it; (2) the relation of the rates to the cost of service; (3) the relation of the intrastate and interstate rates to each other. In addition to having these matters discussed by men learned in the subject, the State has gone further and exhibited the rates under which the great body of interstate traffic moved, and has, we think, demonstrated that the rates bear no relation to the cost of service, and that there is no cost relation between State and interstate rates; and, in fact, no relation between any given set of rates, either State or interstate. The subjects will be presented separately and in order.

## (1) THEORETICAL SIDE OF THE REVENUE BASIS.

On the theoretical side of the case the railroads presented Mr. C. J. McPherson, Assistant to the General Manager of the Missouri Pacific

*Plaintiffs' Evidence.*

and Iron Mountain System. Mr. McPherson has had thirty-two years' experience in railroad service ranging from telegraph operator, station agent, general yardmaster, master of transportation, chief clerk to the general manager and assistant to the general manager.

The next witness is Mr. W. B. Doddridge, who has had a very extensive railway experience and was general manager of the Missouri Pacific System from 1893 to 1900, since which time he has not been an official of any railway. He was also at some time the general manager of the Cotton Belt road.

The next and only other witness on this subject was Mr. Frank Nay, Comptroller of the Chicago, Rock Island & Pacific Railway. Mr. Nay's work in railway service has been entirely in the accounting department. An analysis of the testimony of those witnesses is necessary in order to get a correct understanding of the revenue basis as presented by the railroads themselves.

It will be interesting to note in the testimony of these three gentlemen upon this subject practically nothing is said in support of the division of property between State and interstate business on the revenue basis.

Probably one of them made a general statement that it was the proper basis for both property and expenses; but with the exception of some general remark of that kind, there is absolutely nothing developed in this record to sustain the revenue theory as a basis of division of property in the State between State and interstate traffic. They make arguments in favor of dividing the expenses between State and interstate, and go into it exhaustively. They present fully their views upon that phase of the question. But upon the other phase of the question, and an absolutely necessary one, they are silent.

Mr. McPherson's testimony on this subject begins at page —. (R. p. 304.) He first takes up what is called the "units of measure," which run through railroad operation. He discusses "train mileage," "car miles," "number of tons," "number of passengers," "ton miles," "passenger miles." He discusses learnedly and fully the use of these measures and applicability of each to some given conditions and argues that none of them can be used to divide expenses between State and interstate business. In explanation of the various uses of these different units that are in vogue among the railroads for the purposes of measuring different quantities, he throws a good deal of light upon when and where each measure should be used, in his argument against using any one of them to divide expenses between State and interstate traffic. As none of these various measures that he speaks of is used by the State in this case to divide generally interstate and intrastate traffic, his argument against their use for that purpose, was largely wasted.

The State's accountants have in exhibits prepared by them, used these measures in their appropriate places to measure such matters

as should be measured by the unit applicable to that particular matter and used them much as Mr. McPherson and other railroad officials have testified they should be used. In fact, a large part of the authority for the use of each measure which is used by the State's accountants is found in the explanation of the use of this particular measure in the testimony of Mr. McPherson, Mr. Doddridge, Mr. Rawn and other experts called by the railroads. As the court will see in reading the cross examination of these experts put forth by the railroad, the State attempted, when it found one of these witnesses qualified to speak on a given subject, to find the proper basis for each item of expense, so that when the proper basis was found, it might be used by the State in the various exhibits in which it sought to use the proper basis for dividing each item of expense.

That, however, is a digression from Mr. McPherson's argument.

After making his dissertation against the use of any of these methods, particularly the "ton mile" method of dividing expenses, Mr. McPherson finally comes down to his reasons for adopting the "revenue basis." This is given at page 320. In answer to the question, what is the best basis upon which to divide the expenses of operation, as between intrastate and interstate traffic, he says that the natural basis for dividing the cost of intrastate and interstate business respectively, would, in his opinion, be the proportionate revenue derived from each. This he designates as the "revenue basis." Then he adds: "To this basis as a fundamental one should be added such additional cost as may attach to the handling of intrastate business over that of the interstate." The proposition amounts to this: The best basis for dividing the cost between State and interstate business is the proportionate revenue derived from each and yet to that result should be added additional cost which may attach to the handling of intrastate business over that of interstate. Mr. Nay puts the same proposition in this way (page 635): "After making basic approximation of the operating expenses for intrastate freight or passenger traffic, the figures thus arrived at may be increased in the proper proportion to represent the excess of the cost of transporting intrastate traffic, over the cost of transporting interstate traffic."

It is interesting to note that Mr. McPherson in the beginning of his testimony adds the extra cost to his basis and then argues why the revenue, and by that is meant the straight revenue without the extra cost, is the proper measure of expenses, while on the other hand Mr. Nay makes his argument for the revenue being the proper basis of expense and closes his essay on the subject with the proposition that to the factor obtained on the revenue basis must be added certain extra sums for handling intrastate traffic. Attention is called to it here merely to show the lack of logic of the revenue basis when to it must be added something to make it worth anything—this hypothetical extra cost of intrastate traffic.

That is the revenue basis as developed by these gentlemen. They spent page after page in arguing and in presenting their views to sustain the proposition that the rates represent the cost of the service and that there is a relation between the State and interstate rates. They say that the value of the revenue theory is based upon the cost of the service being a fundamental proposition in the rate and the relation always existing between State and interstate traffic, yet they say after you find that, to give this any value whatsoever you have got to add something to it based upon the opinion of some of the railroad officials, in order to give it any value whatsoever.

That is the revenue basis as presented by them.

After explaining that the revenues are derived from different sources, such as freight, passengers, miscellaneous, rentals, etc., and that a division of these earning can be actually ascertained, then he adds: "Naturally, they reflect the value to the railway of each class of the service it performs." In the next paragraph he makes this statement:

> "Moreover, the revenue basis is reflective of the efforts of the traffic men who make the rates, to consider in a measure the value and character of commodities, and the risk and distance attached to their transportation. This is apparent in the classification of commodities into classes and the different rates established for their carriage."

Then he instances the fact the rate on first-class is higher than on second-class, etc., and that such differentiation in the commodities and rates is recognized by the railways and by all rate-making bodies. He says:

> "The revenue expresses value, character, risk and distance, rather than quantity, and likewise considers to no little extent the question of cost, as it is obvious that it costs more to transport some commodities in small quantities, than it does other commodities in larger quantities."

Then he makes another argument against the ton mile theory and concludes by saying that the revenue basis is a proper basis on which to apportion the cost of operation, as between interstate and intrastate traffic.

Next he takes up the extra cost proposition, which will be considered separately.

At page 401 Mr. McPherson was cross examined upon the revenue basis. He was asked if the revenue basis didn't reduce the price for hauling a commodity to a common level and said that it did not. That the various rates, first, second and third, and other class and commodity rates have considered the differences in character, volume, risk, bulk and as a result of the work, not as a measure of it. The revenue is the result. Then he was asked, does it bear the proper relation to the work done. He answers:

"I never have said that I thought the revenue basis was an exact basis to use, but I believe it has less objections than any other basis, and there are more reasons why it is logical, than any other basis that has been suggested. And it expresses a result of the things that have been done, after they are done."

It was insisted that this was not in answer to the above question, as to whether the revenue bears a proper relation to the work done and he further answered that question as follows:

"I do not know that it bears an exact relation to the work done. That is doubtful. But it probably comes nearer doing so, considering all of the elements, than the other basis. It, of course, does not deal with quantity. It deals with what has been paid for the quantity transported; and that has considered, undoubtedly, the elements of character, bulk, risk and distance."

He was again asked, does it bear proper relation to the cost of transportation, and he says that it comes nearer the proper relation with the cost than any quantity consideration. Then he was asked if it wasn't a fact that rates were largely based upon competitive conditions and not upon the cost of the service. He said that he was not a rate man, but from his general knowledge he knew competition must be considered in rate-making between localities, as well as between railroad companies. He denied that it would necessarily or naturally follow that when rates were made on competitive conditions, that they would not reflect the cost of the service. He takes refuge in the statement that the revenue basis is not perfect, but it possesses less objections than others, and tries to switch off the argument to the ton mile theory. When held down to the question, he says that it is a subject that he does not feel like discussing, as he is not a rate man (page 402).

Mr. McPherson has been put forward as one of the chief witnesses for the railroads, to support the revenue basis.

But Mr. McPherson's experience has been in the operating department. Whenever Mr. McPherson was questioned about rates he declined to answer and stated, as he stated here at pages 402, 403, and again at page 436, that he did not know anything about rates and that these questions that had been discussed by rate-making bodies, and that he did not feel competent to discuss them.

What of the competency of this witness to sustain the revenue theory, when the revenue theory is dependent entirely upon the rate representing the cost of the service, and upon the further proposition that there must be a relation of cost between the State and interstate rates to give it any value?

To proceed with Mr. McPherson's testimony: He was questioned about the cost of handling lumber from Arkansas to its market, St. Louis and other places, where it is handled on a blanket rate and the cost of the service widely differing, but the revenue identical. He admits that there would be a difference in the cost of the service that

would not be reflected in the rates in an instance like this, and admits that the revenue basis is not an exact one. He finally admits (page 403) that distance does not control altogether in rate-making and admits that distance would be ignored in the instances given in order to give two localities an equal chance at the market.

Then he was questioned about shipments of merchandise from St. Louis and other Eastern trade centers to Texas, where shipments are made to various points in varying distance from the common market, like St. Louis, which take the same rate. An illustration of this is given at pages 404 and 405. He admits that on three cars passing through Arkansas from Texas to Texarkana, where the service would be identical, the actual expense identical, the Iron Mountain would receive for one $20.58, for another $14.77 and for another $19.31.

In getting the division of revenue on interstate business where there is a haul in two States, the railroads take the *pro rata* hauled in each State. For instance, if the haul was 100 miles long, fifty miles in Arkansas and fifty miles in Missouri half of the revenue of that haul would be credited to the Arkansas interstate business, notwithstanding the rates in Missouri and Arkansas would be quite different. An illustration of the way that this would work out is given at pages 407 and 408, which shows the inequality of using this revenue as a means of dividing the expense with the intrastate traffic, as there will be a different apportionment for exactly the same service in Missouri, Arkansas and Texas, owing to the difference in the State rate in each of those States. The answer to this question, after several days' consideration, is found at page 426, in which the correctness of the hypothesis is admitted, but it is claimed that such shipments as illustrated therein were obsolete.

But that was no answer to the proposition. An illustration was given of a movement from Carondelet, and so on. But the fact remains that as to some traffic—it may not be a very large volume of traffic—but as to some traffic that would move through those three States, if there were rate suits pending in each of them, there would be a different apportionment of the expense of that traffic in each State, because the State rate in each State is different, while the interstate rate was cut by the State line as a measure of the other.

Mr. McPherson was asked if it was not true that an increase of the State rates made the apportionment of cost to the interstate traffic proportionately higher, and he said that while there was no increase of cost of operation, yet if the revenue proportion of the State as against the interstate was increased, that there would be a proportional increase in the proportion of expense charged to the State.

He admits that an increase in the State rate, without a relative increase in the interstate rate, would increase the expense apportioned

to the State, without any actual increase in the expense under the revenue theory of dividing State and interstate expenses.

He admitted that the interstate passenger and freight rates were not immediately increased when the rates were increased in Arkansas after Judge VanDeventer granted the injunction, and that, therefore, during the period in which there was no increase in interstate rates, application of the revenue basis would have apportioned greater expenses to Arkansas than would have been apportioned prior to these increases, without any actual increase of the expenses. (R. pp. 409-411.)

To Mr. McPherson was quoted the testimony of Mr. Flippen, who stated that there had been an inordinately low interstate rate from Memphis to Arkansas points, and he was asked, assuming this to be true, if under the revenue theory this would not make the apportionment of the expenses charged to Arkansas greater than should be in proportion as the Memphis interstate rates were inordinately low. After a good deal of fencing he says that he does not understand that it would have any effect on the revenue basis of apportioning the expense, and was asked why it would not, and answered as follows:

> "As a probably exact relation does not exist between intrastate and interstate rates in every instance, and it would be difficult to say just what the exact relation should be. There is undoubtedly a relation, but it would be hard to define just what it is.
>
> "The prevailing condition for a short time may have disturbed the relation; that would not be illustrative of or affect the general revenue basis proposition; it would merely throw it out of line temporarily, so long as there was not a proper relation, whatever that might be." (R. p. 427.)

Mr. McPherson, like all other witnesses on this subject, is driven to establish a relation between the State and interstate rates. It is a necessary assumption of the whole revenue theory that there must be a relation between the State and interstate rates in order to make the revenue theory of any value. That testimony will be referred to later, but attention is called strongly to the fact that Mr. McPherson, as all other witnesses for the railroad, necessarily base their revenue theory upon a relation existing between the State and interstate rates. When that relation is demonstrated to be nonexistent, necessarily the revenue theory is exploded.

By all rules of law and evidence, the burden is upon the railroads to prove this relation. That they have signally failed to do, and the State has disproved it. Mr. McPherson finally says that these inordinately low rates from Memphis, which were testified to by the traffic manager of his railroad, might affect the relations between the intrastate and interstate business, but he did not think it would do so materially. Then, again, he apologizes for the revenue theory by saying:

"I would say again that the revenue basis is not perfect. It is open to illustrations that would demonstrate that, but whatever the relations might be between State and interstate raffic rates, so far as my judgment is concerned, it would average up well, taking the whole into consideration, in its entirety." (R. p. 428.)

At other places in his testimony, he frequently says that he is not a rate man and knows nothing about rates, and declines to be questioned as a rate expert (see his statement, pages 402 and 436), yet a relation between the rate, State and interstate, is a necessary factor to make the revenue basis of any value whatsoever, according to his own testimony and admission. And yet he says he knows nothing about rates.

Mr. McPherson says:

"I don't understand the traffic proposition well enough to say what the relation between intrastate and interstate rates is. * * * I must assume that it exists. I believe that it is generally assumed that it exists. If the State rates for any reason are lowered, and that relation would doubtless continue under such circumstances. If the State rates are raised I presume that the relation is still continued by a raise in the interstate rates." (R. p. 429.)

He admits that when the rate is changed that it readjusts relations between State and interstate and readjusts the apportionment of expenses, State and interstate under the revenue basis, but he regards those readjustments as negligible quantities, and yet he admits he does not know what establishes the relation between State and interstate rates. He admits that commercial conditions largely govern both State and interstate rates, and that commercial conditions, as well as others that would enter into rate-making, would apply to both State and interstate rates. (R. pp. 429, 430.)

He finally says that the revenue basis must necessarily give and take in a great many ways, and no doubt illustrations could be multiplied showing where inequalities really would exist under the revenue basis of dividing expenses (page 431). He denies, however, that it gives unto the State which has low rates and takes from the State which has high rates. But that is necessarily the case. The higher the State rates in proportion to the interstate rate, the greater the expenses apportioned to State traffic is, and take States like Missouri and Arkansas, lying side by side, with one interstate rate prevailing for shipments, say from St. Louis to Texas, where the Missouri rates are lower than the Arkansas rates less expenses are charged to Missouri than would be charged to Arkansas, because less revenue is being produced from State traffic in Missouri than is being produced from State traffic in Arkansas, while the interstate traffic in each State bears the same the proportion of revenue, being divided and on a mileage scale.

This is pretty well proven in illustrations put to Mr. McPherson, although he denies them by taking refuge in his lack of knowledge of rates.

On re-direct examination Mr. McPherson says that the cost of the service is kept in view as a fundamental underlying principle upon which rates are fixed (page 435). Mr. Moore then called his attention to Mr. Flippen's testimony that the interstate rates were inordinately low in Arkansas from Memphis and asked him if it were true if the intrastate rates were less inordinately low would the low interstate rates affect the relation as between the two kinds of traffic? He answered that he would have to know the rates and conditions before he could answer the question. That it would be true if conditions were disturbed all round; there would be only one answer to that question, and the answer would be, if the conditions were disturbed all round the revenue basis would be the only basis that they could look to for any hopeful solution of dividing the interstate and intrastate expense of operation. He says that if both classes of rates were inordinately low, it would not affect the relation, and was asked if that would not depend upon the degree of inordination, but the counsel of the railroad preferred to make it a question of co-ordination (page 436). These questions were not answered, but answer themselves.

Mr. McPherson further says on re-direct examination that the revenue theory was the only basis that he knew of that would recognize the classification of commodities or articles that appear in the classes (pages 444, 445). In evidence introduced by the State it is shown that relation between first, second, third, fourth classes, etc., is demonstrated to be a pure theory and not existing in fact, but it is one of the theories which go to make up the argument for the revenue basis. Attention is called to it here, because hereafter attention will be called to the evidence which explodes it.

There is absolutely no relation between these rates, State and interstate. There is no relation between the classification, State and interstate, under which the great body of the traffic moves, and without that relation Mr. McPherson and Mr. Nay and Mr. Doddridge all are forced to admit that the revenue theory has no value. It is a theory absolutely opposed to the conditions, and it is a condition and not a theory which confronts the Court in determining the force of these facts.

Mr. Doddridge was the next witness on behalf of the railroads to sustain the revenue theory. He had had a wide and varied experience, having been general manager of both these railroads, but he has had no active railroad experience since 1900.

He admitted on cross examination that in the Missouri Rate Case and in this case he had acted as adviser to the counsel for the railroads, and in the Missouri case he had discussed the questions with a great many of the witnesses. (R. pp. 466, 467.)

So we may safely infer from Mr. Doddridge's position as adviser to the counsel in expert matters and put forward as one of the leading witnesses, his statements are entitled to consideration, at least. In the later development of the case much that had been said by Mr. Doddridge as to the physical management of the property has been disputed by witnesses put on by the railroads.

He says there is no method he is aware of by which the separation of the expense of conducting State and interstate traffic can be definitely ascertained, and the question arises as to the best manner of arriving at the truth in dividing those two kinds of traffic for the purpose of ascertaining the difference in cost of operation.

He then says there are several bases which have been spoken of, among them the ton mile basis and the revenue basis. He then proceeds to discuss the ton mile basis and attacks it as a proper method for dividing the expense of State and interstate traffic. As the State does not adopt it, although the railroads evidently thought it would, it is useless to follow his argument against it. It might be well, however, to call attention to the fact here that the State does use the ton mile basis for one purpose and one only, and for that purpose Mr. Doddridge says that it is a proper unit of division of such expense. And that is the use of it to divide the traffic between State and interstate on the same train, after the cost of that train has been ascertained.

He says the ton mile as a unit is available for a limited number of comparisons, such as testing the efficiency of car loading, train loading and average cost of revenue derived from certain commodities and the making of comparisons of one commodity with another upon the same railroad or upon different railroads. In the formula for this division prepared by the State, the expenses of the local and through trains are ascertained and then the proportion of interstate and State traffic in each of those trains is ascertained by using the ton mile, in that way deciding the efficiency of car loading and train loading for the actual cost of traffic between State and interstate (R. p. 454.)

After discussing the ton mile, Mr. Doddridge says to be fair and equitable a unit must be used that will reflect all of the average conditions under which the transportation is furnished and charge each ton mile or each passenger mile with the proper proportion of all the expenses. Then Mr. Doddridge continues:

> "In the establishment of rates many elements are considered, such as the physical cost of the service, the weight, the distance, the competitive conditions, the space occupied, the character of the service and the value of the service to the shipper. It is, therefore, necessary to use an arbitrary unit."

Then he says that, in his judgment, the best method that has been suggested for this purpose is what is commonly known as the gross earnings basis. That is, that the gross earnings derived from each

class of traffic for a given period being accurately known, the expenses between State and interstate traffic may then be divided and apportioned upon the per cent each class of gross earnings is made up of, thousands of small units, and they represent the amount received for transportation of the individual shipments. He then adds this statement:

> "The sums charged for transportation bear some definite relation to the cost. These sums vary, being governed by circumstances and conditions, such as weight, distance and classification, and the commercial conditions under which the transportation is furnished." (R. p. 455.)

As will be seen when the State's evidence is analyzed, the definite relation which the sum charged bears to the cost is an unknown quantity. It is true that it varies, as stated by Mr. Doddridge, and the variance is so great and without any system or relation with the cost, that it totally destroys the revenue as a factor to determine the expenses. The whole theory is predicated upon the indefinite hypothesis that the sums charged bear some definite relation to the cost, but no witness has been found to state what that relation is, and the State's testimony shows that it is nonexistent.

Then Mr. Doddridge takes up the commercial conditions and admits and explains how they influence railroads in determining the proper rates to be charged for transportation. He says that all of the elements of expense are reflected in the revenue, and by allotting the expenses in proportion to the amount which each class of traffic produces in the aggregate seems to be the most reasonable and equitable method by which expenses can be apportioned between State and interstate traffic. He says the difference in the value of articles transported and the liability incurred are always taken into consideration as one of the factors to be considered in the establishment of rates. This is undoubtedly true, theoretically, but as will be seen from the admission of the traffic men, who testified on behalf of the railroads and the demonstration of the rates themselves put in by the State, it is theoretical and not in actual use. Mr. Doddridge admits that there are many other considerations which affect the establishment of rates, such as competitive conditions between producing sections and consuming markets. He takes as illustration the interstate rates upon the products of the forest, which constitute a large proportion of the tonnage of Arkansas, and he says that they are established mainly upon the value of the service to the shipper and to the consumer, based upon existing commercial conditions, and that the physical cost of transportation individual cases being a secondary consideration, as a whole the traffic yields a profit either directly or indirectly. (R. pp. 455-457.)

That is the reason, from the railroads' standpoint, that this lumber is transported these great distances at the same rate; that the rate is divided in numerous cases between several carriers, producing a vary-

ing revenue on almost every car of lumber that moves through the State.

That method is not a subject of criticism in this case. That is for the railroad management to determine; whether it is good or bad is for them to determine.

But when they put forward the rates thus made, that are based upon the value to the shipper and consumer, and where the distance and the cost of the service is a secondary consideration, then they can not come in here and claim that the rate represents the cost of the service.

But to return to Mr. Doddridge's testimony. He says at page 456:

> "Changes in rates are necessary from time to time and would affect the allotment of expenses as between State and interstate traffic to that extent, while it is not contended that the actual physical expense would be changed."

He says that interstate rates frequently extend across several States and if below normal by comparison with other rates, for the reason stated, each State would bear its *pro rata* in the reduced expense thus allotted and interstate rates as compared to the total may be abnormally high, which would tend to equalize the condition in the example pointed out. Then he says that interstate rates into and out of Arkansas must be so adjusted as to enable its products to find markets in competition with other producing sections. This principle is essential to the prosperity of both the State and the railroads. Intrastate traffic depends upon this condition being maintained. This is an excellent argument in favor of commercial conditions fixing rates instead of the cost of service fixing rates, and may justify such anomalies as the lumber rates, but certainly this argument does not sustain the proposition that the revenue produced from these rates is a proper measure for the expenses of handling two classes of traffic.

After making the above argument, then Mr. Doddridge says:

> "Transstate traffic as a whole being carried at a much lower cost than short haul traffic, low interstate rates applied to that class of traffic in some cases works no injustice to the interstate traffic in the apportionment of expenses as a whole. The gross earnings method of apportionment of expenses deals with all of the intrastate traffic as a single unit and with all of the interstate traffic as a single unit, upon a system of general averages, without reference to individual shipments or particular rates." (R. p. 456.)

The next argument that Mr. Doddridge makes, is on the allotment of expenses to miscellaneous earnings. In his judgment the State has the best of it, because if there were no miscellaneous earnings from mail and express, the expense would not be very much reduced, as the necessity for running passenger trains would still remain. This is an admission against the accuracy of the revenue theory, but in this case against the interstate side of it.

He makes one statement in his direct examination, to which attention is now called, although somewhat of a digression, that is well worth looking into. He was asked how he thinks taxes assessed and collected in the State of Arkansas on the property of the railroad should be divided between State and interstate traffic, for the purpose of ascertaining the relative cost of those two classes of traffic and he answers that the apportionment of taxes should be based upon the relative amount of property used in the transaction of the different classes of traffic.

For the purpose of ascertaining the relative proportion of taxes on those two classes of traffic he says the proportion of taxes should be based upon the relative amount of property used in the transaction of the different classes of traffic. He says the result of that method of division would be to divide the taxes in proportion to the expense of operation, and that method was adopted by Judge VanDeventer in this case when he granted the temporary injunction, and that is a correct method. He says the division of taxes upon expenses is a correct method and it was adopted by Judge VanDeventer. (R. p. 465.)

In Judge Van Deventer's opinion there is something to that effect, but he obtained his expenses by the revenue theory and, of course, when he used his expenses to apportion his taxes he was using the revenue theory, although his mind evidently ran to the expenses as the proper basis for dividing the taxes.

Mr. Doddridge admits that if the Arkansas Commission should take out of the Western Classification various articles and add them to the commodity lists, thereby resulting in a reduction of revenue on intrastate traffic, it would follow under the revenue theory that this would cause a proportionate decrease of expense against the intrastate traffic in the division of expenses between State and interstate. (R. p. 477.)

At pages 479 and 480 of Mr. Doddridge's cross examination he says that in the division of interstate revenue where the traffic is carried over several roads it would be just to charge the middle road with a part of the terminal expense before the division is made, but that as a general rule that is not done. For instance, take a shipment from Chicago to Dallas, Texas. Say it originates on the Chicago & Alton in Chicago and is delivered by the Chicago & Alton to the Iron Mountain in St. Louis and by the Iron Mountain to the T. & P. at Dallas, Texas; there would be heavy terminal expenses on the C. & A. and on the T. & P. in delivering the shipment at Dallas. There would be no terminal expenses on the Iron Mountain, other than the expenses at division points, particularly in the State of Arkansas. And yet the interstate revenue would be divided in proportion to the mileage, utterly ignoring the heavy terminal expenses at each end of the line. Some system of general averages might equalize this, but no such system is shown and, as usual, Ark-

ansas would get the worst of it, because Arkansas has heavy shipments of cotton and lumber where the terminal expenses originating that traffic are very heavy and yet the interstate rate would be divided on a mileage *pro rate*. In other words, the revenue would be an inaccurate and unjust measure of the cost of the service in this respect.

He admits that he did testify in the Missouri case that the cost between State and interstate traffic could not be correctly determined without using a percentage based on opinion and judgment, and he also admits that it was not accurate and that it was not scientific, but he still clings to the contention that it is the best method or plan in his judgment, for the purpose for which it has been used. (R. pp. 480-483.)

He admits that the only use to which it has been put, has been in litigation and in questions affecting State regulations. (R. p. 481.)

Mr. Doddridge testified in the Missouri case and also in this case (R. pp. 499, 500) that if intrastate rates were put on a compensatory basis, that they would be prohibitive, and further, that it is impossible to have any State regulations, in view of his opinion, as to the cost of intrastate traffic. He says that for commercial reasons the railroads would not adopt a tariff that would be prohibitive, but that State regulations could not get a tariff high enough to be compensatory, therefore there could be no State regulations of intrastate rates. Mr. Doddridge is evidently right if his revenue theory is true. The higher the State rates are put, the more expenses are apportioned to State expenses, and then add the so-called extra cost of intrastate traffic on to the revenue divisions, then it is impossible for the States to have any regulations of passenger and freight rates which would be proof against an injunction as noncompensatory.

At page 502 he admits that there is no accounting system on the Iron Mountain or any other road, with which he is familiar, that will show the cost of the traffic except in a general way and that the only statistics they have are the ton mile statistics of their entire traffic.

Mr. Frank Nay, the comptroller of the Chicago, Rock Island & Pacific Railroad, was the only other witness the railroads presented who developed the theoretical side of the revenue basis.

Mr. Nay has given the most logical evidence of any of the railroad witnesses.

Mr. Nay, beginning at record page 630, gave a carefully-prepared essay which he read into the record. His testimony can not be summarized, and all material parts are copied in full:

"Practically all trains carry both intrastate and interstate traffic at the same time; a very large number of passenger cars and of freight cars carrying less than carload freight carry both intrastate and interstate traffic in the same car; both classes of traffic move over the same rails, roadbed, bridges, etc.; both classes of traffic are super-

vised by the same officers and employees; the accounting work is performed, for both classes of traffic, by clerks without reference to the time expended on either class.

"It is a fact that the two classes of traffic are handled simultaneously through all the various departments of railroad service in such a way that an accurate division of the operating expenses between intrastate and interstate traffic, is an accounting proposition which has never been solved, and probably never will be solved.

"In very rare cases, such as suburban traffic, lying wholly within one State, where separate tracks, equipment, etc., are used for such suburban service, a part of the expenses can be definitely assigned to such intrastate passenger traffic. Certain small railroads situated wholly within one State may be able to assign certain expenses to intrastate freight traffic, but as a general proposition, it is an absolute impossibility to make any definite and accurate assignment of the operating expenses of railways to intrastate traffic. Therefore, when for any reason it is desirable or necessary to approximate the operating expenses for intrastate traffic, some basis for such approximation must be selected."

Then he takes up the fact that the revenue may be accurately determined, the number of tons may be accurately determined, the number of passengers handled, and so forth.

Then he says that it is necessary to find some basis by which to apportion the expense side. He says:

> "In determining which one of the three factors, or bases, should be used the one should be selected which will more nearly represent the service performed, bearing in mind all the time that which is being attempted is the segregation of the total operating expenses of every character of freight and passenger traffic into two classes—intrastate and interstate; that the total amount expended is not increased or decreased, but the aim is to arrive at the best estimate of the proportion of operating expenses to be assigned to the class of traffic under consideration."

"First, with reference to passenger traffic: The passengers, the passengers' one mile, and passenger revenue, can be definitely ascertained for intrastate and interstate traffic separately, and the proportion of each one of these three factors, which is intrastate or interstate, may be positively known."

First taking the passengers; using the number of passengers as the basis, would assume that the cost of transporting a passenger five miles would be the same as the cost of transporting a passenger 500 miles, which is an absurdity, and hence that basis is discarded immediately and search made for something better.

Next, taking the passengers one mile; that factor measures the number of passengers and the distance, so that using that basis assumes that the cost of transporting a passenger 500 miles, is 100 times as much as the cost of transporting a passenger five miles,

which is obviously more nearly the fact than to assume that it cost the same to transport a passenger 500 miles as to transport him five miles. However, the cost of running a train is not greatly increased by doubling the number of passengers therein; as, for example, it would cost but little more to haul one hundred passengers a given distance, than to haul 50 passengers the same distance. Hence, it has been the custom of railroads for a great many years to make excursion rates, in order to produce train loads of passengers instead of having the cars partly filled; while the excursion rates are at a low average rate per passenger per mile compared with the maximum rates the remuneration to the railroad company is greater with such low average rates because the cars are filled, thus producing a higher average revenue per train mile and causing only a slight additional cost for hauling a train with all the cars filled over the cost of hauling one with the cars practically empty. Where the traffic is regularly heavy, the rates are frequently lower than where the traffic is light; as, for example, the average suburban service of the various railroads conducting such service into the city of Chicago, is handled at less than 1 cent per mile, because of the density of the traffic. Therefore, we find that the passenger mile basis is faulty and that the passenger revenue will more nearly correspond to the expenses of the service. If the revenue per passenger per mile was uniform in all cases, the passengers one mile basis would be as good a basis as the passenger revenue in approximating the division of the operating expenses between intrastate and interstate, but since the passenger revenue recognizes certain conditions herein explained which are ignored by the passengers one mile, the best basis known at this time for approximating the operating expenses of intrastate passenger traffic is the passenger revenue basis.

As to freight traffic, first take the tons transported; this basis considers weight only and to use the tons hauled as a basis for dividing the expenses between intrastate and interstate freight traffic, would assume that the cost of hauling a ton 1,000 miles is just 100 times as much as the cost of hauling a ton 10 miles; that the cost of hauling freight in carload lots per ton is the same as the cost of hauling the same kind of freight in less than carload lots; that the cost of hauling a ton of coal is the same as the cost of transporting a ton of showcases; that the cost of hauling a ton of baskets is the same as the cost of hauling a ton of brick; that the cost of hauling a ton of paper boxes is the same as the cost of hauling a ton of canned meats. That the cost of hauling a ton of chicken coops is the same as the cost of hauling a ton of cement in sacks; that the cost of hauling a ton of lantern frames is the same as the cost of hauling a ton of gravel; that the cost of hauling a ton of millinery is the same as the cost of hauling a ton of pig iron; that the cost of hauling freight in full train loads where the engine is loaded to its maximum capacity, is the same per ton as the cost of hauling freight in trains where the

traffic is light and moves in short trains where the engine is not loaded to nearly half of its capacity. The ton basis is very faulty, and is immediately discarded for something better.

Next, taking up the ton mile basis; this basis modifies one fault of the ton basis because it takes into consideration both the weight and the distance, but it assumes that the cost of hauling a ton 1,000 miles is exactly 100 times the cost of hauling a ton ten miles; it is manifest that such is not the case, because there are terminal expenses in connection with every shipment, and the longer the distance carried, the less per mile is the cost of terminal service. Other factors exist which operate to make the cost per mile less on any shipment when the length of haul is increased. This fact is recognized by all rate-making bodies, including the various State railroad commissions which make rates; that is to say, none of the commissions, nor any other reputable rate-making bodies, make the rate for 300 miles 30 times that for ten miles. Such rate-making bodies recognize the fact that the cost per mile decreases as the length of the haul increases, and the rates are made accordingly; therefore, even if we had only the two conditions, weight and distance, to measure, the ton mile basis would be faulty for the reason that it assumes that the cost increases in exact proportion to the increase in the length of the haul and the increase in the weight; then again, the ton mile basis has all of the objections to the ton basis, with the exception of the one which is modified by taking into consideration the distance; but, as has been stated, the cost does not increase in exact proportion to the increase in the distance; for these reasons, a basis is sought which will give more satisfactory results than either the ton basis or the ton mile basis.

The only basis left is the revenue basis.

As has heretofore been stated, the revenue basis assumes that the cost of the service increases when the haul increases but not in proportion to the length of the haul; thus, the rate on a given shipment for a haul of 50 miles is not ten times the rate for a haul of five miles, because it is universally recognized that the cost of a haul of 50 miles is not ten times the cost of the haul for five miles. The rates for distances are graduated, and, while they are increased for greater distances, the increase in the rate is not in proportion to the distance; hence the revenue basis takes into consideration the fact that the cost of the service does not increase in proportion to the length of haul, which is ignored by the ton mile basis; in fact, the ton mile basis assumes positively that the cost of transportation does increase in exact proportion to the increase in the length of the haul. Then again, the rate for carloads is less than the rate for less than carload freight, thus recognizing that the cost of transporting less than carload freight is greater than the cost of transporting carload freight. Likewise, the rate on coal is less than the rate on fruit and vegetables or live stock, because it is recognized that the

cost of transporting fruit and vegetables or live stock is greater than the cost of transporting coal, and so on, the various illustrations heretofore given about baskets and brick, millinery and pig iron and so on, could be mentioned as illustrating the fallacy of the ton mile basis; or, rather, the superiority of the revenue basis over the ton mile basis. In portions of the country where the traffic is very great and is moved in full train loads, the rates are usually made lower per ton mile than in portions of the country where the traffic is very light and moves in short trains, with only a few cars in a train. The ton basis, or ton mile basis, would assume that the cost of transporting freight which required the use of special equipment, such as refrigerator cars, stock cars, etc., was the same as for transporting ordinary dead freight, not requiring the use of any special equipment, but the rates for such freight requiring special equipment are usually higher than those for ordinary dead freight not requiring special facilities and equipment, and therefore the revenue basis recognizes the cost of transporting such freight requiring special equipment, is greater than the cost of other freight which does not require such special equipment and facilities.

A large number of other conditions which are considered in the rate used in arriving at the revenue might be mentioned, and thus show the superiority of the revenue basis over either the ton or ton mile basis. It is not claimed that the rates are made on the actual cost of service, but that the cost is consciously or unconsciously given consideration in making rates, and that any rate schedule made by a reputable rate-making body will give evidence of the fact that the cost of transporting different kinds of freight is given consideration in making the rates.

An argument is sometimes used to the effect that using the revenue basis is like traveling in a circle, and those who take that position claim that when the revenue of intrastate traffic is doubled, the operating expenses are also doubled, and the end is just the same as in the beginning. The following illustrations will demonstrate the fallancy of that argument:"

Then he gives an example of its operation when the rates of intrastate traffic are increased and the interstate is not, and the expenses are stationary. It is, excepting the figures used to illustrate his point, exactly the calculation made by Mr. Kimbell, at the request of the State, exhibit 23, heretofore set out. (R. p. 635.)

Mr. Nay concludes as follows:

"While it is recognized that it is impossible to accurately divide the operating expenses for freight traffic between intrastate and interstate traffic, it is believed that the revenue basis is preferable to either of the other two available bases, and that an approximation of the operating expenses of intrastate freight traffic, or interstate freight trains, based on the revenue derived from such traffic as compared with the revenue derived from both kinds of traffic, more nearly approximates

the facts than by the use of either the ton or ton mile basis, which are the only other two bases available.

After making the basis approximation of the operating expenses for intrastate freight or passenger traffic, the figures thus arrived at may be increased in the proper proportion to represent the excess of of the cost of transporting intrastate traffic over the cost of transporting interstate traffic.

Q. You mean by that you make your computations on a straight revenue theory and then add to your State traffic such proportion as you think the State traffic should bear?

A. Yes, sir."

Special attention is asked of the testimony of Mr. Nay, given on cross examination.

Q. Mr. Nay, as I understand the substance of your testimony, it is you prefer as more nearly accurate the revenue theory than the other two theories you mentioned in your testimony?

A. Yes, sir.

Q. You do not mean to state that the revenue theory would bring exact results, do you?

A. No, sir; I think I stated in the opening that to bring an exact division between State and interstate expenses was an accounting impossibility, that we had not yet found a solution of.

Q. Necessarily, the revenue basis is dependent upon how nearly the rate is based upon the cost of the service, isn't it?

A. Yes, sir.

Q. If the rate does not reflect the cost of the service, then this as a basis for ascertaining the respective expenses, intrastate and interstate, would not be of value?

A. If that was true. If the rate did not reflect at all the cost of service, it, of course, would be of no value.

Q. Its value is entirely dependent upon how nearly the rate reflects the cost of service?

A. Yes, sir.

Q. Have you had any experience in rate-making?

A. No, sir.

Q. That is outside of your experience in railroad matters?

A. Yes, sir.

Q. Your knowledge upon that is largely theoretical, I assume?

A. Well, it is based on the knowledge of classifications and tariffs that have been prepared by other people.

Q. That is what I mean. It is not first-hand knowledge?

A. No, sir.

Q. It is knowledge that has come to you from your experience in the auditing department of railroads, and so far as you are concerned is theoretical; isn't that true?

A. You mean the knowledge of?

Q. Of rate-making?

A. Yes, sir; of rate-making. (R. pp. 654-5.)

* * * * * * * * *

Q. That is on the assumption that there is a relation between the lowering or raising of State rates to the interstate. If that proper proportion were not kept between them, then the value of the revenue basis would be destroyed, wouldn't it?

A. No, sir; it might be somewhat impaired, but certainly not destroyed.

Q. It would be very considerably impaired, wouldn't it, Mr. Nay, if both rates were changed and no change in the rate proportion to each other?

A. Well, not necessarily. It might have been they were not in proper proportions in the first place. That, of course, involves the making of rates.

Q. Of course, you would have to assume at some time a proper proportion between them?

A. But the assumption is, as stated in my direct examination, that the rate-making bodies, while they do not take the cost of service as an exact basis, yet every schedule of rates they produce will give evidence on its face, practically every schedule, that the cost of the service is considered. (R. pp. 658.)

* * * * * * * * *

Q. The fact that I asked you in particular was, if the facts existed that way, will the revenue basis be a proper measure of relation between State and interstate rates?

A. Well, for the revenue basis to be the proper measure excluding in this consideration the addition of anything for increased cost, the State rates should be enough higher than the interstate rates to balance that excess of cost which operating men say exists in connection with State business over interstate business, and if the State rates were not sufficient to produce that revenue, the State basis would be faulty to that extent. And if they were too high and so much higher than interstate rates, of course it would be faulty the other way.

Q. The point of that testimony to which I have just called your attention, is this: There was not a proper relation between State and interstate rates during the period we have under inquiry (that is 1907) and if that is true then the revenue basis would not be a proper factor with which to apportion the expenses, would it?

A. Well, it would not be an accurate factor, but being, in my judgment, the best that is known, it would be the proper one. I think in the first question you have the word "accurate;" it is not an accurate factor.

Q. It will fluctuate according to the fluctuation between State and interstate rates?

A. Yes, sir.

Q. And it will, of course, be inaccurate to the extent that the proper relation does not exist between State and interstate rates?

A. Yes, sir; I think that is true.

Q. And when the rate does not represent the cost of the service, it would not be of any value at all, would it?

A. Well, if there was such a rate, no sir; it would not be. If there was any such rate that did not represent the cost of service at all.

Q. Now, Mr. Nay, does not the rate presuppose it covers the cost of service and a profit also?

A. Surely, I would think it would. As I say, I am not a rate-maker, but it would seem that the railroads should have some profit or return upon their investment.

Q. There should be two factors in that rate; one, the cost of the service; and the other, the profit to the railroad company in performing the service?

A. If I were making rates, I think as a novice, I would use those two factors. I suppose there are others. There are commercial conditions which necessarily govern; and of course, the density of traffic which reduces the cost of the service.

Q. That just goes to the cost of the service in that particular country, I should take it?

A. Yes, sir.

Q. Then it depends upon how much profit or how little profit the railroad company puts into its rate, as well as those other matters, in order to use the basis as a factor to determine the expenses; isn't that true?

A. I should not think the profit would make any difference, Judge Hill. That is, as to the relation between the different kinds of rates. Because I should assume that where a profit was made and my opinion is probably not worth much on that point, but I would assume it to be distributed pretty evenly over all the rates. (R. pp. 659, 660.)

Not only the cost of the service, but the profit of the railroad must find reflection in this rate. And Mr. Nay further assumes that the profit is evenly distributed over all these rates, State and interstate.

Mr. Nay made another explanation, to which attention is called:

Many of the witnesses for the railroad, patricularly the traffic men, were continually referring to the *"relation"* between State and interstate rates, and none of them could locate that mythical being. Mr. Flippen and Mr. Watson made desperate efforts to locate it, and so far as their testimony is concerned, it is a trade relation, an adjustment between trade centers, or something of that kind. Of course, such relations between State and interstate rates when taken to measure the expenses, is nonsense. These traffic men, like Mr. Flippen and Mr. Watson, are out of their domain when they were speaking of these relations in the sense of an accounting proposition—what they had in mind, as shown by their testimony, is the relation of

rates between St. Louis and Memphis and New Orleans and the Atlantic seaboard. Those trade relations and balances; these differentials that exist, 30 cents from St. Louis over Memphis; and 20 cents from Chicago over St. Louis; and all these various differentials that adjust the relations between the various trade centers for commercial and competitive reasons. Those are the relations that the traffic men have in mind. They are the relations they know about. Those are the relations they are talking about.

Mr. Nay is a man of great accounting experience, and he recognized those facts at once.

"Q. If there is a larger profit in the intrastate rate than in the interstate rate, owing to competition that largely controls the interstate rates, wouldn't that fact, the difference in the profit on the two rates make it unfair to use the revenue, intrastate and interstate to measure the expenses of operation with?

A. Of course, in the first place it would depend on what basis was used in determining the profit was larger in one case than in the other. But if that could be absolutely determined beyond any question of a doubt, which is an impossibility, I think, then, of course, the revenue basis would be faulty to the extent that difference existed. Going back to the same statement again, that the revenue basis is not a perfect basis, but is the best known basis at this time.

Q. It seems to have several faults, doesn't it, Mr. Nay?

A. These faults are really the same fault under different names, I think.

Q. Not under different names, but under different circumstances; isn't that more clearly the case than under different names?

A. My idea in making the statement that they seem to be the same fault was that the two rates, intrastate and interstate, seem to be out of proportion to each other, and that is what produced this unfairness that is spoken of. If they were in exact proportion all the time, the revenue basis would be a perfect basis.

Q. And if it represented the cost of the service? You would have to have that also?

A. I presume if they were in proper relation to each other they would represent the relative cost of the service. When I say "in proper relation to each other" I mean in reference to the cost of the service.

Q. Some of those traffic men use that term in an entirely different sense. I think your use of it is correct, but you will see from the testimony the others use it as having a proper adjustment to the commercial conditions. A just rate of one trade center with another trade center. That is the reason I was particular in calling your attention to it. You mean by it a proper relation of the cost of the service; isn't that right?

A. That is what I had in mind.

Q. That is what you had in mind in your testimony generally, I assume?

A. The proper relation?
Q. The proper relation of cost, you mean?
A. Yes, sir; the proper relation in regard to the cost. (R. pp. 667, 668.)

The foregoing is a complete summary of all the material evidence of the plaintiffs to support the revenue theory.

While we have interspersed it with our comments, yet we have endeavored to set forth fairly the position of each witness in his own language.

## (1) THEORETICAL SIDE OF THE REVENUE BASIS.

*The State's Evidence.*

On this opinion side of the proposition, the State introduced H. C. Whitehead, W. E. Fitzgerald, Henry Wilmering, R. D. Parker, C. B. Bee, Charles S. Ludlam, C. W. Hillman, T. A. Hamilton and T. F. Wharton. Mr. Whitehead is a public accountant and auditor practicing his profession in Chicago. He had thirty-five years in railway service, beginning as office boy and ending as General Auditor of the Santa Fe Railroad, which position he held for nine years, and was then consulting auditor for two years, his active railroad service ending in 1907. He was connected from the beginning with the American Association of Railroad Accounting Officers and was its president.

There is no witness presented by the railroads who has had an experience which would better qualify him to speak on this question than Mr. Whitehead.

The plaintiffs have put forward Mr. Nay as having a great accounting experience. Here is a gentleman who had exactly the same experience and held a similar position on the Santa Fe Railroad as Mr. Nay's on the Rock Island.

He says the method pursued by the railroads for dividing State and interstate expense is in his judgment not a sound basis. "That basis is not sound," he says, "where you attempt to divide the expenses as a whole, or a portion of them on that basis. My personal reasons for my view are, that in the case of a trader in merchandise—he would, if he followed that line of argument or reasoning—determine his cost on the basis of his sales of his product; and it further implies the assumption that the end and aim of the railroad enterprise is gross earnings and not net earnings, as I look at it." (R. p. 1077, 1078.)

Mr. W. E. Fitzgerald, at present Auditor and Expert Accountant of the Railroad Commission of the State of Texas, is the next witness to whose testimony your attention is invited. Mr. Fitzgerald had 24 years' experience in railroad service, before he became Auditor and Expert Accountant of the Railroad Commission of Texas, as voucher clerk, general bookkeeper, chief clerk and various other

accounting positions in the accounting department of different railroads. Since becoming an official of the Commission, his work and study has led him into broader fields which caused him to investigate the questions involved in this litigation. He is familiar with the various bases of division of railroad expenses, such as a ton mile, train mile, car mile, etc. He was asked his opinion of the revenue basis as a method of ascertaining the expenses of State and interstate traffic. He says that it appears to him to be an exceedingly erroneous basis, in view of the fact that the operating expenses of a railroad bear little relation to its income or revenue derived from traffic, for these reasons: First, the preponderance of expenditures being apportioned as a whole on a basis irrespective of revenue coming in, makes the expenses largely independent of the amount of traffic, the constant expenses being considered as an average, we will say of 60 per cent. Second, it is a well known fact that the actual cost of service is more often disregarded in arriving at rates, the same being based frequently on other conditions, such as competition or commercial conditions, industrial developments, etc., without any consideration to the distance of the haul. In his opinion the revenue theory would not be a fair basis under these conditions. (R. p. 1081.)

On re-direct examination Mr. Fitzgerald said that since he had been at work with the Commission, they have had under consideration methods of dividing expenses between State and interstate traffic. It was a live question before his Commission and one to which he had given study and thought. The conclusion which he and others connected with the work have reached is, to start with obtaining a unit of revenue on each class or commodity. The Commission has required reports to that end, the intention being not to make any changes in connection with the expenses, until they are better satisfied as to a plan that might come nearer bringing an approximate result. In other words, they are trying to find out from the railroads the cost and the revenue on given commodities, both local, intrastate and interstate. (Rec. p. 1105.)

Mr. R. D. Parker, a civil engineer by profession and expert engineer of the Railroad Commission of Texas, is the next witness to whose testimony attention is invited (R. p. 1161). Mr. Parker is an educated engineer, with much experience in the practical operation of railroads, before he became connected with the Commission. His testimony is largely upon the technical questions, filling in some of the technical sides of the State's system of separating State and interstate business. Attention will be called in another connection to the force of his testimony along those lines.

After explaining the use of the various bases which were adopted by the State's accountant and approving them in their effort to properly allocate State and interstate expenses—he was speaking more particularly of maintenance-of-way, as that had been the line of his work chiefly before he went to the Commission, he having

been in charge of some division of the Southern Pacific Railway, in charge of maintenance-of-way; Mr. Parker was asked whether in his opinion, based upon his experience in the study of these problems, if the expenses of State and interstate business could properly be divided on the basis of revenue derived from each class of their business, and whether such divisions would fairly reflect the cost of operation, as he has observed the cost of operation in his practical experience. He says that it would not be a proper basis; that he can have no conception of a division on the revenue basis of reflecting in any manner the way in which the service accrued. In the first place, the idea of expense carries with it the cost of it and the basis should be on the cost, not on the profit that accrued from the business; and any manufacturing establishment predicates the price of their commodity on the cost basis, plus a reasonable profit. The railroad company has transportation to sell. While he doesn't say the cost of the service controls the making of the rates, yet there are a great many items that enter into it and he does not believe from his practical experience in the operation of railroads and the expenses incurred thereon, that the revenue properly reflects a division of these expenses between State and interstate traffic. (R. p. 1167.)

Mr. Henry Wilmering is Auditor of Accounts and Statistics of the Corporation Commission of Oklahoma. He had various positions in the railroad service prior to his engagement by the Oklahoma Commission, which are set forth in his testimony, beginning at page R. p. 858. He had been with the Corporation Commission of Oklahoma for several years, and has made a study of the accounting system put in force by the Interstate Commerce Commission, and has given much time and thought to railroad accounting, and the distribution of railroad costs. He has heard the testimony of eminent railroad accounting officials, and attended the conventions of Railroad Accountants. He has read the works of Professor Adams, of the Interstate Commerce Commission, and has endeavored in every way to get all the light possible on these problems. He was asked as to the value of the revenue theory of dividing property in the State between State and interstate traffic, and said it is not a fair basis and that the property assignable to any character of business should be obtained on a cost basis. If the rate is increased or decreased the value of the property will be correspondingly increased or decreased on the same volume of business, and will be put up or down according to the rate, and is therefore too elastic. There should be some fixed basis that would in some way assign the property to some particular class of traffic that would be more rigid than the revenue. He was given the rate of increase in the State and interstate revenue per ton mile as shown in the exhibit, after the injunctions were obtained and the railroads made both intrastate and interstate rates; and he said it illustrated the objection he urged to the

revenue theory as throwing an extra burden on the State traffic without, in fact, there being any increase in the property devoted to State uses. (R. pp. 860-862.) He thinks property should be divided on the expense basis, as it is obvious that the expense would remain the same whether the rate was increased or decreased, and it is a more rigid way of ascertaining the value of property not subject to the ups and downs of rates. Then he was asked as to his opinion as to dividing the expense between State and interstate on the revenue derived from each class respectively: He said he had worked out the formula in numerous ways and applied it to the railroads operating in Oklahoma, and found always, owing to the higher rate of charge for State business, it showed unreal profits for interstate business, and the extra cost theory, in addition to the revenue basis shows there would not be any rate made by the State authority that could not be declared confiscatory.

He says he believes that the formulas were invented for litigation purposes only. (R. p. 862.) Mr. Doddridge stated substantially the same thing. (R. p. 481.)

Mr. Wilmering then goes on to say that in a general way he is familiar with the rates in effect in the Southwestern country, and said, as a general proposition, they are not made on the cost of service and they are largely made on tradition and primarily made by the traveling freight agent or contracting agent after feeling the pulse of the business around the territory occupied by his company, and they make the rates irrespective of cost of service, to get the business. He heard many eminent railroad traffic officials testify on this subject, but never heard one state positively that he had any regard for the cost of service in making rates. The railroads have no cost accounting system by which they could ascertain the cost of handling any given traffic. The only statistics they have is the aggregate cost per ton per mile of the entire system of all business, without any differentiation of the particular commodity. (R. pp. 862, 863.) He knows of many rates prevailing in this section of the country that are made upon the zone or blanket-rate, and that is one of his reasons for stating that the rates are made irrespective of cost. He explains the lumber zone rates (R. pp. 863-4) as affecting Oklahoma. As they are explained more fully as affecting Arkansas in another connection, his testimony will not be followed on this point. He shows there is a wide difference in the revenue received from rates for the same service by the railroad from these zone or blanket rates. The grain rate is a similar one. There is a difference in the grain rate on grain moved into Oklahoma from five miles per ton to 20 mills per ton per mile, and there is a large volume of traffic moving under these varying rates into Oklahoma. The same thing is true of rates on crude oil and petroleum and its products from the Kansas refineries to the Gulf and the same conditions prevail on coal. He found in

investigating tariffs that there are more than 10,000 rates in existence that are lower per ton per mile from mines in Indiana and Illinois to points in Dakota, Minnesota and other States, than any rates ever made by the Corporation Commission of Oklahoma or the Railroad Commission of Arkansas. (R. p. 865.)

He takes up the Texas common point rates. These are explained by other witnesses as affecting Arkansas, and it is not necessary to follow them with Mr. Wilmering. (R. pp. 865-874.)

He says that in his State there is a very short haul. And the rate per ton per mile for interstate business through the State is very thin, which results in assigning to the Sate, on account of this high intrastate revenue per ton per mile, a large volume of expenses; and that this traffic passing through Arkansas or Oklahoma, being long haul traffic, where the rate is "thin"—as the traffic men express it—they take out of that a mileage proportion for Arkansas or for Oklahoma, as the case may be, and use a very low interstate rate with which to measure the interstate expenses. And the lower your rate the lower your expenses, under this revenue theory; and the higher the rate the higher the expenses.

So by taking these long hauls on this Texas common point traffic (and it is a large traffic), and the same is true about the lumber traffic, it is a long haul, and the rate is exceedingly thin per ton per mile, and that is divided between Arkansas and the balance of the system on the milage in Arkansas, thereby assign to the interstate traffic a thin share of expenses.

As Mr. Wilmering puts it, at page 866, this assigns unreal expenses to the State—and that is a very happy expression of his—"unreal expenses." He says all of this is true without any regard to the question of the extra cost of 100 per cent or any other percentage to be added to it.

Mr. T. F. Wharton, a member of the firm of Haskins & Sells, certified public accountants, is the next witness for the State. His testimony begins at page 1000. Mr. Wharton is the only witness who has had no practical railroad experience, but he has had a very wide experience in installing cost accounting systems in various branches of business, and various industries, some of them of gigantic proportions, where the factory owner or plant, of whatever nature, wants to put in a system and does put in a system which allocates all the expenses, so they will know what it costs them to manufacture each article.

That is done in a scientific manner and they can find out to a nicety the cost of any product, by putting in a scientific and accurate accounting system.

Mr. Wharton's life has been devoted to that work.

Except in this and the Missouri case he has given no thought to railroad work. But he applies the same principles and says they should be applied the same as to any other great industry in the

country. He states that they do by various systems allocate the expenses of the various departments of any business so they can intelligently and scientifically make out what each article costs.

Mr. Wharton first discusses division of property on the revenue basis, and says he does not see any relation between the revenue of each class of traffic with the property sought to be assigned to either class. His opinion is that the cost basis would be a more correct basis, owing to the fact that the cost would take into consideration the elements of extra use of the property required, if any extra property is required in the service performed, and that would better measure the property required; and, furthermore, it would not be subject to fluctuation, except the fluctuation of expense, and not to the fluctuation of revenue.

In regard to the revenue as a basis for dividing expenses, he says it is no basis of division at all. (R. p. 1013.)

The next witness is Mr. Charles S. Ludlam. His testimony begins at page 1309.

He is one of the partners of the firm of Haskins & Sells, and lives in New York.

He gives an interesting account of the firm of Haskins & Sells. Then he takes up his own career and gives his experience in railroad work. He was an auditor and accounting officer for several railroads and for some land and mining companies before he became a public accountant.

Since he has been a public accountant his firm has had the auditing and supervision of the audit of a great many of the largest railroads in the United States.

This railroad audit work is in charge of Mr. Ludlam, for his firm.

He says as accountant he does not feel himself at liberty to give the names of any of his clients for whom he has worked, except where the companies publish the certificates of the audits made by his firm.

Mr. Ludlam gives in his testimony the names of some of the companies who publish their certificates of audit. Among them are the Louisville & Nashville, the Lehigh Valley, the Atlantic Coast Line, the Philadelphia & Reading, the Erie, the Mobile & Ohio, and the Carolina & Northwestern.

When such large railoads as these publish the audit of Mr. Ludlam and his firm, there can not be any question of his ability to discuss railroad accounts.

He was one of the accountants attending to the State's side of the Missouri rate litigation also, and, of course, has necessarily had to give a great deal of investigation to this very problem before us.

He takes up the testimony of the railroads, particularly that of Mr. Nay, and calls attention very sharply to this proposition:

Mr. Nay says after you get your division of cost then you have to add something to it to make it of any value, viz., the extra cost of intrastate traffic.

Mr. Ludlam is one of those positive men, and probably his emphasis gave some offense to Mr. Nay. He spoke of Mr. Nay's testimony as being like building up a "snow man," and in Mr. Nay's testimony in rebuttal he resents his argument being described as being like a "snow man" built up and then knocked down.

He said another trouble about it was that after you got your basis it was not a basis; you could hardly find any two men who would agree as to just what you would have to add to it after you got it.

He said in the Missouri case the variation was much wider than it was in this case, and some one started out in the Missouri case with the statement that it was 15 times State over interstate—probably it was Mr. Sturgis of the Burlington.

Mr. Ludlam analyzes the revenue theory thoroughly, and an excerpt of his testimony can present it better than a summary of it:

*Ludlam's Analysis of Revenue Theory.*

"A. It is absolutely contrary to all accounting principles and practices. I have never heard the revenue theory advanced for a basis of determining the expense, except in the Missouri case and in the State of Arkansas case.

Q. In what way does it run counter to accepted accounting principles?. A. I would say both the manufacturing, wholesaling and retailing and railroad business, on the ground that the ratio of profit is not the same on all transactions and necessarily can not be.

Q. When you go to ascertain the value of the property, what significance do you attach to the gross earnings of the property?

A. Given the gross earnings by themselves, they would mean nothing. I might illustrate that by saying that if an investor was thinking of buying a factory it would mean nothing at all to him to know that the gross earnings of that factory were a million dollars a year. He would have to know what the expenses and net earnings were. He would probably base his ideas of value upon the net earning capacity of the property.

If a man was going to buy a sugar factory, we will say, and an automobile factory, and he knew that the gross earnings of each was one million dollars, and that the combined operating expenses of the two, we will say, 75 per cent of the earnings, it would never occur to him to buy the sugar factory or the automobile plant on the basis of the expenses being the same as the ratio of expenses of the two together. He would find out as positively and definitely as it could be ascertained, on the actual facts, what the actual expenses and the gross earnings of the particular factory he was thinking of buying were.

You asked me about the relation of gross earnings. A plant might be earning a million dollars gross, and still be losing money; whereas another plant might be earning a million dollars and earning a large per cent of profit. Consequently, unless you considered the expense

and the resulting net earnings, the gross earnings mean nothing in themselves.

Q. Yet the railroads have used gross earnings in this case to determine the relative expense of State and interstate business?

A. Yes, and I think it is illogical, unsound and contrary to all accounting principles, and I think Mr. Nay, in his last paragraph, illustrates that more forcibly than anything I could say. It looks to me as though he had built up in several pages of essay an elaborate—you might call it a snow man—only to knock it down in the last three or four lines; because he proceeds to say after you have thus determined your costs, they are not your costs, but you must find out what they are.

Q. I believe he also stated, if I remember it correctly, that unless there was a proper relation between the State and interstate rates—and by relation he meant relation of cost one to the other—that the revenue theory of dividing expenses would have no value.

I think that is the substance of his statement on that.

Assuming that to be correct, what are you going to do with the extra cost that you have to put on it after you get it bottomed on the theory that there is a cost relation between the two to start with?

A. You will have to ask somebody besides an accountant, I think, to find that out.

Q. Have you given study and investigation to the subject of whether there is a relation, cost relation, I mean, between the revenue derived from State traffic and the revenue derived from interstate traffic?

A. Yes, sir.

Q. What have you found in that regard?

A. As a result of my study, I am of the opinion that there is no relation; not only between State and interstate, but between the different rates in interstate and State.

Q. What do you base that on, Mr. Ludlam?

A. The examination I have made of the rates in the State of Missouri and the State of Arkansas, in a general way, and also the exhibits which have been filed in this case.

Q. Do you understand from your investigations, the system upon which interstate rates are built?

A. In the sense that they are made largely on competitive and commercial conditions; I would not say as to any individual rate.

Q. I am not speaking of individual rates.

A. I know in a general sense, for instance, that rates from St. Louis to New Orleans are cheaper than from St. Louis to Little Rock, which illustrates the point I am trying to make.

Q. Are you also familiar with the varying distances on which large movements are carired on the same rate? You have looked into those propositions, I presume?

A. Yes, sir; in a general sense. Divisions that are made on tap line connections; things of that kind.

Q. Mr. McPherson says in his testimony (R. p. 320):

"My reasons for this opinion are that the revenues of the railway are derived from different sources; the transportation of passengers and freight, and from miscellaneous services rendered, rentals, etc.

"A division of these earnings can be exactly ascertained, and, naturally, they reflect the value to the railway of each class of the service it performs."

Then he follows:

"The passenger and freight revenue consist of both intrastate and interstate traffic; the revenue from each of which can also be exactly ascertained. Moreover, the 'revenue basis' is reflective of the efforts of the traffic men who make the rates, to consider, in a measure, the value and character of commodities, and the risk and distance attached to their transportation. This is apparent in the classification of commodities into classes and the different rates established for their carriage.

"The revenue derived represents the well-established and generally recognized elements considered in fixing rates of the railway for the service it performs."

Then he takes up some illustrations. Now, I ask you to state what is your view of that analysis of the situation by Mr. McPherson?

A. Assuming that Mr. McPherson refers to the gross earnings, I disagree with him, because the value to the railroad of the business which it does is the net earnings which it derives therefrom, and not the gross earnings which it receives therefor.

Q. That is true whether you take it as referring to passenger and freight; State or interstate; miscellaneous, or what not?

A. Yes, sir. Naturally the value of the business is what it will earn, not what it will earn gross, but what it will earn net. It would not profit a railroad to take a million dollars' worth of business if it cost them a million and a half dollars to execute it.

Q. I call your attention also to the fact that in this case the railroads divide their property which is in the State of Arkansas, between State traffic and interstate traffic, in proportion to the gross earnings of each, after setting aside the miscellaneous.

I will ask you what your view is of that division?

A. I think that division is wrong, on account of the fact that the gross earnings, which fluctuate with every change in rate, are not, in my opinion, a fair basis to divide the property. I think you have a more equitable division if you will apportion your property on the basis of the cost.

In my judgment, the cost would represent more correctly the use made of the property by the different classes of business.

Q. Suppose there was an increase in State rates, without any exact proportional increase in the interstate rates: What effect would that have on a division of the property or a division of the expenses?

A. The amount which the State rates were increased in excess of the interstate rates would, on the basis of apportioning the property on the gross earnings, naturally increase the property assignable to the State business.

Q. Have you seen the exhibits worked out here by which it is shown that there was an increase of nine and a fraction per cent on interstate rates, and an increase of ninety-six and a fraction per cent on State rates, put in by Mr. Kimbell?

(This was for month of January, 1909, when the railroads had a free hand and made both State and interstate rates.)

A. Yes, sir; that increase appearing during the month of January.

Q. Yes. These figures, as I understand it, represent the increase of revenue per ton mile.

That is necessarily, is it not, a result of fluctuation in gross revenue, that every time there is a change of rate, either State or interstate, as the case may be, producing a change of revenue, that there will be a change in the amount of property apportioned to the respective class and a change in the amount of expense apportioned to the respective class, when in fact there is no change?

A. Yes, sir. Apportioning the property, expenses or anything else on the revenue basis would naturally mean that if you carried a piano one day at one price, over a certain part of the road, and a month afterwards you carried another piano of the same kind over the same piece of property and charged twice as much for carrying it; that your cost was twice as much and the proportional use of your property was twice as much in the latter case as in the former.

Q. If that piano happened to move in State business and the rate was double, it would to that extent increase the State property and State expenses?

A. Yes, sir; when figured on the gross revenue basis.

Q. If it happened to move across a State line and the rate was doubled or trebled, it would to that extent decrease the amount of interstate property and interstate expenses, and as a matter of fact there is no increase or decrease, as the case may be, in either, by reason of the change of the rate on that piano?

A. There would be no change in the cost or use of the property on account of the rate changing.

Q. Suppose they increased the piano rate 9 per cent in interstate traffic and 96 per cent in State traffic; where would you be then?

A. I think you would be just where you started, on a false premise, on the revenue basis.

Mr. McPherson says (at page 320, 321):

> "The revenue, therefore, expresses value, character, risk and distance, rather than quantity; and likewise considers to no little extent, the question of cost, as it is obvious that it costs more to transport some commodities, and commodities in small quantities, than it does other commodities, and commodities in larger quantities.

"A consideration, therefore, of cost on the mere basis of quantity, would mean the blending of all classes of freight; a reduction of all classes of freight to a common unit, and the assumption that the cost of their transportation was equal. Also that the length of haul and other conditions affecting the cost were equal or the same.

"For these reasons, in my opinion, the revenue basis is a proper basis on which to apportion the cost, or to divide the cost of operation as between intrastate and interstate traffic."

I wish you would state wherein you think that is based on a wrong premise, if you do think so?

A. He says, if I understand your reading correctly, that they consider—

Q. Look over it, if you did not catch it.

A. (After examining statement)—many other elements rather than quantity. I never heard of a railroad rate that did not consider quantity.

I disagree with Mr. McPherson in this, because I think railroad rates do consider quantity equally with value, risk and distance, and I disagree with him in his premise that the revenue—by "revenue" meaning gross earnings—considers to no little extent the question of cost.

He goes on and it seems to me he contradicts himself, because he says:

"It is obvious that it costs more to transport some commodities, and commodities in small quantities, than it does other commodities, and commodities in larger quantities."

I am unable to understand what he means when he says that they don't consider quantity, and then says that it costs more to transport commodities in small quantities and others in large quantities.

Q. Does the revenue derived from the rates represent the cost of the service, as you find it in your investigations in your railroad experience?

A. No, sir.

Q. Is there any system, to your knowledge, by which a rate-maker can ascertain the cost of service?

A. I don't think the rate-maker, as a rule, has any specific data as to the cost of the service.

He knows in a general way how much it costs per ton per mile to move freight on his railroad—as a general rule he does not have that information by divisions—and he knows in a general way—to use the illustration that has been referred to here frequently, that a carload of baskets won't weigh as much as a car of pig lead, and therefore has some idea of equalizing, that they should charge more per pound for a carload of baskets than they should for a carload of pig lead.

Q. Well, there is a vast difference of expense upon one division of the road than another, I should take it.

A. Yes, sir.

Q. We had evidence here this morning that the difference in the ratings of locomotives on the White River branch of the Iron Mountain and locomotives that were run on the main line of the Iron Mountain:

Q. What effect would that have on the cost of the service?

A. There would be a great difference in the cost of service on different divisions of the line, according to the grades and curvatures.

Q. And the ability of the engine to handle larger or smaller trains, I suppose?

A. Yes, sir.

Q. Suppose there was a lime kiln on the White River branch on the Iron Mountain road and they wanted a lime rate; that lime would move on every other line of the road:

How would the rate man know the cost of the service when he started in to fix that rate?

A. I have never seen any statistics of any railroad company that would show the specific cost by divisions of handling lime or any other specific commodity.

Q. Have you seen the statistics of any of the railroads in operation in this Southwestern country that show the cost per ton per mile in the handling of the various commodities?

A. No, sir.

Q. Has any system been worked up so that a rate man can have the cost per ton per mile on coal, lumber or merchandise, as the case may be?

A. No, sir; not that I know of.

Q. Have you gone pretty fully into railroad accounts in this country and investigated that, so if there were such systems you would have some familiarity with them?

A. Yes, sir.

Q. Then, when these gentlemen speak about the cost of service being reflected in the revenue, I would like to know if you can explain to me what basis they had in mind when they made these statements, if you are able to do it?

A. I think their basis is theory, the same as the revenue basis, and not facts.

Q. I presume the rate-maker has before him, or should have before him, the cost per ton per mile of handling freight upon his entire road for the preceding year:

What value would that be to him in making specific rates?

A. In my judgment, I should say only in a general way. It would give him an idea, roughly, of the average cost of moving freight on his line, and, in a general sense, a figure below which he would try not to go.

Q. That is about as far as they have gone in the statistical work of the railroads in the Southwest, is it not?

A. As far as I know; yes, sir. (R. pp. 1315-1320.)

The next is the testimony of Mr. C. W. Hillman—which begins at page 1479.

Mr. Hillman is now an accountant, president of the Mutual Audit Company, of Louisville, Kentucky. He is 53 years of age. He is an educated man, a college graduate, a graduate in civil engineering. His first railroad work was engineering work on the Cumberland Valley.

Then he determined to go into the operating department of railroad service and went into the office at Carlisle, Pennsylvania. He went in as a mesesnger in order to learn the business of telegraphing. He served in various positions, ticket agent, freight clerk, scales clerk, yard clerk, agent and as assistant dispatcher, stationed at Harrisburg, Pennsylvania. He then went to Chambersburg, Pennsylvania, and was the superintendent's clerk, transferred very shortly to the position of assistant dispatcher at Chambersburg, the headquarters of the road.

He remained there until the fall of 1880, when he resigned and took a position in the treasurer's office of the Northern Pacific Railroad, in New York City. His duties there were that as stock bookkeeper, keeping record of the transfers of the capital stock of the road.

Six months afterwards he was transfer agent of the road and had charge of the transfers of both stocks and bonds.

He worked in various capacities in that office for seven years and was then elected assistant treasurer of the Northern Pacific road, with headquarters in New York City.

In 1891 he was transferred from the New York office to the Chicago office of the Northern Pacific road, that line having then leased the Wisconsin Central and obtained control of the terminals in the city of Chicago, and the express business of the Northern Pacific was placed in his charge.

He served the Northern Pacific until 1893, when it went into the hands of a receiver.

He served the receiver for 18 months and when the control of the road passed into other hands he left there and took the auditorship of the Metropolitan Westside Elevated Railway Company.

He devised a system of accounting for that road and placed it in operation.

The management of the road changed in 1903, and he left the road and went to the Rock Island for a year or a little longer, in the office of the assistant comptroller.

He had special charge in that road of the insurance matters, having been in that line when he was connected with the Northern Pacific.

He left there and went into the public accounting business for himself.

He has represented the Railroad Commissions of Kentucky, North Carolina, Alabama, Florida, Minnesota, Illinois and Ohio.

He has recently been engaged, but has yet not done active work, by the Railroad Commission of Indiana.

He was called into consultation for a short time in the Missouri case, but his work was merely advisory and he did not get into the details of that case.

He has been the accountant handling the Minnesota rate case.

He has, of course, given a great deal of thought, study and investigation to these problems.

He first takes up in the discussion of it the claim that the opposition to the revenue theory is in opposition to court decisions; he says that it has been used in these cases because it has been the only factor presented, and the factor most nearly representing the truth in the given cases, but he says he finds there is no adjudication anywhere that it is of itself a proper factor, and that each case must depend upon its own facts. That he does not consider that in criticising the revenue theory he is criticising any judicial utterance supporting it of itself.

Beginning at page 1482, the first reason which he gives for saying that the revenue basis is unsound is:

> "That in the use of this factor, the earnings equalized the operating expenses; all matters are handled on the same percentages.
>
> "This leads to the second point, that an unjust rate, one which is producing too high an operating revenue, would be enabled to perpetuate itself by having assigned to itself a high operating cost, and the converse of that proposition, which is that a non-remunerative rate, one causing a loss, would also tend to perpetuate itself by having assigned to itself a low operating percentage.
>
> "Also, the contention on the part of the carriers of the inadequacy of a rate, and the contention on the part of the State of the unjustness of a rate, would necessarily in each case be measured by the yardstick that is in dispute, which is the earnings." (R. p. 1482.)

Now, that is exactly the situation here. This evidence is full of criticisms of the State's rates, that they are too low, and not properly adjusted; that they do not bear any proper relation one with the other, or with the interstate fabric; and yet the railroads are using the earnings from that yardstick to measure the cost of doing their business, both State and interstate.

Mr. Hillman says:

> "We can illustrate that, perhaps, by taking the comparison of the roads having a longer mileage than other roads between certain points; that is, a road which is in competition for a large portion of its business with short line competitors. This road

must necessarily spend more money in handling trains because it has a longer haul and, therefore, increase the cost of what you might call 'haulage expenses,' and it also must offer extra inducement in the way of equipment in order to obtain the traffic over its longer road, or it must have more expert traffic men, solicitors who can obtain business for them, even under these adverse conditions, and such men come high and must be paid higher salaries than the average traffic man.

"Yet, under this plan of the gross earnings basis, the relative expenses in these two roads would be measured by the earnings and it alone.

"This is quite forcibly illustrated in the Minneapolis & St. Louis Railroad, which is one of the parties to the rate case in Minnesota.

"This road is in competition with other roads for Chicago business. The route from the Twin Cities to Chicago is over the Minneapolis & St. Louis to Albert Lea; from Albert Lea to Chicago over the Illinois Central.

"In handling the grain business from the West, the Minneapolis & St. Louis, together with other roads, are compelled to grant a mill-in-transit privilege at the various mills along the road, principally those at Minneapolis.

"The result is that on this rate the Minneapolis & St. Louis will take a carload of grain and haul it to Minneapolis at its local rate. If this car is destined to Chicago, or the products of this car, after milling, is destined to Chicago, the road is then compelled to haul this car from Minneapolis to Albert Lea, 113 miles, without receiving any compensation whatever, the entire proportion of that through rate going to the Illinois Central road. Therefore, on the carload of grain passing locally from a point in Minnesota to Minneapolis, the M. & St. L. will collect a full rate.

"On another car going the same way, to Minneapolis, being milled in transit, and then proceeding on its way to Chicago, they will obtain exactly the same rate, plus $2.00 per car for the privilege of milling-in-transit.

"As the expense of milling-in-transit amounts to something, the practical result is that the earnings on a car from the western part of southern Minnesota to Minneapolis, and the earnings on another car from the same point to Minneapolis and thence southward to Albert Lea—a distance of 109 miles—are the same, while the expense of handling must necessarily be larger.

"This condition of affairs is borne out by the analysis of the M. & St. L. accounts and is used by me as an illustration of the unfairness and inadequacy of the earnings basis for a division of the expenses.

"Where this method is used, as it is often used by railway

companies, for the division of expenses, first adding an arbitrary varying from 15 to even 100 per cent as an extra charge, or an extra cost of carrying intrastate freight over interstate freight this inadequacy and unjustness of the earnings method is accentuated.

"The usual method of applying that is to consider that it costs 15 per cent more of the gross earnings to do one class of business than the other, regardless of how those gross earnings may be made up, whether on a ratio of intra, two, and inter, one; or whether that ratio is intra, one and one-fourth and inter, one.

"To the earnings intra, will be added the arbitrary percentage of 15 per cent or more. To that result will be added the entire earnings and a percentage taken of the totals, and that percentage is used in the case of this arbitrary addition of the amount which we assume to be 15 per cent, as the percentage of expenses which should be charged to intrastate.

"This is the method adopted by the Chicago & Northwestern Railway Company in their exhibits, in the case against the State of South Dakota."

Q. Mr. Hillman, you are stating the matter too modestly for the railroads in this case. They charge from 100 to 400 per cent on the freight and 25 to 50 per cent on the passenger, intrastate, extra expenses.

A. I left a little margin. I said, "15 per cent or more."

Q. It is the "more" proposition we are up against here. Did you finish?

A. I finished concerning the expenses. I believe our question, if I recollect it correctly, also asked concerning the apportionment of the property—

Q. Before you go into that, I want to ask you a question on the subject of expense.

Has your attention been called to a claim of a parity or relation between the rates, State and interstate, as affording a means by which the two classes of traffic could be measured, the revenue produced from these rates? Have you made any investigation as to that question?

A. I have given no investigation to that phase of the question, personally. Of course, in the hearings where I have been, that matter has been up, more or less, and has been discussed, and I will say here, very much in the same manner as of the showing of Mr. Hamilton yesterday on this stand.

As an illustration, in showing graphically the rates which were in existence on railroads and which were proposed tby the Minnesota Commission, I had made a graphic representation of those, using first-class only, to show how they would work out.

I have not presented it in the Minnesota case, but it was referred to in that by me in my testimony.

Q. Is there any such relation between them, so far as your investigation as an accountant went—

A. No, sir; I should say there was not. (R. pp. 1482-1484.)

Mr. T. A. Hamilton was the last witness to speak on this subject. His testimony, beginning with his personal history, commences at page 1402. He filled many minor positions in the railroad service, in which he had spent his life until 1906, when he entered the employ of Haskins & Sells as an accountant, in which service he has since continued.

His railroad experience splendidly equipped him for the work of investigating railroad accounts and rates and railroad operations, in which work he had been engaged in the Missouri rate litigation and in this litigation. His testimony in regard to the revenue basis is found at pages 1478 and 1479, and is as follows:

Q. Now, to go one step further: Take the evidence that has been introduced in this case as to the rates—principally this which you have been developing—which it is apparent does not represent the cost of service in the instance given: I will ask you what is your opinion, as an accountant, based upon the experience that you have had in the accounting problem, of using the revenue derived from these rates, or, rather, these two sets of rates, interstate and intrastate rates, to measure the cost of operation of business, State and interstate?

A. I would say in that connection that I agree most heartily with Mr. Nay. As I heard him say in this case, the value of the revenue basis is predicated or is dependent entirely on the assumption that the rates are based on the cost of service.

I think that it is a plain proposition, and, as a matter of plain logic, if your revenue is derived from rates which are not based on the cost of service, it is mathematically impossible to accurately divide those expenses on the basis of factors derived from that revenue. If there is no relation between the revenue and cost, I can not see how you can use the revenue to divide cost.

Q. In your experience as an accountant, have you known the revenue basis to be used as a method of ascertaining the cost of production?

A. No, sir; never.

My first acquaintance with the revenue basis for dividing operating cost or cost of production was in the Missouri Rate Case, where it was presented by the railroads.

Q. I call your attention to the further statement made by Mr. Nay, that the revenue theory was not only dependent upon the cost of service, but also dependent upon their being a proper relation of cost between the State rates and the interstate rates, and ask you,

from your experience with the rate situation in Arkansas, whether there is such a relation in the State and interstate rates so that those could be used as the two yardsticks with which to measure the cost of service of that respective kind of business?

A. There may be rates published effective in Arkansas, which are built in that way, but they are few.

When you consider the whole rate fabric, as I have found it in going through the company's waybills, which are records of actual movements, as I have been illustrating from these lumber and other movements, considering it all, there is not any such thing. If there is we have not been able to find it.

Q. Take, for instance, this: What relation could there be between the lumber moving interstate on these various tariffs that you have put into evidence and the lumber moving within the State on Standard Distance Tariff?

A. I think I have made illustrations this afternoon to the effect that the further you haul the lumber the lower the rate you get. I know the Standard Distance Tariff increases the rate according to distance.

Q. That makes the relation or parity between those an impossibility?

A. Yes, sir; that is a good instance of it.

It is respectfully submitted that on the theoretical side of the question, the preponderance of the evidence is decisively against any value ataching to the revenue as the basis upon which property and expenses may be divided between State and interstate.

## (2) THE RELATION OF THE RATES TO THE COST OF SERVICE.

*The General Proposition.*

As has been seen from the testimony of the opinion evidence supporting the revenue theory, the fact that the rates represent the cost of the service is a necessary predicate to give value to the revenue derived from the rates as a proper factor to use to divide property and expenses between intrastate and interstate traffic. In fact, that is the major premise, and the minor premise is the relation between State and interstate rates—cost relation—not trade or commercial relation. Without these predicates the revenue basis to divide property and expenses has no value whatever is the admission made by the learned doctors advocating it, as heretofore seen in the quotations given. Mr. McPherson and Mr. Nay testified that after the expenses are divided on the revenue basis between intrastate and interstate, then, to obtain a correct result, there must be added to the intrastate expenses the percentage, which, in the opinion of operating men, should be added thereto in order to equalize them; in other words, the revenue basis without the element of added cost does not obtain

true results, but is merely used to obtain a result to which something else might be added, towit: the extra cost, so when it is added, then the object to be attained—the true separation of the two classes of expenses, would be accomplished. This alone should be a refutation of the fact that a cost relation exists between the State and interstate rates. If such relation did exist, then a division on the revenue basis might accomplish the result sought, a fair division of expenses of the two classes of traffic using the revenue as a factor, but when something is to be added to the result obtained by using this factor, then clearly there is no cost relation between the two classes of rates, or this additional element brought into the case to make the basis true would not be needed. Certainly there is no relation between one State system and another. Texas, Arkansas, Oklahoma and Missouri each has its own system of rates, and Missouri has two systems, one south and the other north of the Missouri River. The interstate rates prevailing in these four States are practically the same, with many exceptions, and it depends on how high each of these States make their rates as to the degree of confiscation each is working. The higher the intrastate rate the greater the confiscation, according to this revenue theory. There is much testimony in this record in regard to whether the rates are based on cost of service, but the differences of opinion between the various rate experts on opposite sides are more in detail than principle. The rate experts introduced by the railroads have admitted freely that commercial and competitive conditions largely control the rates, and have, at the instance of the State, put in hundreds of illustrations of rates upon large movements, which are not based upon the cost of the service, but into which some other element entered and controlled the making of the tariff. The differences may be summed up about as follows: The rate experts on behalf of the railroads contend that the element of cost is always considered, while not always controlling, and that it is an exceptional condition which makes rates not based on the cost of service; while the rate experts introduced by the State contend that the rates made on account of competition, commercial or trade conditions, are the prevailing rates, and that the movement of traffic is largely upon those rates, and not upon such rates as those wherein the cost of the service may have been a controlling element.

*Plaintiff's Evidence.*

The railroads introduced five witnesses on this proposition—Mr. B. M. Flippen, Traffic Manager of the Iron Mountain; Mr. C. E. Perkins, General Freight Agent of the Iron Mountain; Mr. J. D. Watson, Assistant General Freight Agent of the St. Louis Southwestern; and on the passenger side of the proposition, Mr. Charles L. Stone, Passenger Traffic Manager of the Iron Mountain, and Mr. R. H. Laing, of the St. Louis Southwestern, and Mr. F. O. Becker on classification, Mr. Flippen made this general statement: "In fact, the making of

rates have to do with the commercial conditions; the cost of service; the conditions generally; and where the earnings have not been, as we figure it, compensatory in respect to State traffic, the same is frequently true of interstate adjustments, because one is so very seriously affected by the other."

That is probably as concise a statement of the whole railroad attitude upon this subject as can be found. On cross examination he was asked:

"Q. You can not fix rates on the cost of operation?

A. You have to fix rates on the cost of operation in a general way, or you will not land right." (R. p. 248.)

Mr. Flippen stated that the adjustment of the interstate rates was relatively higher than the State rates. His attention was called to the fact that Mr. Kimbell, Assistant Auditor of the St. Louis Southwestern, had filed an exhibit showing that upon his road the revenue produced per ton per mile for intrastate freight was about two and one-half that produced by the interstate freight, and he was asked if that was true on his road, and he answered that he had made no computation on those points. (R. pp. 249, 250.) The statistics heretofore quoted on his road show that the interstate is 6.750 mills per ton per mile; intrastate, 13.877 mills per ton per mile. This witness, put on by the railroads, as an expert on questions of relating to State and interstate rates, was absolutely ignorant of the fact that on his road the revenue per ton per mile from intrastate traffic was twice that of the interstate traffic, and that his companion road, the one with which he ought to be almost as familiar as with his own road, the revenue was two and one-half times greater per ton per mile for the intrastate traffic than the interstate traffic; and yet, with this density of ignorance on hand, he devotes many pages to the relative adjustments and relation of State to interstate rates, leading to the theory that the intrastate rates are confiscatory. He was asked when his road put in a rate to meet competition, what consideration was given in the making of the rate, and he said competition, but not competition necessarily alone; that it is either the road meets the rate formulated or ignores it. He says there is a potential competition—one not active—such as river competition. He was asked if he took into consideration the cost of service when making rates to meet a competitive one. He said: "In a general way, we can not lose sight of that fact. We figure we do not like to sell our goods at less than cost, and still we do not always know what it costs."

Q. Why, don't you know what it costs?

A. No man has ever been able to figure out just what it costs to handle any one particular commodity in relation to the whole traffic handled by a railroad company.

Q. If you meet a rate at a competitive point you fix your rate primarily on the rate your competitor has fixed; on what basis does your competitor fix his rate?

A. There might be a variety of things which would fix it for him. He might make an inordinately low rate on the raw material into a manufacturing point, contingent on the manufactured article going out at a high rate. And, therefore, taking it as a whole, it might be remunerative. Or it might be a low rate, State rate, predicated on a high interstate rate, and it might be remunerative.

Q. Don't you have any statistics compiled by which you can get at the cost of handling a given commodity?

A. The costof handling any given commodity can not be figured; no, sir." (R. pp. 250, 251.)

Mr. Flippen developed this further point:

"Q. Then the rate is more a relative proposition than it is one of cost of operation, isn't it?

A. No, sir; you can not say that. You must bear in mind the cost of operation, or you would not be making the rate. The rate is the price at which we sell transportation; and you must bear in mind, according to the best judgment and experience of men who know what it costs, otherwise we would not be making a rate. You would not last long if you made it without regard to that." (R. p. 252.)

Further on he said:

"Q. In speaking of the cost of transportation awhile ago, on cross examination, you stated that in many instances it would be based on what the traffic would bear; please state what you meant by that statement, and in what sense you used it?

A. I meant by saying that the rates were made upon just what the traffic would bear, considering the competitive conditions. Certain traffic will only bear a certain measure of rate in competition with a similar article or commodity produced in some other State or some other section of the country directly competing with this particular article in a common market of purchase.

* * * * * * * * *

Q. In your efforts you tried to avoid making rates that will be prohibitive to some of the industries upon your line?

A. Absolutely so. If rates were made so as to restrict or prohibit the movement of certain articles, then the general effect upon the development of your traffic and your earnings which is not confined to that particular product, as it were, but it is the general development of the country in which it is produced, and the contingent qualities or features which bear upon the production of this particular article.

* * * * * * * * *

Q. Is the average cost of handling business any indication of the cost of handling any particular commodity or kind of business?

A. That is simply one element. There are various elements that enter into the question of rate-making. There is competition; the amount of tonnage involved; the movement of traffic in one direc-

tion *versus* the empty car movement in the other direction. And all those sort of things.

* * * * * * * * *

Q. Is the average cost of handling business any indication of the cost of handling any particular commodity or kind of business? The question is, is the average cost of handling the business any indication of the cost of handling any particular commodity or kind of business?

A. As I said this morning, it is absolutely impossible to figure what it costs exactly to handle any particular commodity or article. It may be figured in its relation to the whole. You can not segregate it." (R. pp. 260, 261.)

Mr. Stone's testimony has heretofore been abstracted, in discussing the alleged interference of State rates with interstate rates. His testimony was largely upon the effect of the two-cent rate in Arkansas, the substance of which is heretofore given. Mr. Stone tells us that competition has fixed the rates through Arkansas on California business, and that his road has met the rates fixed by its competitors. (R. pp. 271, 272.) He gives much interesting information as to what rates are fixed by competition, and what are not. Mr. Stone states that his road enjoys more intrastate traffic in Arkansas than interstate, and that it gets much more revenue out of the intrastate, and that the intrastate is more profitable, but when asked if the intrastate traffic was much more profitable at two cents, stated that it was not, but that he had no statistics on the subject that would throw light upon it. (R. p. 274.)

Mr. R. H. Laing, Assistant General Passenger Agent of the St. Louis Southwestern (his testimony appears with the State's evidence, but he was plaintiffs' witness), gives testimony principally on the readjustment of the passenger rates when the fare was restored to three cents. He was asked if the reduction of the State passenger business in Arkansas affected the Texas excursion or homeseeker's rates from St. Louis or Memphis, and he said it did not affect the rate per mile to any extent. He says the Arkansas reduction to two cents did not affect the California rate, but the Missouri reduction did. (R. p. 1614.) Mr. Laing tells of various specific rates affecting Arkansas, which are controlled by competition, the details of which are not profitable. (R. pp. 1614-1616.) He was questioned as to variation of rates, and this occurs (R. p. 1616):

"Q. Is that rate based on the cost of service?
A. No, sir; it is not.
Q. Is it not on the cost of service?
A. No, sir.
Q. Is not that California based on cost of service?
A. I don't think so.
Q. What is it based on?
A. It is simply an agreed rate.

* * * * * * * * *

Q. An agreed rate?

A. Yes. There is no basis for it.

Q. No basis for it?

A. Some thought that was the right figure and put it there.

Q. Is that the sum of the local between here and California?

A. No, sir.

Q. These gentlemen have been teaching me that is the way rates are made.

A. That is the rule; yes, sir; but there are a few exceptions to the rule.

* * * * * * * * *

Q. Do you know the cost per passenger mile for carrying passengers in Arkansas?

A. No, sir.

Q. Do you know what it is in Texas?

A. No, sir.

Q. Do you know what it is in Missouri?

A. No, sir. I am not familiar as to the cost of doing business.

Q. The cost of doing business—the cost of handling business. You make the rates generally?

A. No, sir; the State Legislatures have been making them.

Q. Do they make the interstate rates for you?

A. Practically, yes.

* * * * * * * * *

Q. Do you think the State Legislatures makes them on the cost of the service?

A. I don't know, sir.

Q. Does your office make them on the cost of the service?

A. No, sir; we don't.

Q. What do you make them on?

A. We make them so much per mile, as a rule.

Q. What determines it? How do you figure that?

A. Well, in the State of Arkansas we figure out a rate of three cents a mile.

Q. Not all of them do?

A. Ninety-eight per cent of them.

Q. Well, let us see about it. Don't you have a lot of books to sell down there at two cents?

A. No, sir.

Q. Or, at two and a half cents?

A. No, sir. We honor an interchangeable mileage credential.

Q. Don't you issue them?

A. We are a party to an arrangement under which travelers get a net two cent per mile.

Q. Do you not sell a good many of those books, or honor a good many of them?

A. We honor quite a number; yes, sir.

Q. Don't you sell these 2½-cent-rate tickets then where the Rock Island and these other roads come in competition with you?

A. We meet competition, but there are very few points between which their fares affect us.

Q. The Iron Mountain meets them at a good many points, does it not?

A. The Iron Mountain will meet them probably more than we do.

Q. Do you think that 98 per cent of your rates through Arkansas are 3 cents?

A. Our one-way fares; yes, sir.

Q. I am not talking about one way; I am talking about the whole business. We are not taking it piecemeal.

A. One-way fare is really the basis for everything. That is the standard.

Q. I am asking you about what your fares are in Arkansas, and you said 98 per cent was three cents. After calling your attention to those—

A. I would not say that on 98 per cent of our business we get three cents per mile.

Q. I didn't think you would when you thought about it.

A. But you take our tariff, and the figures are 98 per cent of three cents a mile. (R. pp. 1616, 1617.)

Further on this question was asked:

Q. Is it the cost of the service that you consider when you fix those Hot Springs rates and California rates?

A. Well, the passenger department, as a rule, does not figure on the cost of service.

Q. It does not? Are you sure of that, Mr. Laing?

A. They figure on the amount of business that can be secured." (R. p. 1619.)

Mr. J. D. Watson, Assistant General Freight Agent of the St. Louis Southwestern, testifies, as does Mr. Perkins and several other witnesses, as to the effect of the classification upon rates. As no one was so well authorized to speak on the subject of classification as Mr. F. O. Becker, Chairman of the Western Classification Committee, whom the railroads put upon the stand, we will omit the discussion of this subject by other witnesses, and give it fully as outlined by Mr. Becker. Mr. Watson brings out the fact where the article is changed to a commodity rate, it is taken out of the classification; and that the volume of traffic and commercial conditions incident to the marketing of that particular traffic is what produces the commodity rate, and its elimination from the class rates. (R. p. 556.)

"Q. Is there any uniformity of rules among railroads governing the cases in which commodity rates shall be applied?

A. Uniformity as to locality only. For example, in the lumber district, each line would have lumber commodity rates; and in a coal

district each line would have coal commodity rates. (R. pp. 557-8.) The commodity rate is fixed in the territory involved, from the point of origin to destination, or where the commodity is marketed; and is governed almost entirely by commercial conditions. If, for any reason, the carrier feels the rate is from common point too low to be handled with profit, of course the carrier would not make as low a rate by its rails as would be applicable by some other line. From local points the rate is fixed with a view of earning a reasonable revenue for the service performed." (R. p. 558.)

He says that the commodity rate is fixed in various ways by the cost incident to the service, as to the particular traffic, "minimum weight is one. That is fixed by the difference in the cost of the service. For example, if the minimum weight has to be low, as in the case of hay, you make a higher rate on account of the low minimum weight, but, hay being a necessity and governed by various and sundry considerations other than value, a very low rate is necessary in that case. Each commodity in itself has its own rules and regulations governing the fixing of a rate." But in no case are commodity rates fixed without regard to cost of service. (R. p. 558.) He says: "The commodity rates are governed by the same conditions that govern the rates generally. In addition to that, the volume of the traffic; value of the traffic; the direction of the movement, and the length of the haul, are governing factors in the fixing of rates on commodities, on rates other than those that are classified, and in taking them out of the classification." (R. p. 561.) On cross examination he says that he does not believe that Standard Freight Distance Tariff No. 3 was ever represented as a properly constructed tariff, and that he does not think it represents the cost of the service, nor anywhere near it. Furthermore, he says that he does not think that any tariff could be used to determine the cost of the service; that in addition to the cost of the rate, you should have a profit. (R. p. 569.) He says that the cost of service can not be absolutely determined and that he has not stated that rates are based entirely on cost; that the cost is one of the controlling factors in fixing certain commodity rates, and that the cost can be approximated; that from the accounting department they have the revenue per ton mile, but he does not think that is the proper measure of the cost, but use can be made of it in this way; that it would be improper to assign a rate to any particular portion of the traffic, which would yield a less revenue than the general average on certain classes of traffic; but he admits that they have no statistics on any particular class of traffic. (R. p. 570.) The only service that the statistics of the cost and of revenue per ton per mile is to determine as near as can be where the minimum rate should be. He says they have no separate figures on any separate commodities or classes, and merely have the general result in ton miles. He says there is no cost-accounting system in use on his road. (R. p. 571.) "I

don't think I said that we got at the cost of service, because we do not get at the cost of service; but we have a general idea of the cost of transportation, and that idea fixes for us the minimum charge that we can afford to handle traffic for.

Q. You state that that idea fixes the minimum charge; where do you get that idea?

A. We get that idea altogether from the reports—from various sources, compiled by the Accounting Department—the ton-mile basis of the whole aggregate tonnage; that fixes the general question as to the actual cost for all classes of traffic. Then we must take into consideration our experience and knowledge of the cost of handling the different kinds of traffic, and from that deduct the result that we must have to determine whether we shall handle it or shall not handle it; for example, we would haul stone for considerably less than a higher class commodity.

Q. But you have no data at all to show the cost of handling stone?

A. Absolutely none.

Q. Now, you have referred to commercial conditions; I wish you would explain just what you mean by that term, as a factor in fixing rates?

A. That term has a general application in fixing all rates on commodities that must move. Probably one of the best explanations is the lumber proposition. A mill is located in a certain district, and it must meet competition with another mill handling the same class of lumber in another district. There is a commercial condition the railroads must meet in order to carry the commodity.

Q. In other words, you must foster the industries on your line and protect them in marketing their products?

A. That is one commercial condition.

Q. Then, the competition is another commercial condition?

A. That is a competitive condition; that is not altogether a commercial condition.

Q. You are not including that in your term "commercial conditions?"

A. Competition between localities would be included in commercial.

Q. But as between railroads it would not?

A. Yes; that is a competitive condition.

Q. Those two factors largely enter into the determination of the rates, where they do enter into them, have a large bearing on the volume of the rates, and when the rate is fixed to meet competition, or to meet these commercial conditions you have referred to, it fixes them on a different basis than the basis of cost?

A. Necessarily." (R. p. 577.)

Mr. C. E. Perkins, General Freight Agent of the Iron Mountain, testified, like Mr. Watson, largely of classification, and his discus-

sion of that will be omitted. He was asked if the railroad company in fixing commodity rates paid regard to the cost of service and said they regard the cost of service always; that is, they attempt to do so; that commodity rates are often fixed on commercial conditions which necessitates special rates, but they always tried to make a profit on the business which they handled. (R. p. 593.) In regard to the division between connecting carriers who transport lumber and other commodities from zones, Mr. Perkins says it is always a matter of negotiation and agreement. "There is this general principle, however, that the originating line gets the largest share of the earnings; that is, according to distance. In other words, it gets more than a mileage *pro rata* would yield for the reason that its service is considerably more; for the reason that it originated the business and must furnish the equipment for hauling the business; reasons of that character. (R. p. 596.) Mr. Perkins says that classification committees do not fix rates, they simply assign the articles to the various classes, and that classification applied to the tariff enables the railroads to fix the rate. Each road and each section of the country is governed by its own individual rates. They will use the same classification individually in all of the territory west of the Mississippi River. The rates on the Iron Mountain would be very different from the rates on foreign roads. (R. p. 599.) Mr. Perkins was called upon to identify various tariffs and maps, illustrating the tariffs, which was attached as exhibits Nos. 38-44 inclusive, known as the zone maps. (R. pp. 614, 648, 649.) He was asked if his road furnished any record of the cost for the movement of lumber, or any other article, and said it did not; that in the making of a rate the traffic officials had no data whatever as to the cost of the service on any particular commodity. They have the data of the cost of the service as a whole. and they have statistics of the revenue per ton per mile, and that is of some service as a guide to how much revenue they should receive from different commodities. (R. pp. 615, 616.) The following is his statement of how rates are made: "We know about what our general revenue is and about what our general cost is, and we know from our classification the relative adjustment you might say which we must assign to the various commodities to bring about that revenue. Some articles we know are handled at less cost and must be handled at a lower rate than some other commodities, and our rates are adjusted really on a relative basis. That is, on the various commodities. The rate which we would assign to each one varying, of course, as to the commodity, as to its value and as to its cost and as to the direction of its movement, and as to the length of its movement.

Q. Then you do use these ton-mile statistics showing the cost per ton per mile of your entire traffic in order to divide the charges to be apportioned to one traffic as against another kind of traffic?

A. No, sir; I can not say that we would do that. As a matter of fact, our rates are fixed—that is, our general line of rates, you might say, are a fixture. They have been established for a great many years. There have been changes in this rate or that rate, but the general rate fabric has been in existence, of course, with the changes that are necessary, for years. We know about what results that rate fabric brings us. We know we are charging a little more on one article than on another. But that relative adjustment with all these other incidents I have mentioned—that is, the direction of the haul, the length of the haul, the bulk and value of the commodity to be handled, commercial conditions, all govern us in making a rate on any specific commodity.

Q. That rate is not made on the cost of the service, is it?

A. Yes; fundamentally it is.

Q. What do you mean by "fundamentally?"

A. I mean that the cost of the service enters into our rate-making to a very large extent. I do not mean to say by that the actual cost of the service, but the relative cost of the service.

Q. I am talking about actualities and not relations.

A. The only way we could make this is on a relation adjustment. (R. p. 616.)

* * * * * * * * *

Q. Where do you get the figures upon which to base that relative adjustment?

A. We do not have actual figures." (R. p. 617.)

Mr. Perkins said that in fixing any particular rate, they (traffic men) can not bear in mind the cost because they do not know the cost, and can not bear in mind the profit because they do not know the profit.

Mr. J. M. Johnson, Vice President, in charge of traffic of the Missouri Pacific and Iron Mountain railroads, is the head of Mr. Perkins' department. Mr. Perkins testified that Mr. Johnson was an experienced man in traffic and rates; then this testimony, given by Mr. Johnson in another litigation, was put before Mr. Perkins:

Q. Mr. Johnson, in your experience as a traffic and freight man, have you studied the cost of the movement of the different classes of freight, and the different kinds of tonnage, in determining what would be a reasonable rate in the handling of different classes of traffic, and are not railroad rates based on the assumption that they make a fair return on the cost of the movement of that freight?

A. It is very difficult to determine the cost of moving any particular commodity any particular distance. In fact, it might be said to be impossible to do it. We can only figure in a very general way. We know about what it costs to move a ton of freight one mile, at the end of a year, and we know what we have received for moving a ton one mile.

Now, that is on the business as a whole, which of course, is made

up of hundreds of thousands of different shipments. It is impossible to know the exact cost of moving one ton of any particular class of freight for any particular distance.

Q. But in making the rates, is the general average of cost of moving a commodity taken into consideration in fixing a rate that will be compensatory in the moving of any particular commodity? I refer to the general average of cost you have spoken of, as shown by your records at the end of the year.

A. No, sir; rates are not made that way. By experience we have some knowledge of about what we ought to have for the service in question.

Rate-making, as a general proposition, is largely a guess; and the railroad people claim that by experience they are very much better able to guess correctly than the other fellow.

There are so very many factors entering into the cost that it is impossible to determine the cost of moving the different classes of freight. And we can only determine in a general way, from experience, about what is fair and compensatory." This Mr. Johnson verified the complaint in this case. (R. p. 71.)

Mr. Perkins was questioned as to whether his views coincided with his superior upon the question as to how rates were made, and it was found that they differed considerably, as could readily be seen from Mr. Perkins' previous testimony, showing his views of their method of creation. (R. pp. 650-653.)

The whole of Mr. Johnson's testimony given in the other case was later put into evidence by the State and is found at pages 1603-1610.

Mr. F. O. Becker, Chairman of the Western Classification Committee, and Superintendent of the Western Railway Association Weighing and Inspection Bureau, is a witness of importance. His testimony begins at page 738. He said that his committee has jurisdiction, generally speaking, of the territory west of the Mississippi River; that the purpose of his association is to classify all freight, offered for transportation, which is done as a basis of rate-making by railroads, and that, primarily, the committee first takes into consideration the density of an article; because the lighter and more fragile the more it costs to handle and transport it. Secondly, the value; the greater the value, the greater the element of risk, which also enters into the cost of handling and transporting. Thirdly, the character of risk, susceptibility to damage; the volume—the weight per cubic foot, or the matter of cubic feet per hundred pounds, plus the value per hundred pounds, makes what we call "a unit." And, taking the several hundred commodities, for instance, rated in the classification as "first class," we have found the first-class unit to be approximately 20.61. The other classes range downward from that.

Q. That figure you gave, 20.61, is a kind of a base, is it?

A. Yes, sir; just a basis which we first consider. There may be other conditions subsequently entering into the consideration, but primarily we consider the density and the value.

He says the cost of transportation, including transportation service and handling and the risk incident to the transportation, enter into the consideration of the committee in the classifications made by it. He tells interestingly of the work of the classification committee, which sits as a kind of court of appeals among railroads and shippers. (R. p. 739.) On cross examination Mr. Becker was asked how they got the cost of service, this element which he said was always given consideration, and he answered:

"A. We know that it costs to transport; what it costs to handle; that the element of risk necessarily enters into the cost. We, of course, do not know the total cost; but all of these are factors in the total cost.

Q. You have no basis of cost?

A. I hardly understand what you mean by "basis."

Q. Do you use the ton per mile as a basis in ascertaining the cost of a given line of road, or through a given country?

A. Oh, no, sir.

Q. You do not give any consideration to that?

A. No, sir.

Q. You know that railroad companies prepare statistics of their cost per ton per mile?

A. I believe they do. That is not in my line, but that is my understanding.

Q. But your Western Classification Committee does not use those statistics in making its classification?

A. No, sir.

Q. You know that this element of risk exists, and you bring to bear your experience and your observation on that; is that a fact?

A. Yes, sir.

Q. You have no actual figures on that?

A. Yes, sir; we take the aciduous carboys, for instance, and we know, of course, there is great liability to damage and subsequent loss to other freight.

Q. What I mean is, you do not have the cost of carrying those acids in carboys. You do not know what it costs to carry that particular commodity, do you?

A. No, sir; not definitely.

Q. You know it is very liable to injury and easily broken and you put a high rate on it?

A. Yes, sir." (R. p. 741.)

He states that his committee makes no rates; that it makes the classification upon which rates may be fixed, but that this classification has many exceptions made by railroads in different parts of the country. He says that the Western Classification is generally

accepted by State Commissions, although there are quite a number of exceptions; that each Commission in the Western States has its own classification, but they are largely based upon the Western Classification, but they contain many variations. (R. p. 741.) There are other classifications besides the Western, the Official and the Southern. The classifications are not the same in the Southern or the Official and Western. The ratings are different in each of these classifications; that the traffic is more dense and the rates are lower, but, generally speaking, the classification ratings are similar. Relatively they should be approximately the same. The Western Classification covers a large territory where there are many different local conditions, and that makes the exceptions necessary. (R. pp. 474-475.) The conditions in Arkansas and Nebraska are quite different; that in fact there is a greater difference in different parts of the Western Classification Committee territory than between the Official and Southern Classification so far as the aggregate charge is concerned, but so far as the relation between the different committees are concerned he thinks not. He says that the Texas Commission has worked out a classification of its own and its own exceptions to the Western; that in the interstate tariffs there are exceptions to the Western Classification in the nature of commodity rates. He says that commercial and competitive conditions make these necessary. He says that the traffic moving through Arkansas to Texas would be governed by the exceptions to the Western Classification made to meet the Texas conditions. (R. p. 742.) Further, Mr. Becker said:

Q. Does your committee give consideration to commercial and competitive conditions also, in making classifications?

A. More or less; not to the same extent, of course, that governs in the commodity rating. You know our classification governs over quite an extensive territory and there might be local conditions that would make it necessary to except to that classification. He says that there is a distinct relation between the rates made by the Texas Commission and the interstate rates governing to Texas points. (R. p. 744.)

He further says:

Q. I do not understand you to have stated that your classification is based on a knowledge of the actual cost of transportation of the several commodities embraced in the classification. I understand you to mean that it is made relatively with reference to the cost of the article you are dealing with?

A. Yes, sir.

Q. That you are able to determine, in the way you spoke of, by comparing the density, bulk, weight, the value and those qualities that pertain to the articles that enter into your classification?

A. Yes, sir.

Referring to the relation between the rates made by the Texas

Commission and the interstate rates to Texas points, he said: "That is on account of commercial conditions." Concerning the large volume of traffic through Arkansas from St. Louis to Texas, he says: "It will be governed largely as to both classification and rates by the classification or rates put in by the local authorities of Texas. (R. pp. 745-746.)

This was the substance of all the plaintiffs' evidence on this phase of the question.

## (2) THE RELATION OF THE RATES TO THE COST OF SERVICE.

*The Defendants' Evidence.*

(a) On this issue the State presented Mr. J. C. Lincoln, Traffic Commissioner of the Merchants' Exchange, of St. Louis; Asa R. Bragg, Manager Merchants' Freight Bureau, of Little Rock; Mr. C. B. Bee, Rate Expert for the Corporation Commission of Oklahoma; Messrs. Wilmering, Ludlam, Hamilton, Lewis and others touched also upon this issue and part of their testimony may be profitably read in this connection.

As against the rate experts for the plaintiffs, Flippen, Perkins and Watson, we present equally qualified rate experts, Lincoln, Bragg and Bee; and the latter fortified in their positions from many angles.

Mr. James C. Lincoln is Traffic Commissioner of the St. Louis Merchants' Exchange. His testimony begins at page 961. He was in railroad service from 1876 to 1906, when he left the position of Assistant Freight Traffic Manager of the Missouri Pacific and Iron Mountain System to take his present position. He thus states his experience:

"A. My original work was that of a general utility boy around headquarters. I was then in the office of the Superintendent of car service and from that in the office of the Master of Transportation; then in the General Freight and Passenger office as chief clerk. That, however, was in my association with the St. Joseph & Denver City Railway, now the St. Joseph & Grand Island Railroad, which company I left in September, 1888, to accept service with the Missouri Pacific Company.

I served the Missouri Pacific Company at Atchison, Kansas, for one year, in charge of their Central Branch and their Nebraska Division, in the Traffic Department. I then came to headquarters and served through the various offices from Assistant Freight Agent to Assistant General Traffic Manager.

Q. Was the St. Louis, Iron Mountain & Southern a part of the system that you served?

A. Yes, sir.

Q. Are your duties in your present position such as keep you in touch and familiar with the rates prevailing in the Southwestern country?

A. Quite generally; yes, sir. I have to keep in touch with the general rate adjustment to this entire section. I have to watch the adjustment from other markets in competition with St. Louis.

Q. In what year did you leave the railroad service?

A. In May, 1906."

Mr. Lincoln says:

"The controlling factors in the making of rates, State or interstate, or the foundation upon which a rate is made, is the maximum rate allowed by law, either State or interstate, or on through business the combination of State rates. They are departed from as commercial conditions require."

Then he was asked:

"What consideration in the making of interstate rates is usually given to the cost of actual service performed in transporting the traffic under the given rates?"

A. Very little consideration is given to the actual cost of service in making rates. Rates are made generally, as said, upon competition or commercial conditions. The traffic man necessarily should be informed to a greater or lesser extent as to what it costs, but in the making of any individual rate he is unable to determine what is the cost of handling that individual traffic.

Q. What information or statistics do the railroad companies have before the traffic men when they make rates; that is, as to cost?

A. Well, there are all kinds of statistics that reach a traffic man, or the traffic man can avail himself of them if he wishes to—as to the movement of the tonnage, the various commodities making up the tonnage, car movement and the averages. The ordinary traffic man is not well versed upon the expense of conducting the transportation as to any commodity on any division, but deals in totals.

Q. In fact, there are no statistics made by the railroad companies operating in this immediate section of the Southwest that have the cost of transportation of any given commodities, are there?

A. Not that I know of. I never saw them.

Q. In your experience you did not meet such?

A. Not such statistics.

Q. In fixing rates from large distributing points, say St. Louis to Arkansas, and through Arkansas to points beyond, say New Orleans and the Texas common points on the other side, how largely, if at all, does the cost of the length of the haul from Arkansas points to New Orleans and to Texas common points determine the rates that are fixed for these various movements?

A. Except in a very remote way, consideration is not given to the expense of conducting the transportation in making the rates from St. Louis to New Orleans, from St. Louis to Little Rock, or from St. Louis to Texas points. (R. pp. 962, 963.)

He was asked as to how he would divide expense, State and interstate, and said he had some opinions on the subject, but had never

worked them out, and therefore did not care to go into that matter. He was asked:

"Are there any controlling factors in the difference of the service, State and interstate, or the difference in long hauls and short hauls?"

A. That is in connection with expenses?

Q. Yes.

A. In connection with the expenses of conducting transportation there are controlling factors in the way of terminal expenses. There are controlling factors in the way of these short hauls being more expensive than the long hauls.

Q. How is that taken care of in practical railroading?

A. In the adjustment of rates.

Q. The evidence in this case shows this—I will just speak in round figures—that the revenue per ton per mile on the State traffic is 12 mills and the revenue per ton per mile on the interstate traffic is 6 mills.

Do those statistics indicate to your mind that this extra cost for short hauls have been taken care of in the rates?

A. This would indicate to my mind that in a measure the short haul has been taken care of in the rate by the fact that the average rate per ton per mile is higher than for the longer haul.

Q. And that is the way, as I understand you, in which this extra cost of the short haul, terminals and so forth, is taken care of?

A. It is contemplated in the rate adjustment, taken care of by the higher rates, for the shorter hauls than for the longer hauls. (R. pp. 963, 964.)

On cross examination he testified:

"Mr. Lincoln, you think the length of haul affects the expense of conducting traffic, do you not?"

A. Unquestionably the longer the haul the less the cost should be per ton per mile.

When he was asked the cause of that, he said:

"The causes are the continuous transportation over divisions and that after freight is in movement it would be hauled greater distances without a progressive rate of expense for each mile hauled.

Q. There are two classes of interstate traffic: From one State into another, say adjoining States, and that which crosses States. The latter kind has been termed "transstate" traffic in this case. A movement may originate in St. Louis and terminate in Galveston and it is a transstate shipment in Arkansas because it has no origin or destination there.

To what extent does that enter into and affect the relative cost of transportation as between interstate, including that interstate on one hand and intrastate on the other, in the State of Arkansas?

A. Well, I would say this: That business can be conducted with less expense, which is the average shown by the result in the rate per ton per mile for the longer haul from St. Louis to Galves-

ton than for a short haul within that distance, passing over the same line and in the same direction.

Q. Is there any other element that, in your opinion, would enter into the relative difference in expense than the long and short haul?

A. All things being equal, no.

Q. What is the service rendered with relation to transstate traffic and interstate traffic, in the more limited sense that I explained a while ago, in the State of Arkansas?

A. What is the relative service as between transstate and the interstate?

Q. Yes; in the State of Arkansas.

A. Well, within the State on State traffic, terminal expenses are embraced in the rates.

Q. On what traffic?

A. On the intrastate or short haul traffic. The same terminal expenses are embraced on an average of a long haul. The continuous movement of freight for a long haul enables—when there is a volume of business to move—the conduct of that business cheaper than the short hauls, because the short haul is usually handled in local trains.

Q. Will you charge any terminal service on a transstate shipment to the expense of conducting traffic in Arkansas?

A. No; there should be no expense charged in Arkansas for the terminal service.

Q. When you say there is a terminal service, you mean the traffic itself requires a terminal service?

A. Yes, originally; there would be no terminal service on through business.

Q. How would it be in interstate traffic as distinguished from transstate from St. Louis to Little Rock?

A. There would be one service there in the State and one there out of the State.

Q. How is it usually in State business?

A. There are two terminal services in these States.

Q. Is there any material difference in the expense of conducting intrastate and interstate traffic, referring now to the State of Arkansas, without having to repeat that each time?

A. No.

Q. You think there is no very material difference in expense?

A. In handling State and interstate business?

Q. Yes.

A. No, sir.

Q. On what do you base that view, Mr. Lincoln, that there is no material difference?

A. I base that view upon the fact that an imaginary line does not increase expense. I support the proposition that there is a greater expense attached to the handling of short haul business, State or

interstate, than on long haul business, State or interstate. (R. pp. 964, 965.)

On further cross examination he said:

Q. Mr. Lincoln, when you say, in regard to the cost of service being the large factor in determining the rates, you mean in determining the details, don't you? You do not mean that a railroad could operate unless it could fix its rates with some reference to the cost of the service?

A. I say that the cost of the service is not the factor that controls the making of the rates. The results of operation necessarily, as to the revenue, you would have to have some regard to cost or you would go into the hands of a receiver.

Q. That is what I want to know.

Could a railroad be operated successfully if its rates were fixed without any reference to the cost of the service it rendered to the public?

A. If it absolutely disregarded it and handled its business without regard to cost of the service, it would either have to get a receiver or raise the rates.

Q. When you speak of the disregard of the cost you mean in fixing particular rates?

A. Yes; the particular rates, though, do not take into consideration to any great extent the cost—

Q. But you would not say that railroads are not governed by the same rules that all other industrial institutions are governed by, would you?

A. I say if they do not govern themselves by the same rule, they ought to.

Q. Are they not governed by the general and universal law which is necessary in manufacturing or industrial concerns, to so fix their prices that they would not be under the cost of production?

A. It should.

Q. Would not a railroad that disregarded it, be in the hands of a receiver?

A. Well, it has not done it. (R. p. 760.)

Without going too much into detail, this part of the cross examination is instructive:

Q. How are the rates adjusted from St. Louis and Little Rock, as compared with the adjustment to Benton, Malvern and Arkadelphia, three points on the main line below Little Rock—how are they graduated?

A. I have not studied those rates lately, but I was of the impression that the rates were made to points south of Little Rock by adding the rates out of Little Rock to the Little Rock rate.

Q. In that case length of haul controls?

A. The length of haul south of Little Rock and the measure of rates control that.

Q. Take a shipment from St. Louis to Memphis, which you said on first class was at the rate of 70 cents and to New Orleans a rate of 90 cents—

A. I think those are the figures.

Q. Why is the rate 20 cents higher to New Orleans than it is to Memphis?

A. The rates made from St. Louis to New Orleans and to Memphis are made as against water competition. I presume they could get more money to New Orleans than they could to Memphis. They had boats running in the old days—they do not have them now—from St. Louis to Memphis. We also had boats which operated through St. Louis to New Orleans.

Q. Is it not a fact that the distance from St. Louis to those two places is a factor in fixing those two rates?

A. I do not think so at all, because intermediate rates this side of New Orleans are higher than they are to New Orleans.

Q. What is the intermediate rate to Jackson and Meridian, as compared with Memphis?

A. I do not recall, but it is higher than from St. Louis to New Orleans, the rate from St. Louis to Jackson and Meridian, although the traffic moves through Jackson and Meridian to get to New Orleans.

Q. That establishes the proposition that this disturbance produced by these exceptional conditions is confined to the point where the exceptional condition exists, and does not affect the intermediate rates.

A. I say there was a commercial or competitive condition that required a departure from the mileage scale.

Q. As to New Orleans?

A. Yes, sir.

Q. But does not affect the intermediate points like Jackson and Meridian?

A. Not to the same extent; to some extent, but not to the same extent. (R. p. 978.)

The operation of the Western Classification was also touched up in Mr. Lincoln's cross examination:

Q. Are you familiar with the ratings of the Western Classification Committee?

A. Yes, sir.

Q. Do you know the classification they make for the various commodities moved?

A. They divided them into ten classes.

Q. Do they have any regard or pay any attention to the character of the articles transported with reference to the cost and the risk that enters into the service in reference to the particular classes that are defined by them?

A. They consider a great many things in the development of the

proper rating to be applied. The cost, the risk, the density and the volume of the traffic.

Q. They take all of those things into consideration, do they?

A. They do; by intuition, if not directly.

Q. Why is it that they would classify an article of small value and little density, weight, etc., lower than they would an article of greater value, that did not have so much density and was lighter?

A. To distribute the proportion so as to make the commodity as nearly as possible contribute its share toward the total revenue of the road.

Q. And they have in mind the cost of handling those different classes of commodities?

A. Those are all factors that should be taken into consideration.

Q. Does not this Committee do that?

A. Very largely.

Q. Does not the classification on its face show that?

A. As a whole it shows very good judgment.

Q. Take an article that is very valuable and fragile, easily broken, that would involve a heavy loss and damage claim; they are likely to put a higher classification on that than on one that is less likely to be broken?

A. The classification is the best prepared document of the relations that should exist between the different commodities. The classification shows the relations that should exist, not the rates." (R. p. 981.)

In re-direct the subject came up again:

"Q. Speaking of the Western Classification of commodities as the basis of fixing rates, do not the railroads in the interstate tariff make many exceptions to that?

A. A great many, State and interstate.

Q. Both State and interstate. The State Commissions make exceptions and the railroads make exceptions?

A. Yes, sir. (R. pp. 982, 983.)

As to the movement of commodities in interstate on distance scale tariffs, or on competitive rates, this statement is important.

Q. Mr. Moore has asked about a great many rates which he has called "exceptional" rates, like these New Orleans competitive rates; zone rates and things of that kind that are excepted from the distance scale:

I will ask you, as a general proposition, whether the traffic most largely moves under these competitive rates or does it move under the distance rates?

A. It moves under the competitive rates.

Q. They constitute the larger volume, these rates Mr. Moore has been discussing with you, as based on competition conditions, river conditions and things of that kind?

A. A larger volume moves under competitive rates." (R. p. 983.)

Mr. Asa R. Bragg's testimony begins at page 816. For five years he has been manager of the Merchants' Freight Bureau of Little Rock; his duties are really those of a traffic manager for the merchants and manufacturers of Little Rock. He has to get them rates, see that they are protected against other jobbing centers and manufacturing places in the matter of freight rates, and act as their agent so far as traffic is concerned. Prior to his present position he was in the Traffic Department of the Iron Mountain road for 25 years. His service was from local freight agent to division freight agent.

He was Division Freight Agent at Little Rock for 15 years.

These excerpts from Mr. Bragg's testimony are pertinent:

"Q. I wish you would state from your knowledge and familiarity with the freight rates prevailing in this country, the manner or system on which they are constructed?

A. You mean the method of making rates?

Q. Yes.

A. Well, they have two methods—one is by conference among themselves; that is, with reference to competitive rates; the individual or local tariffs, I think, are made up in their offices, by their rate people.

Q. Their competitive rates are made in conference?

A. Yes, sir; altogether; they are promulgated by a chairman or agent.

Q. You are referring, I presume, to the interstate rates?

A. Yes, sir.

Q. Prior to the adoption of a Commission tariff, how were the State rates made?

A. They were made in practically the same way; they didn't, however issue—their tariffs were not—I don't think their tariffs into Arkansas were issued by a chairman, not all of them, some of them were, and some were not; some of the tariffs even to competitive points were not issued by a chairman.

Q. Prior to the Commission rates were there any what was known as jobbing rates, to commercial centers in the State?

A. Yes, sir; between certain points; that is, from jobbing centers to local territory, what is known as noncompetitive points." (R. pp. 816, 817.)

It was shown by him that prior to the Commission Tariff that special rates and jobbing rates were the rates upon which practically everything in Arkansas moved, and the issuance of the Commission Tariff in 1900 abolished all these rates and put the intrastate traffic on a mileage scale. (R. pp. 817-819.)

Then he explains the much-mentioned "Memphis Adjustment," which briefly was this:

The Little Rock & Memphis road, now part of the Rock Island, adopted the Commission Tariff out of Memphis by practically placing Memphis on the west bank of the river. The Iron Mountain pro-

tested, and it was a year and a half before the Iron Mountain adopted the Commission Tariff for its Memphis business. Its adoption was brought about through a suit between the city of Memphis and the Iron Mountain over franchises (other witnesses say terminals), and an agreement was made by the Iron Mountain, in consideration of the franchises (or terminals), to put in force from West Memphis the Arkansas Commission Tariff. This was in 1902. (R. pp. 819. 820.) In cross examination it was brought out that in consideration of the vacation of certain streets and alleys, the Iron Mountain agreed to forever maintain the same scale of rates from West Memphis that were maintained in Arkansas. (R. p. 839.)

Mr. Bragg was asked to make an estimate of the amount of interstate traffic which was affected by this Memphis adjustment. He says that no part of the transstate traffic was affected by it. Exhibit 26 (R. p. 2391) of the Iron Mountain shows transstate traffic to be 51.16 per cent total ton miles, interstate 40.69 per cent and intrastate 8.15 per cent. He estimates that of the remaining 41 per cent (erroneously put to him in question as 49 per cent) that not over 15 per cent was affected, and gives definite reasons for his estimate. (R. pp. 823, 824.)

Assuming for the moment that the Commission Tariff is iniquitous and confiscatory, the Iron Mountain voluntarily adopts it for 6 per cent of its total business in the State—15 per cent of its strict interstate business—in order to get a franchise or terminals in Memphis, and then seeks to enjoin it on account of 8 per cent (the intrastate) of its traffic, because it is confiscatory.

This evidence, however, is not directed to that point, but to show that cost of service was not regarded in putting in rates for Memphis traffic, but other considerations controlled.

Mr. Bragg explained the fundamentals of the rate situation in Arkansas as follows:

"A. Well, away back twenty-odd years ago, they fixed—the St. Louis, Iron Mountain & Southern Railway Company into Memphis, and the Frisco, or the Kansas City, Springfield & Memphis, as it was at that time, fixed a differential basis between St. Louis, beginning—really it began at the Missouri River, and came on down and came to New Orleans; all these rates were predicated on the Memphis basis, St. Louis was 30 cents, Cairo was 20 cents over Memphis, and St. Louis was 30; in other words, the St. Louis basis was fixed first, and Memphis was fixed at 30 cents per hundred; we are using one class as an illustration, under the St. Louis rate; they went on down below and made the New Orleans rate the same as St. Louis. I am speaking of rates over the line into Arkansas, interstate rates.

Q. Let's get that a little more clear; the Memphis rate was fixed at 30 cents, using one class as an illustration?

A. No; St. Louis.

Q. What was New Orleans fixed at?

A. At the same as St. Louis. If St. Louis was a dollar to Little Rock, it would be 70 cents to Memphis, and a dollar to New Orleans; Kansas City was 10 cents higher than St. Louis; those differentials applied all the way down, and were the basis then and are today the basis of fixing the rates to Little Rock from that territory.

Q. How was that arbitrary or differential arrived at? Was it based on the cost of service or commercial conditions, or what was it based on?

A. No, sir; it is a system that obtains all over the country, and it is used—it is an arbitrary made by traffic people. If they get together and they find that two rates added together are against the movement of traffic generally, they fix a basis for making a through rate; for instance, from Chicago, Cincinnati, Louisville or Pittsburg, or from any point beyond the river.

Q. Are those arbitraries or differentials determined by differences in costs in moving that commodity or are they determined by other considerations?

A. The cost, I don't think, enters into the basis of making those rates.

Q. What does enter into it?

A. The territorial location is largely the reason for it.

Q. What you might term commercial, competitive and geographical conditions?

A. Yes, sir.

Q. Trade conditions?

A. Yes, sir; in all those rates, I presume, they tried to keep all markets on a parity as far as possible.

Q. That is the object of these arbitraries, to keep these various markets on a parity?

A. Yes, sir; that is the only object; of course, the cost of doing business, I presume, is thought of, at the time these rates are made.

Q. Is it any more than thought of?

A. That is all.

Q. Is there any data before them by which they could act upon any more than thinking about it?

A. I don't think so; I would like to explain a little further about this basis; it is followed very closely in making all through local rates; the same basis; Little Rock is the hub, is the axle that controls the entire rates of this State.

Q. You are referring now to interstate rates?

A. Yes, sir; in making rates out of Memphis and St. Louis to local territory, like Arkadelphia or Malvern, or some of these points down here, they hug pretty close to the same basis, the differential between Memphis, St. Louis and New Orleans, that they do to the common points.

Q. Now, take the rates that have been denominated in this hearing as transstate rates, that is, freight moving across Arkansas that

does not stop in it; for instance, lumber from Louisiana north, from States west to common points, such as fruit, from California to the east, live stock, and various freights that move across Arkansas, without having any destination in the State or originating in the State, what effect, if any, do the State rates have upon those rates?

A. None whatever; you have business from St. Louis to Louisiana and to Texas and to Mexico.

Q. Business passes through Arkansas, without any destination or origin in Arkansas, and for convenience in this case, it has been termed transstate business.

A. I don't think Arkansas rates have any effect on those rates. (R. pp. 820-822.)"

On cross examination as to cost of service, Mr. Bragg says:

"Q. Did you ever know of a business, large or small, that was conducted successfully, in which the output of the business was not sold with reference to the cost of its production?

A. I consider that the railroad corporations in that respect are entirely different from any other kind of business.

Q. Can any business be conducted successfully unless it sells its wares upon a basis that will enable it to make something above the cost of producing it?

A. Of course not.

Q. Isn't that true of railroads, the same as any other enterprise?

A. They are trying to make money, there is no question about that.

Q. Can they conduct their business intelligently with reference to results, unless they fix the price upon what they have to sell with some reference to the cost of producing it; isn't that true just as well with railroads as with any other industry?

A. I don't think so; I don't think they can calculate it very closely.

Q. If the cost of transportation is not an element that is absolutely essential that railroads should consider, must they not consider it if they conduct their business successfully?

A. Of course, they must do that.

Q. You do not mean to say that rates are fixed without any reference at all to the cost of service?

A. About half of them are.

Q. How is it with the other half?

A. I don't see how they can figure a rate at all, on the cost of—

Q. Let me ask you, I believe you said awhile ago that the rates depended upon the classification; does the element of cost enter into the consideration of those persons who are charged with the duty of making the classification?

A. No, sir; in a general way, they make these classifications—they are inconsistent; they will classify a commodity, one of the

very cheapest commodities, perhaps, which costs the smallest sum to handle, they will put it away up in a high rate. (R. p. 846.)

He was cross examined at length in regard to the Western Classification, but nothing developed different from the statement given.

In re-direct he was asked:

Q. Now, I understand, your testimony about the classification is that, while the committees are supposed to take into consideration bulk and space and value and risk and things of that kind, that the result of their work is full of inconsistencies where those considerations are ignored. Isn't that about the effect of your testimony about that?

* * * * * * * * *

A. That has been my experience.

Q. You have had pretty intimate experience with the Western Classification, too, have you not?

A. Yes; I have been handling it a long time.

Q. Mr. Moore brought out that you had been attending some meetings of the Western Classification. Did they give you a hearing on your matters?

A. No, sir.

Q. Kind of a hard crowd to get in to?

A. Well, it is usually out horseback riding and a few clerks do the work.

Q. Have a pretty good time down there, don't they?

A. Yes; they usually do. Incidentally a few games of poker.

Q. Are those meetings attended very generally by the intrastate shippers?

A. Oh, they are always besieged principally by manufacturers and people who are sometimes merchants—generally manufacturers, though.

Q. Men that have very large shipping interests go down and have their meetings with them?

A. Well, they go down there and apply for changes in weight or rate or something of that sort.

Q. They go there and discuss changes in weight or bulk and the rates as it refers to manufactured articles?

A. The rate; that is, the Classification sometimes fixes the weight or rate on manufactured goods that become prohibitive, perhaps, or with some other point that has the same goods possibly in a territory covered by some other classification. They are getting around to as nearly perfect as they can. It is a good deal better than it used to be." (R. pp. 853, 854.)

Mr. C. B. Bee, Rate Expert of the Corporation Commission of Oklahoma, testified at great length on rate subjects principally, but his cross examination carried him into almost every subject connected with the case. His testimony begins at page 1176.

He is in charge of the Rate Department and has been for three years past.

His duties are to advise the Commission as to rates in effect in different States of the Southwest, and the interstate rates in effect in the Southwest, and the conditions governing freight rates, and to assist the Commission in making freight rates to govern shipments in Oklahoma and generally the handling of the rate situation in Oklahoma. (R. p. 1176.)

At the time he was selected as Rate Expert for the Commission he was acting as Assistant General Freight Agent of the Mexican Central Railway Company. All his railroad experience had been on Mexican roads and he gives this sketch of his work before going with the Corporation Commission:

"I started in as stenographer to the division superintendent, his office stenographer; promoted from that to car stenographer; and through the different positions in the superintendent's office, such as overcharge and damage clerk; chief clerk; and then on the road with the superintendent as handy man, going where he directed; from that to the motive power department with the assistant superintendent of machinery, and numerous positions in the motive power department; my last service in that department was balancing power; and I was transferred to the freight department, holding all the positions in the freight traffic department up to acting as assistant general freight agent; that is, commercial agent; all the rate positions—first, second, third and fourth rate clerk; chief rate clerk; chief clerk of the rate department; commercial agent; division freight agent; general agent and back into the office." (R. p. 1176.)

Mr. Bee's views are found in answer to these questions:

"Q. I will ask you what relation interstate rates prevailing in the Southwestern territory, particularly in Arkansas and Oklahoma, that you are familiar with, bear to the cost of the service, and what consideration is given in making interstate rates, to the cost of service for work done?

A. Other than a fixed figure which has sometimes been recognized in railroad rate making, I have never known of the cost of service entering into the making of a freight rate; that fixed figure has now been discarded, entirely by all traffic officials; it was the old bugbear of five mills per ton per mile, which was for years considered the actual cost of service on long hauls. That figure has been dropped, and no traffic man at present uses it, and freight rates are not made on the cost of service.

Q. What considerations govern the making of interstate freight rates?

A. All the traffic will bear.

Q. Explain just what that means in rate-making parlance?

A. It takes into consideration the commodity of the traffic, the value of the commodity, the points between which it is moving, the competitive conditions surrounding the movement, and, of course, regard is given in all instances to the nature of the commodity, and

that is the nearest that a traffic man ever comes to the cost of service; the rates on a low value commodity, and one which will suffer very little from damage, are considered low grade commodities, while the reverse is true on high grade commodities; no traffic man would consider the same rate on oil as he did on sand, but he would not be attempting to place the cost of service upon the two, but rather the liability, and the rate that the two commodities would stand.

Q. That is, the relation of one commodity to another?

A. That is it exactly.

Q. That is best expressed in the classification of commodities, isn't it?

A. That is true; the classifications as published today largely govern those things.

Q. But even those classifications are full of exceptions, are they not?

A. Yes, sir; and made largely upon guess work.

Q. Are the exception sheets to classifications prevailing in Oklahoma?

A. Yes, sir.

Q. Are you familiar with the exceptions sheets prevailing to the Texas common points?

A. I am.

Q. Is that large or small?

A. Very large.

Q. Are you familiar with the exception sheets prevailing in Arkansas traffic?

A. Yes; both State and interstate.

Q. That puts another variable quantity into the rates, doesn't it?

A. It does." (R. pp. 1178, 1179.)

* * * * * * * * *

Then Mr. Bee takes up the subject of zone or flat rates on lumber and grain particularly. (R. pp. 1179, 1180.) Mr. Bee explains the movement of cotton. It is delivered to the railway company and by it carried to a compress point, then held on cars till ordered compressed; delivered to the compress, unloaded by the railway company; again taken from the compress when compression completed; loaded again by the railway company, and hauled to final destination. It is treated as L. C. L. throughout its entire movement; the rate is based on bales..

Its first movement from point of origin to compress point is billed on a local rate, but, when forwarded to its destination, the rate from point of origin to final destination is charged and the local rate refunded, or the difference refunded. The entire movement is interstate and all the cotton moved in Arkansas (excepting an infinitesimal amount) is shipped out of the State. (R. p. 1181.) He says that

cotton is the most expensive commodity handled by a railroad company, and these are his reasons therefor:

"I think it entails great expense and more liability upon the railroad company than any other commodity handled, and the reason is that it requires a large force to load and unload. As a rule, cotton is loaded at small stations where there is but one man employed; it is necessary to bring the section foreman into that station to load that cotton on, else employ people there in the town to load it. Oftentimes, railroad companies pay the owners of the cotton to load it for them. Care must be taken to get a perfect car in which to load this cotton. After it is loaded, railroad companies by their rules require that the doors be batted, which requires an additional expense, and this batting is always thrown away at destination, unlike grain doors, which are returned. This cotton must be placed in the yards at the compressing point, and it is a very unusual thing, during compressing season, if there is not an extra switching engine at all large compressing points; as cotton is not handled upon its arrival at the compressing point, but the people who own it hold it, and there is no way for the railroad company to tell what car is next going to be called for. I have seen as high as five hundred cars of cotton laying in a yard, and some of them would be there twenty and some thirty days, some only three days, and every time a car is called for, it generally means the switching of that entire cotton yard to get that car out and switched to the compress. Demurrage and storage has not been charged on cotton heretofore; it is now, in order to do away with this extremely heavy expense. After cotton is moved to the compress, it is again put back in the car, the same process being gone through with. In the cotton countries in our State, some railroads equip their engines with oil burners, in order not to throw sparks. They haul oil a long distance and do not handle oil on other branches of their road; it is merely to protect this cotton. Cotton moving from point of origin to the compress point is in big bales, and I think it requires about 2½ to three cars of open cotton or flat cotton to make one car of compressed cotton, so that there is that many cars moved into the compress which must move back empty for other cotton, and the liability on the cotton is very strong; it is always loaded at shipper's count at blind sidings, sealed after he closes the doors, seldom counted by the agent; fires have often been known to occur where there was a question as to whether there was a bale of cotton in the car at all."

Q. What is the casualty rate on cotton?

A. High, exceedingly so; once a fire starts in a bale there is no telling when it will stop, or when it will be discovered. (R. p. 1180.)

The rates on cotton are thus explained:

From Oklahoma there is a flat rate of 70 cents into the New England States.

From Little Rock it is 80 cents, and from Fort Smith 85 cents.

This is to the New England mills. Most of the railroads in New England participating in the rate, and applies generally in New England irrespective of distance. The 80-cent rate from Little Rock would apply from that point and for some distance around it; and this flat rate is divided between the various carriers, irrespective of number of carriers. (R. p. 1183.)

He also explains the citrus fruit flat rate. A train of oranges from California to New York will be carried, after it gets east of Colorado, on a flat rate. A car dropped at El Paso, Texas, at Houston, Texas, at Texarkana, at Little Rock, at St. Louis, at Pittsburg and at New York each pay the same freight.

"There would be a haul in there of approximately a thousand miles, over that, between the Little Rock car, the New York car, and if the New York car was pulled on the cost of service, there would be an exceedingly high profit made out of the Little Rock car, or *vice versa*, somebody would lose money in carrying that car to New York." (R. p. 1184.)

The Texas common point rates are explained:

"Q. There is a map there on Texas common points?

A. I am thoroughly familiar with that.

Q. State the effect on the revenue of shipments passing through Arkansas under that Texas common point schedule?

A. The conditions could be so changed on two carloads of freight of exactly similar commodities, loading from a given point of origin, to separate destinations in Texas that the revenue received by the lines participating in the business would be almost double on one car what it was on the other. That Texas common point rate applies from the north to the south, and from the east for a long distance west; the highest distance between two points being 662 miles, in what is known as common points territory.

Q. That is at the Texas end of it.

A. Yes, sir; I think that is the highest distance; I figured it out the other day for the Interstate Commerce Commission.

Q. How would that result be brought about?

A. The result would be brought about by two shipments originating at St. Louis, the cars being loaded with identically the same commodity, one being destined to Texarkana, Texas, instead—take to the first point in the common point territory of Texas—I believe there are two stations in Texas (referring to map). Take two shipments originating at St. Louis, handled over the Iron Mountain, one destined to the first station in Texas, on the T. & P. Railroad south of Texarkana or west of Texarkana, the other being destined Big Springs, Texas, which appears from this map to be the end of the common point territory. The distance between those points is in excess of five hundred thirteen miles, and the rate would be exactly the same. Dividing the rate by the miles handled, figuring in mills per ton per mile, it would show a figure nearly one-half for the car

destined for the last station as for the car destined for the first station. The exact figure would be easily worked out. In other words, the haul on one would be something over 513 miles more than on the other, and the rate would be the same per hundred pounds.

Q. What effect would the distribution of that rate between the different carriers in Texas, have upon the matter?

A. The other carriers in Texas would receive a part of the rate.

Q. Within that Texas zone would there be different carriers handling this commodity?

A. Yes; you can figure rates from defined territory to Texas points that would require the handling of three or more carriers to deliver the shipments. (R. p. 1185.)

If this freight movement originates east of St. Louis a similar condition exists. The longer the haul, however, the less disparity. Take Grand Glaize, Ark., the last point in the defined territory to the first point in Texas taking the rate, and it would be about three times as much as for the longest haul. Pittsburg is the eastern limit and a group surrounding Pittsburg take Pittsburg rates, a group surrounding Chicago take Chicago rates, etc. A shipment of steel from Pittsburg to the farthest common point, Big Springs, Texas, would be carried by as high as ten or twelve carriers, or as few as three or four, depending on the routing, but generally about six carriers; this flat rate would be divided between these carriers, whether three or twelve. In its passage through Arkansas the freight to Texas common points would usually be handled by four or five lines and a fluctuating condition of the revenue apportioned to Arkansas for almost every shipment, although the cost would be the same." (R. p. 1186.)

The water competition fixing rates is discussed by the witness. Owing to it there are rates from St. Louis to New Orleans less than to Little Rock which they have under the cheaper rate right through Little Rock to New Orleans. Many of these rates are based on a theory of water competition where none exists. (R. pp. 1187, 1188.)

In the Southwestern country some of the States have combined Commission, legislative and voluntary rates; this is true of Kansas and Oklahoma. Some have all Commission-made rates, Texas and Arkansas; Missouri, Louisiana and Mississippi have partly Commission-made and party voluntary. State rates are strictly arbitrary, mostly on a distance scale. (R. p. 1188.)

Each State has either its own classification or adopts the Western Classification, subject to its own exceptions.

"Q. What effect does this variation in the classification that you have just explained, have upon the revenue?

A. It is possible to change the revenue materially by variations in classifications.

Q. In what way; that is clear to your mind as a traffic man, but to the lay mind it would probably require a little explanation of just how it is done.

A. As a sample we will say the first-class rate is 40 cents, and the second class is 30 cents; a change was made in the classification, and the exception would reduce it to second class; it would immediately change the rate from first to second, and would make a change in the revenue of the railroad of ten cents a hundred pounds." (R. p. 1189.)

Regarding the general proposition that the longer the haul the cheaper, proportionately, it can be carried, Mr. Bee makes a statement worth considering:

"I want to add there that the traffic men themselves say, the longer you haul the shipment the cheaper you can handle it per ton per mile. That is a misunderstanding. I don't think any traffic man will go on the stand and say you can haul a shipment 200 miles cheaper the second hundred than the first hundred. But the fact is that by reducing the rate per ton per mile, you are still paying your terminal expense, and the cost of the haul just the same 100, 200, or 300, with the exception of the terminal expense; and of course the longer you have to go you can exact a smaller fraction on each mile to pay that terminal expense with, and that is the only reason that I know of why it costs less to handle the shipment a long distance than a short distance. After a shipment goes over one terminal or one division, it costs just as much to handle it—

Q. You mean the cost per ton per mile?

A. Yes; or the cost as a whole; any way you want it. The terminal expense at origin and destination has to be taken care of, and if you can haul that shipment 500 miles you can take a less figure on each mile to pay those two terminal expenses, than if you are going to haul it only 100 miles. The actual cost of transportation is just the same, if the condition of the road is the same.

Q. Suppose this factor enters into it: Suppose the longer the haul, the more intermediate carriers?

A. That is largely true.

Q. And the rate is thinned out by every division?

A. It continues to thin all the time. A shipment passing through interstate from road to road will stand a heavier terminal expense, right here in Kansas City than it would cost to be delivered in Oklahoma. I understand that the expense there has been figured out at $4.80 or about that.

Q. Do you refer to St. Louis or Kansas City?

A. I meant Kansas City, $4.80 there, from line to line. They have never contended it cost over $2.60 to deliver freight in Oklahoma, at our largest and most expensive terminal we have. (R. p. 1207.)

On cross examination Mr. Bee, after repeating to him the substance of his statements on direct, on the way rates were made, was asked:

"Is the desire to get a remunerative rate the cause of his taking

these elements (the character of the commodity, its value, etc.) into consideration?"

He says to a certain extent he (the traffic man) does, but he can not tell whether it is remunerative or not, but he has to handle the business just the same.

He will not go below the cost if he can help it, but he does not know the cost, but he does the best he can to get a rate above cost except to meet competition; then he does not take it into consideration at all. (R. pp. 1217-1219.)

In making special rates they take into consideration the volume of business. (R. p. 1219.)

He formerly thought that rate men took into consideration reciprocal tonnage in fixing rates, but from experience and observation of the roads operating in Arkansas and Oklahoma he does not think such is the case, and pressed for his reasons he gives numerous instances, the roads and the officers, who refused to make rates on that basis. (R. pp. 1219-1221.)

A full statement of Mr. Bee's opinion on the cost of service may be gathered from this excerpt from his cross examination:

"Q. In view of what you have stated in connection with the elements that are taken into consideration—since you have been discussing this subject this morning—with reference to the effect of value; length of haul; liability incident to the haul, the nature of the commodity; and in view of your statement that those matters are considered by traffic men, although you think they have not the information as to what the cost is, I want to ask if you think it is correct that traffic men do not give any consideration to the cost of service in fixing rates?

A. I think they give very little consideration to the actual cost. Now, understand me. I don't want to be understood as saying that a traffic man is going to solicit a shipment or make a rate on any figure that might come into his head. I don't want to put a traffic man in that light. I don't want to indicate for one moment that any traffic man is that much of an idiot. But I mean, he is not figuring what the cost of service is. He does not know that the cost of service represents six mills for 100-mile haul or eight mills for a 50-mile haul. He has no figures of that kind. He takes a rate and tries to get what he can out of it. He has in his head, probably, an arbitrary figure that he will not go below, but if he was asked tomorrow to testify as to the cost of service, he would be unable to do so. He is trying to hold the business down so his road can get some money out of it. He is taking business and instructing his men to take business which is paying him enough, or he thinks is paying him enough. He considers he has to take it to keep his trains moving.

Q. And you stated a while ago that he could not give the cost of service?

A. Or even approximate it.

Q. In the nature of things, it is quantity that is unknown to him, yet in fixing the rates he regards the cost in so far that he will not fix a rate which is nonremunerative, and he does consider these elements you have mentioned?

A. He would fix that on a new rate and a rate over which he had the power to make it; there is no doubt about that.

Q. That is where the conditions are normal?

A. Where the conditions are entirely in his power. The other might be a condition where he would not have any power over the rate at all. Some one else might have stepped in there ahead of him." (R. pp. 1221-1222.)

The testimony of Mr. Becker, Chairman of the Western Classification Committee, heretofore given, as read to Mr. Bee and he was asked as to his views on the subject and said:

"A. I agree with him, as I said before, that classification is built upon the relation of the cost between the two articles; it is not made on the actual cost of service to handle it, and I don't think Mr. Becker intended that; as between the first and second classes, Mr. Becker is trying, in making the classifications with his committee, to so arrange those two commodities that they bear a relation to each other, but not that they bear a relation to the cost of service, but to each other, and as far as traffic conditions are concerned, the revenue coming from them, he feels that one commodity will stand a higher rate than the other, and it goes in the classification higher, and that is what I think Mr. Becker refers to when he says the cost of service is the basis.

Q. Isn't it also true that traffic men, in making rates, are influenced by the same considerations?

A. To a certain extent they are; yes, sir; not to the actual exact cost of service—I want to be understood at all times, in making a statement that a traffic man or any traffic man takes into consideration the cost of service or the approximate cost of service; that I mean that he attempts it between the two articles only; rates are made upon a comparison entirely." (R. p. 1224.)

Questioned in regard to the rate from the Southern lumber zone, he says he thinks it an unremunerative rate, and his attention was called to testimony that the freight agents of the roads maintaining it had testified it was remunerative, considering all factors, and they figured on the cost of service, and he says: "The freight agent was figuring that on the 22-cent rate he was not making a profit on shipments from the southern part of the zone, but his idea was that what he was making on the northern end of it would compensate him for it, and that he was trying to make some one else bear the burden of it." (R. pp. 1227-8.) (Elsewhere it will be seen that Mr. Perkins' testimony that about 15 per cent of the lumber movement on this flat rate was from Arkansas and the rest of it south of it, therefore the greater part of it was at an unremunerative rate, according to

Mr. Bee's views.) Mr. Bee goes into very specific illustrations to prove his assertions in regard to the lumber rate, not being based on cost of service. (R. pp. 1228-1230.) In fact, the cross examination of Mr. Bee deals largely with specific instances given to illustrate any statement he makes, and, to get the full force of it, it must be read in its entirety.

Mr. Ludlam testified that a rate-maker, as a rule, has no specific data as to the cost of service; he knows in a general way the cost per ton per mile to move freight on his road, but does not know it by divisions.

There is a vast difference in expense of one division compared with another, and this would make a great difference in the cost of service dependent upon the division of the road upon which it moved, and there are no statistics to give this data and guide the rate-maker. (R. pp. 1319, 1320.)

Mr. Wilmering testified on this subject as follows:

"Q. Are those rates so made that they reflect the cost of service, and that the rates can be taken as a measure of the cost or expense of handling the traffic?

A. In a general way the rates are not made on the cost of service. I believe that railroad rates are made on tradition, not on condition, and from my investigation I find that railroad rates, when they are made without restriction, are primarily made by the traveling freight agent or a contracting agent, and by up-to-date freight agents; they feel the pulse of the business around the territory occupied by their company, and in the past it has been the custom that if the business was offered and could not move at the standard rate, a lower rate was made, irrespective of the cost of service, to get the business. I have been present at the cross examination and assisted in the cross examination of many of the eminent railway traffic officials who are at the head of the traffic departments of those roads operating through the State of Oklahoma, and I have never heard one state positively that he had any regard for the cost of service in making rates." (R. pp. 862-3.)

On cross examination he was asked upon what he based this statement and explained it more fully, and then was asked to give instances, which he did in great abundance. (R. pp. 1123-1130.)

These specific details are too numerous for condensation, but are well worth studying.

Mr. T. A. Hamilton had quite a useful apprenticeship in minor railroad positions and then five years' experience in a rate-making office, and in the last few years has made a minute investigation of the rate situation in Missouri and Arkansas. His views, based on these experiences, are well worthy of consideration. He says:

> "I gave a great deal of thought and study to the rate conditions in that territory—Southeastern territory—for a good many years. I had to do it to earn my bread and butter. I saw those

rates in their daily application, covering practically all the territory east of the Mississippi River and south of the Ohio and Potomac rivers, and I do not believe that there is a more complex territory, from a rate-making or rate-applying standpoint, in the world.

"Rates were made down there—or at least they appeared on their face to be made—so no sane man could understand the reasons for them. Certainly a great many of them were made without any relation to the cost of service. I would like to illustrate that just a little:

"The Mississippi Valley tariffs to common points in the New Orleans group, carry from St. Louis a great many commodity rates.

"For instance, the rate on soap from St. Louis to Mobile, was 28 cents. The rate applied from the west bank of the river. The L. & N. paid the river transfers, as did all of its competitors, the Illinois Central, the Mobile & Ohio and the Southern Railway.

"The rate to points directly north of Mobile, through which Mobile traffic would pass on its way from St. Louis, were almost double the Mobile rate.

"The shippers here in St. Louis would secure what we called 'combination rates.' They had the privilege of shipping their stuff to Mobile at 28 cents and shipping it back at the local rate, making a much cheaper rate than the local rate to any intermediate point. As I recall it, those rates reached clear back to Montgomery. That is, we could make a combination rate cheaper than the straight of way local as far back as Montgomery; and not only that, but when you made the combination on Mobile, you made a St. Louis rate which absorbed a transfer. Your local rate was an East St. Louis rate, which did not.

"That is just one illustration of a great volume of rates that we made in that way.

"I recall that we had a considerable movement of stoves into interior Georgia points, and we found that in the every-day application of the rates we could make a cheaper rate by applying the rate from St. Louis to Jacksonville, Florida, and the local rate back into the interior of Georgia, than the published straight rate to the interior point. (R. p. 1474.)

* * * * * * * * *

"Another instance of making rates to meet the necessities of traffic, regardless of the cost of service, was a set of rates we had in another matter, East St. Louis to the Ohio River, on grain destined to the Southeast.

"We got grain delivered to us at East St. Louis that originated west of the Missouri River, as I recall it, and if it was properly reconsigned through the Southern Freight Commit-

tee—virtually a milling-in-transit arrangement, we hauled it to Evansville, Indiana, for one cent, and if it originated in Missouri locally we got four cents for the same haul. If it originated in an East St. Louis elevator with no indication or surrender of tonnage beyond St. Louis, we got 6½ cents for the same service.

"We had what was known as a proportional rate on grain, which was the same as that. We had a connecting link between Henderson, Kentucky, across the river from Evansville and Louisville, which was much shorter than our own line through Guthrie.

* * * * * * * * *

"It was along those lines, the handling of rates, not the making of them, their practical application to the every-day traffic, and applying that division of them between our line and other lines; work of that character. The building up of rates where we found that the fabric of our through rates could be defeated by combinations. It required quite a study; not only of the railroad I was with, but all of our competitors in that territory.

"That lasted some five years, that actual every-day experience in meeting these problems and applying them to the freight traffic of my employer, the railroad company.

"I have listened with a great deal of interest to what has been said by the gentlemen in this case regarding rate-making and it coincides quite a little with my experience in applying rates, and I would like to summarize that with my best thought on the matter.

* * * * * * * * *

"When a railroad traffic man states that the cost of service is considered in making rates, he undoubtedly has in mind the ideal condition. But as a matter of fact, the basis of his rates, owing to the manner in which they are adjusted from time to time—patching a new rate on to the old—must necessarily be tradition and precedent, and it would be necessary for the origin of that tradition and precedent to go back to the very genesis of railroad rate-making. Assuming that even at that time the first schedule of rates had a cost basis; that the road knew its costs and added a certain percentage of profit to that in making its freight rates—we would have to assume it knew its cost by actual commodities, but even that is doubtful, because the first railroads had to meet stage and wagon competition, as well as canal boat competition. Stages and canal boats were there before we had any steam engines, and if they had to meet that competition they had to meet the cost ideas of the canal boatman, the stage driver and the man who drove the freight wagon.

"If that is the basis of the present rate fabric, and rates are made by readjusting and rearranging, patching, extending and

contracting existing rates, I feel that any traffic man will bear me out in my statement.

"That does not seem to be a cost foundation, to begin with. If a traffic man has any idea at all as to the cost of service, it must necessarily express itself to him in some specific terms—he must have a unit, a yardstick to measure by.

* * * * * * * * *

"Even if we assume that the ton-mile cost of transporting each individual commodity on a given line of railroad was known to the traffic manager of the road and he desired to make his rate based on that cost, plus his percentage of profit, it is a grave question how far he could go in that direction. Certainly, he could not go beyond the first junction where he met short-line competition. He would have to meet his competitor there, and his cost ideas, or go out of business. He could not go beyond the first navigable stream where he would meet boat competition with rates made on a package basis in many instances, as in the case of many commodities between St. Louis and New Orleans and St. Louis and Memphis.

* * * * * * * * *

"It is a question whether a traffic man could solve all these problems and meet so many different conditions of operation and cost on other lines, and so many other traffic men's ideas of what rates are profitable, and still adhere to a basis of actual cost, plus a percentage for profit.

* * * * * * * * *

"As a matter of fact, a traffic man gets out of such traffic as high a rate as he can, but he must be satisfied with what the traffic will bear, or the industries will not open and his cars will come back empty.

"This reciprocal traffic must be considered, too, in making rates on business in the opposite direction where the volume of traffic is, where the predominating traffic is, as the fewer empty cars you have to haul back the less burden of that empty car movement cost your outbound traffic will have to bear.

"Rates to and from large territorial zones are made by freight committees and tariff bureaus, for all the roads operating in the territory affected, and while each road has nominally a voice in making the rates so promulgated, still the views of all or the majority of those roads interested must be met and harmonized. If they did not do that they would not promulgate the rate.

"Rates made in this way are applied by divers routes and the length of haul and general operating conditions, I would say, are seldom, if ever, the same on any two roads between any two given points.

* * * * * * * * *

"Surely rates made on the bureau plan are not based on the operating cost of any one railroad interested. Rates so made often operate to keep down rates to an intermediate and strictly local points where the conditions and cost of operation are entirely different.

* * * * * * * * *

"Combination rates are authorized by many railroads. That is, the through rate to a given point for a longer haul, plus the local rate back to an intermediate point, makes a combination that is lower than the rate published direct to the intermediate point.

"It is plainly apparent that the cost of service is not considered in making both these rates. It may be considered in making one." (R. pp. 1475-1478.)

In examining the record in Smyth v. Ames, the testimony of Mr. Albert Fink, a prominent railroad official of his day, for many years connected with the Louisville & Nashville Railroad Company, and at one time receiver of a railroad in Arkansas, was found to be in point on this subject. He was a witness introduced by the railroads in that case.

*Testimony of Albert Fink in Smyth v. Ames.*

Beginning at page 683 of the Smyth v. Ames record is found this:

"Q. In point of fact, have freight tariffs been framed and are they framed with reference to this matter of cost? A. Of course, the cost ought to be considered as an element in freight tariffs, especially to the extent that you should not do any work at a loss. Q. Would you say cost on any particular shipment or the average cost of transportation? A. If you would ascertain the cost of any particular shipment, of course you should not take the freight at a loss; but it is impossible to ascertain the cost of particular shipments, as I have explained before. You asked me the question how tariffs are formed, and I merely mentioned that cost was an element to the extent that you ought not to take any business at less than cost, but beyond that the cost has very little to do with the framing of tariffs; in fact, as a matter of practice, it is hardly ever considered. A general manager may have in his mind a certain minimum cost under which he does not want to take freight, but the freight agents don't know any more about the cost than the man in the moon. They make their tariffs on commercial principles. They find out what they can get and they adopt the tariff with a view of securing business. If a shipper does not want to ship by them at a certain rate, they must either go out of the business or they must take a less rate, and they have to regulate that from time to time to meet the demands of the public and commerce and of competition, but it is much oftener the case that the tariff of the road is made up by some other road; in fact, there are few roads that have much control over tariffs. They are simply guided by competition with other roads

and water lines and the competition in the market. That forms the principal basis in making tariffs. The cost of transportation is hardly ever considered.

Q. Then you would say freight tariffs are the outgrowth of experience more than arbitrary rules?

A. I would; they are changed constantly to meet the constantly changing conditions of the market and competition. If you were to fix a tariff permanently and some other competing road would lower its tariff, you would lose the business.

On page 670, this occurs in his testimony:

Q. You think the tariffs as made are not based on the cost of transportation?

A. As a practical question, I don't know any of the freight agents in the country who know anything about the cost of transportation.

Q. You think they are ignorant on that point?

A. They have no use for it.

Q. And they base it simply on commercial principles?

A. Commercial principles; that is the principal basis. Of course, I take it for granted that the general manager is looking after the cost of transportation, and no doubt the general freight agent might get his instructions as to what rate he may charge in certain given cases so as not to be below the cost.

Q. And the tariff is based usually, then, on what the traffic will bear?

A. Yes; if you understand that in the proper sense.

Q. I think I do.

A. If you mean by it, do men charge everything they can—I would not like to use that expression. Instead of that I would say what the service is worth to the shipper.

Q. In other words, the first item to be considered is the value of the article to be transported?

A. No; the first item is the value of the transportation service to the shipper. Suppose a certain article of transportation is to be moved from New York to this place; it depends upon the market whether the price here is high enough to stand a certain charge for transportation in addition to the cost of the article. If, for one reason or another, that same article is supplied in Chicago from another source at less than the charge for transportation added to the cost of the article in New York, then the article can not be transported here from New York unless the rate is reduced so as to put the New York article on a footing with the article from elsewhere."

## THE STATE'S DEMONSTRATION EVIDENCE ON COST OF SERVICE.

(b) Heretofore is set out the opinion evidence on both sides of the proposition that the rates are based on the cost of service, and

EXHIBIT 38
Zone Rate on Grain.

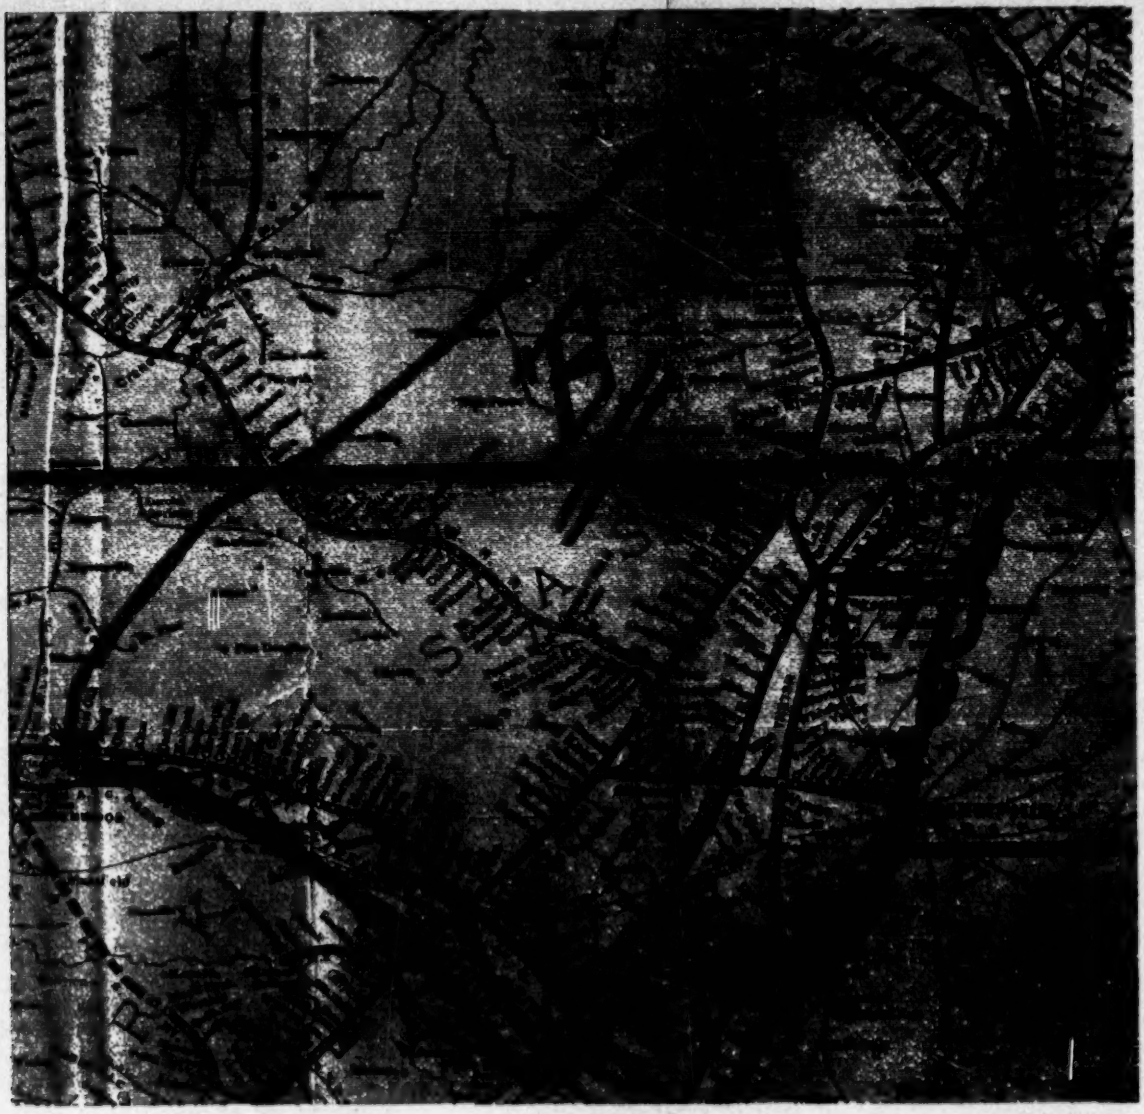

**EXHIBIT 38.**

**Zone Rate on Grain.**

your attention is called to another class of evidence on the subject, which we term demonstrative evidence, wherein the defendants showed from the rates and movements under them that the rates bore no relation to the cost.

*Zone Rates.*

The zone rates will be first considered. This term is not one accepted only by traffic men (R. p. 1647), but is an expressive one to the lay mind, and, as the facts are undisputed, may be adopted. These zone rates are fully explained in the testimony, and, to illustrate some of them, maps were filed, exhibits 38 to 44 inclusive. These are approved by Mr. Perkins, the Iron Mountain Traffic Agent, and made exhibits to his testimony. These maps are not printed, as they are too pictorial and expensive. Exhibits 38 and 40 are reduced and printed with this brief to illustrate pictorially the evidence regarding these zone rates.

The first zone rate considered is grain and grain products. It is illustrated by maps in exhibit 38. In reduced form these zones are herewith presented on opposite page. The grain rates are taken from Iron Mountain Tariff 5714-A, I. C. C. 9975. It names a blanket rate of 19 cents per hundred pounds in carloads on corn and 44 other commodities from all points on Missouri Pacific Railway Company, indicated as Group A, to all points on Iron Mountain, indicated as Group B on the map.

It applies from 157 stations in Missouri and Kansas to 369 stations on Iron Mountain in Missouri and Arkansas.

A blanket rate of 23 cents per hundred pounds is named for wheat and 13 other commodities from all except 11 stations in Group A to all stations in Group B.

The casualty risk on these different commodities vary materially, the minimum weight of cars for these different commodities varying 10,000 pounds and the car capacity varying also for the different products.

The records were investigated and quite a movement found under it—it was not a "paper tariff."

In illustration of the inequalities of the revenue derived under this tariff, flour moving from Independence, Missouri, into Arkansas with a 23-cent rate, moved through Arkansas to Southern territory at 14 cents for the Iron Mountain haul from Independence to Memphis. A shipment moved from Independence, Missouri, to McCrory, Arkansas, at 23 cents and another from the same mill to Asheville, North Carolina, passing through McCrory on its way to Memphis, paid the Iron Mountain 14 cents. (R. pp. 1462, 1463.) Yet this revenue is used in this case as the proper factor with which to divide the expenses of traffic!

The lumber zones are next considered, and are illustrated in maps in exhibit 39. The rates are taken from Tariff No. 5116, I. C. C. 6228.

It is a rate on Iron Mountain and 34 connecting lines situated from Little Rock south to points on Missouri Pacific in Missouri, Kansas, Nebraska and Colorado on D. & R. G. Railway in Colorado. There are three zones in the tariff for the destination of the lumber.

One zone extends from Coffeeville, Kansas, to Omaha, Nebraska, as far east as Etlah, Missouri, 80 miles west of St. Louis. The rate to that zone is 23 cents.

The next zone is in Middle Kansas and the rate is 28½ cents.

The third zone begins just west of Hoisington, Kansas, and extends to Pueblo and takes in the D. & R. G. as far north as Denver and as far south as Trinidad. The rate is 34 cents.

The producing territory covers 236 stations on the Iron Mountain and 300 stations on the named connections.

The zone to which the 23-cent rate applies includes 390 stations, the zone to which the 28½-cent rate applies includes 42 stations, and the zone to which the 34-cent rate applies includes 52 stations on Missouri Pacific and 80 on D. & R. G. Railway.

Testing the movement under this tariff for the first 15 days of October, 1907, it was found 426 cars moved (R. pp. 1456, 1457); a train of 28 cars per day, a very respectable sized train.

Another lumber zone rate is next illustrated in exhibit 40 A reduced edition of it is herein shown.

The rates are taken from Iron Mountain Tariff No. 4903-A, I. C. C. 5057, and provides a blanket rate of 18 cents on pine and cypress lumber, carloads, to St. Louis and 16 cents to Cairo from the zone extending from the Arkansas River to the Gulf of Mexico, including all South Arkansas, Louisiana and part of Texas.

The map does not show the Texas territory, but the evidence shows it applies to part of it, included in another tariff.

Taking this tariff alone, and it shows this rate applies from 584 stations in Arkansas and Louisiana to St. Louis and Cairo.

The most northerly point is Little Rock; the most southerly Lake Charles—a difference in the hauls of 214 miles, giving the shortest route to the Lake Charles movement.

Three hundred and nineteen of these 584 stations are located on connecting lines, and each of which receives its division of the 18-cent rate. To illustrate: If a car was shipped from Lake Charles to St. Louis, the shipper would pay 18 cents per hundred; it would be delivered to the St. Louis, Watkins & Gulf Railway and by it carried to Alexandria, Louisiana, and there delivered to the Iron Mountain, and the St. Louis, Watkins & Gulf would receive 6 cents and the Iron Mountain would receive 12; but if the Iron Mountain picked up another car at Alexandria, it would receive 18 cents for carrying it to St. Louis along with the Lake Charles car; and, going still further, if it picked up another at Little Rock, 150 miles north, it would receive 18 cents for hauling it to St. Louis.

There is no excuse from terminal service in the varying revenue;

**EXHIBIT 40.**

**Zone Rate on Lumber.**

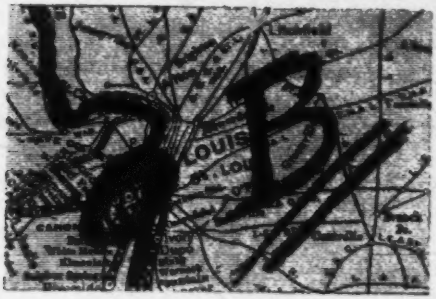

EXHIBIT 40.
Zone Rate on Lumber.

EXHIBIT 40.
Zone Rate on Lumber.

the record shows that during the first half of October, 1907, there were 22 lumber cars going to Iron Mountain from Louisiana Railway & Navigation Company, the Iron Mountain division being 13 cents, and 16 cars from Watkins & Gulf, for which it got 12 cents, both connecting lines, and exactly the same service, and a cost per hundred pounds dependent on the favor to the connecting carrier; and alongside these cars were picked up at Alexandria in the same period nine cars, for which the Iron Mountain got 18 cents. The total movement for the first 15 days of October, 1907, into St. Louis was 566 cars on this tariff. (R. pp. 1450-1456.) This would be 37 cars a day. The average through-train carload is 33 cars. Thus it is seen that under this one tariff alone more than an average through train went into St. Louis every day.

The zone rates on cotton seed products from producing territory in Arkansas and Louisiana to consuming territory in Missouri and Kansas are illustrated in exhibit 41.

There is a blanket rate of 17½ cents on hauls ranging from 256 to 598 miles. The first half of October, the time the books were examined, showed only a light movement under this tariff, 25 cars, for the 15 days (R. p. 1460), but that much moving so early in the cotton oil season would indicate a heavy movement later, and was so explained by the witnesses.

The rates on cotton from Arkansas, Louisiana and Missouri to Eastern seaports, principally Boston and Boston rate points, are illustrated in map shown on exhibit 43. There are numerous zones in the producing territory, but they are comparatively small, but the consuming zone is very large.

The lines east of the river got 35 cents of the rate, those west got the balance. On the eastern end of it the division of the rate is the same, whether the cotton is handled on to Portland, Maine, through the Boston terminals or stops at some mill near New York. (R. p. 43.)

The Texas common point rates are much discussed in the evidence They are illustrated on map in exhibit 42. The map does not show all the zones, but only illustrates three; the evidence explains them fully. The map only gives the Pittsburg territory and St. Louis territory and the receiving zone, which is the common points in Texas. This is all a southbound movement. The same commodities moving north bear another rate. The St. Louis territory extends from Southern Mississippi and a portion of Southwestern Alabama to Central Illinois, extending almost to the Missouri-Kansas line, taking in most of Missouri and part of Arkansas. The result is that the same rate applies from all that St. Louis territory to all of the 2,600 stations in Texas. For instance, the same rate applies from Jefferson City, Missouri, to any of these 2,600 Texas towns that applies from Newport, Arkansas, 60 miles north of the capital of Arkansas. The Chicago and Cincinnati territory extends from

Frankfort, Kentucky, to Omaha, Nebraska; there is an added difference here, as these shipments go into St. Louis on fixed differentials, and when the Iron Mountain takes it there its division of the rate shrinks on account of it, while the rate to the shipper is the same, and the Iron Mountain gets less from the haul from St. Louis to Texas, owing to the differential under which the shipment moved into St. Louis. The cost of the transfer at St. Louis would be more than the cost of receiving it from an industry at St. Louis, but the revenue is less. (R. p. 1458.) The same is true of the Pittsburg territory, the shrinkage greater.

Taking the other end of the situation: The Iron Mountain ends at Texarkana, Arkansas, on the Texas line; it does not deliver a car of this freight to any of the Texas common points, the first one being a few miles from Texarkana. Its haul of all of it (except the small part picked up between St. Louis and Newport, Arkansas), is identical. These Texas towns are distant 626 miles from furthest points. In every case one, and from that up to half dozen, railroads would get divisions of this flat rate, and yet the cost of the service is identical for all of it so far as the Iron Mountain is concerned. (R. pp. 1456-1459.)

Mr. Perkins, the Iron Mountain Freight Agent, testified at great length about these rates, in explanation and justification of them. We are not concerned with their righteousness—merely whether the revenue derived from them is a proper factor with which to divide expenses. (R. pp. 1620, 1627.)

It is in evidence that the transstate traffic of the Iron Mountain is 51 per cent of the total ton-mileage, and Mr. Perkins was asked what proportion of that 51 per cent was the movement to Texas common points under these rates; he said it would be from 5 to 10 per cent of the 51 per cent. (R. pp. 1644, 1645.) In other words, it would be about 3¼ per cent of the total ton-mileage of the road in Arkansas, just about half as much as the intrastate ton-mileage. This is the only evidence in the case on this subject and we presume may be taken as correct. Mr. Perkins was questioned in regard to the divisions between other roads and the divisions between Arkansas and the other States on the track mileage of the revenue received from these Texas shipments. He admitted the revenue would be different on the different shipments owing to the point at which the shipment originated, although the service would be identical. He admits that the apportionment of the revenue to Arkansas by the track mileage would give different revenue for shipments carrying the same rate where the length of haul of the Iron Mountain was identical. He also admits it would vary owing to how many carriers handled it in Texas, although the service of the Iron Mountain was identical, whether handled by one or half dozen. To illustrate: On a shipment of shoes from St. Louis to San Antonio, and a similar one to Marshall, Texas, each carried in the same train or car from St. Louis

to Texarkana, there would be a difference of 25 cents per hundred in the revenue to the Iron Mountain for the identical service. (R. pp. 1640-1646.)

The zone rate on citrus fruit is also explained. While the movement is small, it is an extreme case, and part of the interstate revenue is made up of it, which is the factor used by the railroad to apportion their expenses. It is taken from Iron Mountain Tariff. (R. p. 5118.)

It applies to lemons, oranges, grapefruit. The rate is $1.00 (for 1907) on lemons and other citrus fruits from California to Colorado common points, Missouri common points, Mississippi River common points, Chicago common points, Cincinnati and Detroit common points, Pittsburg, New York and Boston common points. There are several exceptions in Texas, Colorado and the far East, but, broadly speaking, the same rate prevails from the eastern ridge of the Rocky Mountains to the New England States. The same rate applies from Los Angeles to Denver as from Los Angeles to Portland, Maine; Topeka, Kansas, and Boston enjoy the same rate from California.

The member of Congress from Lincoln, Nebraska, pays the same freight on his lemons from California while in Washington that he does at home. Similar rates from the Pacific Coast obtain for dried fruits, canned goods and vegetables, dried beans, celery and some fresh vegetables. There is a constant, but not large, movement of this over Iron Mountain rails. For instance, 22 cars of California dried fruits moved in the first half of October at $1.25 per hundred pounds over Iron Mountain rails, and of it these cars well illustrate the whole:

One shipment of dried raisins from Fresno, California, via El Paso to Knoxville, Tennessee, delivered by Iron Mountain to Southern Railway at Memphis, and the part of the rate from Fresno to Memphis was 90 cents; on a similar car going to Atlanta, likewise delivered by the Iron Mountain at Memphis, the western proportion of the rate was 85 cents. This rate, like the cotton rate, breaks at the Mississippi River. Of this class of fruit traffic there were about 100 cars the first half of October. (R. 1464.)

Outside of the lumber zones, there are interesting lumber rates. One hundred and eighty-four cars moved in first half of October to Kansas City from Alexandria. They were hauled each 812 miles by the Iron Mountain from Alexandria to Kansas City, and were delivered to different connections going to different points not in lumber zones; the Iron Mountain received for two of the cars 11 cents, two cars 12 cents, one car 12½ cents, 11 cars 13 cents, seven cars 14 cents, one car 14½ cents, two cars 15½ cents and two cars 16 cents.

From Smithton, 600 miles from Kansas city, there were two cars moving at 9 cents; three cars at 13 cents, seven cars at 11 cents, nine cars at 12 cents, four cars at 13 cents, one car at 14 cents, three cars at 16 cents.

At Prescott 16 cars moved to Kansas City at 11 cents, one car at 12 cents; six cars at 13 cents; nine cars at 14 cents. The variance in the haul at 13 cents was from 445 miles to 633, and variance in rates for the same haul from 9 to 16 cents.

A 15-cent rate was found on four cars from Benton, 445 miles from Kansas City, and 11-cent rate on two cars from Alexandria, 812 miles away. Except for 24 miles from Benton to Little Rock, these cars traveled on the same track. Another instance is 20 cents from Texarkana, 665, as against 11 cents from Alexandria, 812 miles. These are typical of the 184 moving into Kansas City the first half of October. The waybill number, date and billing stations of all these movements were furnished. (R. pp. 1465-1468.)

A calculation of the differences in amount per car on these Kansas City shipments, taking an average car as standard, shows from $55.00 to $85.00 is the difference in revenue per car.

In addition to this movement into Kansas City, we find lumber moving from Smithton to Pueblo, 1,022 miles, at 16 cents, and other similar cars from Smithton to Kansas City at 16 cents, only 600 miles.

Movements of lumber from Hope, Arkansas, to St. Louis on Iron Mountain and then beyond St. Louis on some other road went on rates of 7½ cents, 11 cents, 11½ and 13 cents to the Iron Mountain and yet if the cars had stopped in St. Louis it would have been 18 cents. (R. p. 1468.)

The State put on one of the plaintiffs' chief witnesses, Mr. J. D. Watson, Assistant General Freight Agent of the St. Louis Southwestern Railway Company, and proved by him these rates prevailing on interstate movements in Arkansas during the period of our inquiry: Coal from Illinois points to Little Rock, $2.25 per ton; coal from same place to Grady, 50 miles south of Little Rock, $2.25; and coal from Illinois fields to Monroe, Louisiana, $2.00; Tullaloola, Louisiana, $2.00; Vidalia, Louisiana, $1.60; Rayville, Louisiana, $2.25; all these Louisiana shipments passing through Arkansas but not through Little Rock, ranging from 150 to 200 miles longer haul for the same, and, in most instances, less rate. (By other witnesses it was shown there was a large movement of coal into Arkansas and Louisiana from the Illinois fields under these rates.) (R. pp. 923-924.)

The rate on shoes and dry goods from St. Louis to Little Rock is $1.00 per hundred, to Alexandria, Louisiana, $1.25; and to New Orleans, 90 cents.

Packing house products, 31 cents from St. Louis to Little Rock; 44 cents to Alexandria and 30 cents to New Orleans.

Pianos from St. Louis to Little Rock 65 cents, and to New Orleans, 75 cents.

Soap, St. Louis to Little Rock, carload, 33 cents, L. C. L. 49 cents; to New Orleans, carload, 22 cents, L. C. L. 25 cents.

Beer, St. Louis to Little Rock, 27 cents; New Orleans, 21 cents. (R. pp. 924-927.)

When it is remembered that Little Rock is the basing point for practically all Arkansas on these interstate shipments, the effect of the Little Rock rate is as a stone cast into a pool—the ripples extend with lessening force to its extent.

Mr. Watson was given time to furnish further data, and was recalled.

Beer shipments from Milwaukee and St. Louis compared, the service identical; the haul from St. Louis to Little Rock. If the beer originated in St. Louis, 27; but if delivered in St. Louis, originating in Milwaukee, 23.7 cents. Packing house products, if originating in St. Louis, the rate is 31 cents; if in Chicago, for the same haul of the Iron Mountain, 30.2 cents (the only one nearly the same).

Farm wagons, if originating at St. Louis, 33 cents; if originating at Moline, Illinois, and attached to the other car originating at St. Louis, and each hauled to Little Rock, 3 cents per hundred difference.

Boots and shoes from St. Louis to Memphis, 65 cents, but if stopped at Paragould, some 75 miles from Memphis, 81 cents; the haul to Memphis passing through Paragould (quite a little city and junction point).

Packing house products, St. Louis to Memphis, 26 cents; stopped at Paragould, 43 cents; carload rate, Memphis, 21 cents; Paragould, 26 cents. (R. pp. 950-953.)

It is frequently stated throughout the evidence that lumber, grain and coal constitute the largest movements in the State. Two coal fields serve the State—the Illinois field and the Western Arkansas field; the latter on an intrastate zone rate from the coal field into Little Rock and distance scale out of Little Rock. This is the only zone rate in the Commission Tariff.

There are no reliable statistics in the record as to the proportion of each commodity. Mr. Roth, a statistician for the Iron Mountain, filed a table at page 1979, but it widely misses the mark. It gives for the year 1909 (two years after our period of inquiry) statement of freight traffic of the entire Missouri Pacific and Iron Mountain systems, a system in nine States, and the intrastate for 1909. If the data is properly compiled the intrastate statistics may have some value for this later period, but the system statistics are utterly useless for any purpose of our case. Cotton, for instance, is given as 2.43 per cent of the total traffic of the system, when practically all of it was raised in Arkansas. The Iron Mountain reaches with small mileage into the cotton belt of Louisiana and Oklahoma, but the bulk of its mileage in the cotton section is in Arkansas, and practically none of the Missouri Pacific States raise any cotton at all. Arkansas raises about a million bales annually, all of which is interstate. The same criticism is true of cotton seed products, 1.38 per cent of the system. Lumber and forest products is put down as 21 per cent of the system

and 40 per cent of the intrastate. Many of the Missouri Pacific States are barren of lumber. Several witnesses have estimated the lumber traffic of the Iron Mountain at 35 per cent of its total traffic in Arkansas; certainly 30 would be conservative. Next would doubtless come grain—all interstate. Mr. McPherson says lumber and grain were the dominating commodities. (R. p. 403.). It is proved by many to be a large amount. Coal is about, if not quite, as large a movement as grain. Cotton is probably 10 per cent of the total traffic, including the cotton seed and its products.

The Texas common point traffic is estimated by Mr. Perkins at 5 per cent to 10 per cent of the whole transstate, 51 per cent of all, say 3½ per cent the whole; the fruit of various kinds, traffic from California, would easily bring these two transstate movements to 5 per cent of the whole.

These deductions are not claimed to be accurate, but are given as A rough approximation based on the testimony:

| | Per Cent. |
|---|---|
| Lumber | 30 |
| Grain | 20 |
| Coal | 15 |
| Cotton and products | 10 |
| Texas common points and fruit movements | 5 |
| Other | 20 |
| | 100 |

Easily 80 per cent of the traffic is moving on zone rates, made regardless of distance. Much of the other, the high class, good pay merchandise traffic, is moving on competitive conditions that delivers shoes in Memphis for less than in Paragould, a city through which they pass *en route* to Memphis; and beer to New Orleans for less than to Little Rock, and farm wagons produce different revenue to the Iron Mountain for the same haul, depeudent on whether they are manufactured in Moline or St. Louis. Coal always has a zone rate in originating territory, but it is usually small. From any point in the Illinois fields coal is carried to Little Rock at $2.25 per ton and on through Arkansas to Louisiana cities for $2.00 per ton.

We insist that the foregoing evidence, not of isolated instances, but of the great movements in the State, demonstrate that voluntary interstate rates are not based on the cost of the service and the expense of the movement bears no relation whatever to the rate on which it moves.

Mr. Nay, the plaintiffs' chief witness on the theory of their case, says:

"Q. And when the rate does not represent the cost of the service it (the revenue basis) would not be of any value at all, would it?"

"A. Well, if there was such a rate, no, sir; it would not be." (R. p. 660.)

"Of course, if the rates are not based on the cost of the service, if there are such rates, that is one of the weaknesses of the revenue basis, which I freely admit. And the weakness would be simply to the extent of the relative amount of such business, as compared to the whole." (R. p. 662.)

*Division of Rates.*

Another subject forming part of the problem as to whether rates reflect the cost of the service, is the division of rates. Incidentally, in presenting the evidence preceding this, much of it has been presented, but it deserves further consideration. In order that there might be no controversy over the facts, when some question relating to plaintiffs' methods of dividing the revenue in the exhibits were put to Mr. Perkins on cross examination, Mr. Roth, one of the Iron Mountain statisticians who prepared much of the exhibits, testified that the interstate revenue was divided between Arkansas and the rest of the haul on a "straight track mileage." (R. pp. 1640-1642.) To illustrate: If a shipment moved 900 miles, of which 600 was on the Iron Mountain rails and 300 of that in Arkansas, the revenue received by the Iron Mountain would be divided on a track-mile basis; in this instance Arkansas would be credited with one-half. There is no fixed rule among railroads as to the apportionment of the rate among themselves as to what the Iron Mountain part of the haul would be.

Mr. Perkins says: "It is a varying rule. We have arrangements with each different line. They are made sometimes on actual mileage and sometimes on constructive mileage, and sometimes on an arbitrary basis." (R. p. 1643.)

Mr. Watson, of the St. Louis Southwestern Railway, thus explains it:

"Q. Your division sheets with the other roads will differ, too, will they not?

A. There is a competition in divisions just the same as in rates, you will understand.

Q. How is that division usually made?

A. That is a very difficult question, because they are not usually made on any fixed scale. There are just as many varying conditions that enter into fixing the divisions as enter into the fixing the rates.

Q. What are the usual bases for fixing the division?

A. I can name some of them to you:

Mileage pro rate; constructive mileage pro rate; rate pro rate; revenue of locals—I could name them to you by the hour.

Q. Those are the principal ones you have named?

A. Yes, sir.

Q. That will make differences as to what your transstate revenue amounts to, as the different basis is adopted for each rate?

A. That would indicate that you understood my former answer to mean that we had different bases for the same service between

different carriers offering the business at the same junction, which is not true.

Q. I did not mean that. I meant the whole body of your transstate business.

You have different bases to reach your transstate revenue and they will differ. That is what I mean.

A. It may differ as to service in different directions, but it does not materially differ for the same service, under the same conditions and on the same traffic. But if we were to take a shipment, as an example and to indicate why I am trying to differentiate—if a shipment was offered to us on a point on the Southern Pacific, we would be forced to allow a division that would compensate that line for turning it over to us.

If the same shipment were to originate on the I. & G. N., who have not this long line to New Orleans, the revenue for that line for this service would probably be somewhat less than we would have to allow the Southern Pacific.

Therefore, on the same traffic, from two different points, on two different lines, our revenue from the junction point to destination or as far as we would handle the traffic, would be different." (R. p. 1690.)

In cross examining Mr. Perkins, by taking many illustrations usually of transstate Texas movements, it was shown that the revenue accruing to the Iron Mountain under this track-mileage division, used in the exhibits of the railroads, gave a different revenue for identically the same service and on the same rates, dependent on the origin of the shipment, on the arrangement with the particular carriers from whom received and further dependent on the particular arrangement with the carrier to whom it was delivered; and further dependent on whether the shipment was north-bound or south-bound. (R. pp. 1642-1646.)

The transstate traffic is 51 per cent of the total; naturally the bulk of it is handled by the Iron Mountain as a connecting line. Whether hauling as a connecting carrier or as sole carrier, the revenue is cut off to Arkansas in proportion to the haul in the State compared with the haul on the system.

The service performed is in each instance identical, whether it is as connecting carrier or sole carrier. To illustrate: Lumber from Louisiana to St. Louis incurs exactly the same service and expense in Arkansas, and the revenue from it depends on the division made in Louisiana with the connecting carrier, which varies materially, and again varies if received from a shipper in Louisiana and not a carrier, yet the expense and service in Arkansas are unchanged by the agreements in Louisiana. The haul is the same through Arkansas and the revenue varying from 11 cents to 18 cents for each hundred pounds is respectively cut by the same division in Arkansas. One shipment produces $30 and another handled with it produces

$20; if the mileage in Arkansas was half the total haul on the Iron Mountain, for one the State is credited with $15, for the other $10, and has paid exactly the same expense for each car. If it goes beyond St. Louis, say to Chicago, still another shrinkage on the revenue for the same haul. Taking a shipment of shoes from a shoe house in St. Louis,, one car to Marshall, Texas, and another to San Antonio, the Iron Mountain hauls them together from St. Louis to Texarkana and turns them over to a connection there, and for the same haul receives 25 cents difference for each hundred pounds, although each car has cost it to the farthing the same. Grain from the Northwest to the Southeast passes through Arkansas over the expensive White River branch. Of this branch Judge Trieber said, in deciding this case: "On the other hand, the White River branch of that road was the most expensive road ever constructed in the State. Miles of it had to be cut out of rock, and tunnels cut through rock mountains. There are no large cities along its line, and the country but sparsely settled. Owing to the heavy grades and many curves, made necessary by the topography of the country, it can not possibly carry as many cars to a train and transport freight as economically as the main line." (R. p. 2606.) The service of handling this grain is identical whether to New Orleans for export or to the cotton and sugar plantations of Mississippi and Louisiana for mule consumption.

The cost on the Iron Mountain is the same, whether it originated at Kansas City, Omaha or Sioux City; and it matters not, so far as cost is concerned, whether it goes from New Orleans to Mobile, Alabama, or the Panama Canal, and yet all of these are factors to determine the revenue, whereas the cost in Arkansas for each of the cars, irrespective of origin or destination, is fixed when handled over this line. The evidence shows most of it is hauled over the White River branch, but still there is a large movement on the Central branch, which would be less expensive service, and that leaves another element of variance between cost and service. We are not questioning the wisdom or unwisdom of such rates and divisions; these are questions for the Interstate Commerce Commission, with which we are not the least interested, but when the revenue produced by these rates is submitted as the yardstick with which to measure cost of producing this revenue, then these inequalities become interesting and pertinent.

Mr. Perkins, in reply to questions as to differences in revenue received on lumber shipments to Kansas City, and on shipments there delivered to connecting lines, says the expenses are not the same, because the terminal expense at Kansas City would be heavier for delivering a shipment to an industry there than to a connecting carrier. His attention was called to the fact that the mileage pro rate of the rate would not take care of the Kansas City terminal expense, and, after a good deal of fencing, he finally admits that, taking the

lumber traffic as a whole, the track-mileage division of the revenue would be unfair to Arkansas, as the terminal expenses in Kansas City and other large cities are greater than the initial terminal expenses, where the traffic originates in Louisiana and Arkansas. (R. pp. 1652-1654.) He says the terminal expenses on grain would run about the same as on lumber. (R. p. 1657.)

Mr. Perkins makes an estimate (and it is the only one in the record) of the proportion of the lumber traffic originating south of the Arkansas State line from the lumber zone extending from the Arkansas River to the Gulf of Mexico. He estimates that from 10 per cent to 20 per cent originates in Arkansas and that from 80 per cent to 90 per cent originates south of the Arkansas State line. (R. p. 1659.) For facility, say 15 per cent originates in Arkansas and 85 per cent in Louisiana.

Mr. Perkins had previously testified that while the rates from Little Rock were high and from Lake Charles low, they were so adjusted as to give a fair profit on the entire lumber business, and that as a whole they were as high as conditions justified. (R. pp. 1621, 1622.) He admitted he knew nothing of a track-mile division of the revenue in this case, and did not have that in mind in giving said testimony. (R. p. 1660.)

Mr. Perkins says the average cost per ton per mile of all their traffic is between 5 and 6 mills; and the revenue per ton per mile on all lumber traffic about 6 mills, and from these two statistics he bases his statement that there is a small profit on the whole lumber traffic. (R. p. 1658.)

Alexandria is the southern point of the Iron Mountain that receives lumber. All the lines converging at Alexandria and carrying lumber to it receives 6 cents of the 18 cents, except one receives 7, so that the movement on the Iron Mountain from Alexandria to St. Louis—using St. Louis as an illustration; the same thing would apply to any of them—the Iron Mountain would receive 12 cents for all of that lumber from the southern part of the zone, for the haul from Alexandria to St. Louis.

That would be equal to four mills per ton per mile for the haul from Alexandria to St. Louis.

The lumber from Little Rock to St. Louis, on an 18-cent rate—or from any of these points where they get the maximum—would earn 10 mills per ton per mile.

In order to have any general average conditions, wherever you had one of the low rates, you would have to have one of the high rates. That is the only way you can make a general average of rates. Only 15 per cent of that movement is represented by the high rate of 10 mills per ton per mile.

If we would concede that all of the Arkansas lumber took that—the highest rate—and, of course, that is not true, because the evidence shows these numerous tap lines throughout the State divide up that

18-cent rate with the Iron Mountain—but assume, for the sake of the illustration, that all of the Arkansas lumber received the maximum of 18 cents, or 10 mills per ton per mile, and make a calculation on that; averaging those two rates, the highest and the lowest, the result is 7 mills.

But as only 15 per cent is represented by the high rate of 10 mills per ton per mile and 85 per cent is represented by the 4 mills rate, it works out that the average haul on the whole business earns 4.9 mills.

Mr. Perkins says that the average cost on the Iron Mountain, of all commodities, is between 5 and 6 mills.

The average revenue on lumber, he says, is about 6 mills.

So, by reason of the fact that the high rate in Arkansas represents only 15 per cent of the traffic, if you take these general average conditions to even that up you have that lumber traffic as it passes through Arkansas averaging less than 5 mills, a mill a mile less than cost.

As a matter of fact, the great body of this traffic in Arkansas does not move under the 18-cent rate, but it is divided among these tap lines, as developed in the evidence. The exact average would necessarily be much lower than the example given and much lower than the average cost of service.

But this is only a small part of the inequality. The divisions are inequal from connecting and tap lines, while the expenses, after receipt by the Iron Mountain, are identical.

The division sheets of the Iron Mountain with its connecting roads in Arkansas on the St. Louis rate of 18 cents were put in evidence. The division of each of these roads are given in detail. (R. pp. 1454, 1455.) For the first half of October there were 566 cars moved under these various division sheets. The rate to the tap line or connecting railroad ranged from 1 cent to 7 cents out of the 18-cent rate. There are 33 of these tap lines or connecting carriers.

One of the "connecting carriers" was a road one-half mile long.

To Cairo, the rate is 16 cents and the same division sheets apply, making the revenue from the haul to Cairo vary from 9 to 15 cents per hundred pounds. (R. p. 1456.)

Mr. C. W. Lewis, a shipper of lumber, and familiar with lumber rates, testified as to the actual movements of lumber from Southern points, being under the tariffs illustrated in exhibits 39 and 40. His testimony begins at page 906.

He says that in addition to the zones, there illustrated, that there is another zone rate from territory directly east of the producing territory there shown, composed of part of Louisiana and territory east of the river, and the rate from it to St. Louis is 16 cents, 10 cents lower.

Mr. Lewis says the lumber from Arkansas largely moves into the zones shown on the maps. He also explains the tap line divisions:

"Q. Now, what we are particularly trying to find out in this case, is the cost of service and the revenue producing the rate; I want to know what would be the difference in cost, say that a shipment originated in the woods on some tap line, and was carried to St. Louis at 18 cents, and another shipment originated at your mill, and you say you have no tap line—that goes into St. Louis, and suppose the tap line joined the main line just where your mill is, what difference would there be to the Iron Mountain Railroad, if you were on that road, in hauling two cars of lumber, one from your mill and one from the other mill?

A. I don't think there would be any difference in the cost of transportation, so far as the Iron Mountain is concerned.

Q. What would be the difference in revenue?

A. For the Iron Mountain, you mean?

Q. Yes, sir.

A. The difference in revenue would be whatever they would pay a tap line, whatever it might be; those tap-line divisions don't all run the same; some fellows are able to squeeze more out of them than the others are.

Q. There is a variation on the revenue of the amount paid to the tap line?

A. Yes, sir.

Q. Does this division principle also apply to different railroads; suppose that lumber was shipped into Alexandria on the Iron Mountain from some other road—

A. They publish a through tariff and divide it up; yes, the same rate is applied, the same as in going over three or four railroads.

Q. And suppose that there would be two cars of lumber shipped via the Iron Mountain from Alexandria to St. Louis, and they would get the 18-cent rate, as I understand it; one of those cars originated at Alexandria, and was delivered to it there; the other originated at some other point on some other railroad, and was delivered to it at Alexandria, and those two cars were hauled to St. Louis together; as far as you can say, would there be any difference in the cost of service in hauling those two cars?

A. No, sir.

Q. Would there be any difference in revenue?

A. Of course, if the Iron Mountain started the shipment and carried it all the way, there wouldn't have to be any division, they wouldn't have to divide it with anybody else.

Q. That is the illustration I gave you of one car, and the other car they would divide that with the road that brought it in?

A. Yes, sir; the one they hauled on their own line all the way, they wouldn't have to divide.

Q. Is there much lumber shipped that way on divisions?

A. Practically all the big mills, they get a division, as far as Arkansas is concerned; practically all the big mills have short lines

of railroad, that is owned and operated by the same people, but of course, it is a separate corporation and the sawmill does not get any rebate, but the railroad gets the division." (R. p. 909.)

Mr. Lewis states there is a rate from Louisiana into Little Rock of 22 cents as against 18 cents from Louisiana to St. Louis, in order to protect the territory near Little Rock. (R. p. 910.)

He says that some of the tap lines have their mills on their own lines, away from the junction point, and then they haul empties to the mill and return them loaded to the railroad; for that service and originating the traffic they get a division of the rate, but many of them have their mills at the junction point, and every cent paid the tap line "is that much over the other fellow that doesn't own the railroad." These tap lines run from 5 to 40 miles in length. (R. pp. 913-915.)

Another queer freak in division of rates is developed in the cotton rate and the California fruit rates. Each divide on the Mississippi River, and a fixed proportion goes to the carriers for the haul east and for the haul west. Cotton, for instance, is fixed at 35 cents for the haul east of the river, divided among many. From the Little Rock zone the rate is 80 cents, being 45 for the western division; from Fort Smith it is 85 cents, being 50 cents for the western division; and from Oklahoma (owing to ocean competition), is 70 cents, being 35 cents for western division, and that for a longer haul, than from either Little Rock or Fort Smith.

There is evidence that 50,000 bales are compressed at Fort Smith; probably half of it from Oklahoma; the other half from Arkansas, the service of the Iron Mountain the same, but on the cotton originating 20 miles west of Fort Smith, and hauled in there and compressed and shipped to Boston, the road participates in a 35-cent division; but if hauled from a point 20 miles east, and compressed and shipped to Boston, it participates in a 50-cent division.

## (3) THE RELATION OF THE INTERSTATE AND INTRASTATE RATES.

Necessarily, there will be some repetition in presenting the evidence on this subject, as it is so closely interwoven with the preceding subjects.

*Plaintiffs' Evidence.*

Mr. Flippen, General Freight Traffic Manager of the Iron Mountain, said: Q. "What is the practice of railroads usually in the observance of a relation between State and interstate rates, if there is any general practice? A. There is a very close relation. In fact, the making of rates have to do with the commercial conditions; the cost of service; the conditions generally; and where the earnings have not been, as we figure it, compensatory in respect to State traffic, the same is frequently true of interstate adjustments, because one is so very seriously affected by the other." (R. p. 239.)

This developed on cross examination:

"Q. When you say you have to have a proper relation between them, I would like to know just what you would consider a proper relation between interstate and State rates, taking the whole volume of your traffic into consideration?

* * * * * * * * *

A. I do not know without having figured it out exactly, because the conditions with respect to certain articles and commodities are so entirely different. You can not take the whole volume, as a traffic man, and say just to a fraction just what the relative percentage of adjustment would be. It is impossible to do that.

Q. I am not asking it just to a fraction. I am asking you to give just your best approximation on that.

A. I can not say as to that, unless I make some figures on it.

Q. When you put in the State rates on November 2, 1908, did you make figures then of the relation that one should bear to the other?

A. Yes, sir; I explained how we made them. That we made them with relation to commercial conditions, and the service, by comparison with the figures that prevailed in other States under similar circumstances and conditions; and that as a whole it fitted in.

I don't know that I could explain it any better. (R. p. 250.)

Q. You do not establish your rates, then, on the relation that the revenue from one rate would bear to that of another?

A. Oh, yes. Classification is made up that way.

Q. Classification is made up that way?

A. Yes, sir; and that is the way the rates are made, with respect to classification.

Certain articles are susceptible to damage; its bulkiness or lack of density, if you please; and the character of the equipment that is required to handle it; and the expedition that is sometimes required. All those things are factors that enter into that.

Q. Those are the factors that determine the rate so far as classification is concerned?

A. Yes, sir; one article compared with another. For instance, we would not haul feathers at the same rate we would pig-iron.

Q. You would fix a rate to compensate you for the difference in the weight, the difference in the liability, the difference in the cost of handling, and many other elements of that kind?

A. Yes, sir; according to our best judgment, having in mind that the total result is remunerative.

Q. Then the rate is more a relative proposition than it is one of cost of operation, isn't it?

A. No, sir; you can not say that. You must bear in mind the cost of *of* operation, or you would not be making the rate.

The rate is the price at which we sell transportation; and you must bear in mind, according to the best judgment and experience of men

who know, what it costs, otherwise we would not be making a rate. You would not last long if you made it without regard to that.

Q. That would be as to total rates. But I am speaking of the relation of one rate to another.

Take your illustration of iron and feathers: the relation of those would be determined very largely by those other factors rather than by the cost of operation?

A. Oh, yes; there are so many factors that enter into it that it is very difficult to differentiate to a nicety." (R. pp. 252-3.)

Then he says the Arkansas adjustment would not affect the transstate rates. (R. p. 253.)

As the transstate ton-mileage is 51 per cent of the whole, necessarily this relation is confined to the other 49 per cent, part of which is the intrastate itself.

Mr. McPherson advocates the revenue theory with an extended argument, but, when asked as to the cost of service as affecting it, declined to discuss rate matters owing to his unfamiliarity with them (R. p. 402); and when pressed further, said:

A. I don't understand the traffic well enough to say what the relation between intrastate and interstate rates is.

Q. Is not that a necessary factor in the development of your revenue theory?

A. Not necessarily; no. I must assume that it exists. I believe that it is generally assumed that it exists. If the State rates for any reason are lowered, the interstate rates are lowered, and that relation would doubtless continue under such circumstances. If the State rates are raised, I presume that the relation is still continued by a raise in the interstate rates." (R. p. 429.)

This is a queer situation, without sufficient knowledge of rates to know their relation to cost of service and of State to interstate, he assumes the latter exists and builds up his argument upon it.

Mr. Watson answered that such an example of the workings of the revenue theory, as shown in exhibit 23, was impossible, because the interstate rates must change with the State rates. (R. pp. 560-561.)

He explains that the railroads could not consistently let an increase of 33⅓ per cent in State rates exist without an increase in interstate. (R. p. 572.)

He says the intrastate rates base the interstate rates. (R. p. 582.)

Mr. Watson was put on in rebuttal, in answer to Mr. Bee's statement that there was no relation between State and interstate rates, because of the difference in the haul of the two classes of business, and said:

"The difference in the length of haul could not destroy the relation as between State and interstate rates for the reason that the State rate in Arkansas to a controlling extent bases the interstate rate.

In the case of the distance referred to in Mr. Bee's testimony, St.

Louis, 500 and some odd miles, as against 50 miles within the State, the relation was still there, but it would require a rate man to check that relation to show what the relation really was and how the one rate affected the other, or would affect the other, but the difference in the distance, as stated by Mr. Bee, would make it difficult for him to understand from the railroad's record just where the relation lies.

There is a very clear relation as between all State rates and all interstate rates operating into the same territory. That is pretty well shown in the testimony in regard to the sugar rate in Arkansas.

The sugar rate from Helena to various points in the State of Arkansas was fixed upon a maximum basis of 13 cents. That added to the rate to Helena from New Orleans, made the rate from New Orleans to the various points in Arkansas, the maximum rate being 25 cents, which was the exact Helena combination.

That is also shown to a very marked extent in all of the adjustments in the State of Arkansas.

Our adjustments in the territory south of Pine Bluff is probably one of the best examples of this." (R. p. 1673.)

On cross examination his position was fully brought out:

Q. When you have been referring in your testimony to relation between State and interstate rates, you are not referring to the cost relation of carrying those commodities, State and interstate, but you are referring, as I understand you, to the effect that the State rate has on the interstate rate; is not that true?

A. "This is true; yes. Both sections of the question are true.

Q. Both of them?

A. Yes. There is a cost relation always, regardless of what the scale rate may be.

Q. What is that cost relation?

A. That is brought about by the adjustment produced by the classification.

Q. Do you know the cost of carrying any commodity, Mr. Watson?

A. The actual cost of carrying any one commodity?

Q. Yes.

A. No. I don't think any one does.

Q. You can not very well adjust the cost relation without having any statistics?

A. Yes; that is what we prepare the classification for. That is exactly the object of the classification.

Q. The classification is the only cost relation that there is in fixing the adjustment between State and interstate, is it not?

A. I don't believe I quite catch the object of your question.

Q. Well, no matter what the object of it is, if you understand the question.

A. I only want to answer it properly. I can answer it two ways.

Q. Answer it both ways.

A. The cost relation as between State and interstate rates is the classification. That is the cost relation.

Now, there is another cost relation as between State and interstate rates and that is where your State rate becomes so low that the railroads do not feel they can meet that low rate and carry the traffic.

Q. Then they just go out of business?

A. Yes; as the Cotton Belt has done in quite a number of cases. There is quite a little business to Little Rock based on State rates, that they don't handle.

Q. The only way you can adjust any cost relation between State and interstate rates, so far as you know, is through the classification of the various commodities and classes?

A. That is the method of arriving at the cost relation.

Q. So far as you know, that is the only method?

A. It is the only method so far as the class rates are concerned, yes; but there is quite a large list of commodity rates.

Q. How do you adjust them?

A. Those are adjusted as near as we can do so.

Q. Just by intuition?

A. And judgment—"guess," I believe you call it.

Q. Mr. J. M. Johnson called it "guess." I did not call it that. You have the average cost per ton per mile on all your commodities, and then when you have that, in fixing rates you exercise your judgment (or, as Mr. J. M. Johnson says, exercise your guessing power) to determine what the rate ought to be?

A. No; not altogether. To determine what the minimum rate ought to be, but not what the rate ought to be, because there are a great many other conditions that fix that rate.

Q. But that is the only way you get a cost relation—the way in which I have indicated?

A. That is the only way you prevent yourself from handling traffic which you should not handle." (Tr. pp. 1681-2.)

Mr. C. E. Perkins, of the Iron Mountain, in answer to a question as to whether there was any relation or connection between State and interstate rates, said:

"There is a very close relation as between interstate rates and intrastate rates; not only is that true with reference to the interstate and intrastate rates in Arkansas, but in a great many of the other States, practically all States that fix the rates to and from the borders of that State.

"The advance in Arkansas intrastate rates which was made prompted a similar advance in our interstate rates. In other words, when the rates locally in the State of Arkansas were raised, from West Memphis or Bridge Junction, which is directly across the river from Memphis, our rates interstate from Memphis into Arkansas were readjusted, were raised. The raising of the Memphis rates practically affects all of our interstate rates to Arkansas. Cairo

is advanced differentially over Memphis; St. Louis is advanced differentially over Memphis. In other words, there is a relation as between the rates which we carry on interstate business from St. Louis to Arkansas as compared with the rates from Memphis.

"This is brought about by the fact that Memphis and St. Louis are large distributing centers and we are forced, in order to carry out a parity of rates which will allow the free distribution of business, to keep those points on a parity; that is, on a relative basis.

"That is true also of the business passing through those gateways coming from beyond.

"Now, when we have our St. Louis rates fixed, the rates from practically all parts of the United States from which through rates are carried into Arkansas, are fixed differentially as compared with the St. Louis rates. In other words, the rates from Kansas City bear a certain relation to the rates from St. Louis. The rates from all Kansas points are fixed with relation to the Kansas City rates. The rates from Chicago to Arkansas are fixed on a differential over St. Louis. The rates from Pittsburg, Pa., are fixed on a differential over St. Louis. The rates from what we call the Fox River District, which is Wisconsin, north of Chicago and Milwaukee, are fixed on a differential over St. Louis. The rates from New Orleans to points in Arkansas, Little Rock and South, are in practically all cases the same as St. Louis.

"So, when we change the rates from Memphis on account of the changes which are made in the intrastate rates in the State of Arkansas, we practically change the entire rate adjustment affecting interstate rates to and from Arkansas.

"This condition is not confined to the State of Arkansas, but it applies to practically all States.

"As an example, a short time ago the State rates in Kansas were changed, being reduced on grain locally within the State of Kansas. The change in those grain rates affected practically every rate on grain which we carried from Kansas to interstate points." (R. pp. 599, 600.)

In his cross examination this occurred:

Q. I want to know just what you meant by "close relation between interstate and intrastate rates?"

A. I mean by close relation, that the interstate rates or the intrastate rates, where not governed by State Commissions, bore a relation one to another and as a general proposition where one is changed the other must be.

Q. Now what relation should they bear one to the other?

A. There is no fixed relation. If you mean on percentage?

Q. I mean on the rates themselves. You have spoken of this parity of rates and the close relation of rates; now, I want to know just what that relation should be?

A. I can not give you any definite basis or any definite relation which they would bear. However, there is this relation, that when one changes the other is almost always bound to change. I will not say always, because there are lots of exceptions; but the general rate basis applicable into a given State depends very largely if not entirely on the State adjustment.

Our rates, as an example, into the State of Texas from interstate points, are based entirely on the rates as fixed by the Commission of the State of Texas.

Q. What are you going to do when your road crosses two States and there is a great difference in the rates in those two States? Take Arkansas and Louisiana: Louisiana, I believe, has the highest rate of any State east of the Rocky Mountains and west of the Mississippi River; and Arkansas has lower rates than Louisiana. You have a line running between those two States. When you come to adjust these relations between the two what are you going to do with your State rates?

A. They have to be graded from one to the other.

Q. How do you grade them? That is what I want to get at, the actual facts.

A. We sit down with paper and pencil and take all the conditions that enter into rate-making. There may be a dozen of them. And fix those rates. In other words, rates may be fixed by an altogether different road—for instance, the rates from Memphis into the State of Arkansas are not fixed by the Iron Mountain road to any very great extent.

Q. That is a commercial condition that is controlling and not the relation between State and interstate, isn't it?

A. It is the condition controlling our railroad.

Q. I understand that. You say now this close relation, this Siamese twins relation, between State and interstate—and I am trying to find out just what the bond of union between the two is as an actual fact?

A. The bond of union is this: As between Arkansas interstate rates and Arkansas intrastate rates, if you want me to take up that feature of it I will and explain it.

Q. I want you to explain what this relation is. How would you fix an interstate rate based on an intrastate rate or *vice versa?*

A. The rates fixed by the intrastate rate in Arkansas fixes necessarily the rate from the border points." (R. pp. 620, 621.)

Then he wanders into illustrations.

Mr. Perkins was recalled in rebuttal and said:

"Q. You have used the term 'relation between State and interstate rates' quite frequently in your testimony here, Mr. Perkins; I wish you would explain just what you mean by that.

A. By "relation between State and interstate rates" I mean that our interstate rates are dependent upon the rates as fixed on State traffic.

Q. I do not believe I quite catch that, Mr. Perkins; do you mean in all your remarks in your preceding testimony as to the relation between the State and interstate rates the effect that the State rate has upon the interstate rate?

A. By saying hat there is a relation between the State and interstate rates I mean that the State rates, as I have said, affect to a greater or smaller degree the interstate rates. In that way the relation exists.

Q. Just what is that relation?

A. That relation varies. It is the subject of practically all of the testimony I have just given with respect to our rates from Memphis to Arkansas points.

Q. As I understand your testimony on that, it was to the effect that the Arkansas Commission rates had, in a measure, controlled the interstate rates to and from Memphis; is that correct?

A. That is correct.

Q. You mean by "relation between State and interstate rates" the controlling effect of the State rate upon the interstate rate?

A. I mean by the relation between State and interstate rates, as an example, where the State rates are reduced it will invariably cause a reduction in our interstate rates, possibly not to exactly the same degree; and where they are advanced it will permit of a smaller advance in the interstate rates.

Q. You say 'probably not in the same degree;' to what degree would that advance be?

A. That would depend entirely upon conditions." (R. p. 1631.)

Again he said:

"Q. Mr. Perkins, I do not quite understand this statement in your testimony at page R 23:

"In case where the interstate rates are shown to be the same to the points mentioned in the chart, the Memphis to Little Rock rate has been applied as a minimum, these minimum figures applying only to the station directly south and west of Little Rock, which it will be seen were selected by the State to disprove our basis."

What do you mean by that?

A. I mean that you have selected a group of stations to which, on account of the conditions which I have mentioned we have in one or two cases a blanket basis of rates; and you picked out that as about the only place you could find in Arkansas to prove or disprove our general theory.

Q. What do you mean by your "general theory?"

A. The relation as between State and interstate rates.

Q. What relation? Cost relation, trade relation, or political relation?

A. The relation of the rates in and of themselves.

Q. What do you mean by the relation of the rates in and of themselves?

A. The relation as between State and interstate rates.

Q. Do you mean the proportion that one rate will bear to another one?

A. I mean the bearing which one rate has on another rate, as a matter of fact.

Q. Control, you would be more apt to say—the control of one rate over another one, rather than the relation?

A. Yes, sir.

Q. That is what you mean by that statement?

A. I think the word relation defines it better.

Q. You are discussing there the relation of the effect of one rate on another.

A. The effect of the relation of one rate to another naturally affects the two; yes.

Q. You take the rates in Arkansas that are less than the Commission's rates and what would you say as to that relation or control of the Commission's rate as to them?

A. The basis which I outlined yesterday as governing that part of our line as applied to State rates brought about that result at that time.

Q. That might bring it to the State level, but how could that bring it below the State level?

A. For the reason that in that particular case we used a minimum figure, which was the Memphis to Little Rock rate, 70 cents first class.

Q. On account of commercial conditions?

A. Yes.

Q. I believe Mr. Bragg gave instances of the Memphis interstate rate being less than the State rate to points on the White River branch and probably other points; do you recall that testimony?

A. Yes, sir.

Q. It was commercial conditions on that line that brought those rates down under the Commission's rates?

A. No, sir.

Q. What was it?

A. Competitive conditions." (R. pp. 1664, 1665.)

Mr. Frank Nay, Comptroller of the Rock Island System, testified:

A. "Well, for the revenue basis to be the proper measure, excluding in this consideration the addition of anything for increased cost, the State rates should be enough higher than the interstate rates to balance that excess of cost which operating men say exist in connection with State business over interstate business and if the State rates were not sufficient to produce that revenue, the revenue basis would be faulty to that extent. And if they were too high and so much higher than interstate rates of course it would be faulty the other way.

Q. The point of that testimony to which I have just called your attention, is this: There was not a proper relation between State and interstate rates during the period we have under inquiry (that is 1907), and if that is true then the revenue basis would not be a proper factor with which to apportion the expenses, would it?

A. Well, it would be an accurate factor, but being, in my judgment, the best that is known, it would be the proper one. I think in the first question you have the word "accurate;" it is not an accurate factor.

Q. It will fluctuate according to the fluctuation between State and interstate rates?

A. Yes, sir.

Q. And it will, of course, be inaccurate to the extent that the proper relation does not exist between State and interstate rates?

A. Yes, sir; I think that is true." (R. p. 660.)

Mr. Nay's evidence on the revenue theory, and in fact the plaintiffs' whole case, is summed up thus:

"Q. If there is a larger profit in the intrastate rate than in the interstate rate, owing to competition that largely controls the interstate rates, wouldn't that fact, the difference in the profits on the two rates make it unfair to use the revenue, intrastate and interstate, to measure the expenses of operation with?

A. Of course, in the first place it would depend on what basis was used in determining the profit was larger in one case than in the other. But if that could be absolutely determined beyond any question of a doubt, which is an impossibility, I think, then of course the revenue basis would be faulty to the extent that difference existed.

Going back to the same statement again, that the revenue basis is not a perfect basis, but is the best known basis at this time.

Q. It seems to have several faults, doesn't it, Mr. Nay?

A. These faults are really the same fault under different names, I think.

Q. Not under different names but under different circumstances; isn't that more nearly the case than under different names?

A. My idea in making the statement that they seem to be the same fault was that the two rates, intrastate and interstate, seem to be out of proportion to each other, and that is what produced this unfairness that is spoken of. If they were in exact proportion all the time, the revenue basis would be a perfect basis.

Q. And if it represented the cost of the service? You would have to have that also?

A. I presume if they were in proper relation to each other they would represent the relative cost of the service. When I say "in proper relation to each other" I mean in reference to the cost of the service.

Q. Some of these traffic men use that term in an entirely different sense. I think your use of it is correct, but you will see from

the testimony the others use it as having a proper adjustment to the commercial conditions. A just rate of one trade center with another trade center. That is the reason I was particular in calling your attention to it. You mean by it a proper relation of the cost of the service; isn't that right?

A. That is what I had in mind.

Q. That is what you had in mind in your testimony generally, I assume.

A. The proper relation?

Q. The proper relation of cost, you mean?

A. Yes, sir; the proper relation in regard to the cost." (R. p. 668.)

The foregoing, saving repetition, is practically the full evidence of the plaintiffs on this subject.

## (3) THE RELATION OF THE INTERSTATE AND INTRASTATE RATES.

*Defendants' Evidence.*

The intrastate revenue used as the factor with which to divide property and expenses for the period under inquiry was Standard Distance Freight Tariff No. 3, or, to be more accurate, the rates which in June, 1908, were republished under that style. With minor exceptions, the rates had been in force several years, and really the tariff in force during the period of inquiry was No. 2, although the witnesses all speak of No. 3 but it was only published in 1908, after this period of inquiry. As there were no substantial difference between No. 2 and No. 3, we will follow the witness and speak of it as No. 3.

Mr. Watson, Assistant General Freight Agent of the St. Louis Southwestern Railway, in his direct testimony, made frequent critical allusions to these rates, and on cross examination we developed fully his criticism of it as not being properly constructed. As his testimony deals in some very specific instances, it is quite tedious to follow:

Bar iron and baskets are favorite illustrations of traffic men as to the relation of rates and cost of service, and the difference in classification as controlling rates. Using these common illustrations, taking Commission rate for 225 miles, the average interstate haul, in order to get the relation in rates between the State and interstate.

Mr. Watson was asked to give these. Bar iron was found to be 16 cents and baskets, which take four times the first-class rate, was $3.08. Mr. Watson says this is not the proper relation; the bar iron ought to be 37½ cents instead of 16 cents.

"That relation in that particular tariff is not a regularly constructed one. The figures are not as near as should be; in other words, fourth-class ought to be somewhere in the neighborhood of 50 per cent of first-class, and the figures are not so constructed in that tariff."

Q. Then that tariff is not properly constructed so far as the relations go?

A. That is my understanding." (R. p. 566.)

This was irrespective of whether too high or too low; merely the relation. He says the undue relations in the Commission Tariff was one of the complaints against it, and was asked to give other instances. He says practically all the L. C. L. commodity rates, giving bagging and ties to illustrate, but he said it was a small movement. (R. p. 566.)

He was asked to give heavy movements, something that went to the revenue-producing feature, and in response instanced:

Wire and nails, 16 cents; should be 37½; sugar, rice and molasses, 23 cents; should be 37½; canned goods, 23 cents; should be 37½. These in L. C. L.

In carload rates, he says the conditions are worse: Cotton seed, 8 cents; should be 15.

Lime, outside of lumber, he says is about as large as any movement; and it is 8 cents, and should be 18 cents. Lumber is 8 cents and should be 18 cents. This for a distance of 225 miles; and he admits that it is also 18 cents from Lake Charles, Louisiana, to St. Louis, Missouri, a distance of four or five times that length.

"Q. I infer from your analysis of that, Mr. Watson, that you are not enamored of the Standard Distance Tariff No. 3, as a scientifically constructed tariff?

A. I don't believe the Standard Distance Tariff, No. 3, was ever represented as a properly constructed tariff. I never heard anybody so represent it.

Q. Do you think it represents the cost of the service?

A. I don't think so; no.

Q. Nor anywhere near it, I would infer from your answer?

A. The result from the application of it would indicate not.

Q. It would not be a very safe measure, then to use to determine the cost of service in the State of Arkansas?

A. I don't think you can use any tariff to determine the cost of service, Judge. I don't think you could use this one (indicating) to determine your revenue on a proper basis." (R. pp. 565-569.)

The lumber rate might be too low, the basket rate too high; these are not the present questions, but do the State rates bear such relation to the interstate that the respective revenues can be used to measure the respective expenses?

Taking the Iron Mountain interstate tariff as standard of relations of one rate with another for the average interstate haul, Mr. Watson is quite emphatic that the Commission Tariff rates are not in proper relation to each other, and necessarily not in proper relation to the interstate.

If the rates of themselves were low, it would assign less expense to the State than if high, but the revenue from these rates is upon

one road 98.18 per cent higher intrastate than interstate per ton per mile, and, upon the other, 141 per cent; and this is not a question of too high or too low, but one of relation, a necessary factor to give value to the revenue basis.

This testimony, exhibiting the actual relation of rates under which the traffic moves, can not be condensed, and must be given in full.

*Nonrelation Graphically Explained.*

(R. p. 1468.) "Q. Mr. Hamilton, there has been a great deal said in this testimony about the parity between the State and the interstate rates, the relation that exists between State and interstate rates. Have you made any examination as to that parity or relation, or whatever it may be called, existing between State rates and interstate rates?

A. Yes, sir.

Q. Give us the results of some of your illustrations?

A. Mr. Watson, and perhaps Mr. Perkins, or Mr. Flippen, one of the gentlemen from the Traffic Department of the railroad interested here, as I recall it, said that the Arkansas Distance Tariff issued by the Commission dominated the rate from Memphis into Arkansas points, and that the Memphis rate was the bridge toll higher. That is, to get a rate from Memphis to an Arkansas point, they added a bridge toll to the distance tariff from Bridge Junction on the west side of the river, opposite Memphis.

Taking that proposition first, I have made a graphic chart covering the rates from Memphis to the line of the Iron Mountain, extending south from Little Rock, some seventy miles, to Arkadelphia (actually to Gum Springs, the station beyond) and commenting upon the statement that Memphis rates were based on the Arkansas rates, plus a bridge toll—that they were made that way—I found that the first class rate ran level across the chart—

Q. That is interstate?

A. Yes, sir.

That is, that the rate is 70 cents from Memphis to each of these 27 stations, shown on this chart, which are 70 miles apart. That is, the most northerly one is 70 miles from the southern extremity of the route.

I found the Commission Distance Tariff beginning at 60 cents and mounting step by step until it reached 76 cents, a fluctuation of 16 cents.

Q. Owing to the distance?

A. Owing to the distance. It is graduated according to the distance. The rates are made in five-mile graduates.

The rates published by the railroads from Memphis to these points, on first class, are absolutely level. That is, the 70-cent rate applies to the entire group.

The distance tariff rate, which I have compared with the railroad interstate rate, is the rate from Bridge Junction, and would be,

according to Mr. Watson's statement, the railroad's rate less the bridge toll. The bridge toll does not fluctuate. There is no distance element in it. It is an arbitrary toll. So that if the interstate rates published by the railroads were based directly on this State rate, they also should fluctuate. As a matter of fact, the chart shows they do not.

The same is true of second class, which is absolutely level across the chart, on the interstate rate, and goes from 53 to 68 cents in the Standard Distance Tariff of State rates.

On third class, the interstate rate goes 37 miles before it begins to climb, and then climbs, the last time 33 miles, some six points; while the State rate begins at 45 cents and climbs in the direct relation to the first and second class State rates until it reaches 57 cents at the last station in the group.

The fourth class interstate rate runs 52 miles level before it begins to climb, although its predecessor, the third class rate, began to climb after 37 miles, and it ultimately climbs 4 cents; while the State fourth class rate, which is now, as it starts with the first station, a cent higher than the interstate fourth class, although the first, second and third class interstate rates begin on a higher level than similar State rates.

This State fourth-class rate climbs all the way and is graduated according to distance, starting at 37 and reaching 43.

Now, on Class A, which in these tariffs is higher than fifth class, and is therefore mentioned first, we find the interstate rate again absolutely level, although some rates between it and second class, which are absolutely level, have been graduated.

We find the State Class A rate graduated according to distance.

The same is true of the interstate fifth class rate. It is level, while the State fifth class rate is graduated according to distance.

The State Class B rate is graduated almost exactly, relatively, to the other State rates, while the interstate Class B rate goes some 37 miles before it begins to rise.

The State Class C rate is graduated, as is also the interstate Class C rate. There is some resemblance to the graduation on that one rate.

The same is true of the Class D, on the State, but not the interstate. It travels level for 59 miles before it begins to rise.

The two Class E rates are most relatively graduated.

I should say that it is apparent there that there is no relation in that set of rates, between the State rate and interstate rate, for the reason that while the interstate in most instances is level—that is, is the same to the first station as to the last station in a group, the extremes of which are 70 miles apart, the State rate is graduated according to distance.

Now, as to the other phase of it, as to there being an internal relation between the interstate rates·

Something has been said here, for instance, that the fourth class

should be a certain percentage of the first class, if rates were scientifically made—take these interstate rates: We found first-class absolutely level; second-class absolutely level; the third class graduated; the fourth class graduated; Class A absolutely level; fifth class absolutely level; Class B almost so, rising at the last two stations on the group.

If there is a relation between the level rates, there certainly can be none between them and the graduated rates.

I am speaking from the chart—in this chart we have shown the names of the stations to which the rates applied.

Q. Have you carried any commodities on that chart?

A. Nothing but class rates on this chart. Down the side we have shown the rates per hundred pounds, in cents; each square across the chart represents a station; the graduations are shown in that way—

Q. I wish you would attach that chart as an exhibit.

* * * * * * * * *

See exhibit "C-1."

Q. Have you made any comparisons of the relation to the St. Louis rates?

A. These are St. Louis rates that I have in this (indicating) chart.

On the other chart we have shown only class rates and have shown the State and interstate rates on the same chart; that is, on the same page of the chart.

Here we have shown both class and commodity rates and have shown the interstate rates on one side and the State rates on the other.

The St. Louis rates, of course, are interstate rates, and are for the whole distance from St. Louis to these points in Arkansas indicated on the head of the chart.

For purposes of comparison, we have set against them State rates which apply for the distance that these interstate rates would cover, in the State of Arkansas. That is:

Here is the rate from St. Louis to Arkadelphia. The haul in Arkansas on that is 226 miles. Against that I have set over here (indicating on chart) the 226-mile distance tariff rate.

Inasmuch as the division of the rate is not in question, but only its relation, and, further, inasmuch as the Iron Mountain, in dividing the revenue derived from these St. Louis rates, divided on a track mile basis, the comparison holds good for any mile that the freight travels over.

Q. Now, please explain what you have on that chart.

A. The first-class rate from St. Louis to station—from Asylum in Arkansas, which is the first station south of Little Rock, to and including Gum Springs, the first station south of Arkadelphia.

The first-class rate is $1 to all those stations from St. Louis.

Q. That is represented by a level line?

A. Yes, sir; and so marked on the chart.

The State rate for the same haul in Arkansas is set opposite that and graduates from 64 to 77 cents.

Q. Graduating according to distance?

A. Yes, sir.

The second-class rate from St. Louis to these points is 85 cents, to all of them—a level line across the chart.

The Distance Tariff State rate graduates.

The third-class rate, interstate, travels 37 miles before it is graduated.

The third-class rate, State, closely follows the first and second-class rates, State, graduated all the way.

* * * * * * * * * * *

Q. You mean interstate?

A. No; the interstate does not. The State rate preserves, in a measure, the relation, but the interstate does not—two of them are flat and the next one is graduated on the interstate.

The fourth-class interstate rate runs out a distance of 214 miles before it begins to rise.

The fourth-class State rate is graduated all the way, although not so markedly as its predecessors, the other three rates.

The fifth-class rate, interstate, is absolutely level.

The fifth-class rate, State, is graduated. Not as markedly as its predecessor, but graduated according to distance, nevertheless.

The Class A rate, interstate, parallels the fifth-class rate and is absolutely level.

The Class A rate, State, is graduated.

The Class B rate, interstate, does not begin to rise until it has traveled 37 miles.

The Class B rate, State, is graduated in the first eight miles and goes up—that is, the first ten-mile group.

The Class C rate, interstate, runs 40 miles before it begins to graduate.

The Class C rate, State, is graduated exactly as the Class B rate, beginning in the first ten miles.

These other rates speak for themselves, and show that while a great many of the class and commodity rates, interstate, are blanket rates or level rates, the State rates are all graduated, preserving a closer internal relation between the various State class and commodity rates than there is preserved between the interstate, and lacking a proper internal relation of each, I fail to see how there can be any relation between the two sets of rates.

* * * * * * * * * * *

Q. Have you some comomdity rates there?

A. The comodity rates are on agricultural implements, less than carload. That is an absolutely level rate, interstate. In fact, it is

really the second-class rate, although it is published as a commodity rate. The same rate, State, is graduated exactly; that is, the second-class rate follows it all the way, step by step.

Q. That is, a relation of a flat rate with a graduated rate?

A. Yes, sir.

The carload rate on agricultural implements, interstate, is graduated all the way, but the less than carload rate on these implements is a flat rate.

If the relation between carload and less than carload, interstate rate on implements, at the first station, was correct, then the relation at the last station is distorted, because there is not a level rate on the less than carload, while there is on the carload. To put that into figures:

The less than carload rate from St. Louis, on agricultural implements, say to Mabelvale, Arkansas, is 85 cents. The carload rate is 30 cents. Now we go to Arkadelphia, and we find the less than carload rate still 85 cents, but the carload rate has gone from 30 to 39 cents. In either one of those cases there is some distortion of relation.

Q. I expect there is a physical condition down there that makes the handling of carloads very much more expensive than less than carloads over that particular piece of track?

A. I should say that there was some commercial necessity for a lower carload rate to some of those points near Little Rock that there was further away. What it is, I do not know, but that may be the cause in the change of the relation.

Now, comparing carload and less than carload, and showing that this tariff is not related, the same statement holds good on "bagging and ties."

The carload rate is a level rate of 19 cents to each of these 27 stations, while the less than carload fluctuates from 39 to 46 cents.

If there is a definite relation, whatever it is, between that carload and less than carload "bagging and tie" rate, it is not apparent at just which of these two points that relation is." (R. pp. 1468-1872.)

He gives further illustration on canned goods, L. C. L. and C. L., and salt, C. L. and L. C. L. In this case a local rate C. L. and a fluctuating L. C. L. rate on the same. These are all shown in exhibit D-1, the tariff numbers all given. (R. p. 1473.)

The testimony of Mr. Perkins, that this territory was exceptional, has heretofore been copied.

To meet Mr. Perkins' statement, this subject was further investigated, and in surrebuttal this additional evidence, along the same line is adduced, commencing at page 2250:

Q. Mr. Hamilton, you put in evidence exhibit C-1, which is a chart showing and illustrating certain rates, State and interstate, on the line of road south of Little Rock. Mr. Perkins, in discussing that, at page 24, said, after explaining the rates set forth in your chart:

"In other words, the State has picked out a comparatively small territory in Arkansas where this condition exists, to try to prove there is no relation between our State and interstate rates; while, as a matter of fact that comparatively small territory is an exception to the rule; although in that territory there is the relation between State and interstate rates as I have explained."

I will ask you if that is a correct statement that you have picked out a small territory there to prove this fact, and that that small territory is the exception to this rule.

* * * * * * * * *

A. First, on the question of the section of the line covered by exhibit C-1, being the only portion of the line in Arkansas where the conditions illustrated in that chart were extant during the period of our inquiry, I would say that I have taken the same tariff naming the interstate rates from St. Louis to points in Arkansas, and have found that a similar condition exists on every section of the line which is covered by nine additional charts of similar character to exhibit C-1, which I have prepared.

Q. Explain those charts, Mr. Hamilton, so it may be understood.

A. The charts are numbered from one to nine, and, to indicate the extent of the territory covered by them, I have prepared as a recapitulation or summary of the charts an outline map of the Iron Mountain mileage in Arkansas, which appears first in the exhibit.

The portions of the Iron Mountain line colored in red are portions covered by the charts attached to the recapitulation.

The numbers shown opposite these red sections of the map are references to the charts which underlie it.

The mileage covered by the charts is 529 miles, including the territory covered by exhibit C-1, which itself covered seventy miles.

Those 529 miles are 39 per cent of the total Iron Mountain mileage in Arkansas.

The charts are similar in nature to exhibit C-1, but cover different territory.

Q. Explain the principle involved in this map and the charts.

A. Take one, for example. Take chart 5, attached to the exhibit, the stations to which the rates apply, cover 79 miles on the White River division, beginning at Fitzgerald, just north of Newport, and running to Cresswell. The red lines indicate the interstate rates from St. Louis to the various stations shown.

The graduated colored lines indicate the State Distance Tariff rates for the same mileage in Arkansas as would be covered on the haul from St. Louis on the through rate from St. Louis to these points.

It is not intended to compare the rates themselves in dollars and cents, but their relation one to the other.

To explain: First-class rate from St. Louis to Fitzgerald was 80 cents. First-class rate to Cresswell, 79 miles further distant (figur-

ing the short-line mileage via Diaz Junction) is also 80 cents. And the rate is 80 cents to all intermediate stations.

The first-class State rate from the Missouri State line to Fitzgerald is 43 cents. The first-class State rate to Cresswell, the most northerly station, is 56 cents, a variation of 19 cents, which is made gradually from station to station or in groups of five to ten miles.

The same is true of other State and other interstate rates.

On this particular chart all of the interstate rates with the exception of Class E, are the same to the first and the last station on the chart.

Class E runs at the 15-cent level for 44 miles and at 16 cents the rest of the distance, or 35 miles.

There is one chart to which I wish to call particular attention; that is No. 2, covering 80 miles on the Helena branch; the first station being Jolly, just south of Knobel, and the last station shown on the chart being Wynne, the junction of that line with the line from Bald Knob to Memphis, the distance between stations being 80 miles.

The first class interstate rates begin at 70 cents and is 70 cents to the first three stations shown on the chart.

The next station the rate is 71 cents.

To the next two it is 72 cents. And then to all except the last two stations on the chart, or a distance of 48 miles, it is 73 cents level, raising one cent to each of the last two stations.

The second and third class interstate rates are absolutely level, being the same to the first station as to the last.

That is all true of the fourth class rate.

Class A from St. Louis recedes.

That is, the rate to the seventh station south, or Paragould, has dropped one cent, although the distance has increased.

That is true of Class B, the rate has dropped two cents when it reaches that station.

And of Class C, which has dropped two cents. And Class D has dropped two cents. And Class E has dropped three cents.

That decrease in the rate remains effective for 19 miles, and then the rate resumes its former level and goes on on a parity with the first and second class rate.

On this same chart the State rates are graduated according to distance, the rates increasing in five or ten mile groups, according to the State Commission Tariff.

Q. This was based on the rates in effect during the last half of the year 1907?

A. This chart was based on the interstate rates in effect during the last half of 1907 and also on Standard Tariff No. 3.

The map, which is a recapitulation, bears a typewritten statement practically the same as what I have given here.

Q. The balance is made up practically in line with the explanation you have given?

A. Yes, sir.

* * * * * * * * *

The exhibit referred to is marked "Defendant's Exhibit L-1." Two of the charts are reduced in size and reproduced herewith and found on opposite page to illustrate this testimony.

* * * * * * * * *

Q. Mr. Hamilton, at page R-7, Mr. Perkins, in discussing the rates to Texas common points, in answer to some testimony of Mr. Ludlam and exhibits filed, uses this language:

"The rates to Texas common points are not made entirely from St. Louis. In many cases the rates are made from the territories east, and rates are then fixed from St. Louis on differentials under the rates so fixed from Eastern territory.

"This is due to the fact that the further east we go the more keenly do we feel the water competition of the Steamer Lines from New York to Galveston and Texas City. In adjusting our rates to Texas we attempt to arrive at a rate which will yield an average return. In other words, we do not figure on the rates to Paris, in the northern part of the State of Texas, nor on the rates to San Antonio, in the southern part of the State, but a rate which applied to the entire territory would yield an average return."

I wish you would state whether you have found that to be correct, and if you think it is incorrect, if you have prepared a chart illustrating how those rates are made different from the way Mr. Perkins understood it?

* * * * * * * * *

A. The rates are made in the way which Mr. Perkins says they are made. The tariffs show that.

But their division between the carriers hauling the freight results in greatly varying rates for the haul in Arkansas.

Q. You mean greatly varying revenue rather than rates, do you not?

A. Greatly varying revenue, assuming the business moves under the rates.

Q. What I am particularly calling attention to is the average of revenue. As I understand, that is made up by the rate and the division?

A. Yes, sir; that would be governed by the average movement of freight also.

Q. That is true. Now proceed with your explanation.

A. I have prepared a chart which covers the rates, or the Iron Mountain proportion of the rate in Arkansas on business from Chicago and Pittsburg and their surrounding territories, and St. Louis, to 15 stations taken at random from the map of Texas:

The stations named are shown as taking Texas Common Point rates and I have selected the first class rates, for purposes of illustration.

MR. PERKINS:

Q. Can you state what roads those stations are on, so we can follow that up?

A. I have Victoria on the Texas and New Orleans.

Brownwood on the Fort Worth & Rio Grande.

Wharton, Texas, on the G., H. & S. A.

Abilene on the Texas and Pacific.

San Antonio on several roads, among them the I. & G. N., and I have figured I. & G. N. divisions on this chart.

Eastline, Texas, on the Texas & Pacific.

Big Springs on the Texas & Pacific.

Austin on the I. & G. N. among other roads and I have used I. & G. N. divisions.

Corsicana on the Cotton Belt.

Waco on the Cotton Belt and I have used Cotton Belt divisions.

Palestine on the I. & G. N.

Fort Worth on the Texas & Pacific among other roads and I have used Texas & Pacific divisions.

New Boston on the Texas & Pacific.

Marshall on the Texas & Pacific.

Tyler on the I. & G. N. and Cotton Belt, and I have used Cotton Belt divisions.

The first class rate from Chicago to these points—that is, the proportion of it which Iron Mountain would earn in Arkansas, is indicated by a red line.

The Iron Mountain Arkansas proportion of the Pittsburg rate is indicated by a blue line.

And its proportion of the St. Louis rates is indicated by a green line.

In arriving at the proportion accruing to the Iron Mountain in Arkansas, I have applied the regular divisions on Chicago and Pittsburg business north and east of East St. Louis, as shown in the company's division sheets current in 1907; and the divisions south of Texarkana as shown in their division sheets with the Southern lines.

The remainder or the proportion of the rate between St. Louis and Texarkana I have divided between Missouri and Arkansas on a track-mileage basis, which is the railroad's method in this suit, of locating revenue to Arkansas.

The chart speaks for itself.

The proportion of the rates in cents per hundred pounds is shown in figures across the top.

The lines extend to a figure which indicates the rate accruing to the Iron Mountain on its haul in Arkansas for the business for each station from each point indicated.

The rate accruing to the Iron Mountain in Arkansas on business from Chicago to Victoria, Texas, was 31 cents.

From Chicago to Tyler, Texas, it was 59 cents.

Q. That would be exactly the same movement over the Iron Mountain tracks?

A. From the Missouri-Arkansas State line on the Iron Mountain rails to Texarkana.

MR. PERKINS:

Q. You are using the first class rate?

A. Yes; that is the only rate shown on the chart. The rate used is the first class rate arrived at by adding the established differentials to the St. Louis rate on the Chicago and Pittsburg basis. And the divisions were obtained from the percentage sheets on file in the office of the auditor of freight receipts of the Missouri Pacific Railway.

The two extremes of the chart are 31 cents on the business from Chicago to Victoria, Texas, and 66 cents on business from St. Louis to Tyler, Texas.

The others speak for themselves.

COL. MOORE:

Q. They vary between those two extremes?

A. Yes, sir.

* * * * * * * * * * *

Q. I think it is in the record but I wish it restated here for the purpose of clarifying a situation:

The rate you have put down here is the proportion accruing to the State of Arkansas?

A. Yes, sir; on the basis I have explained, track mile division of the proportion of the rate from St. Louis to Texarkana.

Q. What I want to get at is, that track mileage basis is the one used by the railroads here?

A. In locating earnings to Arkansas; yes, sir.

See exhibit M-1. (R. pp. 2250-2255.)

* * * * * * * * *

Mr. Bee, the Rate Expert of the Corporation Commission of Oklahoma, was questioned on this subject and said there was no relation between State and interstate rates other than the relation of enabling a jobber to do business, which is a commercial relation. (R. p. 1190.)

The testimony of Mr. Nay to the effect that there must be a proper relation—cost relation—between State and interstate rates in order to give value to the revenue theory, was quoted, and he was asked if there was any such cost relation and he stated it was impossible to have such a relation; that the difference in distance is so great that a rate made on one basis would not apply to the other, instancing the haul from St. Louis to Oklahoma is 600 miles and the average haul in the State 50 miles.

"If rates could be built entirely upon what we call a scientific mileage scale there would then be the chance to have each shipment pay its pro-rata part of the cost, but in the conditions existing, this freight from St. Louis comes in competition with Atlantic seaboard freight, which is handled via Galveston; it comes in competition with German and English-made goods handled in transstate steamers to Galveston, Texas, at a very low rate; practically brought over in cotton seasons as ballast in the boats.

The rates from Galveston are then made to points in Oklahoma.

The same conditions exist in New Orleans. Competition from St. Louis must meet that from Fort Smith and that from Texas centers.

The result is that the relation of the rates from St. Louis to Oklahoma do not take into consideration the local rates in Oklahoma, but the rates from the surrounding States and Territory that supply Oklahoma with the same commodities that the St. Louis rates apply to.

Q. That is sort of a trade balance?

A. Absolutely so; a necessary condition in order to market the product.

Q. Take an illustration and see if I get your idea clearly; you are familiar with the Arkansas Standard Distance Tariff?

A. I am.

Q. Take the lumber schedule that moves on a mileage distance rate, I believe, with a rough material rate into the sawmill:

Compare the rate for lumber moving from a sawmill in Southern Arkansas, moving first into a sawmill, probably from some tap line; then manufactured into lumber at the sawmill and shipped out to Little Rock, Fort Smith or any other intrastate point.

Compare that movement with a similar movement of lumber shipped from Lake Charles, Louisiana, on a 23-cent rate to Omaha.

What relation would there be between the revenue in the lumber shipment under the Arkansas Standard Distance Tariff and the relation of the revenue derived under this interstate tariff in that zone?

A. It is imposisble to make a comparison. There is no comparison there.

Q. Mr. Nay says that unless there is a proper relation based on the cost of the service between the two, the revenue theory would be of no value.

A. There is no possible chance to make a comparison between those two rates. They are not related to one another in any way. One does not depend upon the other. One is not taken into consideration in making the other. They are as unlike as black and white and no comparison can be drawn between them. A man would be foolish to try to draw a comparison between two sets of rates, because no two factors are entering into the rate that are the same except the proposition of the railroad handling the business.

The rate from Louisiana points to Omaha and all intermediate points, is 20 odd cents. At which point are you going to take it to compare it with the Arkansas rate to find the comparison? There are no two things entering into it that are comparable.

Q. Suppose we get something that can be compared:

It is in evidence here that lumber shipped from points in Northern Louisiana to St. Louis would carry an 18-cent rate, but if that were shipped from the same point into Little Rock, it would carry a 22-cent rate, going over the same track, originating at the same place, part company at Little Rock, get a 22-cent rate for the haul to Little Rock and 18 cents for the haul to St. Louis; and a similar shipment that happened to be within the State, the same length of haul, would have still a different rate fixed by the Standard Distance Tariff:

What relation would you figure out existed there?

A. I have worked rates a long time, but I fail to be able to find any relation between those rates. There is a competitive condition, Judge, that creates that 18-cent rate to St. Louis, which the railroad sees fit to meet. That was years ago. I understand from traffic men that it does not exist today, but the rate exists, and that competitive condition that did exist caused that 18-cent rate from Arkansas and 22-cent rate from Texas and Louisiana fields into St. Louis. There was not any State rate in Arkansas or Oklahoma that had anything to do with the making of that freight rate, and when they came along to make the Oklahoma and Arkansas rates I do not think they took that rate into consideration.

We find in Oklahoma, in some instances, there are six cents difference between the local rate in Oklahoma, between two given points, and the rate from Texas to that point.

In one place there would be 8 cents and in another place there would be 10 cents. There was no reason for any of that. There was not any mileage condition that could possibly bring around the exact differences or anywhere in the neighborhood of the differences, and I fail to see where a man can draw a comparison between a State rate and an interstate rate and say they are related to one another, and when built upon the other, there is a condition under which a man could compare a State rate and interstate rate, possibly, on a revenue basis, to see if one was paying its pro rata part of the cost as compared with the other.

Q. What would that be?

A. The traffic moving interstate on each different commodity would have to be of the same proportion as the traffic moved in the State on the same commodity, and then the rates would have to be so far apart as was found the difference between handling State traffic and interstate traffic and if each rate was built upon that exact factor then a man could take the revenue theory and so on that basis could be divided the expense, but I know of no other conditions under which the revenue theory could be taken.

Q. That is a condition that does not seem to be existent, as gathered from your testimony.

A. It not only does not exist, but it is impossible for it to exist." (R. pp. 1190-1193.)

To follow this further, illustrated with the lumber rate, there would have to be the same proportion of lumber hauled intrastate and interstate and the same rate per ton per mile plus the extra cost of one over the other, and, in addition to that, the same profit in each rate. Without these impossible and nonexistent conditions the revenue theory has no value. (R. p. 1194.)

Mr. Nay made a statement regarding the classification being preserved in both State and interstate, and Mr. Bee was questioned regarding it; both statements are given.

Mr. Nay's statement:

"A. Yes; but by examination of the two I find that practically the same relative cost of first, second and third classes in carloads existing with the Commission as with the interstate rates.

Q. You differ with lots of these witnesses, like Mr. Watson, very much, Mr. Nay.

A. His judgment is better than mine. I say practically the same. I have not compared individual rates. But what I mean, Judge Hill, is to say, for example, here is an Arkansas rate, a rate for first class 50 per cent more than the rate for fourth class. In the interstate rate tariff the rate for first class is double the rate for fourth class.

What I mean is that they have preserved a relation and fixed a higher charge for the commodities that are classed as first class in this classification than they have for those fixed as fourth class." (R. p. 1195.)

This question was put Mr. Bee and his answer follows:

"That is the point I want to call your attention to, as to whether as a practical matter, not as a theoretical one, whether this relative cost between first, second and third class exists between interstate rates and Commission rates.

A. I do not think they do. The rate from St. Louis to Little Rock, the fourth class rate, is 45 per cent of the first class rate.

What I understand is the average haul in Arkansas on State rates, the Standard Distance Tariff shows that the fourth class rate is 66.6 of the first class rate. In other words, there is 21.6 per cent variation between the two.

Q. That is the percentage of the relation between the two?

A. Exactly.

Q. It is just another factor in addition to the fluctuation in the rates that reaches to the revenue.

A. Exactly.

Q. You do not find Mr. Nay's theoretical illustration in practice?

A. No; I have worked it down to every possible point in the voluntary rates of the railroads in Oklahoma and the voluntary

interstate rates of the roads, and there is not a single instance I have ever found that they were the same.

I went into that theory to try to find out if they were built upon such a basis.

The Chicago-Guthrie rate is 58 per cent, fourth class of first; the Oklahoma rate on the Santa Fe is 53.44 per cent.

Q. Is that a voluntary rate?

A. Both are voluntary rates. I do not see where any adjustment comes in.

The Chicago-Missouri rate—I will call fourth as against first, as that seems to be the one Mr. Nay took up—that is 40 per cent; Chicago-Guthrie rate is 58 per cent; St. Louis-Kansas City rate is 45 per cent; St. Louis-Guthrie rate is 63 per cent; the Kansas City-Guthrie rate is 65.3 per cent." (R. p. 1195.)

Mr. Bee was cross examined in great detail as to these matters and all others upon which he testified, being subjected to the most rigid and detailed and lengthy cross examination of any witness on either side, but it only resulted in bringing out almost innumerable instances, examples and illustrations of the general statements made by him. To further develop the relations of the rates on re-direct examination, this occurs:

"Q. I want to submit to you an affidavit made by Mr. C. K. Vorhees, which was filed in this suit on motion to dissolve the innjunctions, before the Circuit Court of the United States at Little Rock, in the spring of 1909. I presume you know Mr. Vorhees?

A. Very well; he is general freight agent of the St. Louis & San Francisco Railroad.

Q. On page 3 he states:

"Affiant states that the representatives of the several lines discussed and considered the relations which should exist between the several class rates, and after much study and comparison with the rates in other States and with the class rates applied on interstate traffic in various portions of the territory west of the Mississippi River and other elements affecting the fixing of class rates, it was decided to recommend that the various classes should bear the following relation each to the other:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E | Classes. |
|---|---|---|---|---|---|---|---|---|---|---|
| 100 | 83⅓ | 66⅔ | 50 | 40 | 45 | 30 | 30 | 25 | 20 | Percentages |

Are you familiar with that which I presume is put forward by Mr. Vorhees as the ideal relation of one class to another?

A. That scale looks very much to me like what is known as the Minnesota scale, and which has stood the test of the Supreme Court of that State; I would not be absolutely positive, but it appears to me as very close to the Minnesota scale.

Q. That is presumably considered by those who made it, the ideal scale.

A. It is so considered at present, but I am sorry to say it is not in use anywhere except up there, that I know of.

Q. From page 4 of Mr. Vorhees' affidavit, I want to take what he gives as the rates that were applicable; these are all interstate rates applicable at the time of the injunction in this case; he first gives those from Memphis to Little Rock:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 70 | 60 | 45 | 36 | 27 | 29 | 22 | 18 | 15 | 12 |

Then the rates from Memphis to Fort Smith, distance of 302 miles:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 102 | 87 | 67 | 49 | 40 | 42 | 35 | 30 | 28 | 23 |

Then the rates from St. Louis to Little Rock, a distance of 345 miles was:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 100 | 85 | 65 | 49 | 37 | 39 | 32 | 27 | 23 | 18 |

Now, with those before you, I will ask you if they illustrate the point that you were making in your cross examination, that there was no proper relation between the classes in the interstate tariffs with which you could compare or establish a relation with the State tariffs?

A. They are. I had all those percentages figured out, but they seem to have disappeared; I read them into the record this morning; I read all the interstate rates in, and I had the State rates figured out as to the percentages of those. I believe 40 miles is supposed to be the average haul in Arkansas.

Q. Forty-two, I think it is?

A. I have taken 40 miles; now, I will call four columns, the first column will be the Memphis to Little Rock rate, the second column will be the Memphis to Fort Smith rate, the third column will be the St. Louis to Little Rock rate, and the fourth column will be the Arkansas Standard Distance Tariff No. 3, for 40 miles:

| | M.-L. R. | M.-F. S. | St. L.-L. R. | A. S. D. T. No. 3. |
|---|---|---|---|---|
| 2nd | 86 | 85.3 | 85 | 90 |
| 3rd | 64 | 65.7 | 65 | 80 |
| 4th | 51.4 | 48 | 49 | 66.6 |
| 5th | 38.6 | 39.2 | 37 | 50 |
| "A" | 41.4 | 41.1 | 39 | 53.3 |
| "B" | 31.4 | 34.3 | 32 | 40 |
| "C" | 25.7 | 29.4 | 27 | 30 |
| "D" | 21.4 | 27.4 | 23 | 26.6 |
| "E" | 17 | 22.5 | 18 | 23.3 |

Those are the percentages of first class rate in each class. Now, that shows that the relation of the interstate rates to the State rates for the average haul in Arkansas, is not relative at all.

Q. There is not one of those interstate rates where you could make the relation so it would fit in with another?

A. No, sir.

* * * * * * * * *

Q. Are those the rates in force now?

A. No, sir; the ones in 1907, I understand.

* * * * * * * * *

Q. Were those rates Mr. Voorhees has been testifying about the interstate rates in force at the time of the injunction?

A. Yes, sir; these are the rates I took from that affidavit, and 40 miles distance rate in Arkansas." (R. pp. 1299-1301.)

Mr. Voorhees' affidavit is of record, pages 2576-2579.

Mr. Ludlam, in his cross examination, was questioned in regard to statements of traffic officials in regard to classification fixing a relation between rates, and gave this full exposition of the situation:

"A. Those same gentlemen, for instance, testified that in fixing the rates, the casualty risk was considered, and lost space was considered, and that all of the elements that would enter into the increased cost were considered, and yet I find in the actual movement of railroad traffic that that situation is not true. While it is true to a certain extent, in the great bulk of railroad movements the actual conditions do not accord with their theories.

For instance, taking the St. Louis, Iron Mountain & Southern Tariff No. 70, Texas Tariff No. 1-DD, which was issued by Mr. Cale, agent, in effect during the last six months of 1907, from St. Louis to Texas common points, a map of which is already in evidence in this case.

The Texas common points cover some 2,600 stations, I think, in Texas, and represent a movement that may vary as much as 400 miles in the length of the haul, and I find that that tariff shows that from St. Louis to Texas common points, the rate on beer in glass is 48 cents per hundred pounds, with a minimum weight of 30,000 pounds, and that the same tariff gives the rate on bar iron of 55 cents, a minimum weight of 36,000 pounds.

Now, the casualty risk on beer in glass would certainly be very much higher than it would be on bar iron, and yet beer in glass is hauled cheaper under that tariff from St. Louis to Texas Common Points than bar iron is hauled.

In addition to that, the beer rate provides for 6,000 pounds of free carriage of ice, sawdust, straw, etc., during the months of June, July, August and September, and in the other months 3,000 pounds.

In making that rate where they carry beer in glass for less than they do bar iron, they did not consider either the lost space or the casualty risk.

The same tariff quotes excelsior from St. Louis to Texas Common Points at 43 cents, with a minimum weight of 20,000, as compared with the rate already quoted of 55 cents for bar iron.

They certainly did not consider the space required in the car or the casualty risk. Excelsior would burn up very easily. Bar iron, if you had a fire, would not be an entire loss, at least.

The same tariff quotes potatoes: This is from St. Louis to Texas Common Points. The difference in every one of these hauls may exist of over 400 miles.

The tariff quotes potatoes at 54 cents, with minimum of 30,000 pounds.

It quotes horse and mule shoes at 62 cents, with a minimum of 35,000 pounds.

When I see tariffs actually made up on that basis, when the rate is actually less on potatoes than it is on horse and mule shoes, I know that consideration was not given to the casualty risk or the space required.

The same tariff shows poultry netting, 48 cents, with a minimum weight of 30,000 pounds, and iron and steel claims at 70 cents, with a minimum weight of 36,000 pounds, and when a traffic man testifies that they consider the space and the casualty risk, he is certainly not considering such items as these, and the tariffs upon which the great bulk of the business moves.

Certainly no man would claim that poultry netting required less space or that it had a less casualty risk than iron and steel chains.

The same tariff shows hollow building tile at 25 cents, minimum 40,000 pounds. Also pig iron at 33 cents, with a minimum of 50,000 pounds, and the tariff itself shows that they expect to load more pig iron in the car than they do hollow building tile, and yet the rate on hollow building tile is less than it is on pig iron.

The same tariff shows iron pipe coils for refrigerating machines at 42½ cents, as compared with bar iron already quoted at 55 cents.

The lesser rate is on the hollow and bulky stuff and the higher rate is for the more compact stuff.

These rates apply to 2,600 points in Texas from St. Louis, with a difference of over 400 miles in the possible length of the haul.

Here is sheet iron pipe, up to 30 inches in diameter, quoted at 55 cents, as compared with sheet iron flat at 62 cents.

When a traffic man testifies that they consider the weight and bulk and these things, does not imagine for a moment that they can put more sheet iron into a car when it is rolled into pipe 30 inches in diameter than they do when it lies flat?

Here is another one: Matches, from anywhere in St. Louis to any Texas Common Point, at 71½ cents. The rate on wooden toothpicks on the same tariff is 80 cents.

The casualty risk on matches, it seems to me, would be higher than it would on wooden toothpicks, notwithstanding what the learned gentleman say who have made those rates and studied these elements, and say they consider them when they can, but on the great bulk of railroad movement they don't apply them.

Here is wooden kegs, 80 cents, with a minimum of 14,000 pounds, as compared with saddlery and hardware in packages, 90 cents, with a minimum of 30,000 pounds.

The light and very bulky stuff—that is, wooden kegs, is quoted lower than the heavier and compact stuff.

Here is pickles and preserves in glass, 58 cents, with a minimum of 30,000 pounds, as compared again with saddlery and hardware at 90 cents.

Anybody, I imagine, to use the term you used a few minutes ago, that was sane, would not imagine that pickles and preserves in glass would take less space or be less liable to damage than hardware.

And that rate is from St. Louis to 2,600 points in Texas.

Here again, comparing pickles and preserves in glass, at 58 cents, with iron and steel chain at 70 cents, with a minimum of 30,000 pounds for pickles and preserves in glass, and 36,000 pounds for iron and steel chain; anybody knows that pickles and preserves in glasses are fragile and the casualty risk is greater and that they do not weigh as much, and yet the rate is lower.

Mr. Nay knows that, when he says that the expenses bear a direct relation to the revenue. What relation has the expense to the revenue, when they haul pickles and preserves in glass at a lower rate than they haul iron and steel chain, when they have to haul pickles and preserves in glass at 58 cents 400 miles further than they haul iron and steel chain for 70 cents? I might add some questions about sanity.

Another rate on baskets, talked about a great deal in this case, the rate from St. Louis to Texas points, is 80 cents. On pig lead it is 75 cents.

They may haul pig lead 400 miles less than they haul the baskets, and yet the variation in rate is 5 cents.

There has been a lot of talk about baskets and the rate taking those things into consideration; what is the consideration of a man worth that says the variation between baskets and pig leads should be only 5 cents? And in the tariff the minimum on baskets is 14,000 pounds, and the minimum on pig lead is 36,000 pounds. And, furthermore, under this tariff baskets may be hauled 400 miles further than pig lead.

Q. On the contrary, pig lead may be hauled 400 miles further than baskets?

A. Yes, sir; in either case the revenue has no relation to the expense. Here are a few samples:

From St. Louis to Atlanta, Texas—those are flat rates—apples 41 cents per hundred. This is the same tariff, No. 70, effective during the last six months of 1907—apples 41 cents, with a minimum of 24,000 pounds, as compared with wire rope, 60 cents, with a minimum of 36,000 pounds. That is, the rate on apples is only about two-thirds what it is on wire rope.

Surely nobody would say that the casualty risk would be greater on wire rope than it would on apples, and the minimum fixed by the railroad itself shows that the density of wire rope is greater, because the minimum of apples is 24,000 pounds and the minimum on wire rope is 36,000.

Again, beer in glass from St. Louis to Atlanta, Texas, is 48 cents, with a minimum of 30,000 pounds. The rate on crowbars is 62 cents, with a minimum of 36,000 pounds.

Certainly beer in glass has a greater casualty risk than crowbars, and it would seem to me that the density might enter into that question. They could hardly put as much weight into beer in glass as they could into crowbars, and the minimum shows they don't expect to.

Again, lamp chimneys are quoted at 61 cents, as compared with crowbars at 62. Whoever made that rate certainly did not give attention to the casualty risk. Any man must know that crowbars would not be more likely to get broken than lamp chimneys.

Here are a few more rates, St. Louis to Atlanta, Texas:

Common brick is 17½ cents and pig iron 32½ cents. The common brick rate carries the valuation of five dollars per thousand brick, which would indicate that the railroads themselves anticipate such a hazard of breakage and hazard of carrying bricks, but they do not expect any on pig iron, which is practically indestructible.

Pickles in glass, 39 cents, and shot in double sacks, 52 cents, with minimum on pickles in glass of 24,000 and shot of 36,000 pounds.

Here is a flat rate from St. Louis to Marshall, Texas, quite a long haul, everything the Iron Mountain hauled would come through Arkansas, as I understand it.

There is a flat rate of 80 cents, with a minimum of 14,000 pounds on any one of the following articles, either in straight carload or in mixed carload lots.

Baskets, shot, paper bags, blacking, blueing, bottles, brushes, lamp chimneys, coffee mills, crayons, galvanized iron tube, galvanized iron pails, ink, lamps, lead, cotton mops, oil cans, oil tanks, paper, pipes—smoking pipes—ropes and twine.

Now these are just a few samples. You can take almost any waybill of a railroad, take one waybill after another and compare it, and you will find the same condition existing, and when gentlemen sit on the stand and say they consider casualty risk and bulk and all those items, I know they do theoretically, but they don't in the practical application of their rates, and it is in the face of these violent fluctuations; in one case they carry baskets and shot at the same price, and in another case they carry lamp chimneys at less than crowbars—and that traffic fluctuates and necessarily fluctuates; when I give these examples, I am not criticising the rates. I do not mean they are not practical and possibly the best rates possible; that they are not compelled by competitive conditions and proper conditions, too,

but I do say there can be no relation between cost and revenue when those rates exist, and it seems to me it must be apparent to anybody, and when Mr. Nay, knowing that, being familiar with those rates, and it being his duty to check them and keep in touch with them, says you must determine your cost or how much more it costs to move State business than interstate business, on the total revenue, I say he builds up a snow man, which I think he knows is a snow man, and in the last few lines of his essay he proceeds to knock him down." (R. pp. 1353-1356.)

The record is full of much other evidence showing the nonrelation of State and interstate rates, but it is confidently submitted that what is here given completely disproves a cost—or any other relation—between State and interstate rates. This evidence proves that rates in one tariff are not consistent with another, the differences are radical and far-reaching; and there is no standard of rates or relation of one class to another or one commodity to another, so that there could be a relation of one set of rates to another. If a relation was shown with one movement, say the Texas Common Point movement, it would at once be disproved as to another similar movement, say the Memphis movement, as each are moving on rates bearing no relation to each other. If a relation was established in lumber from Louisiana to St. Louis, it would be disproved on the movement from Louisiana to Kansas City. If the relation was found on coal from Illinois fields, it would be disproved by the relation on coal from the Alabama fields.

Then what is to be done with the traffic which moves wholly interstate all the cotton and most of the grain? There is no corresponding or relative intrastate movement in these commodities.

If classification has fixed a relation, then when the commodities are controlled by the Texas classification or Louisiana classification or come from other classification territory, to which shall the Arkansas classification be fitted? There are substantial movements from all.

The relation theory falls to the ground when confronted with the concrete facts.

This completes our review of the revenue theory in all of its aspects; both sides have been presented, we think, with fairness, usually in the witnesses' own words.

It is respectfully insisted that the assignments of error based on the use of this theory should be sustained, because it is proved by a decided preponderance of the evidence to be worthless for the purposes used.

## EXTRA COST OF INTRASTATE TRAFFIC.

In opening the discussion of this subject, we quote with approval this excerpt from the brief of the learned counsel for the appellants in the Missouri Rate Case.

"The issue tendered by the complainant is that it costs more to handle State than interstate freight. The evidence offered in support of that issue is that a way freight train is more expensive than a through freight train. The record is crowded with—indeed, it is devoted to the recital of details, important and unimportant, substantial and trivial, real and fanciful, nothing within the range of the imagination being omitted, to show that the way train is more expensive than the through train. The evidence so offered can not be said to be irrelevant because it does bear upon the issue. But in and of itself it is not sufficient to maintain the issue tendered. * * * Hundreds of pages of this kind of evidence were introduced by the complainant as if it were decisive of the issue; just as if the real issue is (as it is not) between 'way train' and 'through train' instead of being (as it is) 'State freight' and 'interstate freight.' "

The same confusion of ideas prevailed with all, possibly except Mr. Doddridge, of the plaintiffs' witnesses. At the time they testified, as is shown, the State had not worked out the statistics on the Iron Mountain road of the proportion of freight carried on the trains respectively of State and interstate, and was handicapped by not being able to put the exact facts before them, but the relative situation had been worked out on the St. Louis Southwestern by its officials and put in evidence as the basis of much of the plaintiffs' testimony, and when the witnesses were confronted with it, several of them candidly admitted their testimony was inapplicable to such a situation. The showing on the Iron Mountain, when finally worked out, was a vastly stronger refutation of their theories than the then available statistics.

Stronger against their theories than either of these tests was the test of Mr. Whitenton on the Rock Island, put in by plaintiffs after their other evidence was closed.

*The Plaintiff's Evidence.*

On the extra cost of intrastate traffic, the plaintiffs introduced Mr. McPherson, Mr. Doddridge, Mr. Sewell, Mr. Rawn, Mr. Ward, Mr. McKee and Mr. Whittenten. Mr. McPherson did not discuss the local and through trains as representative of the two classes of traffic as do the other witnesses. He was the first witness, and gave a great mass of details as to railroad operations and railroad facilities and the use of each by each class of traffic, some of it pertinent and much irrelevant. He based his argument on the long haul and short haul, and two terminals of State as producing the extra expense of the intrastate. He constantly compares the intrastate with the transstate as representing the two extremes. He argues that the transstate is the cheapest of all traffic, and uses less of the facilities of the road. He is a very tedious witness, and his testimony long drawn out; it is believed that these two excerpts fairly state the substance of all of it on this issue:

"Q. As to intrastate, but I am now asking you as to a comparison of the three classes.

I understand the reason you gave as to burdening intrastate traffic with greater expense, but I am asking you now for a comparison of the three grades of traffic.

A. I should say that so far as expense in Arkansas is concerned, the relation would be something like this:

In the transstate traffic there is no charge in the exhibits here for operation, for stationary service.

In the interstate traffic there would be one charge for stationary service.

In the intrastate traffic there would be two charges, in the exhibits filed here, showing the operating expenses of the road.

Q. Are these the only reasons you have for so grading these classes of traffic, according to their expense?

A. Those are the principal reasons, and the other reasons I have given would, of course, influence me in my answer to that question.

Q. What other reasons would influence you?

A. I believe I have spoken of the length of haul and of the elements that would enter into the variety of traffic.

Q. I don't quite follow you about the variety.

A. Well, the consideration of the character, value, risk, bulk, and so forth, of the freight or commodity.

Q. Does not that apply equally to all those classes of traffic except as to the length of the haul and the terminal expenses?

A. Yes, sir.

Q. Your reasons reduce themselves to the terminal proposition and the length of the haul.

A. No, sir; I can not say that. I have analyzed my reasons thoroughly, and if I should have to repeat them now it would mean repeating my analysis. (R. p. 346.)

Q. You say there would be greater efficiency of car service in interstate than in intrastate, and less cost for maintenance of equipment. That comes back to the same proposition of the length of haul and the use of terminals, does it not?

A. I presume it would, fundamentally.

Q. Your reasoning, then, in its final analysis places the difference in these classes of traffic, intrastate, interstate and transstate, upon the difference in the length of haul and the use of the facilities—terminal facilities, I mean?

A. And the consequences.

Q. Well, that would be included in it, I take it.

There are no other factors now that have influenced your judgment in this matter?

A. Yes, there are many other factors that have influenced my judgment.

Q. I would like to have them.

A. I don't know that I can reduce them to figures. They are matters of observation.

Q. Is there any further answer you would like to give, Mr. McPherson, to that?

A. There are other matters that apply to the consideration of these questions, that might exist one month and might not another month.

There is the handling of empty cars. The traffic—State traffic, is not well balanced and requires more empty cars to be handled to provide for its loading than is the case with interstate traffic.

Q. Anything else?

A. As I said before, this would be one of the additional reasons that I would have in mind. There are others, but they don't occur to me just now.

Q. The fundamental and principal one are the terminals and the length of haul?

A. The added equipment and the maintenance; the various results that are dependant on those factors and results that work out." (R. p. 348.)

It was also established by record evidence from two opposite periods of the year that the transstate did largely use the stationary facilities of the road. It was also shown that cotton platforms, cattle pens and other facilities were exclusively for the interstate traffic.

Later, it was shown by him and other officers of his company that in the exhibits here the large interstate traffic in and out of Fort Smith and Memphis (the latter being placed constructively in Arkansas), was interstate, and two terminal expenses incurred by it in Arkansas and all the transstate traffic passing through those gateways incurred one terminal expense in Arkansas. Furthermore, it was later developed that cotton—all interstate—had three terminal handlings in the State, much of grain and lumber, also large interstate movements had two, and sometimes three, terminal handlings. As they are established, it is well to bear them in mind when considering Mr. McPherson's basis reasons above quoted.

Mr. W. B. Doddridge, who had at one time been general manager of both of the railroads now before the court, was the next witness on this subject. As there is much repetition in the testimony, it is well to set out in full one witness so that the Court can get the full benefit of the reasons given for the extra cost. Mr. Doddridge states it stronger, more logically and has better experience to judge of it than any other witness, and therefore, his testimony on this subject is given in full.

"Q. Is there any difference in your judgment in the cost of handling State and interstate traffic?

A. Yes, sir.

Q. I wish you would give your views as to that difference and the grounds upon which you base them?

A. The difference in cost can not be accurately determined. Relatively but few of the expenses can be identified as directly attributable exclusively to either class of traffic. Under normal conditions, the best that can be done is an approximation based upon a system of averages.

After ascertaining certain of the elements of cost, it can be approximated by applying the per cents of expense thus obtained to those items of expenses that are common to all classes of traffic.

Individual cases have but little bearing upon the subject as a whole.

In considering this question, State lines are artificial and have no effect other than in a technical sense.

Under equal conditions as the haul shortens, either in the freight or in the passenger service, the proportional cost increases.

As the density of an evenly balanced traffic increases within certain limits the ratio of cost decreases.

The reason for this is, that a large percentage of expenses is stationary and have nothing to do with the haul.

It is the circumstances and conditions under which the traffic is necessarily handled that affects its proportional cost.

Interstate freight is in two classes, each handled under somewhat dissimilar conditions.

That part of which is transported across the State, as upon a bridge, and that part which originates or has its destination within the State, and in that respect is local freight.

Transstate freight has a small percentage of terminal expense within the State; and the interstate freight has but one terminal expense.

But for economical reasons both classes of freight are sometimes rehandled at divisional or junction points.

The great bulk of intrastate freight is carried upon local or way freight trains, in common with such interstate freight as there may be for distribution or collection.

This train is run daily, except Sundays and holidays, as nearly as practicable in daylight only. It does the local switching along the line and any other local work that may be required. The train crew load and unload less than carload freight.

It is a special, arbitrary freight service, run without regard to the tonnage-load to be moved; and, therefore, as measured by its performance is a very expensive class of train.

Upon branch lines the local trains do all the business, as a rule.

The through trains are loaded with transstate, interstate, and a small percentage of State freight. They are started from massing points and are not usually run unless there is a tonnage-load, or run for the purpose of balancing the power.

The intrastate freight traffic is the shortest haul business handled by the railroads in Arkansas; and for that reason, if for no other, is the most expensive.

It is true that quite a large amount of interstate freight is carried upon local trains, but the proportion of that class of interstate freight to the total of interstate freight is very small.

Q. Can you state approximately what portion of the freight carried on local trains belong to each class of traffic; that is, intrastate and interstate?

A. I have no definite information upon that point; but, based upon my general knowledge and experience with railroads in Arkansas, I should judge that the greater proportion of the load of the local trains is interstate freight.

But, at the same time, the bulk of the State freight is carried upon local trains, and but a small proportion of the total interstate freight is carried on local trains.

Q. What proportion of the intrastate freight is carried in local trains; that is the question I want you to answer.

A. On the St. Louis Southwestern Railway 8 per cent of the interstate freight is carried upon local trains; and 92 per cent is carried upon through trains—as shown by their test made in October, 1908.

I can not state what the proportions are on the St. Louis, Iron Mountain & Southern Railway, but the exhibits filed by that company show that a little less than 20 per cent of the total tonnage is local or intrastate; and that something over 80 per cent is interstate.

It is also shown in evidence that 51 per cent of the traffic of that road in Arkansas is transstate.

It would, therefore, follow that a very small proportion of the interstate freight is carried on local trains, but I can not state what that per cent is.

Q. If it is true that a small proportion of the interstate freight is carried on local trains, does it not follow that a very large proportion of that class of traffic is not subjected to the local train expense that accrues against local traffic, and to the increased expense growing out of the difference between the long and the short haul?

A. That is true. Only a small percentage of the interstate traffic is subjected to the high cost of the local trains.

Q. In what manner does the terminal expense increase the expense of conducting local traffic?

A. All the terminal expenses are the same, without regard to the length of the haul; therefore, these expenses per ton per mile increase as the haul shortens.

What is meant by "terminal expense" is the point of shipment and point of delivery. The terminal expense includes labor at stations, supplies, and all the facilities used in the transaction of business, such as house tracks, team tracks, yard engines, switchmen, and the cost of the maintenance of these structures.

The average length of haul on the freight business handled by

the St. Louis Southwestern Railway in Arkansas, as shown, is, interstate 231 miles; intrastate 44 miles.

The average interstate haul is 5.3 times greater than the State haul.

The average length of haul on the freight business handled by the St. Louis, Iron Mountain & Southern Railway in Arkansas, as shown in the exhibits filed by that railway are interstate 224 miles; intrastate 70 miles.

The average interstate haul is 3.2 times greater than the intrastate.

Therefore, the terminal expense in the case of the St. Louis Southwestern Railway is 10.6 times greater than the terminal expense of the interstate freight.

In the case of the St. Louis, Iron Mountain & Southern Railway it is 6.4 times greater than the interstate freight carried by that company.

This estimate does not makes any allowance for the absence of terminals in the transstate freight by either company.

Q. Do the additional terminals involve a large element of additional expense in the transportation of the local or State freight?

A. Yes, sir. I am not advised of the exact percentage that the terminal expense bears to the whole expense of operating the railroads, but it is usually somewhere in the neighborhood of between 15 and 20 per cent." (R. pp. 457-460.)

Analyzing these principal statements one by him in the light of the exhibits and established facts:

(1) That part which is transported "as upon a bridge." This is the origin of the "bridge theory" of transstate freight and its lesser cost, which is so utterly overthrown by record evidence as to become ludicrous. It is presented at great length hereafter.

(2) He says: Transstate freight has but a small percentage of terminal expense, and the interstate but one. All transstate has an average of three divisional handlings in the State, which are almost, if not quite, equal to terminal handlings. Much interstate has two and three terminal handlings.

(3) He says: For economical reasons, both classes of freight are sometimes rehandled at divisional or junction points. The through freight divisions are on an average 98 miles, the haul through the State about 300 miles. The local freight divisions are on an average 74 miles. The average intrastate haul is 70 miles on one road and less on the other. The intrastate freight on an average can have no divisional handling, that having one or more is compensated by that having none. The transstate handlings have these and all the interstate—224—will average two.

(4) The great bulk of interstate freight is carried on local trains: The statistics show that on the St. Louis Southwestern Railway 22 per cent is carried on the through; and on the Iron Mountain 61 per cent is carried on the through.

(5) He says: The greater proportion of the load of the local trains is interstate, but the bulk of the State freight is carried on the local. Mr. Doddridge is the only witness for the plaintiffs who recognizes that a greater proportion of the load of the local is interstate, but he misses the other proposition almost as badly as the other witnesses for the plaintiffs, that the bulk of the State freight is carried on the local; he was correct as to the St. Louis Southwestern Railway, there being only 22 per cent of the State freight carried on the through, but on the Iron Mountain 61 per cent of the State freight was carried on the through.

(6) His calculation to show that the terminal expenses increase by average length of haul is an egregrious blunder. The reasoning, using the Iron Mountain figures, is, that the average interstate haul is 224 miles, and the intrastate 70; therefore, each ton of intrastate freight is hauled 3.2 times as far and handled 6.4 as much. But distance is not a factor in this handling; this is not moving, but stationary expense. The average length of the haul has nothing to do with this terminal handling, the State freight is handled twice—whether the haul is 10 miles or 100 miles—the interstate (saving many exceptions elsewhere mentioned), is handled once—whether hauled 100 or 300 miles. The character of freight—intrastate or interstate, fixes its amount of handling in the State and the character and movement fixes generally its handling. As soon as a shipment is determined as intrastate, it is at once apparent it has two terminal expenses in the State. As soon as it is determined as an interstate, one; unless transstate, then none, but numerous divisional handlings; much interstate and some transstate has three handlings, cotton from Louisiana or Oklahoma to Boston, compressed in Arkansas, while transstate, would have two terminal handlings in Arkansas. Wheat from the northwest going into an elevator at Little Rock and resold in the State would have three terminal handlings in the State although an interstate shipment. All the Fort Smith and Memphis traffic—all interstate—would have two terminals so far as expenses go in Arkansas. But aside from these physical facts changing the force of the statement, the proposition is *per se* wrong, even assuming all interstate one and all intrastate two. The terminal handling at origin and destination is a matter of handling tons and cars, not ton mileage. The State, in its plan of division of expenses puts station expenses—the item to which the instant kind of terminal expenses is applicable—upon a ton basis. It counts each intrastate ton twice, and each interstate ton once, and divides accordingly. This accurately divides this expense between the intrastate and interstate. When it takes three intrastate cars to equal one interstate, then to the intrastate six terminal charges accrue; when one intrastate car equals one interstate car, two accrue against one. If the average hauls are made up of three cars in each class of traffic, then the intrastate will stand two charges to one instead of six to one. If more it will accordingly

be charged with more. It is a question of tons—not miles. There is an absolute lack of relation between tonnage and average length of haul. Mr. McPherson used the same argument in piling up extra expense to intrastate. (R. p. 323-326.) He takes the same average hauls, but resolves the fraction against the intrastate, using four intrastate shipments to equal the mileage of one interstate. He takes one car of 20 tons moving from Texarkana, Texas, to Nuckells, Arkansas, 224 miles, and four cars of 20 tons each moving between Nuckells and Corning, 70 miles, and an intermediate movement to equalize distance. He explains the identity of the service and argues that it was repeated eight times in the State for the four cars of intrastate freight as against one such service for the one interstate. He takes the average mileage in interstate traffic and average mileage in intrastate traffic, and then increases the intrastate tonnage so as to bring the two classes together on an equal ton mileage. The ton-mileage has nothing to do with producing these expenses. Mileage does not produce nor affect them. At page 315, discussing the ton-mile basis, Mr. McPherson says:

"The ton-mile basis makes no provision for terminal expenses, because there are no ton-miles at terminals that represent the expense.

"It only attaches as a unit of measurement between two given points, the beginning and the end of the journey, but does not consider the expense at either end. It can not measure the expense at either end."

Yet, both he and Mr. Doddridge use the ton-mile basis here to work out extra expense against the intrastate. We have gone into this fully at this time as it is the first appropriate place to point out one of the errors of the trial judge. Doubtless misled by the plausibility of the argument of Messrs. Doddridge and McPherson, he rejected the State's plan of dividing station expenses (tons, multiplying the intrastate by two), and adopted the ton-mile, multiplying each intrastate on the Iron Mountain by six, representing three times the haul. (R. p. 2628.)

Elsewhere we have discussed the ton-mile as a possible factor to divide property; then it would be ultimately representative of the whole freight traffic—the result of use of the freight equipment and facilities. To use it as a factor to divide any expense except train expense when it may be used "as a unit of measurement between two given points"—has been so heartily condemned by Messrs. McPherson, Doddridge and Nay, that its use here to augment terminal expenses against the intrastate traffic is *contra bonos mores.* The State, probably giving too much weight to the testimony of these learned experts on the iniquities of the ton-mile as a basis to divide expenses, in its plan only used it "as a unit of measurement between two given points;" but it seems on further reflection that to some items it would be appropriate, certainly more so than the revenue; but its vital weakness is in applying it to terminal and station

expenses, as so forcibly pointed out by them and yet here is where they use it to point the tale against the intrastate.

Mr. Doddridge's evidence on the passenger side of the question, follows:

"Q. Is there any difference in the cost of transporting State and interstate passengers?

A. Yes, sir.

Q. What are the reasons that constitute or cause that difference?

A. The general principles affecting the ratio of extra cost, short haul freight traffic, applies to the short haul passenger traffic; but not in so pronounced a degree, as the elements of weight and time are absent.

The length of the journey of each State passenger upon the St. Louis Southwestern Railway, for the year ending June 30, 1908, was 23 miles.

The length of journey of each interstate passenger was 121 miles.

Therefore, to produce an equal number of passenger miles 5.3 State passengers were handled to one interstate passenger.

For the St. Louis Iron Mountain & Southern Railway, the average journey was for a State passenger 30 miles.

And for an interstate passenger 118 miles.

To produce an equal number of passenger miles, 3.9 State passengers were handled to one interstate passenger.

The use of two terminals for each State passenger, which includes ticket sellers, baggage handlers, the maintenance of depots, yard service, light, heat, and in some cases extra daily train service upon the main line, run especially to accommodate local traffic, increases the cost of train service arising from the frequency of stops to receive and discharge the short haul passengers and baggage; which includes the wear and tear of equipment, and the increased road speed to make scheduled time; the constitutional requirements providing for separate depot accommodations in coaches.

The increased casualty cost arising from the increased number of passengers boarding and alighting from trains at stations.

The carrying of passengers upon mixed trains.

Q. Those are all elements which you think enter into this increased cost?

A. Those are all elements upon which the extra cost is based.

Q. Are there any other elements that cause extra cost in the carriage of intrastate passengers, such as stations, yard service and things of that sort?

A. I have referred to those elements in a general way.

Q. What do you think is the difference in cost, Mr. Doddridge?

A. In my opinion the proportional extra cost in Arkansas will range from 20 to 30 per cent." (R. p. 464.)

On cross examination, Mr. Doddridge modifies this statement as to ticket sellers at two terminals, and as to yard service, and as to separate coach laws. (R. pp. 487-490.)

(1) He attempts to use the passenger-mile basis here to show extra cost of intrastate as he does the ton-mile on the freight side.

(2) On the St. Louis Southwestern Railway, there are no through trains, and on the Iron Mountain only 8 out of 56 are through trains. The local passenger train, carrying indiscriminately interstate and intrastate, is not a factor of extra expense to the intrastate here as it attaches alike to both.

(3) Owing to the large passenger traffic in and out of Fort Smith and Memphis charged with two terminal handlings, and the undisputed evidence of Maurice Wright explaining the handling of interstate and transstate passengers at Little Rock and other junction points, it is established that little, if any, extra expense can attach on that score. In the State's plan of separating expenses, it, however, charges itself with two terminal handlings to one for the interstate; an allowance which will manifestly more than take care of all extra cost.

Mr. I. G. Rawn, President of Chicago, Indianapolis & Louisville Railway Company (Monon Route), testified for the plaintiffs, his testimony beginning at page 672.

He was asked the difference in cost of operating local freight trains and through freight trains, and explains at length and in detail the greater expense incident to the operation of the local freight train (R. pp. 673-676.) Briefly, they are: The greater time on the road of the local between given points, due to stopping for local work at stations, incurring greater time for the employees; rate of pay is higher; greater consumption of fuel and supplies; additional switching at local stations; greater capital invested in locomotives and cars for local service on the road; larger station forces consequent upon local business; the train load of the local much less than in the through; through trains run only for a load while the local run is scheduled irrespective of load; even if local is loaded full its full load is not equal to full load of through; consequently less efficiency for the locomotive; he considers no additional maintenance of way expense of the local over the through, but an additional expense for maintenance of locomotives; additional sidetracks and cost of maintenance for local traffic, but expense of passing tracks for the through would equalize this.

It will be later seen that every item mentioned by him is properly cared for in dividing costs between local and through trains. After he finished his dissertion on extra cost of local trains, he was asked what relation, if any, there is between local and through traffic, and State and interstate, and answered:

"A. For the purpose of determining the cost of operation of transportation, the question of State and interstate traffic is not the method of consideration. The method is that of through and local business.

I would consider, however, that the relation (if it may be termed so), between through and local business, and State and interstate business, would be that State business might be termed a local business, and interstate business a through business.

I would not consider those lines as accurately drawn, but State business is of necessity limited in territory and extent, and so is local business. So that I presume, to a very great extent, on railroads throughout the country, the local freight trains as a rule would be confined to within States, although that would not wholly apply, and railroads do not run their local freight trains with a view to confining them within State lines. But to my mind, there would be a relation between State and interstate business, and through and local business, in that State business would very nearly conform to what we term local business, and interstate business would ordinarily conform to through business; if that answers your question.

Q. I wish you would state, taking into consideration the direct train expense and other expenses, such as terminal at stations, the difference in the cost of maintenance, either of way or equipment, and all the elements that have been mentioned by you, what difference you estimate there is in the expense of conducting local as against through business?

A. That subject has been a matter of very great consideration on all railroads for a long period, for many reasons and many purposes, and my own deduction and investigation leads me to say that I have regarded—and it has been universally regarded—that the operation of local freight trains—the direct cost of operation of local freight trains, as compared with through freight trains, is a minimum of 3½ times more.

That has been a generally well accepted basis, I think I am safe in saying, excepting further, that there are a number of elements entering into the cost of local freight trains, as compared with through freight trains, that increases that difference."

He sums up the full difference, adding station expenses, capital, etc., as five times. (R. p. 676-8.) On cross examination the proved facts in regard to lumber, grain and cotton—interstate movements—largely handled on the local trains were stated to him, and he was asked if, in view of these facts he regarded a close relation as existing between the local train and intrastate traffic and answered:

"A. I stated a moment ago, or intended to state, in answer to your question, that while there is more or less interstate business moving on local trains, as you say, I give it as my opinion that the great preponderance of freight moved on local freight trains, is State freight and not interstate. That is my best judgment. The question of territorial boundaries of local freight trains has never been, as I said be-

fore, regarded as between State borders; but I think that investigation throughout the country will show that perhaps more largely confined to within State borders.

Q. I understood your general proposition, but I was calling your attention to what was in evidence in this case, as to conditions in Arkansas, and asking you—assuming these conditions that I have stated, to be true—if that would not disturb somewhat the relation which you have given of interstate to local, as you generally find it?

A. Well, I should think if it is shown to be a fact that the local freight trains in the State of Arkansas actually handle the preponderance of interstate freight, that is one thing, but I would have to say that in the first place, I have no knowledge of Arkansas, and in the second place, the statement you make with reference to local freight trains in Arkansas has not been my experience during my time.

Q. That is what I supposed, and the reason I was stating to you what we conceive to be the facts that have been developed here, and ask you to give your views, assuming the facts I stated to you are correct.

I take it those are not what you have generally found to be the case?

A. No, and therefore it seems to me that I am not competent to discuss a matter with which I am not at all familiar.

Q. I would not think of questioning your competency to discuss these propositions.

A. I thank you very much, but I question my own competency, because I have no knowledge of them.

Q. Then, if the situation in Arkansas is about as I have outlined in these questions, you would not consider yourself competent to discuss the relation of the local to the through?

A. No, because it is at variance with my experience. (R. pp. 681, 682.)

W. J. McKee, General Superintendent of the Missouri Pacific, formerly division superintendent in Arkansas, next testified, beginning at page 687.

He was questioned as to local and through trains, and character of freight carried on each, and says the freight on through trains is mostly interstate, very little intrastate carried on it. (R. p. 689.)

The local train he says largely consists of "less than carload freight" (L. C. L.) (R. p. 690.)

He repeats practically the same reasons given by Mr. Rawn for the greater expense of local and through trains, running in the additional theory that the greater expense of L. C. L. freight on it than the through. (R. p. 690, 691.) In fact, he regards the local as principally a vehicle for L. C. L. freight. It is in evidence that taking the two test months and calculating from their statistics as was done by Mr. Nay, there is proportionally more L. C. L. interstate than State (R. p. 2059), and if the local train is the vehicle of the

L. C. L., it is more for the interstate than the intrastate. Moreover, the only statistics in the case giving amount of L. C. L. on through and local trains is the St. Louis Southwestern Railway test month statistics, exhibits 19, 20. It is seen therefrom (R. p. 2377), that the through train carriers 80 per cent of the L. C. L. and local 20 per cent of it.

Mr. McKee also testifies that the local passenger train is the more expensive and gives his reasons therefor. (694.) As there are only eight through passenger trains on both these roads, that point is not worth considering in this case. It is, however, rather amusing to see that the General Superintendent of this system regards the passenger traveling on local passenger trains as synonymous with intrastate passenger. (R. p. 695.) If he is correct, the interstate passenger traffic is certainly a negligible quantity.

He says the interstate freight carried on local trains "is so small it is hardly a mathematical problem." (R. p. 701.)

The tests show 72 per cent on Iron Mountain of the load of the local is interstate, a pretty fair "mathematical problem." Another case of theory v. fact.

Mr. Edmund D. Sewell, assistant to the President of the Chicago, Milwaukee & St. Paul, and vice president of Chicago, Milwaukee & Puget Sound Railway Company next testified, page 703:

Over objection, questions were put to Mr. Sewell as to the difference in manner of conducting State and interstate business as if there was separate trains for each class, but he answered them as if he understood all local freight loads were intrastate and all through loads interstate. (R. p. 704-710.)

"Q. Now, all your testimony that has been given heretofore, has not been in relation to State and interstate, but has been in relation to through and local?

A. No, sir; in connection with State and interstate.

Q. Let us get that clear now: I understand these expenses that you put there as four times, was on local trains as against through; is that right?

A. Yes, sir.

Q. You are treating that as synonymous with State as against interstate?

A. Yes, sir.

Q. That is, you are disregarding the amount of interstate traffic of the local train, and disregarding the amount of intrastate traffic of the through train?

A. Yes, sir.

Q. I believe you stated a while ago that you did not know the conditions in Arkansas?

A. I did." (R. p. 711.)

A summary of some of the established facts regarding the situation in Arkansas together with the statistics of the railroad in exhibits 19 and 20 (R. p. 2375-2377), were put to Mr. Sewell and he said:

"A. If the conditions in Arkansas are such as you have described, and as the evidence states (which, of course, I do not question), and there is no other situation which would offset that to any considerable extent, the testimony I have given would not apply to the conditions in Arkansas.

Q. What would you say, in view of what I have stated to you to be what I understand is the testimony here, and in view of these statistics of the railroad company, of this four times as much to operate State as interstate freight?

A. I could not tell at all without having their traffic figures and knowing what their traffic was as a whole." (R. p. 715.)

Mr. Frank E. Ward, General Manager of the Burlington line east of the Mississippi River, was the next witness. He was one of the railroad's principal witnesses both in chief and in rebuttal. His testimony in chief begins at page 722.

Mr. Ward very intelligently and fully discusses operation of local and through trains and greater expense of the local and the reasons therefor. Then this occurs in his testimony:

"Q. Do the local trains carry any interstate freight and do the through trains carry State or local freight?

A. Yes, sir; I think ordinarily there is some interstate freight in local trains; and some State freight in a good many through trains. But I should say, as a rule there is very little State freight in through trains." (R. p. 725.)

In view of 61 per cent on the Iron Mountain of intrastate freight on the through train, his testimony loses force.

Then he discusses the greater expense of short haul (intrastate), compared with long haul (interstate), and difference in terminal expenses.

He says that interstate freight never has more than one terminal handling, and transstate none. (R. p. 728.) He badly misses the mark on that so far as Arkansas is concerned. He estimates State freight as costing five times the interstate. (R. p. 729.)

Then he takes up the passenger side of the problem. He stresses the expensive local passenger train running only in daylight. (R. p. 729.) Then he discusses the added expense of short haul against the long haul. He concludes with an expression of opinion of 40 per cent to 50 per cent extra cost for intrastate passenger. (R. p. 730.)

On cross examination, this occurs:

"In speaking of these five times more cost for handling State freight, you mean by that freight which is carried on the local, don't you?"

A. Well, I took that into account as the principal item going to make up the total of State freight; and meant it in the broad sense

that it does cost in my opinion five times as much to carry State as interstate, taking that element into consideration.

Q. Basing that principally upon the proposition that you think the local train carries largely State freight?

A. Yes, sir.

Q. And the extra cost is the extra cost of operating the local train?

A. Well, yes; the local train and all the freight that is carried on that local train.

Q. There is no difference in the cost of freight, State or interstate, *per se?*

A. No, sir; it is because of the different character; State being short haul and interstate being long haul." (R. p. 731.)

Mr. W. M. Whitenton, General Manager of the Rock Island line in Arkansas, Oklahoma and Louisiana, was the last witness on this subject. His testimony begins at page 749.

Mr. Whitenton gives a more detailed and exhaustive analysis of the extra cost of the local freight over the through freight than any of the witnesses. (R. p. 751-754.) He gives 13 separate items. On the passenger side he gives seven separate items. (R. p. 755.) His testimony forcibly brings to mind the quotation with which this chapter opens:

"The record is crowded with—indeed, it is devoted to the recital of details, important and unimportant, substantial and trivial, real and fanciful, nothing within the range of the imagination being omitted to show that the way train is more expensive than the through train."

As applied to the established fact that 61 per cent of the intrastate freight is carried on the through trains, and 72 per cent of the load of the local is interstate, on the Iron Mountain, the whole force of Mr. Whitenton's testimony is broken when it is seen to be based on a radically different thought of it.

"Q. Mr. Whitenton, is there any difference between State and interstate traffic, in the handling of it?

A. Judge, I don't know that I just get your meaning.

Q. Does not State and interstate traffic move in the same cars, by the same men, and pulled by the same engine?

A. Yes, sir; that is true.

Q. In both the questions and answers in your testimony there seems to be an interchange in the word local as compared to State, and through as compared to interstate; do you mean it that way?

A. I mean this: That in my belief the State business is largely a short haul business, and for that reason it is naturally handled on the local freight trains. That is the only distinction I make between the handling of State and interstate.

Q. The length of the haul?

A. Yes, sir.

Q. And owing to the length of haul, would more probably be handled on local trains?

A. Yes, the short haul business more naturally falls to the local freight train in the conduct of the business. (R. p. 758.)

Mr. Whitenton says cotton has three terminal handlings in Arkansas before it leaves the State. (R. p. 763.)

Grain in intrastate traffic, he says, is negligible, and that the movement into the State is very large, and it usually goes to Little Rock into an elevator, unloaded, reloaded and shipped out again, three terminal holdings in the State. The great majority of lumber goes out of the State, and in its movement, it first is carried to a mill, there unloaded, planed and reloaded and shipped into other States, three terminal handlings. (R. p. 763.)

Mr. Whitenton's test of the loads of local and through on his line is set out in another connection.

This completes a summary of all the plaintiff's case regarding extra cost.

## EXTRA COST OF INTRASTATE.

*State's Opinion Evidence.*

The State did not rely upon opinion evidence on this proposition, and, as will be seen, developed the actual situation and presented facts against theories, but it was not without opinion evidence on the subject, and from men better posted as to actual conditions than the presidents, vice presidents and general managers of other roads whose testimony has just been summarized.

Mr. James C. Lincoln, Traffic Commissioner of the St. Louis Merchants' Exchange, was put on the stand by the State as to rate matters, but plaintiffs cross examined him at length as to operating questions, and as he had had a long and varied railroad experience, he was a thoroughly qualified expert. In his cross examination, he was asked if there was not a very large increased expense in operating a local as distinguished from a through freight train, and says:

"A. There is a larger expense in handling local as compared with through trains.

Q. I would like you to state, in a general way, what produces that increased expense in the operation of local trains?

A. The increased expense in connection with the operation of local trains is the constant service that is required at the local points as they go along, in stopping trains and starting trains, as well as the switching service. There is also some additional expense attached to the conduct of the trains in the way of expense of employees' overtime, usually. (R. p. 967.)

* * * * * * * * * * * * *

Q. You would say then, that there is very considerable increase of expense in the operation of local freight trains over through trains, would you not, Mr. Lincoln?

A. No, I would not say it was so considerable. When I say that, Judge, I do not want to be misunderstood in it.

Q. And I do not want to frame my question so as to mislead you.

A. I do not want to be misunderstood in connection with the operation of the local trains. The local train is handling interstate and State business at the same time; the expense goes to both.

Q. I am not speaking now of expense as applied to State and interstate. I am speaking of operating local—

A. The expense of operating the local trains is greater than the expense of operating the through trains.

Q. Is it not very considerably greater?

A. I don't think it is, but I am not competent to testify on the measure of it." (R. p. 968.)

The various items making up the extra expense of the local train of which he was cross examined in detail, and the double terminals for intrastate, the consequent greater expense of the short haul, the lighter loading of short haul traffic, and those various other matters, he had in mind when he testified that the higher intrastate revenue representing the short haul more than compensated for the extra cost. (R. p. 915.) He also testifies that the cotton movement in Arkansas is very large, and that there are three terminal handlings of it, and the first movement is always L. C. L., and the whole traffic is interstate. Most of the grain also has three terminal expenses, and it is handled on transit rates, and is interstate. (R. p. 984.)

Mr. Willmering, Auditor of the Oklahoma Corporation Commission, was cross examined in regard to all the items in the State's plan of separating expenses, and gives this pointed testimony, which is pertinent to this issue:

"Q. I observe that you make no allowance on account of local service in your division, you divide it straight:

In exhibit K, filed by Mr. Wharton, he adds 50 per cent to local engine mileage for station switching.

A. Yes, that is an arbitrary allowance and it is favorable to the interstate business. It is following the theory advanced by the railroad experts and it is unfair to the State.

Q. Why.

A. Because it is both, foolishness. The idea of wanting to charge additional maintenance for switching expense to local freight trains! Any one that has been in the railroad service and observed these things daily would know that it is humbug.

Q. You think there is no more station switching on local than on through?

A. Certainly; but the local trains are doing switching for the through trains in reality, under existing conditions—

Q. What do you mean?

A. A through train sets out—a carload of interstate freight. That through train don't stop there to spot that car at an industry

track, or spot it for unloading or loading at the team track or the industry located at that station; but the way freight train, which is the workshop of a railroad, it goes along, follows that through train and performs that switching service—

Q. You think an extra charge ought to be made the other way?

A. I believe there ought to be some plan devised where the time employed by the local train crew to that particular character of switching—which ought to be ascertained and could be, for the future; for the past there has been no record kept of it.

Q. In your view, it should be charged to the through instead of the local train?

A. The through train should be charged in reality for whatever service was performed by the work train.

It is a misnomer, calling a way freight train a local train and trying to confine it exclusively to State traffic, which, by inference, a great many railroad experts have tried to either mislead the layman; it is unfair on the part of the railroad experts by inference to assign all this extra cost to a local freight train, and by inference allow some one to believe—who is not familiar with the real conditions—that this local train performs exclusively service for State business. It is a wrong inference for those railroad experts, and it is unfair for them to assume anything of that kind." (R. p. 1141.)

In redirect, Mr. Willmering stated succinctly his views on this subject as follows:

"Q. I don't know that I quite understand your position on the local and through service, and I will state what I gather, and ask you if it is right and if not, wherein it is wrong; that you don't think it right to charge these additional sums which have been called arbitraries, like 50 per cent local train for extra switching, and others, because you regard the local train and the through train as both doing State and interstate traffic, one helping the other one, and that the difference, if any, in the expense of local over the through, should not be recorded in the final division between State and interstate?

A. That is the position I have taken, yes, sir; that the services are largely reciprocal; there is a sort of reciprocity, and at division points where they employ yard engine service, it is true that the yard engine performs the switching for the local trains as well as the through trains, but all the switching that is performed for through trains as a rule, with very few exceptions—as a rule all switching performed for through trains, interstate business, is completed by local way trains, at way stations." (R. p. 1159.)

Mr. Bee was asked how much of the switching is done for the through train by the local, and says:

"A Virtually all of it. All cotton is picked up and carried to a division point, at least. The through train sets out cars at a terminal point and the local train takes them out to their destination.

The local train sets the empties for the grain and for all of that movement and brings it back into the terminal and gives it to the other train. But for a local train, it would be impossible to run through trains. There is no question about that. They might run through trains in Arkansas—in Missouri, without a local train in Missouri, but if they did they would have to have them in Arkansas. They might cut them out of one State, but they could not operate through freight trains unless they had local freight trains.

Q. I will call your attention to another matter that is in evidence, and ask you if you know anything about that; that is the lumber traffic:

It is in evidence here that logs are hauled to a sawmill in the local train. They are to be manufactured and shipped out to St. Louis and outside of the State. They are carried sometimes to the nearest division point on local trains, and sometimes on the local train directly to the sawmill point; are you familiar with that situation?

A. I am. The through train handles nothing except freight that originates for it at big towns, unless in exceptional instances if there is a carload of perishable merchandise for some small jerk-water station. The through train may get instructions to stop there and get that; it has been set out—what we call "first out" at the end of the track; they have to make one cut; they pick it up and then go ahead. That, however, is exceptional.

The local train is supposed to clear up its division and get everything into the terminal, north or south or west, whatever direction.

Q. The local train is clearing up the way for the through train to go out without any interruption?

A. Yes, the local train lays on the side until the through train gets through. The through train has a time-card right which the local train has to regard and has to observe. She starts from one station to another and finds a little more work at a siding than she expected; her time is up; she can not make the next station. The result is she goes into a "hole" and stays there for one, two or three hours, waiting for the through train to come along, sometimes having a man walk to the next station to telegraph—

Q. It is sort of a "beast of burden?"

A. Yes, and it is the one that you can never put the last straw on the camel's back and break it.

Q. Is it serving State and interstate, both?

A. So inseparably that you can not find it.

Q. I would infer from some of this testimony that it did not serve the interstate?

A. The man who testified to that either did not know or was not fair.

Q. Of course he was fair. He was going on a theory, probably." (R. p. 1199, 1200.)

Regarding L. C. L. freight, he explains at length that much of it has three terminal handlings in the State. The summary of his statement is this:

"Q. In comparing the terminal handlings of State and interstate L. C. L. freight, you attribute two terminal handlings to State freight, and what number to interstate?

A. Some of it will have one, some will have three; I went into that largely this morning.

Q. You base your assumption of three handlings upon the proposition that you described here this morning, it was loaded, came in, unloaded, and perhaps back-hauled?

A. Yes, sir; and the further condition of traffic from Fort Smith and Memphis which I did not take into consideration this morning." (R. p. 1305.)

## THE "BRIDGE THEORY" OF TRANSSTATE TRAFFIC.

One of the basic proposition in the plaintiff's case is, that transstate freight passes through the State "as on a bridge." The conclusion reached therefore that no terminal and little station expense attaches to it; comparatively few of the facilities of the railroad are called into play in handling it, and it is by far the least expensive freight hauled. The transstate being 51 per cent of the Iron Mountain traffic, and it moving through the State on a bridge leaves the great mass of the expense to attach to the strict interstate and the intrastate, and principally to the latter.

Mr. Doddridge is the father of the bridge theory in expression, and Mr. McPherson in statistics.

The State met this testimony with an examination of the records of the transstate movement on the Iron Mountain road.

The data gathered is not disputed and is conclusive on this question, and also furnishes proper bases for distribution of yard expenses and station expenses.

The testimony of Mr. McPherson on this subject, and of Mr. Doddridge is found at page 1432—where it is repeated—and then this testimony was adduced from Mr. Hamilton, who got his facts from the records of the company. It may be explained here that under orders of Court, the State's accountants had full access to the records and books of the road:

"I will ask you if you have made any investigation of the records of the facts in regard to this theory upon which these gentlemen have spoken, as to transstate business passing through the State as upon a bridge, and if you can, give us the results of your investigation upon the facts, as opposed to the theory upon that subject."

A. I have here a record of about 3,000 cars, 1,454 in October, 1907, and the balance, 1,560 in March, 1907, a spring month and fall month.

Q. Describe how you got at that movement and the result of it?

A. In endeavoring to see just how long it took this transstate freight go through Arkansas, and how long it was on the company's rails, in Arkansas, in completing its journey across the State, and how long it remained inside of the State, we had recourse to the waybills for what we thought were typical movements of that character of freight. That is, we took in the October month, billing from Texas roads, going to the Iron Mountain at Texarkana, and moving via Little Rock and Van Buren, and on out into Oklahoma and beyond, destined to Kansas City points, in that territory or beyond.

We took the movement from Louisiana, crossing the State line some distance below McGehee, and leaving the State line five miles above Van Buren, destined to Kansas City and points in that territory.

We took the movement from Memphis, via the Memphis division, main line and the White River division, the last terminal in the State being Cotter, going to Kansas City and points in adjacent territory.

We took the movement from beyond Texarkana, straight up the main line into Missouri, the last terminal in Arkansas being Hoxie.

We took the movement originating in Louisaina and moving via McGehee, Little Rock, Hoxie and into Missouri, and the movement originating at Memphis or beyond, moving via Bald Knob, Little Rock and Van Buren, and so out of the State to Kansas City and adjacent points. By the way, that movement from Texarkana to Hoxie, if I said that was headed to Kansas City, that was in error; it was to St. Louis.

We took the movement southbound from the White River division, main line, Little Rock, and out into Louisiana by the way of McGehee, that being the last terminal.

The movement from Van Buren, coming from beyond, and going out into Louisiana through McGehee.

The movement coming down the main line from Missouri and going off into Texas at Texarkana.

The movement from Missouri and beyond over the White River division, main line and Memphis branch, to Memphis and beyond.

We went to the billing without knowing where we were going to find the movement of the cars, abstracted all the cars for a period of fifteen days, then traced the cars into the first terminal in Arkansas, and out of the last terminal in Arkansas, most of them being very close to the border, because the only record we could get was at the last terminal.

The record we have of their movement is actual, it is taken from the wheel reports, showing the movement in trains into the first terminal, and the movement out of the last terminal; the intermediate time was spent in Arkansas.

All those cars, on the movement from Texarkana through Van Buren, a distance of 298 miles, the schedule time for which move-

ment, linking up the through freight schedules, without any terminal delay, is 28 hours.

Q. Where did you get that?

A. From the company's official time cards for the ordinary freight. The company classifies its trains between Red Ball, Green Ball and ordinary, and this is the slow time.

On that movement, there were 100 cars, which consumed in total, 1,477 days, or an average of 14.7 each; some of the cars might have gone through quicker, some took a longer time; in fact, our detail shows it did; it amounts to the same thing whether one car spent 14 days or one hundred cars spent 1,400 days. The lost usage of cars is there just the same.

Q. What was the excess over the 25 hours which the cars visited in the State of Arkansas?

A. Fourteen days—about 12 days, lacking four hours.

Q. They found the climate inviting down there on their transstate flight?

A. I don't know as to that; this is what the wheel reports show on the movement through Louisiana and McGehee and Van Buren, a distance of 256 miles, the schedule time for which, on the same basis as I mentioned, was 26 hours; a movement of 28 hours consumed in total 340 days, an average of 12 days per car.

* * * * * * * * * * * * * *

Q. You don't catch the point I want; one would be delayed two days, and one 20 days, something of that kind, just give us a few instances of the two extremes, the longest and shortest, and then give us the average, I don't want too much of the detail, but I want some of it.

A. One car got through in three days, and seven cars got through in four days.

MR. MOORE:

Q. Can you give us the number of the cars as you go along, so they can be identified?

A. That detail is available; I can not give it right now; I can get the car number, if you desire, the time, date and the hour in and out of the State and the train numbers; I have it but I haven't it with me.

I found one car consuming three days, seven cars four days, three cars taking nine days; four cars taking 25 days, one car 43 days.

Q. Just give us a few illustrations, I just want to see how they were running?

A. That is the movement between McGehee and Van Buren, which were the first and last terminals; the movement from Memphis and beyond, going out of the State through Cotter on the White River Division, a distance of 240 miles, the schedule time for an ordinary freight train, the entire distance, is 23 hours.

I find 134 cars consumed 772 days, an average of five days per car.

Q. Against what is the schedule?

A. A little less than one day, 23 hours; we have one car that got through in one day, 28 cars that got through in three days, 12 cars in 9 days, six cars that took 14 days, one car that took 22; there were other cars.

Q. That is the division—we had some testimony that those grain trains went through like greased streaks of lightning.

A. Yes, sir. I might say in that connection, in locating the billing for the White River Division, that is the division we speak of, for October, 1907, and on some of their local trains in the State, we found a great deal of that wheat moving on local trains—I say a good deal, I haven't the number of cars, but it is obtainable from our memoranda.

Q. When that export wheat came through on local trains, it didn't go through like a greased streak?

A. No, sir; it couldn't when it got on that local run.

Moving from Texas, through Texarkana, and up the main line through Hoxie into Missouri, a distance of 264 miles, I am giving the distances between the first and last terminals in the State, and not from State line to State line.

Q. Some of those cars might have gotten lost after leaving the terminal?

A. Yes, sir, but these are pretty close to the State line, and I suppose they got across.

Two hundred and sixty-four miles, Texarkana to Hoxie, schedule time for ordinary freight trains, 27 hours, movement of 166 cars, consumed 932 days, five days per car, and between Texarkana and Hoxie are but two through freight divisions, through freight trains should run, Texarkana to Little Rock, and Little Rock to Hoxie. That would indicate to my mind that the schedule time of 27 hours for two through freight divisions, where five days were consumed by this number of cars, that they must have been in a yard some place, or a passing track.

Q. They would hardly be on the main track during those five days?

A. Not if they ran any other trains.

Q. I understand the main track was about all this transstate freight needed?

A. The figures speak for themselves.

The movement from McGehee, by Little Rock, and through Hoxie into Missouri, a distance of 221 miles between McGehee and Hoxie, schedule time for ordinary freights, 35 hours; 98 cars consumed 635 days, an average of 6 days per car. McGehee to Little Rock is one through freight division, and Little Rock to Hoxie is another; the same remarks would apply there as on the Texarkana-Hoxie movement.

Q. Add a few of the shortest and longest movements as you go along?

A. From Texarkana to Hoxie, where the average was 5 days per car for 166 cars, I found one that made it on the schedule, got through in time.

Q. That was one of Mr. McCutcheon's onions?

A. I don't know the contents of the car now; I found 46 cars that got through in 2 days, 20 cars in 4 days, and 43 in 3 days, 14 that took 5 days, 3 that took 23, 2 that took 25, and 1 in 66 days—that car must have been in bad order.

On the movement from McGehee to Hoxie, 98 cars an average of 6 days apiece, I find 10 cars made that run in 2 days, 27 in 3 days, 18 in 4 days, 2 of them in 14 days, and the maximum is one car which consumed 56 days, and the one immediately proceding that, being 1 car in 34 days. The movement from Memphis to Van Buren, a distance of 305 miles, via Bald Knob and Argenta, schedule time 31 hours, 25 cars 195 days, average of 7 days per car; I find that out of those cars, that 5 took 4 days; that is the minimum, 4 took 5 days, 5 took 6 days in transit; the maximum was 1 car 16 days; ranging from 4 to 16 days or an average of 7 days.

I might say, in stating those averages, that we dropped the fractions; that really figures 7.8 to split hairs on the proportion; it might really be called eight.

Moving in the opposite direction, from north of the Missouri-Arkansas line, via the White River Division, via Bald Knob and Wynne and McGehee out into Louisiana, and beyond, a distance of 281 miles from Cotter to McGehee, the schedule time for ordinary freights is 39 hours; I find 138 cars consuming 930 days, or an average of 6 days per car.

Q. That is the greased streak of lightning road I believe?

A. That was the way export grain you refer to was handled, that is if it was off the White River Division.

Q. I think there was some testimony that that was the route it used.

A. I find the minimum was 4 days, 8 cars consuming that much time; 32 cars, 5 days; 38 cars, 6 days; 31 cars, 7 days; 9 cars, 9 days; 1 car took 23 days, moving southbound between Van Buren and McGehee, originating beyond Van Buren in Oklahoma or beyond and destined to Louisiana, a distance of 256 miles, schedule time 22 hours, I find 291 cars consumed 2004 days, an average of 6 days per car.

Q. That is on October?

A. Yes, sir, still on October; the minimum on that movement was two days, between Van Buren and McGehee, 2 cars consuming that much time; 28 cars 3 days, 73 cars 4, 41 cars 5 days, 45 cars, 6 days, going up, 21 cars 9 days, 13 cars 11 days, runs on up to 12, 14 days, up to the maximum of 32 days consumed by one car.

The movement from Hoxie to Texarkana, originating in Missouri, destined to Texas a distance of 264 miles straight main line over two through freight divisions, schedule time in that direction 24 hours; 216 cars consumed 670 days, or an average of three days per car, or exactly three times the schedule time—24 hours. In that movement, is included 14 cars that got through on schedule time, 86 cars took twice the schedule time, 76 that took three times, and 22 cars that took four times, speaking in round numbers; the maximum was one car consuming 19 days; that car was perhaps in bad order.

From Missouri and beyond, via White River Division to Memphis and points beyond, that should come from Cotter to Newport, on the White River Division down the main line to Bald Knob, across to Memphis, a distance of 240 miles, schedule time 24 hours; 258 cars consumed 823 days, an average of three days per car; in that movement, we find 55 cars that got through on schedule time, out of 258; 76 cars took twice the schedule time, 45 cars took three times the schedule time, 37 cars took four times, and the maximum time consumed was 15 days by one car; that is the October movement.

Q. Have you a summary of the October movement there?

A. Yes, sir, totaling it all, 1,454 cars, averaging 6.03 days, in round figures six days; the schedule time averaging it all, would have been 1.1 days per car; it consumed almost five days in excess of the schedule on the average."

In tracing these car movements, the accountants took the transstate billing for the territories named and took every transstate car. There was no selection of cars, but all for the first half of October, 1907. Then they took the first half of March, 1907, a spring month, to compare with a fall month, and in similar manner traced all the transstate cars; omitting the detail, which is similar to that of October, the result was: Total schedule time for the movement of the 1,560 cars traced, average a little over one day per car, the actual time taken a small fraction over four days per car. (R. pp. 1437, 1438.)

As to the transstate cars going through divisions unbroken, the records were again examined to find the truth of it.

"Q. There has been a good deal said in this record, about the division handling of cars; there seems to be quite a marked theoretical difference between the handling of transstate, interstate and intrastate; have you investigated the question of handling of cars at terminals?

A. Yes, sir.

Q. Have you got any data worked out as against these theories, about the handling of them there?

A. We have made an investigation; I have the result of it here.

Q. State generally the methods that you have pursued, and what you have there, and then we will take it up somewhat in detail.

A. I have a set of figures here, representing the conditions of affairs that we found at all the through freight division terminals in

Arkansas for five days in the month of October, 1907; the first five days—we stopped at the fifth day because it was an immense task; the cars were standing around the terminals so long it was a superhuman task to find some of them going out, and we didn't attempt to get more than the five days; I say all the terminals; I discovered this morning that the Little Rock figures had not been recapitulated, although they had been compiled; that is being done now, and I will have to omit that for the present, and will get it for you a little later." (R. p. 1439.)

Then he gives each of the division terminals in the State, and what lines they served.

"Q. Give us the result of your investigation; take them up by division points?

A. We got at our figures in this way, taking Hoxie as an example; I can explain it by reference to a particular terminal better than I can by an abstract example.

We took all the trains shown on the dispatchers' sheets, as through trains, moving into Hoxie from the North; we listed each train, showing all the car numbers, the hour and date of their arrival at Hoxie, and as a little further guide, what the conductor said was the final destination of the car, in some cases the contents; having listed all the train as it came into the terminal, by car number and initial, we proceeded to trace those cars leaving the terminal, our plan being to find them going out in another train; that information being derived from the wheel report of the train that took them out of that terminal, and of course, when the cars were not in the care of the train crew going into the terminal or going out of the yard, they were charged up as being in the yard.

Q. May be they were out on the main line if they were transstate; did you find whether passenger traffic had been interrupted by storing them on the main line?

A. Of course, that wouldn't be good railroading to leave the main line blocked.

Q. So you have assumed that they didn't leave that transstate freight on the main line?

A. No, sir; there is no question but what they were put away; stored somewhere.

Q. Then what did you do?

A. Deducting the hour and date of arrival in the terminal, from the hour and date of departure of the cars, the lapse of time was the time the same was in the terminal, or the time in which the car remained in that terminal.

Q. From that dispatcher's sheet, you got the time it went into the terminal and the time it went out?

A. From the dispatchers' sheets we located all the through trains that went into the terminals, and then we took the conductors' wheel reports of those trains and the car numbers, and the hour and date

of arrival of the train, and the hour and date of departure in other trains.

Q. From what the dispatchers' sheets or what the wheel reports showed?

A. From the wheel reports; we used the dispatchers' sheets as an index to what through trains came in that terminal, so we might know whether we got them all.

Q. Go ahead and explain what you have found?

A. Taking the Hoxie terminal—these figures cover all trains for the first five days of October, 1907, into Hoxie from the North, during that period, there were 23 through trains, hauling a total of 842 cars, 830 loads and 12 empties; the caboose is excluded from all these figures; it is a service car and is necessarily taken off at the division terminal.

Of those 842 cars, there remained in the Hoxie yard quite a long time—I will state the average first; I found that those 842 cars, the cars in that individual train went south from Hoxie in from two to seven other trains, and remained in the Hoxie yard from one hour and twenty minutes to two hundred and twenty-five hours and fifteen minutes.

Q. That is a nice place up there at Hoxie.

A. We found seven cars that stayed there 121 hours and 20 minutes; seven cars that stayed there 6 hours and 5 minutes; 2 cars, 52 hours; 2, 45 hours; four cars, 36 hours; 10, 34 hours; 35, 19 hours; 14, 22 hours.

Q. Was there any discrimination between the visitation at Hoxie, of transstate, interstate and intrastate cars?

A. The only information we have on that is what the conductor said was the destination of the freight, and that is not very good, because we found they were not reliable on that; we didn't go to the waybills.

Q. You just took the wheel reports?

A. Yes, sir; he might have said it was going to Texarkana, and it would stop at Little Rock.

Q. You used whatever might be indicated on the wheel reports for whatever probative force it was worth; is it indiscriminate between the classes of traffic?

A. In the case of these trains coming from Hoxie from the north, through Missouri Division trains running all the way from Piedmont, most of them, as we understand, are through trains; they may make some pick-ups and set-outs, but with the exception of that, all of it was interstate; I wouldn't say all of it was, but the major portion of it was.

Q. It would be necessarily all interstate except what might be picked up between the State line and Hoxie?

A. Yes, sir; some sixty miles of road.

Q. I believe you stated you haven't the Little Rock figures here?

A. Yes, sir.

That was stuff from the north into Hoxie which we traced out southbound; of the trains from the south into Hoxie, we found 13 trains, carrying 572 loads and 78 empties, total 650. Those cars went out in from three to seven other trains, remaining in the yard a period varying from 1 hour and 20 minutes to 103 hours and 40 minutes; we found 14 cars that stayed there 1 hour and 20 minutes, and 40 cars, 12 hours; 27 cars, 16½ hours; 34, 11 hours, and there are some cars that stayed there but two hours—19 of them.

Q. Did you get the averages of that?

A. They went out in form two to seven other trains; I have no average here in days; they can be figured from this data.

Q. Going out on the different trains was what I was asking you about; it was from two to seven?

A. Yes, sir; that is, they consist of any one train, went out in not less than two trains and some went out in seven trains; I mean the cars carried by the train.

Q. You mean that of the cars coming into Hoxie on those known trains, instead of going through on a bridge, they would go out on from two to seven trains?

A. Yes, sir; one train going into the terminal, the cars in that train going out in perhaps two trains, perhaps seven, that is the widest range, none less than two and none more than seven.

Q. You didn't find the unbroken train there?

A. Not at that terminal. (R. p. 1439-1441.)

Omitting the detail of the other divisions, this has been given in full to show the reliability of the methods employed to ascertain the data.

On the White River Division, one train got through without a break, the cars in the other trains went out in from two to three other trains; in the reverse direction, no train went through, and cars in each went out in from three to six other trains.

At Newport, one train of twelve cars got through, others went out in from one to four other trains.

At Van Buren, they went out in from two to nine other trains; on the reverse movement, three trains got through and the others went out in from two to eight other trains.

The other divisions are followed through, and will not be further detailed. In the whole movement of a good many thousand cars, four trains went through a division unbroken. The hours and minutes of the stay in each division yard, origin, and number of trains the cars went out in are given.

The Little Rock Division, the largest in the State, is fairly typical of all: Coming south, there were 822 cars in 18 trains and went out in various directions in from three to eleven other trains, and none of them went through unbroken. The time spent in the yards varied from 3 hours and 40 minutes to 189 hours. On the reverse move-

ment for the same period, there were 15 trains containing 444 cars. They went out in from two to seven trains, no train went through unbroken. Time in the yard varied from 2 hours and 30 minutes to 104 hours and 55 minutes, one car only consumed minimum. (R. p. 1441-1451.)

The State also proved from the records that physical reasons prevented the "bridge theory" of transstate freight being true:

"Q. Mr. Ludlam, there has been a great deal said in this case, about the transstate business and the cheapness of transportation of freight on transstate trains:

I want to read you a statement of Mr. McPherson (vol. 1, page 326):

"The railway company establishes by accurate test, the hauling capacity of each locomotive, over a particular district or division to which it is assigned, and this establishes a measure that we designate as the 'potential capacity' of the locomotive, and the number of tons the locomotive draws from day to day is recorded, to determine whether the operating officers in charge of the various divisions or districts, are securing the full measure of the efficiency of the power."

In handling transstate freight through Arkansas, say into Louisiana, it would have about these routes to follow:

The main line from St. Louis to Tearkana, what you might call the eastern Illinois line down the east side of the river, over this Paragould leased track that has been referred to, of the Cotton Belt; or, from the Northwest over the White River branch down to the connection of the main line at Diaz, close to Newport—just north of Newport; and west over the Little Rock & Fort Smith line; starting in at the State line at Van Buren and then going from Little Rock towards Louisiana, it would go to Alexandria, passing through Pine Bluff; then from Memphis, coming in from the east via Bald Knob and then south to Little Rock. Then, of course, the reverse movement, taking in those routes from the north, east or west, as the case may be.

Now, if you have any data to show the potential capacity of the locomotives on those routes I wish you would put it in evidence.

A. We have prepared an exhibit showing the tonnage capacity of engines on the St. Louis, Iron Mountain & Southern Railway Company in freight service, as shown by official timecards, issued for the government of employees only, effective during the last half of 1907, compared on the various operating districts over which so-called "transstate" trains would pass through the State of Arkansas. As various classes of engines with varying tonnage ratings are in service on the different districts, the maximum rating on each district has been used below as the basis of comparison. (See exhibit "W," R. p. 2563.)

* * * * * * * * * * * * *

Q. What would be the direct effect of this upon these so-called "transstate" trains moving through the State like they are on a bridge, Mr. Ludlam?

A. It shows that such a train would be an impossibility.

Q. Suppose there was a train of transstate freight made up at St. Louis, going south; that would have one of two routes to take: One on the main line via Poplar Bluff and those hills north of that—I have forgotten the name—and the other using this leased line that they lease from the Cotton Belt track:

What would be the effect of the operation of a train of that kind?

A. The official time table, number 16, of the St. Louis, Iron Mountain & Southern, taking effect July 4, 1909, shows that any one of the engines, from number 1 to number 100, could haul 1,900 tons from St. Louis to De Soto, but that any one of those same engines could only haul 900 tons from De Soto to Piedmont. That is, the train would have to be more than divided in two when it got to De Soto.

When it got to Piedmont it could haul from Piedmont to Hoxie 2,300 tons. In order to run through from St. Louis to Hoxie the train would have to have 1,000 tons less than the capacity of the engine between St. Louis and De Soto, and it would have to have 1,400 tons less than the capacity of the engine between Piedmont and Hoxie. That is, the engine would be working about one-half its capacity a large part of the distance—one-half or less than one-half of its capacity.

Q. Of course that would necessarily mean the breaking up of the train?

A. Yes, sir.

Q. Now, supposing instead of taking that route they took this other low grade route; I don't care about going into rating on that, but just call attention to this, that it is a low grade line:

That would be more economical to operate, I presume, than this other?

A. If it is a low grade line it undoubtedyl would be.

Q. And this transstate matter either must take the expensive operation on the main line, or else go to the expense of hiring another track on another railroad, to take care of it?

A. In order to operate more economically—in order to handle it cheaper; yes, sir.

Q. Where does the benefit to the State of Arkansas come in on that sort of economical management of these transstate trains through Missouri and over these leased lines, or out here in Missouri and eastern Arkansas?

A. Arkansas would not be interested in the economical operation of transstate freight."

Mr. Bee also explains the practical workings of this rating of the locomotives (he has had experience in the motive power department, and is familiar with it):

"Q. This morning Mr. Moore was asking you some questions about the carrying capacity of trains, and gave you an illustration of the rating of locomotives; I hand you a list showing the capacity of different classes of engines, used there on the Arkansas Division, and here is the capacity of different classes on the White River Division. I wish you would look over those, I don't suppose you have had an opportunity to see them.

A. These seems to vary from 350 tons to 2,400 tons per engine on different divisions and different engines.

Q. Take a movement through from Hoxie to Texarkana, one of those bridge movements, where the cars go through on a bridge, show the ratings of the engines here, and what effect that would have on your train?

A. These districts read straight down, do they? Hoxie is first, Little Rock second, and Pine Bluff third?

Q. Pine Bluff would be on a branch; Hoxie, Little Rock and then Texarkana would be on the main line?

A. Hoxie, Argenta, and Argenta to Texarkana, that would be the main line would it?

Q. Yes, Argenta is the yards across the river from Little Rock.

A. If a Red Ball train came out of Hoxie or otherwise, if it has its full tonnage, it would have to set part of those cars out when it got to Argenta.

Q. Why?

A. Because it carries 1,500 tons up to Argenta, and from there south, it could only carry 1,200. so it would have to set out 300 tons, and if you figure the average cars at 33 1/3 tons—that is a little light, but it will make the figures even—to handle three cars would be 100 tons; that would mean setting out six cars off the train.

Q. Take the White River right before you; you see one represents the haul north and the other south?

A. Take a train starting out of Carthage, Mo., moving to Crane, any engine between 851 and 893 would carry 975 tons to Crane; between Crane and Cotter, it would reduce its tonnage 375 tons, and then from Cotter to Batesville, it would reduce its tonnage 800 tons. From Batesville, if it was going back in the back direction from Batesville to Cotter, it would carry 1,200 tons, but going on south, the shipment has been raised from Cotter to Batesville to 800 tons; then from Batesville to Newport, the train would have to reduce 700 tons.

Q. Then from Newport to Argenta, is that shown on that, or would that be on the other sheet?

A. Yes, sir.

Q. There wouldn't be very much bridge movement on transstate freight with that kind of capacity of the engine?

A. Not unless they started with an under-tonnage train; a very light train; an engine would be losing the value of its capacity if it was making a bridge movement.

Q. I am just using the expression of Mr. Doddridge which was emphasized by Mr. McPherson?

A. I simply meant, going through that picking up or setting out, it would lose its character." (R. pp. 1294, 1295.)

Mr. Bee explains in detail how the transstate traffic use more facilities than other traffic.

The fast freight necessitates other freight being sidetracked and giving way to it; breaking up trains in division points to put the fast cars together for a fast train. If a transtate train was run through the division would have to be cleared for its use; the transstate train is inspected as other trains and everything delayed in the yard while it is standing there; a bad order car is cut out with usual use of facilities attaching to it. Cotton in Oklahoma is taken to Arkansas for compression, and uses the terminals at Fort Smith; and at all other junction points use the terminals; all freight has to be scaled at the first scale, transstate freight from near the border use the facilities in Arkansas; the large lumber movement from Louisiana north would use the scales at the McGehee yards in Arkansas; the same is true of the Louisiana cotton. If it were not for the transstate traffic, Arkansas would not have to maintain the large terminals it has, and their heavy expenses would be materially reduced if not for the transstate service. (R. p. 1200-1203.)

Some other witness, probably Mr. Hamilton, explained the number of cattle pens and chutes in the State, and the cotton platforms were explained, probably by Mr. Bee or Mr. Bragg; all of these facilities are for interstate traffic.

Coming to the practical operation of transstate trains, the best explanations is given by a man who was for years a switchman in the Argenta yards at Little Rock, the largest yards in the State:

His name is Thos. McCutcheon. His testimony begins at page 930. These excerpts on from pages 931 and 932:

"Q. I wish you would explain what is done with a through freight train coming in from St. Louis, say, and what would it largely be composed of; how would you handle it, explain it in your own way?

A. It is broken up, just as I told you; I never saw a through train that came in that didn't have to be broken up.

Q. What do you mean by being broken up?

A. There were different cars that didn't go through with that same train, cars for different points in it; I never did see a through train for the South from the North go straight through.

Q. Some of these gentlemen high up in the operating department of the roads have compared their through trains to a bridge running through the State. Is there anything like that?

A. No, sir.

Q. You did not discover the bridge?

A. No, sir.

Q. What difference is there between the bridge and the actual facts?

A. Now, I have seen a fruit train come, that there would not be anything done to it, but to change the caboose.

Q. That would be from the South?

A. Yes, sir.

Q. Have you seen many of those?

A. No, sir.

Q. Have you seen anything else but a fruit train now and then?

A. A vegetable train, onion train.

Q. Some onion train from Southern Texas?

A. Yes, sir.

Q. You have found a few of those?

A. Yes, sir.

Q. They are the only bridges you discovered?

A. That is all.

Q. The bridge only worked occasionally in going from Texas through to the North; the bridge didn't work from the North when it came down South?

A. No, sir.

Q. What do you do with the cars in the train as they come in, you speak of breaking them up; that is a technical term that you understand, but we don't; just explain that operation?

A. There is different tracks designated for different cars for different points; all cars that would go to the Valley, there is a track they go on; also, we set North and South cars for different tracks.

Q. And with the exception of these few onion and fruit trains, that come in here, every train you handled was broken up in that way?

A. Yes, sir.

Q. And new trains made out of those trains that had been broken up in that way?

A. Yes, sir.

Q. Was there any difference in handling the carloads that would come in, say from St. Louis, than there would be handling carloads that were delivered to the railroad here, say from the brick plant or cotton seed plant, or any other industry in Little Rock, after it was delivered to the railroad, would there be any difference in the handling of that than there would be in this train from St. Louis?

A. No, sir; they would be all handled in the same way.

Q. Of course, before it was delivered to the road, a car would be set out to the industry's switch, and loaded there, and then delivered to the road?

A. Yes, sir.

Q. The same would be true in St. Louis, or wherever the car originated, that same service would be performed elsewhere?

A. Yes, sir.

Q. After it is delivered to the road, the handling of the car originating locally would be the same as a car originating in St. Louis or Chicago?

A. Yes, sir.

Q. Suppose a car came down from the Fort Smith branch, or came up from Pine Bluff; how could it be handled?

A. The same way as the other; if it came from Fort Smith, it is switched in the Fort Smith yard, and it is set out on the track; if it was going north, it would be set on the north track, where they kept the north cars, and if south, it would be on the south track, and then another engine comes up and gets it and switches it out again, down below the south end?

Q. To the main line track?

A. Yes, sir.

Q. As I understand you, all the trains, the freight cars are brought into Little Rock, they are broken up, and new trains made out, and they are sent out to their destination in that way?

A. Yes, sir."

He was cross examined at length, but the more he went into the subject the more fully he proved the statements above made.

The plaintiffs made Mr. Lincoln a witness on movements of trains and on this point he testified at the instance of the plaintiffs:

"A. I don't think there is a great deal of difference between that in the handling of interstate or transstate carload business, because it is simply a switching service. Now, that expense is smaller at some division points than at other division points. Take a division point like Little Rock: Trains have to be broken up more there than at Poplar Bluff, or Hoxie—I think that is the division point now. There is more breaking of trains at Kansas City than at Sedalia.

Q. What would be done at Hoxie, for instance, I mean in the transstate?

A. With a through train going to Hoxie?

Q. Yes, going to Texas?

A. Well, a through train starting from St. Louis to Texas pulls out of here as a solid train, we will say, to Hoxie. There the crew taking it releases that train. There is a new engine and a new crew to take it out. That train is broken up to some extent at Hoxie in order to take care of the through freight which may accumulate, and go in that train and set out some that is not time freight.

Q. Please explain that.

A. There are three classes of freight in the train, red ball, green ball, and the third class on which the time does not cut a figure. When they break up at Hoxie, they will put in red ball there and take out some unclassified freight.

I stated that at a point like Hoxie the service of breaking up the train and switching will not be as great as a point like Little Rock. There they will probably have to break the train up very largely because the contents of that train out of St. Louis to Little Rock is distributed over other divisions. It is not all going to Texas, but some may go to Fort Smith or Monroe or Shreveport, or Pine Bluff; so it requires the breaking up of that train and the making up of a new train at Little Rock.

Q. Let me see if I understand you: At Hoxie there was a car that was not to go on: With that the work would be to set that car off?

A. I would say that if you start the train out of St. Louis to Hoxie, and Hoxie will have cars coming in there from Cairo and from Thebes. Trains break at Hoxie.

Now, if there was some red ball freight, the time freight, in the trains out of Thebes and Cairo, it would be put in the train going south from Hoxie.

Q. Assume that that is transstate tonnage.

A. Yes, transstate, all of that is, or interstate tonnage, not necessarily transstate—Poplar Bluff or Texarkana or El Dorado.

Now they take out of that train the slow freight and put in the red ball so as to have that train take care of the red ball south of Hoxie. There would not be very much changing of the contents of that train at Hoxie, but there would be at Little Rock and there would be at Kansas City.

Q. If there were five cars on that train going to Texas, when it reached Hoxie—I mean in its orginal condition as it left St. Louis—there are two cars that come in from Cairo which you want to put into that train to take to Texas, you simply hook those two cars on to the through train to Texas?

A. That is hardly the situation. I will try and explain a little better than I have.

We will assume—I don't know what the tonnage is of the engine that takes that train out of St. Louis to Hoxie—that is one division, there is a division in between—that the engine is rated to carry 1,500 tons:

It has in the train 700 tons of red ball. It has in the train five hundred tons of green ball, that is 1,200 tons.

Q. What is green ball?

A. That is next to the preferred freight. Green ball comes next to red ball.

Then it has in the train 300 tons unclassified freight on which time is not an object. Now, it arrives at Hoxie. These trains that came in from Cairo and Thebes have red ball freight in them. They will take out at Hoxie—by the way, Hoxie is on the main line, no branches there—in the train that carries 1,500 tons there at Hoxie, they take out at Hoxie green ball freight—or they first take out the

nonclassified, the slow freight, and if necessary, take out of it some of the green ball freight and put in the red ball, the time freight, to expedite the movement of that freight through.

Q. They take out the unclassified freight?

A. Yes, first.

Q. And put in the higher grade for the purpose of giving the latter the benefit of the quicker movement?

A. That is predicated on the power in and out being the same.

Q. I understand. What do they do with the train when they have hooked on that additional green ball?

A. When they make up their tonnage for the train south of Hoxie that has to go on and what is left—

Q. The train goes right along?

A. Another train.

Q. What do they do with the unclassified traffic that is on there?

A. Leave it there to fill out the next train or carry it forward on a local train; or they may accumulate sufficient freight by reason of three divisions to take care of that and run an extra train; or, they may be able to handle on the train south of Hoxie if there are a greater number of tons to the engine than into Hoxie.

Q. That is yard service?

A. Switching and yard.

Q. For the purpose of expediting the more important freight with reference to the movement?

A. Yes, sir.

Q. And it consists in taking out of a train certain freight and putting in certain freight which can not be delayed?

A. It requires a switching service, yes.

Q. Now, we will go to Little Rock: What do they do at Little Rock, tell me in detail.

A. The train going into there would be broken. It would be broken to a greater extent than at Hoxie because of the various branches—suppose there is a carload each going to Camden, Hope, Texarkana, Fort Smith or Galveston, or maybe to Pine Bluff: Now, there are three lines branching out there. If the red ball freight going in different directions, that requires another breaking up of that train." (R. pp. 986-990.)

On re-direct examination, he further explained the handling of transstate freight:

"Q. Mr. Moore referred to through trains that would have ten cars of transstate, and probably ten other cars would be set out at Little Rock, and asked you, if I understood him correctly, whether this switching or breaking up of a train was not necessary so far as regards the ten cars that were going on through. I will ask you if this switching was not done, and other cars hitched onto those ten cars, if that would not make the transstate freight a very expensive proposition?

A. I think I catch the idea is this; if the ten cars of transstate traffic were allowed to go on through as a continuous movement, without putting other cars into that train to bring it up to its tonnage that the engine can haul and the crew can hadle, that it increases the expense of handling the transstate freight—undoubtedly.

Q. Well, that would be true if it started from St. Louis that way?

A. Anywhere.

Q. It is economy of the transstate business, as well as general economy, if you break up these trains at these division points or distributing points, as you have indicated has been done?

A. It is economy to all of the traffic handled to make each engine haul full tonnage and not having light trains, whether it is one class of freight or another.

Q. Then it is good economy to set out these through trains at Hoxie or Little Rock, whatever the point, and wait for a train to be made up to carry them?

A. It is economy to wait at a division point and fill out your trains.

Q. In reference to various services performed at the division points, you generally have an inspection? Isn't that a service performed at these division points?

A. Inspection of what?

Q. Inspection of the cars?

A. I assume the cars are inspected at the division points. I hadn't thought of that.

Q. The wheels, boxings, and everything of that kind?

A. That is what is usually done at division points, is to attend to equipment.

Q. That is a cost of service, of course, that would apply—

A. To all.

Q. Apply to all alike?

A. Yes, sir." (R. p. 996.)

More testimony is adduced on both sides as to the switching services at division yards in connection with the State's plan of dividing these expenses, but it is largely detail. The general service is fully explained by Mr. McCutcheon and Mr. Lincoln, each thoroughly familiar with it; one introduced by the State and the other, on this subject, by the railroads.

Mr. Willmering had some positive opinions on the bridge theory, and thus expressed them:

"I found from actual experience, and I can testify from my own knowledge, that the interstate, both carload and less than carload, is actually handled at division terminals, and this theory that has been advanced in this case and applied by Mr. Doddridge—this bridge theory—that this transstate business going over a State as though it were on a bridge, does not in reality exist.

"There are too many cripples sidetracked or ditched in these supposed solid through trains, and I have not given that any consideration at all, because it don't exist. I know from my own knowledge that cars of lumber handled from points in Louisiana and points on the Iron Mountain in Louisiana—I recall some moving to points in Oklahoma, that have been delayed in transit from 60 to 90 days, and have been weighed four or five times in transit; the waybill itself showed that this bridge theory is an absurdity. It is nonsense and it don't exist in reality. It occurs to me Mr. Doddridge and McPherson tried to apply the ideal theories in railroading for the most economic management possible, but they have not accomplished their ideals and never will, I don't think.

"So for that reason and owing to the fact that these interstate cars both less than carload and carload are handled at the division terminals if the length of haul is greater than 100 miles—that also double the tons handled in order to ascertain the ratio." (R. p. 1151.)

The conclusion from this testimony is irresistible that the "bridge theory" of transporting transstate freight is nonsense. Freight moves from division point to division point and at each division point, each car goes into other trains with rare exceptions, like the onion train from Texas; one train may go through one division, but the engine ratings forbid any train loaded to its engine capacity (and all through trains should be), going from one division to another without breaking into several parts. The usual rule is for the train to go into the division yards and other trains made up, and the cars coming in in one train will go out in from two to eleven other trains. It is sheer nonsense to say that the transstate cars do not use the facilities like other cars, and do not incur the same expense in the yards car for car. The records show that of 1,500 transstate cars passing through the State in October, each staid on an average five days over schedule time, and in March, 1,500 cars stand four days over their respective schedule time. During that interval they are using every facility of the road, division yards, passing tracks, switch tracks as well as main line; they are handled by switchmen, inspectors, weighmen, trainmasters, train dispatchers, and every other class of employees. They are, while spending their time, necessarily switched and shunted around much more than a car which is switched to an industry track and returned loaded.

The basic principle of the plaintiffs' case that the cheap freight is the transstate freight, cheap because carried through the State "as if on a bridge," is proved to be a mere theory, not a condition..

## AS TO EXTRA INTRASTATE PASSENGER TRAFFIC.

The situation of extra expense of intrastate passenger traffic has been brought into the preceding discussion, but there are some phases of it which call for separate consideration.

The character of the passenger trains on the Iron Mountain were definitely fixed by Mr. McPherson, Assistant to the General Manager of that road, who filed exhibit 46 (R. p. 2412), in which he lists the through trains and their runs and stops, and the local trains, their runs and stops. The situation was discussed fully with Mr. Ward, one of plaintiffs' witnesses in rebuttal, where the exhibit was analyzed and some additional facts brought out; (R. p. 1884-1888 and 1891.) also at page 2066-2068. There were eight through trains, one a fast mail, carrying one sleeper and no other coaches. There were 48 local trains running daily, including Sunday. Two of these made the same runs that were made by six of the through trains. Thirteen of the local trains carried sleepers, one of them three sleepers, and all of the through carried sleepers. It was testified by Mr. Maurice Wright, and later sustained by some statistics of a test that it is undisputed that of the passengers riding in Pullmans, 18 per cent were intrastate and 82 per cent interstate. (R. p. 2287, 2288.) It is undisputed that all the trains on the St. Louis Southwestern Railway are local. It carried no through trains. (R. p. 2285.) Mr. Wright, called in rebuttal, testified as to handling transstate and interstate passengers at Little Rock: Transstate passengers from Texas to Memphis would change cars at Little Rock, on one train making close connection, on the other waiting one hour and 20 minutes. Coming from Memphis to Texas points, they would change at Little Rock on one train and go through on the other, on the fast train they would have to change. Passengers from Louisiana going to St. Louis or any other transstate point, would have to change at Little Rock; on one train they would make close connection, on another spend one hour and 20 minutes, and on another spend a night. All passengers from the central division, the Fort Smith road, going to St. Louis or Memphis, or anywhere out of the State would change at Little Rock. Going out of the State on the White River branch, all the transstate passengers from Louisiana or Texas or Tennessee, would have to change at Little Rock, or Newport or Bald Knob; all passengers from Fort Smith territory (165 miles long through the heart of the State), going north, east or south would have to change at Little Rock to get out of the State. Interstate passengers from north, east or south of Little Rock going west on the Fort Smith road, and all transstate passengers from the north, east or south going west over Fort Smith branch would change at Little Rock. (R. p. 2265-2267.)

It has heretofore been explained that the tracks of the Iron Mountain run into Oklahoma before reaching Fort Smith, and all freight traffic on that road into and out of Fort Smith is interstate. The Iron Mountain has a contract with the 'Frisco road to use its bridge in getting into Fort Smith, and runs two passenger trains across it. Memphis has been placed by the plaintiffs as constructively in Arkan-

sas. When Mr. Nay was on the stand in rebuttal in behalf of the railroads, this situation was put to him, and his testimony follows:

"Q. While on that subject let me tell you about some of the evidence in this case:

Memphis is treated as an Arkansas point in this case. The expense is all charged up to Arkansas. Of course, all the travel is interstate and from Memphis to Texas would be called transstate.

A. From Memphis to Little Rock is interstate.

Q. Yes, and the expenses of Memphis are treated as if incurred in Arkansas.

A. That is by some arrangement between you?

Q. No, sir. I have been kicking against it and am still kicking. It is by "force of arms" that that is in here in that way. But those are the facts, there is no dispute on that point, and that the traffic from that point in interstate traffic.

The same thing is true of Fort Smith, but to a lesser extent. Two passenger trains, run over the bridge which makes it intrastate. All of the freight traffic is interstate as they do not use the bridge at all for the freight, but only for the two passenger trains.

So far as the Cotton Belt is concerned, I believe the yards in Texarkana are in Texas; isn't that true, Mr. Kimbell?

MR. KIMBELL: Yes, sir.

Q. You know the travel out of Texarkana on the Cotton Belt and out of Fort Smith and Memphis on the Iron Mountain would be a large volume of traffic.

COL. MOORE: You mean transstate?

JUDGE HILL: I am speaking of the traffic. It would be all interstate or transstate and as to all of it there would be two terminals in Arkansas, and on transstate there would be one, out of each of these points.

Would not those facts modify to some degree at least your objection to this method?

A. Yes, sir, that would modify it to a degree. But what I had in mind when I spoke of transstate—I did not have in mind particularly Fort Smith or Memphis or Texarkana, but passengers from St. Louis to Texas points.

Q. I understand that. And that is why I call your attention to the local conditions and ask you if those local conditions would not modify your position?

A. Yes, sir, but there would still be certain transstate passengers in these 145,000; say passengers from St. Louis to San Antonio or from the Southeast going into Oklahoma.

Q. Of course there would be some, but in these there would be the interstate passengers from Fort Smith and Memphis to Little Rock that would have two handlings under this method of accounting and they are only charged with one.

A. Possibly those might offset each other so the difference would be 'negligible.'" (R.p p. 2063, 2064.)

One of the chief items of extra expense assigned to intrastate passengers traffic by Mr. Doddridge (R. p. 464), and other witnesses is the increased casualty risk arising from increased number of passengers boarding and alighting from cars at stations. Taking the transstate passengers going through Arkansas, except on eighttrains, and there are as many alighting and boarding trains as the short haul State passengers, who would rarely have but two. The longer haul interstate would have as many, and in many instances more than the intrastate.

Transstate passengers using Memphis and Fort Smith would have in this case double the casualty risks charged up to them that the interstate passengers have. The rest of Mr. Doddridge's testimony is largely inapplicable to the traffic in Arkansas, is upon conditions not existing, due to the absence in this case of the intrastate carried solely on the local and the interstate on the through.

The trial Court, in his opinion, stated there was no extra cost of intrastate passenger traffic on the Southwestern, but that there was an increased cost of 10 per cent on the Iron Mountain. Where he made the difference under this evidence, we are unable to see unless it be that the Iron Mountain carried eight through trains which were largely patronized by interstate traffic. Doddridge admits that the local train is a feeder for the through, and it is not right to charge all its stops and all its expense to the traffic carried by it, for much of it is done to enable the through train to make time, deliver and take up mail and express. (R. p. 488, 489.)

Mr. Doddridge admits that the casualty risk is greater on the fast train than on the local, and that they cause more wrecks than the local. (R. p. 490.) But, he says the casualty risk he referred to in his extra cost items against the intrastate, was that of getting off and on the trains. (R. p. 490.) This other casualty risk was not enumerated; but as shown by the conditions in Arkansas, the interstate is receiving as much or more casualty risk in getting on and off the trains than the intrastate.

In the face of the conditions shown to exist in Arkansas and the inapplicability of the reasons assigned for attributing extra expense to intrastate passenger, it can hardly be seriously urged by the plaintiffs that they have made out any appreciable extra expense. The action of these plaintiffs since obtaining the injunction against the two-cent passenger fare is pretty conclusive evidence that they had no cause of complaint against it.

Mr. H. C. Halverson, chief clerk to the assistant general passenger agent of the Iron Mountain, was called as a witness by the State.

He came to Little Rock in March, 1910, and is familiar with prices of transportation sold by the Iron Mountain in that year.

The Iron Mountain is a member of the Southwestern Passenger Association, which sells a mileage credential book in Arkansas for 2,000 miles at 2 cents per mile, plus $1.00. His road sells a mileage book of 500 miles for $12.50, and in Kansas sells the same book for $10.00, 2 cents a mile. The books are good anywhere in the State, and are on sale in all stations. At all competitive points in the State, they are selling tickets at 2½ cents per mile to meet competition with Rock Island and other roads having 2½-cent rate. (R. p. 928.) According to the allegations of the complaint, the 2-cent passenger rate was confiscation. At that time the interstate revenue per passenger mile through Arkansas (exhibit No. 5, R. 2327, 2328) was less than 2 cents, to be exact, 1.865 (the intrastate was 1.903). Having a free hand in fixing the rate, it is raised to three cents, and then voluntarily reduced it by the sale of books to all comers and at all places for the confiscatory rate of 2 cents a mile, if they travel to 2,000 miles; at 2½ cents if they travel 500 miles, and at competitive points a general rate of 2½ cents prevails. The exhibits worked out by the State's accountants on their plan of separating expenses, on the passenger side between mail, express and passengers, and then between intrastate and interstate passengers on the passenger mile basis after charging the intrastate with two terminals to one interstate, shows the intrastate is making larger return upon the property invested than the interstate.

Having so completely failed on proving extra cost and the State revenue even under the despised 2-cent act being higher than the interstate, naturally the net earnings on intrastate should show better, as they do, over the interstate.

This concludes the plaintiffs' case on extra cost, and the evidence against it, except the chief evidence of the State on the extra cost proposition which is shown in the result of the State's plan of dividing the expenses. It is impossible to present that evidence disconnected from the bases of division, but briefly stated, it may be said:

The State accepted every item of extra expense claimed—terminals, local trains and their attendant extra expense, and allocated it on bases supported by a preponderance of the testimony as sound and approximately accurate, and under such division, the intrastate traffic was shown to be earning a compensatory return.

Before reaching that subject, however, there are other subjects to be discussed which further weaken, if not destroy, the plaintiffs' case.

Before passing from this review of the evidence on the extra cost, attention is again called to the rule that the invalidating facts must be clearly and decisively proved, and when that touchstone is applied to the evidence in this record of extra cost of intrastate traffic in Arkansas, we are entitled to the Scotch verdict.

## TRAIN-MILE DIVISION OF MAINTENANCE-OF-WAY BETWEEN PASSENGER AND FREIGHT TRAFFIC.

The plaintiffs in their exhibits use the revenue basis to apportion expenses and property between intrastate and interstate traffic and adduce much opinion evidence as to that being the best known basis. They depart, however, from that basis in dividing the expenses of maintenance-of-way and other common expenses between the freight and passenger traffic, and it is to that subject your attention is now invited.

The adoption of the revenue basis for dividing this expense will result in showing a compensatory return on intrastate property, on the straight revenue basis as against a return that is on the border line between confiscation and compensation, towit: 4.70 per cent.

The adoption of the car-mile basis, which will be shown to be far more reliable than the train mile, will result in a return far above any cavil as to the rate being compensatory.

The railroads' exhibits contain three fundamental errors: (1) Division of property on revenue basis; (2) division of maintenance-of-way expenses between freight and passenger on train mileage basis; (3) division of expenses on revenue basis.

The State, in order to meet the great mass of testimony as to the extra cost of intrastate freight and passenger traffic over interstate, attempted to make a division of expenses on practical lines and to allocate approximately each item of extra expense, thereby to demonstrate (a) that it was unnecessary and wrong to use an arbitrary basis to divide expenses between State and interstate, and (b) to demonstrate from actual facts—as opposed to theories—that after making maximum allowances for all these items of extra expense, most of them attributed to the local train and double terminals, that the higher expense of intrastate traffic was less than the higher revenue of intrastate traffic, and therefore if the road as a whole was making a compensatory return on all its traffic in Arkansas, necessarily it was making a compensatory return on its intrastate traffic.

The fundamental error of using the revenue as a factor is elsewhere discussed and this chapter is devoted to the single error of using the train mileage as the factor to divide maintenance-of-way expenses between freight and passenger traffic.

The State in its exhibits used the divisions as made of the property on the revenue basis and the freight and passenger expenses on the train-mile basis by the railroads, for the purpose of testing out the error of using the revenue to divide expenses and left untouched the other two errors. The State never conceded the correctness of either of these bases and only took them as starting points to demonstrate the fallacy of using the revenue to divide expenses. Both of these bases work harshly against the State; how the revenue basis attributes to State traffic 13 per cent of the property devoted

to State freight while the State freight's use of the property represented in ton miles was only 7 per cent, has elsewhere been discussed.

Judge Trieber, while rejecting the revenue theory for dividing expenses (although he uses the rejected theory to divide many of the largest items of expense), accepts it as sound for the division of property between State and intrastate, and the soundness of his conclusion is elsewhere discussed, but will be accepted here to direct attention solely to the train-mile division between passenger and freight. We desire for the nonce to dismiss all of the debated questions and drive solely at the train mileage division between freight and pasenger of the maintenance-of-way expenses:

Mr. Parker, engineer of the Texas Railroad Commission, a witness introduced by the State, testified that 90 per cent of the expenses of maintenance-of-way was due to the elements and natural decay and only 10 per cent from the result of use. Mr. Byers, chief engineer of maintenance-of-way of the Iron Mountain road, placed as low as 75 per cent as due to the elements and natural decay; the fact is established by competent witnesses on both sides, that a percentage varying from 10 to 25 per cent of these expenses only is attributable to the use of the way by the passage of locomotives and cars; the remainder due to natural causes.

Two of the large items of expense are maintenance-of-way and maintenance-of-equipment. In Arkansas for the six months' period in suit they were, respectively, $1,054,676.51 and $1,035,566.07, on the Iron Mountain, according to its exhibit No. 3 (R. p. 2293.)

Excepting minor matters, with which this discussion will not be burdened, the maintenance-of-equipment expenses are from their nature definitely located to freight and passenger, respectively, but the maintenance-of-way, from its nature, and especially in view of the much greater part of it being due to natural causes, is not susceptible of definite location between freight and passenger, and therefore some factor bearing the nearest relation to the subject must be used in order to separate maintenance-of-way expenses between freight and passenger traffic. The railroads in their exhibits used the number of train miles in each class of service as the basis to divide maintenance-of-way expenses between freight and passenger traffic. (R. p. 2316.) The mileage of passenger trains and the mileage of freight trains, irrespective of the weight, number of cars in the train and class of cars in train, is the adopted factor.

Does that factor bear such a relation to the subject that it may be safely used to apportion a million dollars of expense? Judge Trieber, after referring to the established fact that from 75 per cent to 90 per cent of the expense is due to deterioration and action of the elements, regardless of the operation of trains, says:

> "In view of these facts, any attempt to apportion this item of expense on the ton, car or *train mileage* (italics ours) would be an injustice to the roads. The court is of the opinion that the

straight revenue basis will get more accurate results. The difference in intrastate and interstate rates will be taken care of by proper allowance to be made on the final calculations of the entire cost." (R. p. 2623.)

Passing for the moment the proper allowance to be made as to the excessive charge to the State on account of the higher intrastate revenue which will result in injustice to the State as pointed out by Judge Trieber, and examine which basis is more favorable to the railroads, the train mileage or the revenue, even with the revenue burdend with the excess.

Exhibit 5 (R. pp. 2327, 2328) shows intrastate freight revenue 13.41 per cent and interstate freight revenue 86.59 per cent of the total freight revenue and intrastate passenger revenue 59.54 per cent and interstate passenger revenue 40.46 per cent of the total passenger revenue. These are the factors used to apportion the expenses between these classes of traffic by the plaintiffs in their exhibits where they use the revenue basis.

Exhibit 3, par. A (R. p. 2292), shows 73.35 per cent of the revenue is from the freight traffic and 26.65 per cent from the passenger traffic. Naturally one would think from reading the evidence of the plaintiffs' witnesses that when the freight and passenger expenses of maintenance-of-way were to be apportioned that the revenue basis would be used. Had it been done, then 26.65 per cent of maintenance-of-way would have been apportioned to passengers and 73.35 per cent to freight. But the basis for this division is the number of train miles in each class of service. (R. p. 2310.)

The actual apportionment in dollars and cents is $553,395.11 to freight and $501,281.40 to passenger. (R. p. 2293.) That is 47.53 per cent apportioned to passenger against 26.65 per cent if the revenue basis had been used, and 52.47 per cent to freight as against 73.35 per cent if the revenue basis had been used.

If the proportion between intrastate freight and interstate freight were the same as the proportion between intrastate passenger and interstate passenger the difference in apportionment of freight and passenger expenses would make no difference, for the test is finally as to whether the combined revenue from the two classes of intrastate traffic produces a compensatory return, but where the proportions are different the final result is correspondingly different.

The difference works out as follows:

The greater apportionment to passenger traffic from use of train-mile basis instead of revenue basis is $220,216.46. It results from apportioning to passenger traffic 47.53 per cent of this item instead of 26.65 per cent of it. As 59.54 per cent of passenger expense is, under the revenue basis, charged to intrastate as against 40.46 per cent charged to interstate, the greater the sum apportioned to passenger traffic the greater the sum apportioned to intrastate passenger; on the other hand, as the freight traffic as apportioned on the

revenue basis is 13.41 per cent to intrastate and 86.59 per cent to interstate, the less the sum apportioned to freight traffic the less will be the sum apportioned to interstate freight traffic and more to the total intrastate passenger and freight traffic. This difference of $220,216.46 more assigned to passenger and less to freight under the train-mile basis than would be under the revenue basis, according to the above-named percentages, assigns more expenses to the intrastate passenger than its just share under the revenue basis and less expense to the interstate freight than its just share, and works out a let loss to the intrastate traffic of $101,582.92 and a net gain to the interstate traffic of $101,582.92 by adopting the train-mile instead of the revenue basis to divide maintenance-of-way expenses between freight and passenger, as seen by this calculation:

APPORTIONMENT OF MAINTENANCE-OF-WAY EXPENSES ON TRAIN-MILE BASIS.

| | | *Total.* | | *Intrastate.* | | *Interstate.* |
|---|---|---|---|---|---|---|
| Freight | (52.47%) | $ 553,395.11 | (13.41%) | $ 74,210.28 | (86.59%) | $479,184.83 |
| Passenger | (47.53%) | 501,281.40 | (59.54%) | 298,462.95 | (40.46%) | 202,818.45 |
| Total | | $1,054,676.51 | | $372,673.23 | | $682,003.28 |

APPORTIONMENT OF MAINTENANCE-OF-WAY EXPENSES ON REVENUE BASIS.

| | | *Total.* | | *Intrastate.* | | *Interstate.* |
|---|---|---|---|---|---|---|
| Freight | (73.35%) | $ 773,605.22 | (13.41%) | $103,740.46 | (86.59%) | $669,864.76 |
| Passenger | (26.65%) | 281,071.29 | (59.54%) | 167,349.85 | (40.46%) | 113,721.44 |
| Total | | $1,054,676.51 | | $271,090.31 | | $783,586.20 |

SUMMARY.

| | |
|---|---|
| On train-mile basis | $372,673.23 |
| On revenue basis | 271,090.31 |
| Excess of train-mile basis over revenue basis | $101,582.92 |

The value of property assigned to total intrastate traffic, under the revenue basis adopted by Iron Mountain, exhibit 3-A (correcting an error in exhibit 3) (R. p. 2318) is $4,424,048.46. The net revenue, after deducting expenses, taxes and rentals, according to Iron Mountain showing on all intrastate traffic, is $208,032.21. (R. p. 2295.) This produces return of 4.66 per cent on the property (R. p. 2296), after correcting error in property assessment, a return of 4.70 per cent on the intrastate property. (R. p. 2319.) Unless the argument on rate of return to the effect that a rate yielding as much as the rate of interest paid on the securities of this road, 4.50 per cent, is accepted as sound, this would be a confiscatory return, as being less than the legal rate in Arkansas, 6 per cent, which under some of the cases is *prima facie* the test.

If the revenue basis, instead of the train-mile, had been used to divide maintenance-of-way expenses, this $101,582.92 would be added to the net return shown on intrastate property, making the net income $309,614.13, instead of $208,631.21, and a net return on the property of 7.04 per cent, instead of 4.70 per cent. If the 4.70 per cent be held confiscatory, certainly 7.04 per cent will not be held confiscatory.

It will be said that this return of 7.04 per cent is upon the straight revenue basis before the extra cost of intrastate traffic is added to bear down the intrastate return, and that is true, and also true that it is upon the straight revenue basis throughout only discarding the unfair train-mile basis where it is and substituting what Mr. Nay calls "the best known measure" (R. p. 662) for it, and without allowance for the higher intrastate revenue, 98.18 per cent on freight and 3.48 per cent on passenger. That the whole evidence establishes that the intrastate freight traffic cost less than 98.18 per cent, more than interstate freight, is thoroughly established by preponderance of the evidence; in fact, the only evidence against it is the opinion evidence of operating officials where cross examination proved that they were giving opinions on general conditions, which were shown not to exist in this case, and which several of them candidly admitted rendered their testimony inapplicable to this case.

The State's exhibits made up with the unfair train-mile division of passenger and freight maintenance-of-way expenses and an unfair revenue basis for apportionment of the property and making maximum allowances for all items of extra cost showed the intrastate freight only 86 per cent more expensive per ton per mile than interstate, as against the higher interstate revenue of 98.18 per cent per ton per mile.

The correction of this basis makes the intrastate return 7.04 per cent and extra cost is absorbed in the higher percentage. The State's exhibit allowing for all extra cost and using rational bases, but still retaining the train mile factor, which worked harshly against it as explained, shows a return of 7.69 per cent on the face of it, and after

correcting the error as to Pullman mileage, a return of 7.09 per cent. This strongly corroborates this showing and plainly indicates that more than 7 per cent is the minimum return the intrastate property is yielding. In fact, the return is much greater. All these examples are made up with concessions against the State to work out with less controversy the actual facts, contrasting them with the theories of plaintiffs.

It must be borne in mind that the correction of this erroneous basis lifts the intrastate return from 4.70 per cent to 7.04 per cent; it correspondingly decreases the interstate, but as the combined return is 7.50 per cent (R. p. 2318), neither traffic is suffering from confiscatory rates.

Really the whole Arkansas traffic is earning much more than that. Its expense is loaded with the Memphis expenses, and unfair methods of apportioning repairs of tools, fines for violating the criminal laws and other matters hereafter explained, and its revenues depleted by improvident contracts, to use an euphemistic expression, for them. But if this train-mile basis for dividing maintenance-of-way is right, it should be used, notwithstanding the burden of it to the intrastate traffic. As to whether it is right, we invite your attention to the testimony of the witnesses, particularly the plaintiffs' witnesses, and the utterances of courts which have considered it.

Mr. McPherson, in his direct examination, thus gives his views of the train-mile basis:

*Plaintiffs' Evidence.*

"The 'train-mile' measure being divided between freight and passenger service, may be followed in dividing the common expenses as between freight and passenger traffic. That is, the expenses that are common to both, but it must be discarded in any consideration of division between intrastate and interstate traffic, for various reasons, among which are, that it represents trains carrying both classes of traffic, and it also represents empty cars, the ultimate assignment of which can not be determined, and which, in themselves, yield no revenue.

"Then again, in conditions where the traffic of a railroad is not balanced in both directions, it may represent trains making no earnings whatever. That is, an engine and caboose, run from one end of the division to the other, to take a train or return a train.

"It does serve in railway operation as one of the factors in determining operating efficiency, in showing the average train haul, and tons per train mile, as all of the freight train mileage must be taken into consideration in any statistics that are prepared for comparative purposes, or for the study of railway operation.

"It is further useful in other statistics that the railway uses; in testing the efficiency of various divisions, or its operation generally." (R. p. 305.)

Mr. Doddridge, in re-direct examination, was asked in regard to the uses of the various statistics of the railroad companies on cost of traffic, and this was said:

"A. The train mile is also used.

Q. What is that used for?

A. For the apportionment of expenses, sometimes; the division of certain accounts where it is applicable.

None of these units are perfect. They are more or less of an arbitrary character and represent the conditions." (R. p. 534.)

Mr. Carl R. Gray, Senior Vice President, formerly General Manager, of the St. Louis & San Francisco Railway Company, was one of the railroads' chief witnesses in rebuttal. His testimony begins at page 1894, where an autobiography of his railroad service is found.

In direct examination Mr. Gray said:

"I believe there is in railroad practice only one more unreliable factor than a car mile, and that is a train mile." (R. p. 1897.)

On cross examination he said that it is perhaps a fair basis between passenger and freight on account of the fact that while one subjects the track to greater use it does not require the same degree of maintenance, and they come more nearly compensating, but he does not think it would be a satisfactory basis, but least obnoxious when used to divide passenger and freight than by other items.

Referring to this exact point is this:

"Q. But that would not properly represent the relation between freight and passenger when you are seeking to divide the expenses between State and interstate, as I understand your testimony?

A. That is my view." (R. pp. 1939, 1940.)

Mr. M. L. Byers, Chief Engineer of maintenance-of-way of the Missouri Pacific and Iron Mountain systems, testified for plaintiffs in rebuttal, his testimony beginning at page 1695.

He says that maintenance-of-way expenses should be divided as general expenses are divided, but that he does not know what would be a proper factor to divide general expenses, and he says he thinks the train mile as a basis for dividing maintenance-of-way between passenger and freight "is somewhat less in error than the use of the car mile statistics would be for the same purpose." (R. p. 1706.)

He admits that many criticisms he makes of the car mile would be applicable to the train mile or revenue basis. (R. pp. 1706-8.)

It was with him simply a degree of error in the various bases suggested. (R. 1708.)

Mr. Frank E. Ward, General Manager of the Burlington System, when testifying in rebuttal for the plaintiffs, said on this subject:

"Q. Coming to the division between freight and passenger, what do you think of the train mile as a proper factor to determine that?

A. I don't think that is proper. It would depend a good deal on the purpose for which we are undertaking to make the division. It may be for the purpose of simply making a comparison of a superintendent's performance of work on his own division, from month to month or year to year. On the other hand, it might be on a matter as important as the making of rates for freight and passen-

ger. And if for the latter, a great deal more care would be needed to be exercised in order to make a fair division.

Q. The latter is the object to which this litigation reaches, of course, to ascertaining whether the intrastate rates are compensatory. With that object in view and approaching the problem in this first step, maintenance-of-way, is it proper to divide that on the basis of train mile, as representing the use of the way?

A. My opinion is that it is not.

Of course, my opinion differs so materially from those of the accountants for the State in this respect, that I do not think the use of any of these factors, or any method that has been proposed heretofore, can really satisfactorily solve the problem. I wish it could, but I do not see that it can.

Q. Taking this as a basis, I want to ask if I correctly understand your position:

"Maintenance-of-way and structures: This account includes all repairs due to maintenance-of-way and track, bridges, trestles, fences, culverts, etc., also material and supplies used in repairing same and supervision. This expense is practically all localized and is charged to the State in which the expense is incurred. The total charge to maintenance-of-way and structures is divided between freight and passengers upon the basis of the number of train miles in each class of service."

Q. What do you think of that method of division?

A. That, as I understand it, is a method of division prescribed by the Interstate Commerce Commission. Speaking as an operating man, I would hesitate very much to accept that as a basis upon which to determine the question we have under discussion now—that is, the cost of handling State versus interstate business.

I think it omits a good many items that should be considered in trying to solve that particular problem. I do not think that division had in mind any such proposition as that we are discussing now.

Q. If that is used as a basis here to start a division of expenses, you consider it unsound?

A. Yes, sir." (R. pp. 1875, 1876.)

We can not assume that the force of Mr. Ward's condemnation of the train-mile basis to divide maintenance-of-way expenses between freight and passenger would have been lessened by the fact that he thought its use for this purpose was an invention of the State's accountants. The basis read to him in the foregoing question is taken from Iron Mountain exhibit 3, statement 5. (R. p. 2310.)

Mr. Nay, in his rebuttal testimony, says that train mileage division between passenger and freight for maintenance-of-way expenses is the best unit found for comparative purposes.

"These statistics are compiled for comparative purposes. They do not purport to cover the actual separation between freight and passenger of those common expenses. By using the same unit from

month to month we are able to make comparisons of one month with another." (R. p. 2034.)

Mr. Nay admits that much of his criticism of the car mile division of maintenance-of-way expenses in the State's plan would apply to any other basis, but he thinks not with the same force against the revenue basis. (R. p. 2042.)

In re-direct of Mr. Nay this occurs:

"Q. You stated on cross examination that the revenue does not represent the expense of maintenance-of-way, any more than the car miles.

Do you mean by that to say that that expense is not represented by either?

A. Yes, sir; I mean that neither one causes the expense.

Q. That class of expense is shown by the evidence in this case to grow largely out of causes other than operation. The testimony shows that 75 to 90 per cent of it is caused by the elements and other independent causes.

Now, in that view there is no connection or relation between that and car miles to the extent that it is not caused by operations.

That is true, is it not?

A. Yes, sir.

Q. You have already stated that?

A. Yes, sir.

Q. If it is true, it is more or less of an overhead expense rather than direct expense of transportation, is it not?

A. Yes, sir; I should think it might very fairly be treated as an overhead expense.

Q. If you had to divide it on some other basis I believe you stated it is your view it should be divided on the revenue basis?

A. Yes, sir.

Q. But if you had to plan some other basis than the revenue, what basis would you take? How would you treat it?

A. My second choice would be to treat it as an overhead expense and divide it on the basis of the direct expense." (R. pp. 2074-5.)

Mr. F. P. Johnson, who had charge of the accounts for the Iron Mountain in this case, testified, in rebuttal, and criticised the State's plan of dividing maintenance-of-way expenses between local and through trains on the car-mile basis and said: "The larger the proportion of that expense that is due to the elements the less accurate would any unit, either of car miles or train miles become, as has been stated by other witnesses, neither the train miles nor the car miles would have any effect upon that class of expense." He says it is more of a general expense than any other item in the operating department. (R. p. 1986.)

Mr. Wharton, who prepared the State's exhibits, testified in cross examination that he made no division of his own between freight and passenger for maintenance-of-way expenses; he simply took the division of the railway company of it, and considered it good enough for the purpose he used it. He was asked if he regarded it as a proper basis and said: "As between freight and passenger, it was probably good enough for the purposes of this case. I would not care to pass a personal opinion on that, because I have not studied it sufficiently to form an opinion as between freight and passenger." (R. p. 1031.)

*Defendants' Evidence.*

He says that while it was necessary to have this division correctly made in order to obtain correct results, and after he used it the only study necessary was as to a division of freight expenses between local and through and passenger expenses of the various classes. He was asked why he departed from the train mile and adopted the car mile between local and through and said because the car mile would more nearly represent the differences in cost. (R. p. 1032.)

Mr. Ludlam testified that his firm (Haskins & Sells) had prepared a statement which he thinks reflects pretty closely the cost of the intrastate and interstate in Arkansas, and in preparing that statement they had not gone back of the statement prepared by the railroad in dividing maintenance-of-way expense between passenger and freight. (R. p. 1321.)

We call especial attention to the testimony of Mr. Conway W. Hillman on this subject. Mr. Hillman is an expert railroad accountant and represented the State of Minnesota in its accounting matters in its rate case. He was a witness for the State in this case. He testified generally as to the various bases adopted by the State's accountants in this case, and on cross examination this testimony was given on this subject:

"Q. The expense between passenger and freight in these exhibits filed by the State, is divided on the train mile, isn't it?

A. I don't know, sir.

Q. That is the train mile made by each class of train?

A. That is whatever the loads had done, I don't follow that.

Q. Which would you regard as the better method of division?

A. Which two, do you mean?

A. The train mileage or car mileage?

A. Neither of them.

Q. Give me your views upon that subject?

A. My views on that subject would be that the expense of maintenance-of-way and structures should be divided upon the basis of the train weights in lieu of train mileage.

Q. Explain to me what you mean by train weights?

A. I mean that a passenger train will weigh approximately 250 tons, and a freight train will weigh approximately 900 tons, engine

and tender included. The division should be made upon a gross ton-mile basis.

Q. You would adopt that instead of the train-mile basis?

A. Yes, sir.

Q. When you say trains, you speak of the weight without regard to the contents, do you?

A. No, sir; I mean the weight of the engine and the tender, and the weight of each car, what you call light weight of each car, that is the weight of the car without any load on it, and to that, I add the number of tons which are loaded on those cars, so it would be the weight of the motive power, the weight of the rolling stock and the weight of the live load and also the weight of the caboose.

Q. That is freight?

A. Yes, sir.

Q. On the passenger, you adopt the same method?

A. Yes, sir; the weight of the engine and tender, the weight of the equipment, the rolling stock, the average passenger miles, taken at the basis of 150 pounds each, an allowance for 50 pounds of baggage per person, and the express, varying according to the amount of express which the road carries, light or heavy; mail the same way, the load of your cars." (R. pp. 1509, 1510.)

On re-direct he said if this data was not obtainable (and it was shown it was not in this case) he would take the train weights and obtain the percentage which exists in the train mile and take the car mile and that percentage and add the two together and divide by two and use that, putting the car mile on the train mile. (R. pp. 1521, 1522.)

Judge Sanborn, in his opinion in the Minnesota Rate Case, referred to Mr. Hillman's testimony, which was evidently to the same effect as here given, and said that no other witness came to support him, and, on the other hand, a number of witnesses of long experience in operating railroads had favored the revenue basis, as we understand the opinion, for the division of maintenance-of-way expenses between passenger and freight; and that was the basis adopted by the master and confirmed by Judge Sanborn.

Shepard v. Northern Pac. Ry. Co., 184 Fed. Rep. 765, on pp. 812, 813.

Mr. Wilmering thus expressed his views on the subject:

A. But the basis I have suggested here, in my judgment, is a fair basis—an equitable and a just basis, for the reason that the expense of "maintenance-of-way" is common to all classes and characters of traffic. It is not caused by any particular class of traffic, and the expense or outgo for "maintenance-of-way" is caused by the acts of Providence, acts of God, whether a washout, deterioration of ties owing to weather conditions. In all truth and in all logic, the car mile ought to be accepted for the basis of division between local and through.

Q. If that is true, why should it not also be used as a basis of division between passenger and freight trains?

A. Well, we have made a concession to the railroad companies in that respect and have accepted the theory advanced by the railroad officials themselves.

They were first to advance train-mileage for a division between passenger and freight business, and where the charges could not actually be located, in a great many of the instances, between passenger and freight, might be assigned directly to passenger and freight traffic accounts.

One of the principal reasons why we have accepted the revenue train mileage basis for a division between freight and passenger, where the expenses can not be located, is just a concession to the majority of the accounting officials. It is accepting the railroad's own theory." (R. p. 1139.)

The defendants introduced a vast amount of testimony tending to prove that the car mile was the proper factor with which to divide maintenance-of-way expenses. It was introduced to sustain the State's plan of dividing maintenance-of-way expenses between local and through freight trains on the one hand and mail and express cars and passenger coaches on the other hand. It took wide scope and goes to the general proposition that the car mile is the factor reaching nearest actual results. The train mile is incidentally brought into the discussion, but most of it is explaining why the car mile is the appropriate factor for this item of expense. Its consideration is necessary in the connection given, but attention is called to it here as it strongly reinforces the objection to the train mile in furnishing a better and more reliable factor.

But other testimony should not be needed. The plaintiffs have predicated their case on the revenue basis as the one offering the best solution of this whole problem and Mr. Gray criticises the State plan severely for using different factors with which to divide different items. (R. pp. 1907-1909.)

The use of different factors by the State is consistent with its plan, seeking in each instance the factor nearest applicable, but it is wholly inconsistent with the railroads' plan, which offers the revenue theory as the best unit yet found.

Certainly it should not be departed from unless good cause is shown in the selection of a factor more nearly accurate for the particular item than the revenue. Have they found it in the train mile? No witness for either side commends it—many condemn it.

Mr. McPherson says it will do between freight and passenger but must be discarded when a division between interstate and intrastate is made. Certainly when its use ultimately is for the latter purpose all the reasons he assigns against it for a division of intrastate and interstate must apply.

Mr. Doddridge, Mr. Nay and Mr. McPherson tell of the use of

the train mile for comparative purposes and evidently confine its use to such. Mr. Nay advocates the revenue basis of dividing maintenance-of-way and next to it the overhead plan.

Mr. Johnson advocates the latter and so does Mr. Byers. The fallacy of the overhead plan, however, is thoroughly explained in Mr. Ludlam's surrebuttal testimony. Mr. Byers condemns the train mile but considers it less erroneous than the car mile.

Mr. Gray considers it more unreliable than the car mile, and that it is too unreliable to be used to divide maintenance-of-way expenses between freight and passenger when seeking a division between State and interstate.

Mr. Ward's condemnation of it for the exact purpose used by the railroads in this case is emphatic and positive. He supposed the quotation from exhibit 3 was a formula of the Interstate Commerce Commission for same report and says for the purposes of this suit this basis omits a good many items that should be considered and for the purposes of this suit is unsound.

The train-mile basis attributes an unreasonable share to passenger traffic. Turn to the following account:

Maintenance-of-equipment, $723,431.33, is assigned to freight and $312,134.74 is assigned to passenger (exhibit 3, R. p. 2293).

The expenses of repairs to freight and passenger cars are compiled separately and only expense of a common nature divided between freight and passenger on a train mile (exhibit 3, statement 5, R. p. 2310). Turning to the detail of this account and getting to the actual facts when the train mile is not used but where a separation is made, actually between the two classes of service, and it is found: Repairs of passenger cars, $132,100.40, whole line; repairs of freight cars, $748,317.08, whole line. (R. p. 2304.) Just 15 per cent of the actual expenses is attributable to passenger cars when the expenses are located. Next is found the respective freight car repairs in Arkansas, $398,992.36, and passenger car repairs in Arkansas, $77,775.19, less than 15 per cent actually allocated to passenger cars. When the train mile is used 47.53 per cent is attributed to passenger traffic.

In station expenses the wages of employees handling both freight and passenger are divided 75 per cent freight and 25 per cent passenger. (R. p. 2310.) The railroads made an arbitrary division of this expense on above percentages, which are within one per cent of the proportion had the revenue been used. This arbitrary division was not complained of by the State, as it is one in frequent use, and is referred to in Smyth v. Ames. But why not use that arbitrary division for maintenance-of-way? If correct in one it would be in the other; but instead of taking a factor commonly used, they use the train mile and assign 47.53 per cent to passenger.

The mixed train expense is also divided between passenger and freight on arbitrary percentages of 75 and 25 (R. p. 2311) and it was

explained in the testimony that the Interstate Commerce Commission recognized this as a proper arbitrary.

The total amount of taxes paid in each State is divided by the railroads between freight and passenger on the revenue basis. (R. p. 2312.)

Why train mileage is the factor to divide the expenses of maintaining the way and the revenue the factor to divide the taxes on the way is an incomprehensible distinction.

Rentals for use of track—both debits and credits—are divided on revenue basis (R. p. 2312), and yet the upkeep of the tracks divided on a train-mile division.

There is an unaccountable and unaccounted-for change of base from the revenue to the train mileage and the effect of it on the railroads' own showing, as to one of these items only, is to reduce the rate of return on the property (before the extra expense is added) from 7.04 per cent to 4.7 per cent. If the revenue basis was substituted for train miles as to all other items where train mile is used, it is apparent that the return on the intrastate would far exceed 7.04 per cent. So far as our investigation goes, wherever the revenue theory has been accepted it has been applied to the division between freight and passenger.

*Decisions on the Train-mile Basis.*

In the Missouri Rate Case we are not sufficiently familiar with the record to state how the railroads divided it in their exhibits, but Judge McPherson had the accountants on each side to assist him in compiling the divisions according to his judgment, and it is found from this quotation from the statement of the case that he divided maintenance-of-way between freight and passenger on the revenue basis. St. L. & I. R. Ry. Co. v. Hadly, 168 Fed. Rep. 317, on page 322. "For reasons stated in an opinion herein filed, the revenue basis has been and is adopted as the only logical basis to use in arriving at a correct conclusion. The one basis or the other as a whole must be adopted. Either side can make a better showing by adopting the one basis in part of the accounting, and the other basis for the other. Neither should be and is allowed to do this."

In the opinion he says:

"The State earnings are made known to a certainty, concerning which the experts on both sides agree. And whether in earning them the company gains a profit, or sustains a loss, is dependent upon the expense in making such earnings. Some of these expenses can be definitely specified, but others, like maintenance-of-way, salaries of all officers, including ticket agents, handlers of freight, terminal expenses, compensation of many laborers, and other things, are all occasioned for carrying both freights and passengers, State and interstate, and miscellaneous of each. And herein is the problem how to make the apportionment.

"The track mile, or train or car mile, does not furnish the solution,

because every one agrees that neither of those methods will do, and no one of the experts or counsel on either side asks for such a solution."

*Id.*, on page 348.

In deciding the Oklahoma Rate Case, Judge Hook says:

"Having the total value of the railroad property in the State, the gross revenue from all operations therein, the gross revenue from each class of business, interstate and local, freight and passenger and mail, express and miscellaneous, and the proportionate property value devoted thereto respectively, there must then be ascertained the net revenues from the local freight and passenger business so that their relation to the value of the property employed in producing them may be disclosed and the ultimate question answered, towit, whether the rates from which the net revenues come are reasonably compensatory. At this point arises the principal controversy. A substantial part of the expense of railroad operation is incurred indiscriminately in all its business. For example, the maintenance-of-way and structures in a State, which makes one of the most important general expense accounts, is almost entirely for the common benefit of all traffic, interstate and local, freight and passenger. As between freight and passenger traffic a large part of the expenses may be directly located and distributed, and it is the custom to apportion the remainder by various rules not necessary to mention here; but generally speaking it is impracticable in railroad business to separate expenses into the interstate and local, and the minor and incidental operations. From the very nature of the case, therefore, some rule must be adopted for charging to each of them their fair and equitable proportion of the common expense. Of necessity it must proceed upon average conditions commonly known or shown to exist, and it argues nothing to say that it does not fully apply to this or that exceptional instance. A general rule based on experienced observation is fair, and what is lost by its application in one place is doubtless gained in another, and an equitable equilibrium maintained. Of those suggested the revenue basis appears to be much more uniform in its adaptability, and much less subject to substantial objection. It has been frequently employed (citing cases). It is the one to which the mind naturally turns in every problem involving the charging of common expense to different departments of a business. When a general or common expense can not be located, what is more obviously reasonable than to say in the first place the different branches or departments shall bear it according to the value of their products or their gross earnings, and then make due allowance for exceptional conditions if any are perceived. That seems at the start to satisfy the mind intent on equity. It is a working basis for the distribution of all expense incident to a railroad business among its revenue yielding operations of every character."

M., K. & T. Ry. Co. v. Love, 177 Fed. Rep. 493.

This case, being on the issuance of a temporary injunction, was carried to the Circuit Court of Appeals and there affirmed. The opinion was rendered by Judge Sanborn, who upon this subject said:

"In order to ascertain the net return from the intrastate passenger business and from the intrastate freight business of each of these companies, it was necessary for the Circuit Court to find and deduct from the gross earnings of each of these classes of business the cost of doing that particular business. There were many items of cost of doing all the business of the company in Oklahoma that disclosed the class of business on account of which they were incurred, and these are called 'allocated items.' But there was a large percentage of the cost of doing all the business of each of the companies in Oklahoma, like the cost of the maintenance-of-way and structures, which was incurred for the common benefit of its interstate business and its intrastate business, and there is no method of dividing these items of common cost between these classes of business which is sure to be mathematically accurate. Many methods have been and still are suggested. The question was: Which was the most equitable, the most likely to produce a fair and just division? And upon this subject there was much testimony of many witnesses, whose long experience in the practical operation of railroads, exceptional opportunities for extensive observation, and peculiar knowledge qualified them to form and express opinions. The Circuit Court examined all this evidence, considered the arguments of counsel, and adopted the revenue basis, and assigned these items of common cost to the classes of business in proportion to the gross earnings of these respective classes.

"Counsel now argue that there were other available methods, more likely to be fair and just, which they insist the court should have preferred. They now suggest (1) the ton-mile and passenger-mile basis; (2) the division of the items of common cost in the same proportion that the allocated items assigned themselves; (3) the subtraction of the aggregate of the items of common cost from the gross earnings of all the business, the division of the balance between the various classes of business according to their respective gross earnings, and the subtraction therefrom of the items respectively allocated to these classes. There is no basis of division that is free from objection and criticism. But the decisive preponderance of the evidence is that the revenue basis is the most likely to be just and fair. Much that has been said concerning the use of this basis for the apportionment of the value of the property is applicable to its employment for the division of items of common cost. No reasons for the use of either of the other bases that seem to us so cogent and persuasive as those given by Judge Hook at pages 498, 499, of 177 Fed. Reporter, for his adoption of the revenue basis have been called to our attention or occur to us. The use of that basis is sustained by many decisions, and it can not be held to be erroneous or mistaken."

Love v. Atchison, T. & S. F. Ry. Co., 185 Fed. Rep., on 330. We have heretofore referred to Judge Sanborn's opinion in the Minnesota Rate Case, rejecting the basis advanced by Mr. Hillman—the train weight. Not being familiar with the Minnesota record, we can only gather the facts from the opinion, and it seems that the revenue basis was applied by the master to both a division of property and expenses between passenger and freight, and the master's finding approved by Judge Sanborn. It is certain that Judge Sanborn accepted the revenue basis as a sound factor for application both to property and expense. While we radically differ with that opinion, and think the evidence in this record is convincing that that basis is of no value for either, certainly if used for the other items it should be used for the common ones. The revenue bases has been adopted, after consideration, so far as our investigation has gone, in only three cases, Minnesota, Oklahoma and Arkansas, where it was tried out. Judge VanDeventer adopted it in this case, on the preliminary hearing, but on the final hearing, when the facts were fully developed, Judge Trieber declared it "clearly wrong." Judges Hook, McPherson, Sanborn and Trieber each declare the revenue basis the proper division of maintenance-of-way, and so does the Circuit Court of Appeals of the Eighth Circuit. Doubtless due to oversight in preparing his calculations, Judge Trieber overlooked that both sides had in their exhibits used the train mile division between passenger and freight, the railroads as the foundation for separating freight and passenger before each were separated into intrastate and interstate, and the State solely to take the railroads' assignment to each class of traffic the respective expenses and test out their method of apportioning such items between intrastate and interstate. We do not for a moment advocate the revenue basis for dividing maintenance-of-way expenses between passenger and freight as right in principle, but do say that if the revenue basis is to be used to divide the property between freight and passenger and between State and interstate and the expenses between State and interstate, then it must also be used to divide the maintenance-of-way and other common expenses between freight and passenger; and, furthermore, that the factor here used, the train mile, set apart to passenger traffic an unreasonable and undue amount of expense and to an extent clearly not attributable to the passenger traffic.

As seen when actual expenses are divided on repairs of cars only 15 per cent goes to passenger, and, when the revenue is used, only 26 per cent goes to passenger. We have used maintenance-of-way to illustrate the error of using train mile to divide common expenses. As is seen in the statement of plaintiffs' bases (R. p. 2310), it is used to divide other common expenses between passenger and freight. In maintenance-of-equipment common expenses not definitely located to freight cars or passenger cars are so divided; water and other supplies in engine service and engine house expense are so divided

between passenger and freight; "other transportation expenses," not definitely located, are so divided. The extent of this erroneous basis can not be ascertained from the exhibits as they stand. As to maintenance-of-way alone, it amounts to over $101,000, a sum sufficient to more than absorb the extra expense of intrastate traffic and change what on the face of the railroad exhibits might be a confiscatory return into one which is unquestionably a compensatory return upon the property.

As explained in the evidence (R. pp. 2286-2289), the State's accountants made an error in their exhibits in regard to Pullman mileage; the railroads in their exhibit 56 attempted to correct it and also made an error, but both errors were carefully worked out. The railroads filed a supplemental exhibit, 56-A. (R. p. 2471.) The amount of error against the interstate is, in dollars, $29,705.71; a difference in return on property of about six-tenths of one per cent. It reduces the return on property shown on State's exhibit "O" (put in at pp. 2540, 2541), from 7.69 per cent to about 7.09 per cent.

In exhibits made part of this brief this correction is made.

Judge Trieber says in his opinion, referring to maintenance-of-way expense:

"In view of these facts, any attempt to apportion this item of expense on the ton, car or train mileage would be an injustice to the roads. The court is of the opinion that the straight revenue basis will get more accurate results. The difference in intrastate and interstate rates will be taken care of by proper allowance to be made on the final calculations of the entire cost." (R. p. 2623.)

Again he says at page 2608: "The train basis is conceded by all as the least accurate."

Elsewhere in the opinion for reasons given he finds the intrastate freight rates are 50 per cent higher than interstate and passenger rates 3.48 per cent higher intrastate than interstate. (R. p. 2619.)

The railroads' statistics are that freight intrastate revenue is 98.18 per cent higher than interstate and passenger 3.48 per cent; but the learned Judge, taking into account all the various elements of extra cost of intrastate freight traffic, concluded that for the reasons given by him that 50 per cent was the proper allowance to be made for the difference in intrastate freight revenue or rates.

We have requested Messrs. Haskins & Sells to prepare an exhibit to this brief, in order to illustrate the difference in returns, had Judge Trieber discarded the train-mile basis for dividing maintenance-of-way expenses between freight and passenger and adopted the revenue basis, which he said should be adopted with the aforesaid allowances. It also adds two small items of omitted earnings, according to Judge Trieber's opinion erroneously omitted. (R. pp. 2599, 2600.) The exhibits follow the State's exhibits in other respects.

The exhibits are as follows:

## COMMENTS REGARDING EXHIBIT "AA" EXHIBIT "BB," EXHIBIT "CC."

The total maintenance-of-way and structure expenses have been divided between "freight" and "passenger" on the basis of the revenue derived from each class of service, as shown by exhibit No. 3. The proportion thereof so applicable to freight has been divided between "local" and "through" trains on the basis of the engine and car miles of these trains, as shown by page 1 of exhibit "K." The proportion thereof so applicable to "passenger" has been divided between the various classes of cars hauled in passenger trains on the basis of the car miles to each class during October, 1907.

The value of property has been divided between "freight" and "passenger" on the basis of the revenue derived from each class of service, as shown by exhibit No. 3. The proportion thereof so applicable to "freight" has been divided between State and interstate on the basis of the revenue derived from each class of service after equalizing such revenue by eliminating from the State revenue the excess of State revenue over interstate revenue on the 50 per cent basis stated by Judge Trieber. The proportion so applicable to "passenger" has been divided between mail, express, State and interstate, on the revenue basis after equalizing such revenue by eliminating from the State revenue the excess of State revenue over interstate revenue on the 3.48 per cent basis, stated by Judge Trieber.

All expenses, other than those of maintenance of way and structure, have been distributed in the same manner as in exhibits "J," "L" and "N," with corrections made covering passengers carried in Pullman cars.

EXHIBIT "CC"

DARK PAGE BLEED THRU

Thus it is seen that adopting the State's exhibits, which are in the main followed by the trial court except on maintenance-of-way and the proportion on local and through trains, which will be discussed at length, the return on the property is far above a confiscatory rate.

Exhibit "O" gives the total intrastate return 7.69 per cent, which should be reduced to 7.09 per cent; whereas, following Judge Trieber in the matters mentioned, gives a return of 10.03 per cent on the property used in the total intrastate traffic.

We think when the whole evidence is analyzed that the court will be convinced that the car mile is the proper factor for maintenance-of-way expenses, not only for local and through trains but for freight and passenger. The expert opinion from leaders of thought in railroad operation is practically unanimous for the car mile or "wheelage" basis as the factor to apportion maintenance-of-way expenses. and it has met the approval of this court. What is stronger than opinion evidence is the admitted fact that it is the accepted basis, when railroads contract with each other for the use of ways. Even these two plaintiff roads here have a contract between themselves apportioning maintenance-of-way expenses between themselves for a leased track on the car-mile basis.

Whatever opinion the Court may reach as the proper one—revenue or car mile—certainly in face of their own testimony the plaintiffs are not justified in using the train mile between passenger and freight, and, if it be rejected, then their case falls, without going into the defendants' evidence or its plan of division, which even under the harsh divisions made before they attempted allocation show a compensatory return.

## OTHER ERRORS IN PLAINTIFFS EXHIBITS.

There are other errors in plaintiffs exhibits to which attention is next called.

None of the errors here referred to were eliminated in the State's exhibits because it would have involved a world of confusion to have changed this or that item to conform to what we believed the evidence justified; so that the State's exhibits contain all the errors herein complained of. All mathematical errors in plaintiffs' exhibits were corrected. The Iron Mountain, finding they had duplicated a bridge on their property, revised their exhibits and took it out, and the Southwestern, finding it had erroneously computed extra cost, filed revised exhibits, but the errors herein referred to are errors of method, not of figures. They must be adjusted by determining the correctness of the method; then the figures can be made, if the data has been produced.

The State's exhibits contain the matters herein referred to, which we contend should be corrected, and invite your attention to them prior to considering the State's exhibits.

The first item to which your attention is called under this head is charging to the Arkansas expenses all the expenses at Memphis. Tennessee. Mr. F. P. Johnson introduced the exhibits for the Iron Mountain and testified regarding exhibit 2 (R. p. 2291), where it shows 1 mile and 1.07 miles, "Arkansas Division Terminals in Memphis, Tenn.," the property is not in the Arkansas assessment, being situated in Tennessee, but the earnings and expenses of that piece of road in Tennessee are all charged in the exhibits to Arkansas. (R. p. 116.)

*Memphis Expenses Charged to Arkansas.*

He further explains that this represents a trackage arrangement across the bridge over the Mississippi River at Memphis and their line in Memphis, the latter being 1 mile. (R. p. 120.)

As we understand it, there is one mile owned in Tennessee, and 1.07 miles leased, being from center line of bridge into the city of Memphis, connecting with the owned track.

Mr. McPherson testified that the Memphis terminals are treated as in Arkansas for this reason:

"As to Memphis, there are substantially no earnings on the freight business in Tennessee that the Iron Mountain receives, and so far as the accident of location is concerned, it would be the same to the railway company whether delivery was made to it on the east side or the west side of the river." (R. p. 349.)

Mr. McPherson says the traffic from Memphis into Arkansas is "undoubtedly a heavy traffic." (R. p. 428.)

Mr. McPherson also testifies as to the number of trains in and out of Memphis:

There were five passenger trains and four freight trains in each direction—18 trains daily. There was one local freight each way and the others were through, and all the passenger trains were local except one. (R. p. 375.)

This would necessarily incur heavy expense for division and terminals and the expenses of Memphis must be a large item. Not only the division and terminal expenses are charged to Arkansas, but all other expenses, even the salary of counsel for the State of Tennessee, $200 per month—is charged to Arkansas. (R. p. 184.)

Certainly a business requiring this amount of regular legal service is of considerable moment.

It may be that the extent of the Memphis expenses can be hereafter segregated and substracted; the burden is upon the plaintiffs to do so, and they have so far failed. The Fort Smith terminal expenses can not be now ascertained as will be seen later. Where improper or doubtful sums go to make up the plaintiffs' case, the defendants do not have to prove the extent or amount of them when they prove them to exist or likely to exist, the plaintiffs have failed. A similar situation was presented in Railroad Commission of Louisi-

ana v. Cumberland Telegraph & Telephone Co., 217 U. S. 414, and what was said by the Court is applicable here:

"In the course of the trial various questions were argued as to the manner of conducting such a business as this, with regard to extensions, earnings, and disbursements, as well as questions of depreciation of plant and how to treat the amount collected therefor, and other questions of that nature. Exactly how the money which resulted from the rates in actual operation was used was not, in all cases, shown in detail, either from the books or by oral testimony. Something was left in doubt and to conjecture. In the course of the opinion of the circuit court, the following was said: 'It is urged by the commission that, included in the Louisiana investment of complainant, is a sum earned from Louisiana business, set aside in the reserve fund, and then used in extending the system in Louisiana, and now treated as a part of the Louisiana investment of the stockholders. This may be so to some extent—it is certainly possible. But it is impossible for me to determine, from the figures in the record, to what extent, if at all, it is a fact. Counsel for defendant have not themselves undertaken to indicate what, even in round figures, they consider is the sum thus earned in the business and reinvested in the business, without having been distributed to the shareholders in dividends. It will be time to consider the legal results from such a state of facts when it shall have been shown to exist in a definite sum, and not in a purely conjectural amount.' And again: 'Counsel for the Commission argued that the complainant's property in Louisiana was not all paid for with complainant's capital, but was partly paid for out of a surplus or reserve, or depreciation fund, which was accumulated by complainant from the receipts of its Louisiana business, and was then reinvested, not in repairs or maintenance, but in extensions and additions to the property. This may be a fact, but it is not shown to be a fact. The Commission has power, if it wishes to do so, to direct the books of complainant to be so kept as to show such use of receipts. In the present state of the books, this seems to be impossible. And the floating debt of the complainant would seem to be much greater than any sum which could possibly have been used from the reserve, or surplus, or depreciation fund for extensions and additions, after paying for maintenance and repairs." (156 Fed. 831, 832.)

"If the onus rested upon the Commission to show these facts, it is evident that the obligation has not been fulfilled; but it is just here that the difficulty lies. It was obligatory upon the complainant to show that no part of the money raised to pay for depreciation was added to capital, upon which a return was to be made to stockholders in the way of dividends for the future. It can not be left to conjecture, but the burden rests with the complainant to show it. It certainly was not proper for the complainant to take the money, or any portion of it, which it received as a result of the rates under

which it was operating, and so to use it, or any part of it, as to permit the company to add it to its capital account, upon which it was paying dividends to shareholders. If that were allowable, it would be collecting money to pay for depreciation of the property, and, having collected it, to use it in another way, upon which the complainant would obtain a return and distribute it to its stockholders. That it was right to raise more money to pay for depreciation than was actually disbursed for the particular year there can be no doubt, for a reserve is necessary in any business of this kind, and so it might accumulate; but to raise more than money enough for the purpose, and place the balance to the credit of capital upon which to pay dividends, can not be proper treatment. The court below said it was impossible to find out from the books how much of this had been done, and it treated the fact as one to be explained by the Commission, and not by the complainant. In other words, while this fact was a material one, the onus was placed upon the Commission, and not the complainant, to show it. We think, on the contrary, that the obligation was upon the complainant. Now, although the books, it is said, do not show how much money collected for depreciation has been, in fact, used to increase the capital of the complainant, upon which dividends were paid to stockholders, yet, still, even if the books do not show accurately, or even at all, what disposition was made of these moneys, at any rate the officers of the complainant must be able to make up some reasonable approximation of the amount, even if it be impossible to state it with entire accuracy; and this duty rests with the complainant, in order that it may discharge the duty devolving upon it to prove that the rates were not unreasonably high under order No. 488, or, in other words, that they were unreasonably low under order No. 552. It may be that the sum, if any, thus used, was not enough to affect the claim that the rates under discussion were unreasonably low. The evidence is insufficient to show clearly that which complainant is under obligations to show."

All of the traffic—passenger and freight—leaving or entering Memphis, is necessarily interstate, and so carried in these accounts. The local trains, two freight and four passenger, after leaving Memphis, undoubtedly would do a little intrastate business before reaching the end of their division and a small part of the expense of such traffic, housing engines, etc., might fairly be attributed to intrastate business, but it is so small, it could not be found in the mass, and is easily compensated by similar items for which the intrastate gets no credit. The through passenger train from St. Louis to Hot Springs picks up some intrastate passengers, particularly from Little Rock to Hot Springs, but the plaintiffs do not attempt to charge any part of similar expenses incurred in St. Louis to those intrastate passengers.

The passenger train moving wholly in the State will pick up passengers who are interstate and carry them to Little Rock or other

junction points where they will take a train carrying them without the State and no part of their expense—being classed as interstate—would appear against the intrastate.

These divisions of expense can not be mathematically exact, but the give and take will equalize each other, and because trains doing some little intrastate traffic are housed in Memphis, is not a fair reason for throwing all of that expense into the Arkansas account just as the Little Rock terminals are thrown into the common mass and divided between State and interstate on the revenue basis.

Certainly an application of the injustice of the revenue theory is found here; from its nature, as shown from the preceding testimony the intrastate traffic picked up by these 18 trains after leaving Memphis and before reaching the next division point, would be negligible compared with the large volume of interstate traffic hauled in and out of Memphis on these 18 trains, and yet it ascribes to intrastate traffic the same share of the expense which the intrastate bears of the expenses of the Little Rock terminals. This argues to the error of the revenue theory, but the whole principle of including terminal or other expenses incurred out of the State is wrong. There is a part of this railroad in Tennessee. It is true that it is only 2.07 miles long and it is the eastern terminus of the road. That does not affect the proposition the least. It is the eastern terminus for Oklahoma and Missouri and Louisiana as well as Arkansas; and if all the expenses are to be termed "terminal expenses," why should they be charged to Arkansas any more than to Oklahoma? If nearness in geographicical location is the reason the half of the Fort Smith terminal expenses should be charged to Oklahoma. Should all the Kansas City terminal expenses of a road moving through Kansas from California into Kansas City be charged up to Kansas because it is nearer the terminus than Colorado, Utah and California?

Terminal expenses are spread over the whole haul of either passengers or freight, and properly so.

Mr. Doddridge testified that the terminal expenses per car were no greater in large terminals like St. Louis and Kansas City than in small country towns. (R. p. 524.)

Other witnesses stated that the greater density of the traffic in the large terminals reduced the terminal cost per ton as low or lower than the terminal cost at small stations. Be that as it may, there are terminal expenses on every shipment and every passenger and these are necessarily spread through the journey and the rates made accordingly. The longer the journey the thinner the terminal expense, and therefore the lesser rates for the long haul than the short. That is a constant theme of the plaintiffs' rate witnesses. While the theory is not carried out—for commercial and competitive reasons—there is no reason for not spreading the cost of terminals throughout the haul, whether the rate is properly or improperly made. In contradiction of that policy of rate making, the Memphis termi-

nal expenses are all charged into the Arkansas expenses and borne by the initial part of the haul, or the final part, instead of being borne by the whole haul.

Mr. McPherson says: "The expense of bridge transportation and of the interchange of cars, with other railroads at Memphis, is not an operating expense; it is an expense that traffic bears directly." But here it is made both. The bridge toll is absorbed in the rates as the rate men testify, and the traffic bears terminal expense throughout its haul in the rates fixed for the long and short haul, and in addition to that, this method charges solely against the Arkansas traffic all the expenses of an expensive terminal, both expenses strictly terminal and general, as attorney's salaries, and we presume, taxes and rentals paid in Tennessee, as Mr. Johnson says all expense is charged to Arkansas. Terminals in cases like Memphis are expensive to operate, and represent large investment of capital. The State charged with the heavy expenses of terminals which affects its rates obtains some compensation in taxes on the large investment, but in this instance Arkansas is charged with these large expenses without the compensating return in taxes to assist its citizens to bear the rates so much the higher to meet the heavy expenses of the terminal.

*The Fort Smith Terminals All Charged to Arkansas.*

On the opposite side of the State are the Fort Smith terminals situated on the Oklahoma border and serving both Oklahoma and Arkansas. The census shows Fort Smith to have a population of 23,985, and the evidence shows it is a large manufacturing and jobbing point and that about 50,000 bales of cotton, about equally from Arkansas and Oklahoma are compressed there. Mr. Johnson was called upon to give information as to the Fort Smith terminals and put in evidence exhibit J-1. This statement shows mileage of the terminals, their assessed value and also other terminal property not assessed with right-of-way and blueprint of the terminals in the city. (R. p. 1611.) Counsel stipulated for the exclusion from printing all pictorial matter, and the stipulation (R. p. 2661), provides for not printing the blueprint, but it was construed as omitting the entire exhibit. However, under section 5 of the stipulation, we are entitled to use this evidence, and call attention to it briefly; there are 8.71 miles in the city, and the total property in the city is assessed at $76,257, which, according to stipulation as to value (R. p. 653), should be doubled to get the value.

This is only important in an argumentative way to show that these terminals are not a "negligible quantity."

Mr. Johnson testified that he prepared the exhibits of his road in the Oklahoma Rate Case, and did not include any of the Fort Smith terminal expenses in them. (R. p. 1611.)

A statement of the physical situation may not be out of place. It is fully brought out here and there in the record. A large branch

of the Iron Mountain is from Little Rock west to Coffeyville, Kansas. It is the former Little Rock and Fort Smith road and Kansas and Arkansas Valley road, each now part of the Iron Mountain. Van Buren is a mile or two from the Oklahoma line. About five miles west of Van Buren is Greenwood Junction, where a line follows the Arkansas River into Fort Smith over its own bridge at that city. The distance is nine miles. The Iron Mountain has trackage arrangements with the Frisco road which has a bridge at Van Buren by which it sends two passenger trains a day over it; the distance to Fort Smith by this route is five miles.

All the other traffic, both from Arkansas and Oklahoma, goes by Greenwood Junction into and out of Fort Smith. Van Buren is the freight division terminal, there being large freight yards there. The train movement at Greenwood Junction is daily, 14 trains each way—28 trains, and six switch movements each day. (R. p. 422.)

Judge Trieber held it was proper to charge Memphis expenses to Arkansas, but says: "This also applies to the Fort Smith terminals, in so far as Arkansas business is concerned, the Oklahoma business being charged to that State with its proportion of expense." (R. p. 2602.)

We can not understand how the learned Judge made this error, unless it occurred in this way:

It was in testimony that the general attorney for Oklahoma and Western Arkansas lived in Fort Smith, and his expenses were divided between Arkansas and Oklahoma (R. p. 149), but that has nothing to do with the terminal expenses of Fort Smith The uncontradicted testimony of the railroad's accountant is as follows:

"Q. I would like a statement of the amount of property owned there for terminal purposes, at the same time. You will furnish us with this, will you? (This was later furnished, exhibit J-1.)

A. Yes, sir.

Q. Now, Mr. Johnson, how do you charge the expense of the Fort Smith terminal? To what accounts does that go?

A. What expense accounts?

Q. Yes, I mean geographically, where is it charged?

A. The State of Arkansas. Now the train service that passes through Fort Smith and Van Buren is divided on a mileage basis, but the station and yard service is charged to the State of Arkansas at Fort Smith.

Q. That is what I am referring to—the exhibit in your testimony—it is charged to the State of Arkansas?

A. Yes, sir.

Q. Have you in your office any separation of the terminals expenses of Fort Smith from other expenses?

A. No, sir.

Q. Is there any way that that could be ascertained from the books kept in your office?

A. I don't believe that the entire expense of the Fort Smith terminals could be determined now over that period. There are certain items that could be, but others that come from labor and repairs—the same conditions prevails at Kansas City during the Missouri Rate Cases. We were unable to get that information during the entire period. These operating expenses are maintained by accounting districts.

Q. What accounting districts would cover these Fort Smith terminals?

A. All mileage from the Oklahoma State line to Argenta, or Fort Smith crossing at Little Rock, that is the central accounting district, the central division.

Q. These operating expenses would be swallowed up in the expense of about 165 miles?

A. Yes, sir; a hundred and sixty-five miles." (R. p. 858.)

According to Judge Trieber, Oklahoma should share part of the expenses of the Fort Smith terminals, and Arkansas to bear all of Memphis, but as a matter of fact, Arkansas is bearing all of Fort Smith terminal expenses and taxes on the terminal property as well as all of Memphis.

This is wrong. Either Arkansas ought to be relieved of Memphis or Oklahoma share Fort Smith.

It is impossible for the railroads to blow hot and cold on these two border terminals.

The plaintiffs are in the attitude of having large items in their accounts improperly charged—either Fort Smith or Memphis.

In our view it is Memphis, but necessarily one or the other, and for the purposes of this case, it makes no difference which is proper, as one is clearly wrong—both can not stand.

Exhibit 2 shows that the Iron Mountain leases from the St. Louis Southwestern Railway Company, 34.05 miles of track. (R. p. 2291.)

*The Paragould Trackage.*

This is called the Paragould trackage in the evidence.

Mr. McPherson thus explains it:

"Taking the most important one of those items you mention, the road from the Missouri State line to Paragould, the railway company found from the enormous volume of traffic between Bald Knob and the State line, that it must make further provision to handle it expeditiously. There were two things that might be done; one was to build a double track and the other to ascertain if the track already existing could not be secured at a reasonable cost, to relieve the situation. And such an arrangement was made.

"No local business is done on that line between Paragould and the State line. It is merely a through line.

"After this arrangement had been completed, it was found as a practical business proposition that it would be better to use it for interstate traffic, and that is the present practice." (R. p. 285.)

It is in evidence from Mr. Hamilton that the rent and expenses of this track for the six months' period is $36,000 in round numbers.

Mr. McPherson and Mr. Doddridge have said a great deal about the transstate freight using so little of the facilities of the road compared with the intrastate.

If proper to consider that as an element of difference in cost, which they do, how about the other side of the story?

This piece of track is used exclusively for interstate freight traffic. It is claimed to relieve the main line and serve as a double track.

It is admitted by Mr. McPherson that there are steep grades on the main line between the Arkansas State line and St. Louis, and that this leased track furnishes a low grade line from St. Louis and avoids the heavy grades about Gad's Hill and Tip Top, Missouri, and that there is greater efficiency in service of using it and that is one of the reasons, the other to benefit the whole traffic for using this leased line. (R. p. 337.)

The Arkansas interstate traffic can not benefit a farthing by this arrangement and attendant expense.

It was doubtless good management to secure this low grade line and we are not questioning for a moment the wisdom of it, but only the injustice of making Arkansas intrastate bear any part of it when it is used exclusively for interstate freight traffic, a facility in which it does not participate, but in the expenses of which it does.

*The Bunch Elevator.*

The facts regarding the Bunch elevator are these, as given by Mr. Johnson: "Q. I see an item in your 'rental account' that has been analyzed showing the buildings and elevator at Little Rock as leased to Mr. Bunch for $1.00 per year. Is that right? A. That is my understanding. That is 'miscellaneous rental account' No. 18. * * *

Q. The Bunch elevator is on the right-of-way, is it not?

A. Yes, sir; I believe it is, and that is the rental for it."

The assessment of it was inquired into, but Mr. Johnson had no information on that subject, and did not know whether it was assessed as outside property (that is property not included with right-of-way, track, etc.), or as part of the right-of-way. (R. p. 207.)

His is the only testimony in the record upon it except that of Mr. R. T. Brooke, as follows:

After stating name, residence, and familiarity with grain elevators and their values:

"Q. Do you know the elevator situated in Little Rock, commonly known as the Bunch Elevator?

A. In Argenta?

Q. Yes.

A. I do; it is a mill and elevator.

Q. Do you know about its value?

A. The value today would be about $186,000, that is, the mill, elevator and warehouse.

Q. Do you know about its value in 1907, say, the last half of 1907?

A. It is about the same; I don't think there was very much difference in machinery at that time.

Q. Do you know whether that was a public elevator, during the last half of 1907?

A. It was a private elevator.

Q. I wish you would state your opinion of the rental value of that elevator property, taking the entire property?

A. The mill, elevator and warehouse rental value, reasonable rental value, would be about $20,000 a year.

Q. In 1907, what would it have been?

A. Same thing.

Cross examination by MR. MOORE:

Q. How long have you been engaged in business in Little Rock?

A. About four years and a half, since October 1, 1905.

Q. And where did you do business before you came here?

A. Oklahoma.

Q. What was your business there?

A. Grain business, and interested in a mill; elevator business and mill business.

Q. Did you rent an elevator there?

A. No, I had one of my own.

Q. Did you ever rent one?

A. No, I didn't rent an elevator.

Q. Never rented one as lessor or lessee?

A. No, sir.

Q. Have you any knowledge of the cost of the elevator in Argenta?

A. Only the knowledge which I acquired during a suit which I had against the Iron Mountain, the actual cost as shown in that suit; the cost of that elevator came out in that law suit.

Q. Was it as much as you have estimated the value here?

A. Pretty close to it; let's see; it was $106,821.76, and there were additions made since that time; a drier was put in, corn drier put in, amounting to about $50,000 odd dollars." (R. pp. 905, 906.)

Judge Trieber refused to allow credit for the fair rental of the elevator, saying the proof was not sufficient to show that the elevator was the sole property of the railroad company at that time, and that it is not shown whether the dollar a year was paid for the use of the right-of-way upon which it stood or for the elevator itself. (R. p. 2601.)

But he overlooked Mr. Johnson's statement, who referred to the company's rental account which showed "the *buildings and elevator* at Little Rock leased to Mr. Bunch for one dollar per year;" and said such was the fact as he understood it.

Further, it was shown that it was situated on the right-of-way.

The presumption of title in the railroad would arise from its location on its ground. It was found in this account of rentals submitted to the State for examination.

The matter was opened in this way in an earlier part of Mr. Johnson's testimony.

"Q. Referring to the question of rentals, the St. Louis, Iron Mountain & Southern Railway has a controversy down at Little Rock with the Bunch elevator; I don't care about going into that controversy, but I just want to know whether that elevator property would be included in your rentals?

A. Any rentals we would receive from Mr. Bunch would be included in "rentals." (R. p. 151.)

Mr. Johnson stated that he and the accountants from the State had been analyzing the miscellaneous rental accounts together. (R. p. 182.)

It was after this joint analysis and in reference to it that Mr. Johnson stated that "miscellaneous rental account No. 18" showed the *buildings and elevator* rented for $1.00 per year.

The Judge refers to another case pending before him wherein the railroad purchased the elevator from Bunch for $93,665, but states that that fact was not put in evidence in this case. Even this outside evidence in another case is not entirely inconsistent with Mr. Brooke, who testified that in a suit with the Iron Mountain it was proved to have cost $106,000, and then $50,000 more added to it, and it might be that Bunch did the latter, and the railroad purchased his interest. But we can not try one law suit on evidence in another.

There is no contradiction of Mr. Brooke's statement that the elevator was a private one and not a public one. Certainly the railroad could not operate a private elevator.

The plaintiffs did not put in any evidence on this subject, and let the situation stand in regard to the elevator as they did as to the Pratt Hotel, another item found in the same miscellaneous rental account, and developed in the same way as the elevator property.

Judge Trieber sustains the State's objection to this item. A hotel, lunch rooms, saloon and other privileges known as Pratt's Hotel, at the station in Little Rock were owned by the railway company and maintained by it and leased to Pratt for $1.00 a year. The evidence showed $4,200—a fair rental for it. (Opinion, p. 2600.)

*Pratt Hotel Rental.*

Judge Trieber also sustained the State's objection to not receiving a share of the express company's dividends. The express company gave the Missouri Pacific 40 per cent of its capital stock for the exclusive privilege of doing the express business on its lines. The Missouri Pacific owns all the stock of the Iron Mountain and put this express company on the Iron Mountain lines as part of

*Express Company Dividends.*

its system under this contract. The Missouri Pacific has for 20 years regularly drawn $144,000 a year from the dividends on this stock, and not a penny has gone to the Iron Mountain.

Judge Trieber held that a proportion should be credited the Iron Mountain earnings for the six months period, amounting to $15,984. (R. p. 2599, 2600.)

This is clearly right, but what becomes of the $15,984 which should have been paid for the last 20 years? A sum of over $300,000 has been withheld from the Arkansas earnings of the Iron Mountain under this decision, and it is confidently submitted that no other decision can be rightly reached on the facts. This sum would help out in lean years for which a surplus ought to be provided. Merely giving credit for $15,984 for a six months' period does not square this account. It ought to be treated as surplus or in some other way do equity to the Arkansas business. A fine of $10,000 was imposed on the Iron Mountain.

*The Fine of $10,000.*

Here are all the facts, elicited from books of the company, and proved by Mr. Johnson: "Q. In the month of November, 1907, I find that you have paid judgments, in the case of the State of Arkansas v. the St. Louis, Iron Mountain & Southern Railway in fines, for a violation of the law against furnishing free transportation to Legislators, of something over $10,000—or, $10,000 plus the court costs; that is correct, isn't it?

A. Yes, sir.

Q. That was for a violation of the statutes, to which the railroad company pleaded guilty, wasn't it?

A. Yes, sir; that is the way the account reads." (R. p. 184.)

This is the only other reference to it:

"Q. Mr. Johnson, there was one question I should have asked you before and I forgot it.

Do you think that fine of $10,000.00 in those cases of violating the law is a proper charge against operating expenses?

A. I don't know where else it would go. It is an incidental expense and I know of no other place you could put it.

Q. Do you think that is an operating expense?

A. It is an expense that is undoubtedly incurred in the operation of the railroad. You can not charge it to "capital account" and I don't know where else you would put it.

Q. Ought not it be charged against surplus or profit and loss account?

A. I hardly think so.

Q. Your judgment as an accountant would be that a fine against a railroad for violating the law should properly go into operating expenses?

A. Yes, sir." (R. p. 199.)

Mr. Justice Brewer, speaking for this Court, said:

"Surely, before the courts are called upon to adjudge an act of the Legislature fixing the maximum passenger rates for railroad companies to be unconstitutional, on the ground that its enforcement would prevent the stockholders from receiving any dividends on their investments, or the bondholders any interest on their loans, they should be fully advised as to what is done with the receipts and earnings of the company; for if so advised, it might clearly appear that a prudent and honest management would, within the rates prescribed, secure to the bondholders their interest, and to the stockholders reasonable dividends. While the protection of vested rights of property is a supreme duty of the courts, it has not come to this, that the legislative power rests subservient to the discretion of any railroad corporation which may, by exorbitant and unreasonable salaries, or in some other improper way, transfer its earnings into what it is pleased to call 'operating expenses.'"

Chicago, etc., Ry. Co. v. Wellman, 143 U. S. 345.

Is not this an "improper way" in which the earnings of the railroad company have been transferred to "operating expenses" within the meaning of that opinion?

Judge Trieber says the evidence fails to show whether the free passes were given to members of the Legislature with the knowledge and approval of the higher officials of the company, or by some inferior officials for whose conduct the company would be liable.

But the burden rested on the plaintiffs to show that the higher officials did not know of it—if that makes a difference.

Passes can only be issued by an officer clothed by the company with that power. If he violates the laws of the land in the performance of his duties, and in furtherance of the purposes of his principal, his principal is bound.

The plea of guilty fixes the responsibility of issuing free passes on responsible shoulders.

*Salaries To Lobbyists.*

The State contended that salaries paid W. H. Phelps and J. M. Seibert in Missouri, parts of which were distributed against the Iron Mountain in Arkansas and T. L. Cox in Arkansas were not proved to be legitimate expenses. Seibert was carried on the rolls as "commissioner of statistics," and witness after witness connected with the road, was asked what statistics he kept, and none knew. None of the vast array of statistics produced in this case emanated from the "commissioner of statistics," none of these gentlemen compiling the statistics ever obtained statistics from him or knew his duties. (R. p. 425.)

He was paid $250 per month, of which $110.33 was charged to Arkansas.

W. H. Phelps was carried as assistant to the vice president at a salary of $500 a month, of which $128.22 was charged to Arkansas.

T. L. Cox was paid "for services rendered to the law department," the sum of $200 per month. (R. pp. 184, 185.)

It is true, as stated by Judge Trieber (R. p. 2602), that the State failed to prove these salaries were paid to these parties as lobbyists. The lack of duties of a "commissioner of statistics" in a case involving the statistics of his road for years; the absolute lack of knowledge of the assistant to the general manager and other officials of the road of his duties and of the statistics compiled by him was certainly sufficient to require the railroad to explain this item and especially why any part of it should be charged to Arkansas. No one questioned could account for the services rendered by Phelps to the Iron Mountain in Arkansas.

No evidence was necessary in regard to Thos. L. Cox. He is part of the history of Arkansas, of which all courts may take cognizance. " 'Tis true, 'tis pity; and pity 'tis, 'tis true."

A graphic sketch of him and "his services rendered to the law department" is found in Butt v. State, 81 Ark. p. 17, and another chapter is found in State v. DuLaney, 87 Ark. p. 17.

These were prosecutions of legislators for bribery.

*The Van Buren Bridge.*

Another instance of improvident contract is the one with the Frisco road, just referred to, for use of the bridge between Van Buren and Fort Smith. It saves four miles of distance, and is used by one passenger daily each way. Exhibit 46 shows these trains are "slow trains in Arkansas," stopping every five miles. Hence, the saving of four miles is not an economy in a slow train. There is no excuse of congested traffic or the need of a double track, for Mr. McPherson testifies that from Van Buren to the junction by which all the other traffic moves there are 34 movements including a switch movement in 24 hours. (R. p. 412.)

For running these two trains per day, a rent is paid so much for each car and each engine with a minimum payment of $1,000 per month. This luxury of two slow trains using this bridge instead of the company's own track costs $12,000 a year. It is not strange that the ratio of expenses is so high.

In Group 8, the average cost is $64.34 for every $100 revenue. On the Iron Mountain in Arkansas, $74.24 for every $100 of revenue. (R. p. 139.)

*Erroneous Division of Expenses.*

Exhibit 3, statement 4 (R. p. 2303, 2304), shows division of operating expenses between Arkansas and the rest of the Iron Mountain road. The track-mileage is 52 per cent in Arkansas, and the average of the expenses apportioned to Arkansas is 55 per cent maintenance of equipment. Many of these items will vary from month to month and year to year and generally, the plan adopted is fair, as a heavier expense of one month in Arkansas will be compensated next month in Missouri, but where there are local conditions pre-

venting this, then it is unfair, and that is manifestly true of item 40.

"Tools and machinery, repairs of—total $63,288.35; amount chargeable to Arkansas, $48,671.67—77 per cent."

Mr. Johnson thus explains it:

"A. This account for repairs to tools and shop machinery and heating and lighting, are charged to an operating division, or, rather, they are charged to the jurisdiction of each master mechanic. In Arkansas, of course, our principal master mechanic is at Little Rock, which perhaps entails a heavier expense than it does at any other division point.

Q. Why?

A. Because it is larger than any other division point.

Q. Why?

A. Because it is larger than any other division point on the St. Louis, Iron Mountain & Southern Railway.

Q. Aren't those shop expenses apportioned over the entire Missouri Pacific system?

A. No, sir; not miscellaneous shop expenses, such as that item.

Q. What shop expenses are apportioned over the entire system?

A. The repair account is apportioned over the entire system. But the repairs to tools and shop machinery are localized to the particular division.

Q. Isn't this a repair account?

A. When I speak of a repair account I mean cost of repairing equipment, such as locomotives and cars.

Q. Why do you make a distinction between repairing those cars and locomotives and repairing the tools and shop machinery?

A. The only reason that I can give for that is that we have never thought it proper to pool the miscellaneous shop accounts. We localized them to the division where they occurred. If we pooled them perhaps Arkansas would be compelled to stand a proportion of the other shop accounts.

Q. It does stand that on repairs to cars and locomotives?

A. Yes, sir.

Q. Well, then, why should not it also stand it on repairs to tools and shop machinery?

A. The only reason is that the amount is too small to handle that way.

Q. It is a pretty considerable item here. I see it is $63,000.00.

A. Yes, out of one million dollars.

Q. That grows out of the Baring Cross shops?

A. The $48,000.00 does, yes.

Q. I believe this is $63,000.00.

A. It is $63,000.00 on the St. Louis, Iron Mountain & Southern Railway.

Q. And $48,000.00 on the Baring Cross shops, which runs up the percentage for Arkansas to 77.

A. Yes, sir.

Q. Does that uniformly run that high, assigning that account to Arkansas?

A. You mean the proportion chargeable to Arkansas?

Q. Yes.

A. I would say that is a normal amount. I do not believe it fluctuates to any great extent, and the basis for apportioning it has always been the same. Whatever the charge is on the St. Louis, Iron Mountain & Southern Railway, proportionately 77 per cent would be charged to Arkansas." (R. pp. 141, 142.)

Owing to the location of the master mechanic in Little Rock and the Baring Cross shops there, the company localizes this item of expense current to the entire Missouri Pacific system instead of apportioning it as all other items are apportioned throughout the system on the car-mile basis. The only reason assigned is that it has never been done.

It is fair to assume that if this item had been distributed as the others, Arkansas would not have had to have stood more than the average, 55 per cent. In fact, this 77 per cent lifts the average above what it should be.

Charging Arkansas with 55 per cent instead of 77 per cent would make a difference of $13,863 for the six months or an annual difference of $27,726, and this going on for years—another reason that the operating ratio is overhigh.

The St. Louis Southwestern Railway does not pursue this course in their exhibit, and distribute fairly this item.

There are other items questioned, like paying lawyers in Texas for law suits there, and distributing parts of it over the intrastate traffic in Arkansas (R. p. 182, 183), but they are small, and we will not burden this discussion with further detail.

Summarizing: We submit, that the account of the railroads should be purged of this $13,863 excess expense erroneously charged the State, and a good part if not all the $12,000 per annum improvidently paid the Frisco road, and $2,631 paid Cox, Phelps and the "commissioner of statistics," and the $10,000 fine for violating the criminal laws in giving free passes to members of the Legislature, and the $36,000 paid for the Paragould track, exclusively devoted to interstate service, a total of $58,631 for the six months' period, and in addition the large expenses of the Memphis terminal and of the legal and other departments of that road in Tennessee, the amount of which is not shown; on the other hand, they should be charged with the Pratt Hotel reasonable rental, $2,100 for six months, and of the Bunch elevator, $10,000 for the six months, and the Pacific Express Company dividends, $15,984 for the six months, $28,084, a difference of $86,715 from the account as it now stands, and with the exclusion of the Memphis expenses, it would doubtless make a difference of near, if not quite, $200,000.

## THE TEST MONTHS.

We have assumed in some preceding discussion the accuracy and reliability of using the statistics of the two test months—both put in evidence by the plaintiffs—and will now proceed to prove, principally by the plaintiffs' witnesses, reinforced by undisputed statistics, that they are a fair test of the six months' period on which the plaintiffs seek to try their cases.

We do not concede that a six-months period is a fair test of the operation of rates, especially this six months where the panic of 1907 began to be felt in the revenues of the roads, at least in November. But that is another subject; our text is now, if the six-months period fairly represents the business of a series of years demonstrating the effect of a system of rates, that the test months fairly represent the period in detail. The final stand of the plaintiffs amounted to saying that at large the six months represents a series of years, but the test months do not represent the details of the six months.

In their case in chief their position was that six months fairly represent conditions for a series of years and the test months represented the six months in detail, especially as to the respective movements, revenue and expenses of interstate and intrastate traffic. But when these months' statistics destroyed their carefully built-up theory of extra cost, and the facts in them at war with the alleged facts upon which the extra cost theory was based, they bring on another set of witnesses to impugn their force and the later witnesses combat their own testimony in chief.

Before the later developments, however, their witnesses in chief had used the statistics of the test months upon which to bottom their arguments and point their moral and adorn their tale.

We contend that even if the later witnesses are correct that the plaintiffs are morally and equitably estopped to question the force of the test month's statistics. We have pointed out many reasons, independent of any consideration of these test months, why the plaintiffs have failed to make their case; and, independent of all other reasons, if the result of either of these test months is accepted as representative of the interstate and intrastate traffic, the plaintiffs by it alone fail. In the St. Louis Southwestern Railroad (commonly called the Cotton Belt) test the load of the local train is 68 per cent interstate and on the Iron Mountain 72 per cent. With the much greater cost of the local freight train assigned 68 per cent or 72 per cent to the interstate traffic, instead of it being the vehicle for intrastate traffic almost exclusively as the plaintiffs' witnesses would have it, the claim of 100 and more per cent of extra cost is destroyed. Charge all the extra terminals to the State that they seek, disregarding the extra interstate terminal handling of cotton, grain and lumber, as well as the Fort Smith and Memphis double interstate handlings, and with the 98.18 per cent extra intrastate revenue on the one railroad, 141 per cent on the other, per ton per

mile, all extra cost is absorbed. If the Iron Mountain test of 61 per cent of the intrastate freight on the through train is accepted it is apparent that the intrastate traffic is the cheaper, and if the 22 per cent of intrastate freight of the Southwestern on through train is accepted, their higher revenue of 141 per cent per ton per mile will equalize, if not overcome, all other items of extra cost where the interstate is bearing 68 per cent of the expenses of the local train.

The importance of this subject is great for two reasons—first, the one given—the destruction of the plaintiffs' claim of extra cost based on opinion evidence radically at variance with these facts; and, secondly, they are used as the basis of the State's plan of dividing expense.

The plan if found sound—even if the statistics are not—should of itself be a destruction of the plaintiffs' case, as proving that by proper tests and detail their expenses can be properly allocated and not left to arbitrary bases, supported by opinion evidence solely; and if the statistics are correct, the extra cost is demonstrated, even after using the revenue basis to apportion the property and the train mile to apportion common expenses between freight and passenger—to be less than the higher intrastate revenue for the same service performed. These months are not used for the passenger traffic. In truth, two facts destroyed any appreciable claim for extra cost on passenger traffic: (1) That all the St. Louis Southwestern Railway trains were local, and all except eight of the Iron Mountain's were local; and (2) that the two terminal expenses in and out of Memphis and Fort Smith charged to interstate and the system of transferring interstate passengers at Little Rock and other junction points, put as much or more terminal handling and casualty risks in getting on and getting off trains by the interstate as by the intrastate. Hence, the passenger side may be dismissed and attention solely directed to the freight where the extravagant claims of extra cost are atributed, especially as Judge Trieber found no extra pasesnger cost on one road and only 10 per cent on the other.

At the expense of tediousness, but not thoroughness, we will put before you fully the evidence as to the test months.

*The St. L. S. W. Railway Test Month.*

Mr. R. E. Kimbell, Assistant Auditor of the St. Louis Southwestern Railway Company, introduced the exhibits of his road upon which it sought to make out its case. After introducing the exhibits of revenue, operating expenses, division of expenses, etc., on his direct examination in chief, this testimony was given:

"Q. Mr. Kimbell, did the operating officers of the St. Louis Southwestern Railway Company make a test at any time after this litigation was instituted, for the purpose of ascertaining the relative cost of conducting State and interstate transportation? If so, I wish you would state what was done in that respect.

A. A test of that kind was made under my direction.

Q. What period did it cover?

A. The month of October, 1908. The temporary injunction was granted in St. Paul on September 3, and the month of October was selected for the purpose of this test, on account of it being the first full month following the injunction. October is rather a heavy month, but for a test of this kind, in my judgment, it fairly represents the general conditions.

Q. Would it represent, fairly, a year's business?

A. I should say so. It would represent relatively the difference between the two classes of traffic.

Q. I wish you would describe in what way that test was made.

A. We employed special men to ride on every local freight train running in the State of Arkansas, during the month of October; and also stationed men at terminal points; all of these men being provided with special forms on which they were required to make an abstract showing way-bill, reference points from and to, and weight of all freight handled on their train These reports were accumulated in our Superintendent's office by a representative stationed there, and sent to my office, where the ton miles and other data required, was figured out.

Q. Did they also obtain the weight of the car?

A. They also obtained the tare weight of all cars, loaded and empty; cabooses; gross weight of locomotives in each train. The fuel consumed on each run was reported by each engineer, which was the way we figured it could be most accurately obtained.

Q. Was there any record kept of the cost of labor?

A. The wages of train and engine men were obtained from the time slips of each train, and therefore are very accurate.

Q. All the various elements, then, that entered into the cost of moving freight on those trains was ascertained, was it?

A. I think it was; yes.

Q. Have you prepared any statement showing the result of that test?

A. Yes, sir.

Q. If you have, I would be glad to have you file such statement as you have, as exhibit 19.

The paper referred to is marked "R. E. Kimbell, Exhibit 19."

Said paper is in the words and figures following, towit:

For exhibit 19 (R. p. 2375).

Q. Have you prepared any additional statement of statistics that have a bearing upon the information obtained in that test?

A. I have prepared a statement of miscellaneous statistics, in connection with that, which I file as exhibit 20.

The paper referred to is marked "R. E. Kimbell, Exhibit 20."

Said paper is in the words and figures following, towit:

For exhibit 20 (R. p. 2377).

Q. Did that test enable you to ascertain, with exactness, the commercial ton miles made by the different trains, the through and local trains?

A. Yes, sir; it did.

Q. And did it give you also the ton miles of dead weight, including the locomotive and caboose, and all cars, including empties, on all trains?

A. It did.

Q. Did it enable you to determine with exactness the cost, wages and fuel?

A. Yes, sir.

Q. Mr. Kimbell, I wish you would state what result was shown. State it in your own language." (R. pp. 156, 157.)

Then Mr. Kimbell summed up, in his testimony, the statistics given in full in exhibits 19 and 20.

He concluded his statement regarding it as follows:

"Q. Was that test made with care and caution, and are you satisfied that the information as obtained was correct and accurate?

A. It was made under my personal direction and every possible care was taken to have it correct." (R. p. 159.)

In cross examination it was shown that the conclusions drawn by Mr. Kimbell in his preceding testimony were made by applying the revenue basis to the actual conditions found in his test; while that affected the conclusions reached, it did not reflect upon or question the actual results obtained and shown in exhibits 19 and 20. (R. p. 159.)

On cross examination, after explaining that the test was made of October, 1908, and not of the passenger traffic, but of the freight alone, and while the Commission Tariff was in force, this testimony was given:

"Q. Then on your freight test, it was all under the Commission Tariff?

A. Yes, sir.

Q. Do you think that one month would fairly represent the business of your line for a year?

A. I think for the purpose of a test of that kind, determining the relative difference between the two classes of freight, that one month is perhaps as good as another.

Q. Why did you select October?

A. As explained, it was the first full month after Judge VanDeventer granted the injunction. He granted it in September, September 3; we wanted to make this test as soon as possible, so we selected the first full month.

Q. In your judgment, a test of this kind, made for the month of October, would fairly represent the operation for a year, or for a series of years?

A. I should say so.

Q. Well, do you think that would be affected by the fact that this was after the panic, when the normal condition of affairs was not fairly resumed?

A. I don't understand that the month of October was after the panic.

Q. That was when the panic began.

A. Right along in there we began to feel it.

Q. This was the year after the panic begun.

A. Exactly.

Q. Well, do you think that matters had fairly resumed themselves, so that you could make a fair test of that year?

A. I think so. I believe that under almost any conditions, good times or bad, the relative difference between the two classes of freight would travel uniformly. In other words, if we have poor business, it is going to affect both classes of traffic.

Q. And you think that any one month completely worked up, would fairly represent those conditions?

A. I do; yes, sir." (R. p. 163.)

On re-direct examination this was said relating to the panic and when it was felt:

"Q. Mr. Kimbell, when did the panic of 1907-8 begin to have its effect on the railroads?

A. I should say in November, 1907.

Q. Well, when did the effect of the panic—when was it fully felt by the railroads?

A. It began to be felt during the month of November, and I should say it increased in its intensity from month to month and was felt very severely in February or March.

Q. Was it not at its height in the spring, in March?

A. I think so.

Q. It began, then, in November?

A. Yes, sir.

Q. Is it true that the effect of it was felt severely in November, or did it come on later, the severity of it?

A. I can only testify from memory of the situation, and not from—

Q. I want your best impression in regard to that; whether it was felt severely in November, or began to be felt in the spring.

A. My impression is that it did not begin to be seriously felt until the early part of 1908.

Q. The reason I ask you is, Judge Hill asked you if it was severely felt in November, and you stated it was, and I wanted to know, whether you understood his question.

A. I expect I should have qualified that, because I think that is where it commenced, in November.

Q. And it became severely felt and was perhaps at its height later on, in the spring of the next year?

PAGES

A. Yes, sir." (R. pp. 168, 169.)

In cross examination Mr. Kimbell had been presented with an annual report of his road, showing that, beginning with November, 1907, the volume of traffic decreased and the gain previously made had been lost. (R. p. 161.) Evidently to show the six-months' period was normal, he put in the gross earnings for each six months for four years, and he also gives comparative monthly earnings for several years. (R. pp. 169, 170.) The trend of this testimony was to prove the six-months period normal and one month fairly representative of the whole. We will not burden the discussion with the statistics given.

To further reinforce the test, this was brought out in Mr. Kimbell's re-direct by the plaintiffs' counsel:

"Q. Mr. Kimbell, speaking of the test you made for October, 1908, did I understand you to state that that test was based upon an ascertainment of the relative cost in the various percentages of service that was involved in transacting the two classes of business—that is, it was intrastate and interstate?

A. That is freight only.

Q. I said nothing about passenger. I say the two classes of business, interstate and intrastate freight.

A. Yes, sir.

Q. That, then, developed the actual expenses of each one and therefore the relative expense as between them?

A. I think so.

Q. Now, would the ratio be affected or changed, by a change in the prosperity of the business of the road; would it depend upon whether the business was light or whether it was large?

A. I would say that the relative proportion of State and interstate traffic would travel uniformly, whether business was up or down." (R. p. 171.)

After the change of base by the plaintiffs in their attitude to the test movements, it is gratifying to read Mr. Kimbell's testimony, given at the close of the plaintiffs' case in rebuttal.

As will be seen in reading the evidence, whenever the plaintiffs put on a witness to impeach the reliability of the October tests, the State read him these excerpts from Mr. Kimbell and called for a statement as to his agreement therewith. After this, Mr. Kimbell thus epitomized his testimony previously given:

"Q. Counsel for the State has called your attention to a statement made in your evidence to the effect that October, 1908, the month in which a test was made on your line, would represent relatively the difference between interstate and intrastate traffic: You recall the reference to this which counsel made? Do you wish to make any statement in connection with that?

A. The testimony I gave in direct and cross examination concerning the test made on this road in 1908 has been frequently quoted

by the State in connection with its action in using the figures for October, 1908, in apportioning expenses for a six months' period.

I do not know whether I have been misunderstood in this matter or not, but I would like to make my position plain.

This test was made for the purpose of determining the cost of the labor and fuel on local and through trains and the relative handling of State and interstate business on each class of train.

As I stated in my direct and also on cross examination, it was a very laborious task to make this test, and to cover a period of more than one month would be almost prohibitive, on account of the labor and expense required to do the work.

I testified in direct examination that so far as this test was concerned, it would represent relatively the difference between the two classes of traffic. I also testified on cross examination that I thought for the purpose of a test of that kind, to determine the relative difference between the two classes of freight, one month was perhaps as good as another. And that under almost any conditions, good times or bad times, the relative difference between the two classes of freight would travel uniformly. In other words, if we are going to have poor business it is going to affect both classes of traffic.

I did not intend to convey the impression, nor do I think the testimony indicates that I did, that the month of October or any other month would fairly represent the character and volume of business for the period of six months or a year.

One month may reasonably be taken as a guide in determining the relative amount of State and interstate freight handled by the two classes of trains. And for that purpose it would seem, perhaps, that one month is as good as another.

The results of this test are embraced in exhibits 19 and 20, as illustrating the relative cost per ton per mile, intrastate and interstate, for wages and fuel, and are not used in any of the other computations included in other exhibits filed by this company.

Q. You ascertained the actual amount of freight carried on each class of train?

A. Yes, sir.

Q. You did not arrive at the tonnage hauled by the through trains in the manner used in the exhibits prepared by the State?

A. This test was the actual tonnage handled on both classes of trains, local and through, from the first day of the month to the last, irrespective of the dates of the waybills." (R. pp. 2081, 2082.)

The State used it in its exhibits for the actual facts as to results found by him as to these items of expenses, applying them to the intrastate and interstate in the relation actually found by him carried on the local and through trains respectively. It was used for the exact purpose he here repeats it was useful for; the relation of the two classes of traffic on the two classes of trains; and that relation as found destroyed the theories about it.

Mr. W. B. Doddridge had been General Manager of both of these plaintiff roads. (R. p. 452.) He was employed as an expert by the Missouri Pacific Railway in the Missouri Rate Case. In that case he attended the sessions and consulted with the witnesses, and in that case and in this case he acted, so he testified, in an advisory capacity to the counsel for the railroads. (R. pp. 466, 467.)

In direct examination he was asked if he had knowledge of the test on the St. Louis Southwestern Railway "for the purpose of ascertaining the difference in the cost of conducting the two kinds of traffic under consideration," and said that he had. (R. p. 459.)

Then he quotes at length the statistics shown and draws similar deductions, using the revenue basis applied to actual results to work out extra cost. (See cross examination, where he admits that both he and Mr. Kimbell used the revenue per ton per mile even after he got the actual facts to make their calculations of extra cost. (R. p. 508.)

In cross examination this occurred:

"Q. You say you made a test on the Cotton Belt—in October, 1908, was it?

A. The Cotton Belt Company made a test.

Q. Under your direction?

A. Well, no; under Mr. Kimbell's direction.

Q. You had a hand in it, didn't you?

A. Yes, sir; I had something to do with it; I wanted the test made.

MR. MOORE:

Q. What did you have to do with it?

A. I say, I simply wanted it made to determine—

Q. You mean you suggested it?

A. Yes.

MR. HILL:

Q. Do you think the test of one month's operation would be fairly representative of the entire year?

A. I think in this case that it would be representative as to the relative proportions of the different kinds of business, for the reason that the month of October, 1908, was one of the heaviest months of the year, and considerably above the average twelve months, probably.

The main purpose in making this test was to determine the average relation that one class of business bore to the other, and if the business of the road was lighter in a subsequent month, the chances would be more than likely in favor that the relative proportions would remain pretty near the same." (R. p. 476.)

Mr. Doddridge uses the statistics of these two exhibits fully and in detail, working up to his extra cost of intrastate freight. (R. pp. 459-461.)

The Iron Mountain exhibit 26 was thus brought into evidence by the plaintiffs in their case in chief: Hubert Roth, recalled, testified as follows: Direct examination. Q. I hand you a paper which is marked "statement of transstate, interstate and intrastate freight, handled during the month of October, 1907:" Was that statement compiled by you, or under your directions?

*The Iron Mountain Test Month.*

A. Yes, sir.

Q. And is it a correct statement of the operations represented on the statement, during that period?

A. Yes, sir; I think it is as correct as figures of that kind can possibly be. It is correct with the exception of possibly clerical errors.

Q. Will you file that statement as exhibit 26 to your testimony?

A. Yes, sir.

The paper referred to is marked "Hubert Roth, Exhibit 26."

Said exhibit is in the words and figures following, towit:

For exhibit 26 (R. p. 2391).

CROSS EXAMINATION.

"Q. You compiled this statement yourself?

A. It was compiled under my direction.

Q. Will you vouch for it as being absolutely correct?

A. No, sir. It is reasonably correct.

Q. What do you mean by that?

A. I mean that I can not vouch for clerical errors. Every care was taken to have those figures correct.

Q. Did you have a competent force under you?

A. Yes, sir; I had a competent force, men accustomed to that class of work.

Q. And you gave that work your careful, personal supervision?

A. Yes, sir.

Q. You are thoroughly satisfied it is correct?

A. I am satisfied it is correct.

Q. In every particular?

A. Yes, sir." (R. p. 279.)

As will be seen hereafter, the statistics in exhibit 26 were repeatedly used by plaintiffs' witnesses throughout the case in chief and the first time, so the record shows, that any question of their force was raised was in the cross examination of Frank E. Ward, when the history of this exhibit was thus given:

"Q. The statistics on the Iron Mountain Railway were put in by the Iron Mountain, but I do not believe they had been analyzed as between local and through, as they were on the Cotton Belt:

The State's accountants have analyzed them substantially as was done with the Cotton Belt statistics.

MR. MOORE (the plaintiffs' counsel): The statistics contained in exhibit 26 in this case, to which counsel refers, which gives the total amount of State and interstate tonnage taken in the Auditor's accounts from the waybills, was prepared at the request of the State's counsel in a conference held in the Judge's chambers during the progress of this case.

I state this in order that there may be no misunderstanding as to how that came into the record.

JUDGE HILL (the State's counsel): I did not so understand that. I remember it was given to us as the result of such a conference, but I understood it had already been prepared by the railroads and certainly the State's counsel did not ask for it to be introduced. Isn't that correct, Mr. Johnson?

MR. MOORE: Some of the data was prepared, but that data was prepared as the result of a conference in Judge Trieber's chambers.

MR. JOHNSON (the accountant of the Iron Mountain): In the Missouri case such a statement as that was called for by the railroads and it was our understanding that it would be required in the Arkansas case; and we worked it up for that purpose.

In Judge Trieber's chamber, at a conference between yourself and Colonel Moore, when Mr. Wharton was present, Mr. Wharton asked for three months of these figures and we told him we had prepared them for one month for his convenience and did not feel we should be called upon to prepare them for three months. Judge Trieber then said we should not be required to prepare those figures.

Mr. Wharton finally agreed that the figures for one month would answer the purpose.

For our own purpose, in presenting this case, we would have no use for that exhibit. We believed that rather than check over the State exhibit it would be better for us to work that up ourselves, because it took us a considerable time to check their statement in the Missouri case.

JUDGE HILL: You did prepare these and had them prepared before Mr. Wharton ever requested them, did you not?

MR. JOHNSON: That is right.

JUDGE HILL: And you introduced them yourself, and not at our request?

MR. JOHNSON: Only to this extent: that it was the statement compiled for this case and if we had not introduced it we felt you would call for it, just as was done in the Cotton Belt case.

JUDGE HILL: But we did not call for them?

MR. JOHNSON: It was not necessary, because we had filed it. And in the meantime we had turned over a copy to the State expert." (R. pp. 1878, 1879.)

In the cross examination of Carl R. Gray, a witness for the plaintiffs in rebuttal, the above history of the preparation of exhibit 26 was repeated and this evidence added:

"Q. You took it as typical?

MR. JOHNSON: We took it for one month, because we could not work up any more, and we took October because it was the largest business of that period.

JUDGE HILL: You took it as a typical month?

MR. JOHNSON: We took it as representing the largest movement of freight.

I want to say that the freight in that exhibit is not freight handled on the trains. It is made up by the auditor from the auditor's accounts. The only purpose that that statement was used for by our witnesses was to show the relative proportion of the transstate, State and interstate freight carried into the accounts.

JUDGE HILL: And the length of the haul?

MR. JOHNSON: And the length of haul.

JUDGE HILL: State and interstate?

MR. JOHNSON: Of each class.

JUDGE HILL: Now, Mr. Johnson, you selected that month of October to work up these statistics, did you not?

MR. JOHNSON: Yes, sir.

JUDGE HILL: And when the State asked you for a three months' statement you said you were not willing to work that up, but you had the figures for one month already worked up, which you were willing to give them?

MR. JOHNSON: I said in Judge Trieber's office that we had those figures worked up in anticipation of their request, which we would give them and preferred to give them that, rather than check up figures which they might make.

JUDGE HILL: You were asked at that time whether that one month was fairly representative of the six months' period?

MR. JOHNSON: I said it was, so far as volume of business and the revenue was concerned.

JUDGE HILL: Didn't you say it was fairly representative of the six months?

MR. JOHNSON: So far as volume of business handled and the revenue." (R. pp. 1929, 1930.)

During the examination by the State of Mr. Swaim, rate clerk of the Commission, a question of statistics came up, and, as frequently happened, Mr. Johnson, the Iron Mountain accountant, was called up to furnish the information, and his view of October, 1907, as a representative month was thus shown:

"Q. This is an L. C. L. movement; do you know what the percentage of L. C. L. intrastate movement is to the entire movement?

A. No, sir; I do not; I have heard it variously estimated. I think it is a very small part of the carload.

Q. Mr. Johnson, do you remember the statistics of your road, as to the percentage of the L. C. L. movement?

A. Yes; I remember it for one month, October, 1907, which I consider a fairly representative month, of the total movement, and it is 4½ per cent, but I do not know that it is an exact apportionment between carload and less than carload.)" (R. p. 774.)

Up to the point where Mr. Wharton introduced the State's exhibit, using the test months as the basis to work up a division of expenses between local and through trains, and consequently interstate and intrastate, there seemed, from no side, any question but what these statistics in every detail fairly represented the six months' period.

Shortly before Mr. Wharton introduced the exhibits the counsel for plaintiffs, in cross examining Mr. Lincoln, gave him the statistics of exhibit 26, and asked him, with that as a basis, what proportion of the entire interstate business would be conducted on through trains rather than local. (R. p. 967.)

The statistics found therein were constantly used as showing the conditions indicated by the statistics quoted, and it would be too tedious to follow it in detail. To illustrate: Exhibit 26 furnishes the only separation of traffic into transstate, interstate and intrastate. It shows that the transstae is 51.16 per cent of the ton miles of all the traffic and 33.61 of the tons. Mr. McPherson's argument of extra cost of interstate was largely predicated on the fact that 51.16 per cent of the whole traffic was transstate, which had "straightaway movement" through the State, utilizing fewer of the facilities of the railroad, less labor and less station force. He draws comparisons between the classes of traffic, comparative expense and economy of each, assuming throughout the proportions found in exhibit 26, from which he freely quoted in this argument. (R. pp. 321-323.)

Mr. Doddridge uses the same table to show the volume of traffic which "is transported across the State, as upon a bridge." (R. pp. 457, 458.) He also uses them to show proportion of traffic on local train. (R. p. 458.)

Mr. McPherson also used these statistics as to the transstate traffic taken from exhibit 26 in his argument against the ton-mile basis of dividing expenses. (R. pp. 316, 317.)

In discussing the extra cost of intrastate transportation from a physical standpoint, Mr. McPherson again uses exhibit 26 as giving percentages of the relative classes of traffic. (R. p. 307). And again in the same connection he appealed to exhibit 26, at page 441, to illustrate his argument.

In cross examination he uses the statistics in exhibit 26 as to length of transstate haul with which to confound the State. (R. p. 448.)

Exhibits 26 and 19 (the test months) are the only exhibits which separate carload and less than carload freight, and throughout the

course of the evidence the relative C. L. and L. C. L. freight, intrastate and interstate, was referred to as affecting extra cost.

Another act of acceptance of the statistics of these months and their representative character is found in questions by the State's counsel to plaintiffs' witnesses, which were not challenged. To illustrate:

The tonnage of intrastate and interstate freight on local and through trains, as found in exhibit 19, was given to Mr. Ward with this statement:

"And it is in the testimony by the railroad witnesses that that month would fairly represent the business of that company." (R. p. 731.)

The statistics in exhibit 26, as to L. C. L., State and interstate, was also given him with the statement it was "a month which they (the plaintiffs') took as representing their traffic" (R. p. 736), and he was fully cross examined on these unchallenged statements of the plaintiffs' position, that these statistics fairly represented the condition of these roads; and in re-direct was further examined upon them. (R. pp. 737-8.) In truth, the record shows their constant use by both sides (to illustrate, see page 583), without question as representing undisputed facts during both the plaintiffs' case in chief and defendants' case in chief. The question of their representative character and value was first raised in plaintiffs' rebuttal. For that reason it is apparent why, in their case, the defendants had no evidence on the subject; they were no more questioned than the maps of the roads were questioned. Before proceeding to the attack upon them, some further testimony of plaintiffs' witnesses have a bearing on this issue:

Mr. McPherson gave this testimony in direct examination of the plaintiffs' case in chief:

*Plaintiffs' Evidence of Normality of Period.*

"Q. Mr. McPherson, from an operating standpoint, what do you think of the year 1907 as a representative period for the purpose of testing and determining the reasonableness or unreasonableness of the rates that are in controversy in this case? A. In my opinion the year 1907 was a fairly representative year. Q. You have spoken in your previous examination of certain increases in the cost of labor and material in and during the year 1907; did those increases in any way affect that period as a representative period for the purpose of testing the rates referred to?

A. Not in the ratio of the increase they represent because they will continue in the future. They are permanent in their character and would affect in the same way the operation of subsequent years.

Q. Did those increases change in any way the relation as between the rates or the earnings of the property during the year 1907 in your judgment?

A. I do not understand your question.

Q. Did the increase in the cost of labor and material which occurred in 1907 affect the relation as between the conduct or the cost of the interstate and intrastate traffic?

A. They are burdens on the whole traffic.

Q. Did they affect all of the traffic alike?

A. They would affect all of the traffic alike.

Q. When did the panic of 1907 first begin to be felt in the operating department of the railroad?

A. The operating department felt it in December of 1907.

Q. When did it reach its height in its effect upon the operation of the Iron Mountain railroad?

A. In the following summer I should say, from April to June it reached the high water mark of effect.

Q. How long did the conditions brought about by the panic continue?

A. Well, they continued all through the fiscal year of 1909." (R. p. 332.)

Mr. Johnson gave this testimony on cross examination during plaintiffs' case in chief:

"Q. Do you consider the last half of 1907, especially in view of the question you have just answered, to be a fair and normal test of operations on the St. Louis, Iron Mountain & Southern Railway in Arkansas?

A. I do, under the two-cent rate.

Q. I am asking more broadly than that. I am asking you is that a fair test, whether on a two-cent rate or not?

A. I believe it would be.

Q. I would ask you separately as to the different classes of freight, but I am asking you now as an entirety.

A. I believe the six months ending December 31 will be a reasonable period and a fair test of the result of operations on our line.

Q. A fair test for what period of a year?

A. A fair test for any period, to show the returns upon the property, or of the earnings to the road.

Q. Do you think that would be a fair, representative period of your earnings and expenses?

A. Yes, sir." (R. pp. 134, 135.)

Mr. Johnson says the panic begun in October, 1907, but did not affect the earnings of the line to any great extent in October, but begun to be felt in November. (R. p. 136.)

Mr. Johnson was questioned at some length on the percentages of the various expenses apportioned to Arkansas and summed up his evidence on that subject as follows:

"The average charge upon all those accounts to the State of Arkansas for the six months is a fairly normal charge." (R p. 193.)

Mr. C. E. Perkins' opinions on traffic and rate conditions were exhaustively given at the instance of plaintiffs. In his rebuttal evidence this occurs on cross examination:

*A Traffic Opinion of Using One Month To Test Intrastate and Interstate.*

"Q. You have heard a great deal of testimony here, I presume, from witnesses largely on the railroads' side in this case, that State and interstate traffic moves hand in hand, that they move together, haven't you? A. I do not know that I recall that testimony.

Q. You know that to be a fact, whether or not you heard that testimony, don't you?

A. I would say, generally, yes; that is true.

Q. If you take a given month, or a given six months' period, or a given year, and you take all the revenue, State and interstate, for that given period, wouldn't it ordinarily reflect the same movement of the same classes of freight, State and interstate?

A. For a given time?

Q. Yes.

A. As between State and interstate, I should say it ought to. (R. pp. 1631-1632.)

The last witness of the plaintiffs in their case in chief was Mr. W. M. Whitenton, Manager of the Rock Island lines in Arkansas, Oklahoma and Louisiana. The two test months' statistics previously put in were of all the freight traffic for the month, but Mr. Whitenton's test was for part only of the trains for a month, but he considered it sufficient. The testimony covering it is as follows:

*Whitenton's Test Month.*

"Q. Have you made any special investigation or test for the purpose of determining in any way the relative efficiency of the service applicable to State and interstate traffic, either freight traffic or passenger?

A. We made some tests on freight traffic in Arkansas.

I think from about November 22 to about December 21, 1908; that is about the date those tests were made.

Q. Will you state what the test was and what was developed through it?

A. The tests were made by putting men on trains and seeing just what each train handled, with regard to State and interstate business.

We did not work up all of that data, but we did take ten local freight trains and ten through freight trains, and worked up some data as to the per cent of State and interstate business on those trains.

Q. Who had that done; was it under your supervision?

A. It was partially done under my supervision. I outlined many of the methods used and went over a great deal of the information at the time it was compiled; that is, at the time that the men would make their test on the train. It all came to my office and I personally handled a great deal of it. The actual figures taken from these

reports on the ten local freight trains and eight through freight trains, were compiled by some of our accounting officers from these reports and worked by the men we had on the train.

Q. What did that show, as to any bearing in regard to the matters that you have been testifying about?

A. On the ten local trains, the per cent of State freight to the total freight handled, was 17.9 per cent. In other words, approximately 18 per cent of the total was State freight, and 82 per cent was interstate freight on those ten local trains.

That 17.9 per cent of State freight handled on those ten local trains represents about 60 per cent of the total State freight handled on the 18 trains that was worked up.

The L. C. L. or less than carload State, to the total State handled on the ten local trains was 11.2 per cent.

The less than carload interstate to the total interstate handled on these ten local trains was 4.6 per cent.

(He gives other statistics, car-mile haul, dead weights, etc.)

* * * * * * * * *

On the eight through freight trains, the percent of State freight handled on those trains, to the total freight handled, was 5.1 per cent. or, you might say, that of the total freight handled by those eight trains, 95 per cent of it was interstate freight and 5 per cent was intrastate freight.

Of the 18 trains combined, the through freight trains and the local freight trains, the per cent of State freight handled to all was 9.2 per cent. In other words, of those 18 trains, we will say 91 per cent was interstate and 9 per cent State freight." (R. pp. 755, 756.)

On cross examination it was shown that his road tried to cover everything for a month, but only worked up statistics of 18 of the trains; and gives routes of the trains worked up, and his examination continues:

"Q. How many freight trains does your road run a year in Arkansas?

A. I do not know.

Q. How many a day, then?

A. Oh, I could figure that out, of course—

Q. I would like to know somewhat within the range of what it is; I could not expect you to give an absolutely accurate answer, but you ought to know, generally speaking, how many freight trains you run in the State in a day.

A. I can figure up now about two scheduled freight trains which we have in the State of Arkansas.

Q. By schedule do you mean local?

A. Local and through, both; they are both scheduled.

Q. That is 32 per day?

A. Yes, sir.

Q. These 18 that you referred to were taken out of a period of ten days?

A. November 22 to December 21.

Q. A period of about thirty days. In that thirty days it would be 960 scheduled trains that you would run in that period?

A. If that is what it figures out, that is what it would be about.

Q. Within that period you would have some extra trains run, would you not?

A. Yes, sir.

Q. In round numbers it would be something like 1,000 trains run in that period?

A. I expect so.

Q. And you have given us the benefit of 18 out of 1,000?

A. That is what we have taken; whatever that would be.

Q. Do you think that would fairly represent the percentages of your traffic as you have given them in those 18 trains?

A. I think that would be fairly representative; that is my opinion about it.

Q. Do you know that there are about 1,300 trains in Arkansas, on the Iron Mountain alone, in one month?

A. I don't know anything about that.

Q. But you think these 18 trains out of 1,000 would be fairly representative of the percentages as you have given them here?

A. Yes; I think it would, because in taking that we represent all of the territory; practically all of the territory." (R. pp. 760, 761.)

The vigor with which it is contended that local trains are composed of intrastate traffic almost entirely was all in the record before Mr. Whitenton's test was introduced. The subsequent attack on the statistics showing 68 per cent on Cotton Belt and 72 per cent on the Iron Mountain of the local train was interstate freight becomes amusing in view of Mr. Whitenton's test on the Rock Island in the same country, handling the same commodities and in a subsequent month and shows 82 per cent of the freight on the local trains was interstate.

Mr. Whitenton shows 5 per cent of the through trains' load was interstate, and that the intrastate traffic was divided 60 per cent on the local and 40 per cent on the through, *i. e.*, 18 per cent of the local load was interstate, but that composed 60 per cent of the intrastate traffic, while the 5 per cent on through composed 40 per cent of it. Exhibit "I," worked up from exhibit 26, shows also 5 per cent of the interstate on the local train, but in this case it constituted 60 per cent of the interstate traffic.

This representative test of the traffic on 18 trains is another refutation, by facts, of theories; *i. e.*, that intrastate traffic is enormously expensive on account of the expenses of the "beast of burden"—the local train—when 82 per cent of that expense on the Rock Island is attributed to interstate freight, a different face is put on the problem.

## THE ATTACK ON THE VALUE OF TEST MONTHS.

The testimony of plaintiffs in rebuttal on the value of the test months was of three classes: (a) Opinion evidence that one month, especially October, was not representative of six months' business, thereby coming in direct conflict with Kimbell, Doddridge and Whitenton and Johnson. (b) That there was a congestion of traffic in October, 1907, on account of which the local train carried more interstate traffic than in normal times. (c) That exhibit 26 was made up from the auditor's books and not from actual movements on the road, and it would not therefore represent the actual movement; and, moreover, that the State in working up the performance of the local trains took actual movements, and the result of those substracted from results shown on the books would not be accurate, due to the lapovers. (d) The other atack is two insignificant for extended notice, and that is as to the accuracy of exhibit "I," prepared by the State from exhibit 26 of the Iron Mountain.

It will be noted that only the first of these grounds reach to the Cotton Belt test, all the others reaching to Iron Mountain exhibit 26 and State's exhibit "I," based on it.

## THE USE OF ONE MONTH'S TEST.

*Attack on Using One Month.*

(a) The witnesses on this proposition were Mr. Frank Nay, Comptroller of the Rock Island; Mr. Frank E. Ward, Manager of the Burlington road, and Mr. Carl R. Gray, Vice President of the Frisco road. Mr. Nay says: "I should say that no month is representative of any six months, or any twelve months, and, certainly, if I would choose a representative month, I would not choose the heaviest month in the year.

An average month might be more representative than either the heaviest or the lightest month, but I think when actual results are desired, no one month should be taken as representing a period." (R. p. 1822.)

In cross examination this occurred:

"You have objected a good deal in your direct examination to the use of one month as a representation of a six months' period, or a year's period, as testing State and interstate results. You do not believe it is fairly representative for that purpose, as I understand you?

No, sir; I do not." (R. p. 2024.)

Then the testimony of Messrs. Kimbell and Doddridge, heretofore quoted, was read to him, and he was asked as to his agreement with them, and he disagreed. (R. pp. 2024-2026.)

Then this occurs in his cross examination:

"Q. In view of the testimony of these two very distinguished gentlemen, who are so thoroughly familiar with these two roads, do you think the State is subject to criticism for taking one month's business as representative of six months?

A. That is an embarrassing question, the way you have put it to me, but my judgment is they are.

Q. Notwithstanding Dr. Kimbell and Dr. Doddridge differ with you?

A. You press it so it makes it rather embarrassing to answer.

Q. That is a fact?

A. I think I have stated it before. I would like to agree with everybody but I can not.

Q. There is another question I think would be fair to ask you, Dr. Nay:

You have spoken a good deal in your testimony of the consistency of our position: What do you think of the consistency of the railroads here, proving by these distinguished witnesses in their case in chief that one month was fairly representative of a year's business; and then proving by an equally distinguished gentleman, who is now on the stand, that in his opinion it is not:

Is not there some degree of inconsistency in that?

A. The testimony shows that the witnesses do not agree in every point. In fact, if witnesses agreed on every point it might look as if they had all been coached and told what to say, in advance.

Q. Certainly. But isn't there an inconsistency in the positions I have stated to you?

A. I don't understand just what you mean. There is a difference of opinion.

Q. The proposition is just this: In making its case in chief the railroads put on these two distinguished gentlemen thoroughly familiar with affairs on those roads and proved by them that honestly in their judgment one month was representative of six months or of a year's period, or of a series of years, as between State and interstate traffic; and now they put on another distinguished gentleman, honest in his opinion, to prove that is not the case:

Is not that an inconsistency?

A. I think it is a difference of opinion, because I think each man has been consistent throughout.

When I spoke of inconsistency I spoke of the same man using one method in one division of expenses and then switching to a different method for a division of a similar expense.

Now, I do not understand that that is the case in the question you are asking?

Q. I am removing the personal equation and putting it as to the railroads:

Both these gentlemen are entirely consistent and so are you. But here is the railroad proving by one set of gentlemen, who are con-

sistent, who held one view, and then in their rebuttal testimony they are proving by another consistent gentleman another opinion, on the same point in the case.

A. I do not think I should be asked to pass upon the position of the railroad. I think the court can do that.

Q. I think the question rather answers itself, anyway."—(R. pp. 2026, 2027.)

Mr. Nay admitted that in a recent hearing before the Interstate Commerce Commission on the application of Western roads for an advance of rates, he had presented the statistics of one month completely worked up, supplemented by the revenue of three weeks, "as the best index we had." (R. p. 2029.)

It seems he was questioned as to whether he regarded one month and three weeks as a fair index of the volume of traffic or earnings or expenses for the year compared with a prior year, and he said it was the only index he had. He admits he put it in as an index, and gave his opinion and judgment of the future based on that index.

One month's detail of traffic, earnings and expenses, supplemented with three weeks' revenue, is thought to furnish an index of business entitling his road to an advance of rates, but one month, selected by another road and used by the State after it was selected as representative of volume of business and the relation of transstate, interstate and intrastate is quite faulty. It takes a mental gymnast to entertain both views.

Mr. Frank E. Ward, in rebuttal, said:

"In the first place, the taking of any one month would not, in my opinion, be safe for determining so important a thing as the cost of performing service, when it is to be used for determining the revenue of the company.

The months vary very greatly, one from the other. The month of October, on most railroads in the West, is a month of very heavy business, by reason of the difference in the method of taking record of the tonnage, part of it being taken from billing, and part from the date of receipt, there would be a very great opportunity for tonnage to be omitted that was actually carried in that month. Or, on the other hand, there might be a great deal of tonnage included in the figures which would not move at all on the rails of the company during that month. Therefore, the great uncertainty as to the accuracy of the tonnage would make the first grave doubt as to the accuracy of the method for computing the cost.

* * * * * * * * *

I do not believe that any one month should be taken or could be taken as a basis upon which to determine an accurate computation. Any month might be a high one or it might be a low one; and if it should happen to be correct in any given case it would be so purely by accident and not by reason of the inherent accuracy of the theory. No short period of a day, a week, or a month, would be safe. They

would all give opportunity for variations sufficient to destroy the value of the method as a means of determining the separation of cost." (R. pp. 1854, 1855.)

In cross examination, Mr. Ward was read the testimony of Messrs. Doddridge and Kimbell heretofore quoted, and admitted he was not familiar with these roads, but he would not accept the test, saying, "It is a thing that can not be measured out by figures and facts, even though you put men on the trains to watch every movement."

He positively disagrees with Doddridge and Kimbell that one month could fairly represent six months or a year, or a series of years so far as the relation of interstate and intrastate traffic is concerned. (R. p. 1876-1879.)

Mr. Carl R. Gray, Vice President of the Frisco road, testified on this subject as follows:

Q. Mr. Gray, I want in that connection to have you state your views as to whether October, or any one month out of six months, say of the last half of 1907—is that month of October, in your judgment, to be used arbitrarily as representative of the six months, with reference to that class of expense?

A. From my knowledge of the conditions on all Southwestern railroads in October, 1907, I would say that in my opinion for a comparison of this kind it would have been difficult to have selected a month in which the results would have been more misleading as applied to a longer period, for the reason that the congestion reached its flood during that month, and the conditions which were distorted by reason of the efforts of the operating department to move this unprecedented tonnage would reflect themselves through all of the remaining months, and the proportion of tonnage included which really did not move in that month, and the proportion of tonnage excluded which did move in that month, due to the Auditor's method of keeping his ton miles, would equally distort, and perhaps distort more greatly, all of the other months." (R. p. 1898.)

In his cross examination, the history of the Iron Mountain exhibit was brought out, as hereinbefore set out. He disagreed entirely with the testimony of Messrs. Doddridge and Kimbell, and finally said he did not believe a test could be made at all. (R. pp. 1927, 1928.)

Then this occurs, to which especial attention is invited:

*Gray Estops Plaintiffs in Their Attack on Test Months.*

"Q. Mr. Gray, my question is, after this statement was put in evidence, and after it was compiled by the railroads in the way you have heard stated, and after the railroad witnesses used that statement for various purposes, to illustrate their position in regard to the statistics, contained therein, was not the State justified in using that exhibit as a basis to illustrate those same conditions?

COLONEL MOORE: That is objected to because that is calling on the witness to make a statement about a

matter which should be determined by the court and should be determined only by the court and not by the witness.

JUDGE HILL: I think the witness has passed upon questions similar to that, in answer to your questions yesterday, and I think I am entitled to ask his opinion about it.

A. My answer to that would be that if a month's statistical data has been testified to by the competent officials of that company as being a representative month and safe to apply to a period of six months, the State would be justified in assuming that for the basis for that six months.

COLONEL MOORE:

Q. You mean for the purpose for which it is being used here by the State? If the railroad accountant represented it was a proper basis for the use that has been made of it here.

A. I meant to say, if that had been testified to by the competent officials of the railroad, which would include the accounting and include the operating officials, as being one which was safe to use for a basis for six months' business, then the State would be justified in so using it.

Q. You mean if they testified it was safe for the purposes for which they used it?

A. Yes, sir.

Q. And not safe for other purposes?

A. I mean it is reasonable for them to think it was safe to use it for the purposes for which they used it.

Q. Suppose the railroad officials testified that would be properly representative of six months for one purpose, and the accountants for the State used it for another and different purpose.

A. My answer must be considered as meaning that there should have been (to be of value) unanimity of opinion among the competent officers of that company, that that was a safe month to use as illustrative of an entire period.

Q. For the purpose for which the exhibit you criticise was used, for ascertaining the relative amount of tonnage carried by local and through trains in the month of October, 1907?

A. Yes, sir; that is right.

I want to add this to that answer: That the amount of tonnage carried on local and through trains is not the only deduction which the State made from these October statistics and that my criticism extended to all of that in the same proportion." (R. pp. 1930, 1931.)

The fairness of the State's position so appealed to Mr. Gray that in the above straightforward manner he justifies the State fully in the use of the test months, although in his direct testimony his criticism of using one month was both severe and caustic. But when the facts are developed, like any fair-minded man, he says the State was fully justified in using one month as a basis for the six months.

In truth, a system of rates ought not to be tested on the six months' statistics, but when the plaintiff stood on the six months, their officials testified it was a normal period and fairly represented a series of years, necessarily, the State had then to ascertain all facts possible regarding that six months. It asked for three months' statistics of the Iron Mountain, and the road declined to compile them, but offered one month which it had selected as representative and had worked up in anticipation of such request. If the State had worked up every detail of the six months as it did this month, the treasury would be empty and the case not yet ready for trial. We have no evidence of the length of time it took the plaintiff's road to compile exhibit 26, which represented the movement of all freight on all trains and all the expenses and all the revenue.

Using it as a basis, it took a force of trained accountants six months to work the local trains' movement, expenses and revenue and tonnage, and it represented probably one-fifth of the tonnage.

The Interstate Commerce Commission has designated March and October as two months to serve as an index of a year's business.

Mr. Nay testified:

"I have talked with one of the representatives. I forget, now, who it was, but, I think it was Mr. Lutz, who is assistant to Professor Adams, and he picked those out as being perhaps average months—not being the largest months nor the smallest months." (R. p. 2032.)

That is exactly what is needed—an average month, not the largest, not the smallest.

When the plaintiffs only test out their case with six months, certainly the State is justified in using the average of them, even if it had selected it and worked it up, instead of which, the plaintiff selects it, introduces it, uses it and then when it results in their overthrow, seek to reject it.

(b) Was there a congestion of traffic in October, 1907. In view of the selection of this month as normal and representative, and its use by the plaintiffs to make their case, it ought to be wholly immaterial whether it was congested or not. They are entirely dependent upon it for their transstate traffic, and if congested, the transstate statistics are wholly unreliable, and without the transstate traffic going through the State "as if on a bridge," with a "straightaway movement," where would the 100-plus per cent of extra cost be?

*Was October, 1907, a Congested Month?*

The evidence of this was opinion evidence of Mr. Gray, already quoted, and Mr. Ward, who said October, 1907, was an exceedingly heavy month; in fact, in the entire West, business was heavier that month than in any previous month in the history of railroading (R. p. 1857), and also the opinion of Mr. Nay.

It is easy to express general opinions on these subjects, but unsafe.

Mr. Nay expressed an opinion as to the first half of 1907, compared with last half, and was confronted with the statistics and found he was mistaken, and then said that the first half of 1908 (the worst part of the panic, as all admit), would be as fair to compare with as to take last half of 1907, and compare with first half of the calendar year, 1907, because the panic began the latter part of October, 1907, and the "slump" showed up in November. (R. p. 2015.)

If Mr. Nay is right, the plaintiffs can not maintain this bill based on conditions of the last half of 1907. The answer raises exactly the point he makes—it was a period of panic and distress, and not a normal period with which to test a system of rates in vogue for the past eight years.

The plaintiffs introduced testimony to overcome these allegations; they said the revenue and expenses were normal, and it was a fairly representative period.

The State dug into the details of that period as it was its duty, and found intrastate traffic making as much return as interstate, and both compensatory.

To overcome the State's evidence, the basis used is attacked as a congested month, and Mr. Nay attacks the whole period as abnormal and suffering from a panic.

But it makes little difference whether congested or depleted, the consensus of opinion of practically all the witnesses on both sides is that interstate and intrastate traffic respectively moves uniformly.

The only evidence of any importance bearing on the congestion is that of Moore, Cannon and Brown.

Mr. B. W. Moore was night yardmaster in the Little Rock terminals in October, 1907.

He says there was a general congestion of traffic during that month, owing to the heavy movement.

That such congested condition made them add to their local trains probably 500 to 600 tons in order to move as many cars out of the terminals as quickly as possible.

He says the superintendent issued orders to utilize all the power of the local trains, which had light engines of 1,200 tons' capacity, and not to exceed 1,000 tons on each division.

The through trains, he says, at all times, carried full capacity of the engine, and that is not true of the local, and the excess of cars in the terminals from St. Louis, Kansas City and New Orleans, Alexandria and Memphis, and under orders of the superintendent, these excess cars were added to the local trains; ordinarily, the local trains only handle local cars and L. C. L. freight on the local divisions.

He says local trains came in from other division points with additional cars, using the full capacity of the locomotives, and says it was mostly freight from without the State. (R. pp. 1777-1779.)

In cross examination, he says the congestion continued into Janu-

ary, 1908, but in March, 1908, the movement was normal. (R. p. 1783.)

Mr. John Cannon was Superintendent at Little Rock in fall of 1907.

He says in that fall they departed from the usual practice of loading local trains, owing to the heavy movement. In normal times, the local freight handled nothing but L. C. L., and short loads for its own territory.

During the fall of 1907, in addition to that class of loading, the locals were filled to nearly their maximum tonnage, though loads, loads that went the entire division.

The excess tonnage ran from 300 to 800 tons per day—gross tons, the car and its load; and the excess tonnage was mostly interstate.

In his opinion, the local train in October, handled 75 per cent interstate, and in normal times, 25 per cent. (R. pp. 1797, 1798.)

On cross examination, he said this was only his opinion; he had no statistics on it. To know definitely would require scrutiny of the waybills, which he did not make, and never before had he had occasion to study the problem of how much interstate freight was carried on the locals.

Mr. H. V. Brown was terminal clerk (R. pp. 1798, 1799), in Little Rock in October, 1907.

He says the congestion of traffic in October increased the tonnage of the local trains.

He says in normal times the local handles about 70 per cent of State freight, and not to exceed 30 per cent of interstate freight. But during October, the proportion of interstate freight on the local was 60 per cent. (R. pp. 1805, 1806.)

On cross examination, he admitted he thought all the Fort Smith traffic was intrastate; it is a heavy traffic, and especially heavy in October, 1907. (R. p. 1807.) (The undisputed fact is, that it is all interstate.)

His attention was never called in the performance of his duties, as to whether freight was State or interstate, and he only saw the waybills of four local trains, and that is the extent of his observation of the movement of freight in October, based on four local trains out of Little Rock. (R. pp. 1807, 1808.)

An analysis of this evidence is important, except the last witness, whose observation was so limited that it is of no moment.

Cannon says:

"During the Fall of 1907, in addition to that class of loading the locals were filled up to nearly the maximum tonnage with through loads, loads that went an entire distance over the district the local was run on. That excess tonnage ran all the way from 300 to 800 tons per day." (R. p. 1798.)

Moore says:

"A. We added to our local movements and added tonnage of probably 500 to 600 tons.

Q. To the train?

A. Yes, sir; to the train. (R. p. 1777.)

Exhibit I (R. p. 2518), shows loading of revenue cars averaged 18.6; on through freights, 19.2 tons.

Taking 600 tons as the average of Cannon and Moore of additional tonnage put on local trains, and see the effect. It was stated by Mr. Bee, in a calculation which seemed to have been accepted, that 35 tons was an average car and load (R. pp. 1282, 1283); considering the average load, as above found, we presume this is sufficiently accurate to use.

Six hundred tons of gross weight would therefore represent 17 cars. Exhibit I shows local trains averaged 16.6 cars, and through trains 33.2 cars.

If Mr. Moore's version is correct, that 600 tons were added to each local train, then, more was added than the whole local train, and it started with nothing but engine and caboose, and its whole load added. If Cannon's version is accepted as 300 to 800 tons added daily to all the trains, then these 17 cars would be lost in the totals.

Mr. Roth and Mr. Hamilton agreed that there were 46 trains by number, but about 1,400 individual local trains running during that month. (R. p. 1974.)

We assume there were 46 regular locals running for the month, would make nearly 1,400.

Not quite three cars would be added to each local according to this version of the excess tonnage. Less than three cars per day on the locals changes the complexion of its freight from 25 per cent interstate to 75 per cent interstate!

Exhibit 26 (R. p. 2391), shows the number of tons moved in Arkansas for October, 1907, was 643,404; this would be an average daily movement of 20,755 tons per day. Six hundred gross tons, approximately 400 tons daily, do not cut much figure in a daily movement of 20,755.

As the through trains have double and a little over (16-6 to 33.2), cars to the train, and the loading of through cars is four tons heavier than the local, and the number of local trains run is less than the through (R. p. 2518), it is apparent that, roughly speaking, at least four-fifths of the total tons was carried on through trains.

This conforms, roughly, with the relation in ton-mileage shown in exhibit "I," page 2516. The local ton-mileage is 11.17 per cent, and through, 88.82 per cent. As the local run is shorter, and it carries much more short haul—intrastate and interstate—freight than do through, necessarily the proportion in tons would be greater than in ton-mileage.

For instance, the oft-quoted 51 per cent transstate is in ton-mileage, while in tons it is only 33.61 per cent. (R. p. 2391.) Therefore, we think we can safely assume that 20 per cent of the daily movement of 20,755 tons would be ordinarily carried on the local train as a daily movement on local of 4,151 tons—an addition to that movement of from 300 to 800 gross tons daily, say 600, or only 400 tons of actual freight, and it is seen that excess movement represents less than 10 per cent increase to the load of the local, and yet, Cannon, on account of it, changes the complexion of the local from 25 per cent interstate to 75 per cent interstate—another case of Theory v. Fact.

But really, it is useless to pursue this class of testimony as the undisputed statistics absolutely disprove the Cannon-Moore-Brown theory, and establish beyond controversy that October was a normal month of the six months' period so far as operation of the trains are concerned.

## STATISTICS DEMONSTRATE OCTOBER NORMAL.

Some uncontroverted statistics prepared by Mr. Hamilton and calculations of data in the railroad statistics demonstrate that October was a normal part of the six months' period:

"Q. One of the witnesses for the Iron Mountain, in rebuttal, Mr. Cannon, I believe it was, testified that during October, owing to a congestion of the business, that there was a shifting of through business on to the local trains in Arkansas—probably other witnesses expressed opinions along that line, but I remember that one in particular:

Have you investigated that question and prepared any statistics on that subject?

A. Yes, sir.

Q. I wish you would give us the benefit of it.

A. Exhibit "I" filed by the State, covering the month of October, 1907, shows the average number of cars per local train to have been 16.6.

As I recall what Mr. Cannon said, he stated that to relieve through trains during the month of October—which he said was a more or less congested period—they had burdened the local with more than it would ordinarily haul of freight which went from one end to the other of its run. That is, it carried some of the burden of the through train during that period, and that that would reflect itself in any ton mileage figures that might be made as to the local trains' performance.

As I recall it, he stated that that would result in putting more than a normal amount of interstate ton mileage on the local trains.

Q. That is the substance of it.

A. I have had in the last week or two weeks, the wheel reports for all of the local trains on the Iron Mountain in Arkansas, for the month of March, 1907, a spring month of the same year.

I find that the average cars per local train, for that month, were 16.7.

Q. What was it in October, 1907?

A. Sixteen and six-tenths.

COLONEL MOORE: I do not think it is proper for you to go back—

JUDGE HILL: You are the one that brought that in in rebuttal. We took your testimony to begin with, that October was normal. We did not introduce testimony on that, and then in rebuttal you took this testimony of Cannon and others, to show it was not.

COLONEL MOORE: This is objected to because it is a reopening of a matter that has been gone into before by the State.

A. The figures that I have just quoted were obtained from the wheel reports and the car-mile calculations shown in the wheel reports by the statistician in the car accountant's office.

Those figures which we have abstracted for the local trains were an integral part of the total car mileage figures made by them for that month for the information of the operating officers of the company and other statistical purposes.

The method followed was to abstract the car miles made by the local and the train miles made by the local, and dividing the car miles by the train miles to get the average number of cars in the train each mile, which is exactly the process followed in compiling exhibit "I" for October.

Q. You just matched March, 1907, with October, 1907?

A. Yes, sir.

Q. And found on the second decimal a difference of one point?

A. On the first decimal a difference of one-tenth of a car more in March than it was in October.

Q. Have you any other statistics on that point?

A. Do you mean as to the normality of October, from a transportation standpoint?

Q. Yes.

A. Yes, sir. I have made a comparison of the October movement with the six months which covers the period of our inquiry in this case, the last six months of 1907.

I find that the freight train miles made in Arkansas on the Iron Mountain in October, 1907, were an exact one-sixth of the freight train miles made in the six months ending December 31, 1907—16.63 per cent, an exact one-sixth.

I find that the freight car miles made in October, 1907, were also one-sixth of the freight car miles made in Arkansas during the latter one-half of 1907; they were 16.57 per cent, virtually one-sixth.

Q. You mean per cent of what; of the total train miles made?

A. No. The October car miles were one-sixth of the freight car miles made in the six months' period.

Q. Ending December 31, 1907?

A. Yes, sir; the period of our inquiry here.
Q. Anything further?
A. No, sir." (R. pp. 2260-2262.)

The Interstate Commerce Commission has selected March and October as the two average months to work out this class of problems when representative periods must perforce be taken. (R. p. 2032.) We find in October, the local trains carried an average of 16.6 cars, but according to the Cannon-Moore-Brown theory, these local trains had from 300 to 800 gross tons a day (or on each train), in them, over ordinary movement, and therefore, it is unreliable and abnormal; but, in March, 1907, when there was no charge of abnormality, the local trains averaged 16.7 cars per train.

Mr. Roth testifies that there is a heavy cotton movement in Arkansas in October, the effect of which would be to load the local with an increased percentage of interstate traffic—as cotton is all interstate. (R. p. 1975.)

But in March, there is no heavy cotton movement, and yet the local train has as many cars then as in October.

Mr. Gray testified that on roads in the Southwest in October, 1907, the congestion reached its flood and conditions were distorted, owing to efforts of the operating department to move their unprecedented tonnage, and any comparison based on that month would be misleading. (R. p. 1898.)

A mathematical calculation demonstrates that the freight train miles made in October, 1907, on the Iron Mountain were 16.63 per cent of the freight train miles for the six months ending December 31, an exact one-sixth.

When the number of miles made by all the fregiht trains for that month were exactly a representation of the six months, it seems that the conditions were not badly disturbed so that operating comparisons with it would be misleading. According to the Cannon-Moore-Brown theory, however, additional cars were put on the local, the through at all times running to its engine potentiality, and the train miles would not detect the excess loading of the local, but the next mathematical calculation demolishes that also.

The freight car miles, taking the individual cars run, not the train's run, were 16.57 per cent of the freight car miles of the six months period, a trifle less than one-sixth.

It is true that the ton mileage for October was more than a sixth, and also true that the revenue was more than a sixth, but neither of these facts affect the operation of the traffic, the revenue varying according to commodities—in both classes—moving according to the season, and in this instance, the State and interstate keeping apace with each other, and the ton mileage also varying by length of haul and amount of tonnage, but where the train movement and car movement are normal, the variance in ton mileage and revenue would not

affect the expenses at all, and it is expenses with which we are dealing.

Judge Trieber finds indications of abnormality of October in the greater ton mileage and greater revenue (R. p. 2622), but he overlooked the fact, the pivotal fact of this inquiry, that the relative movement of intrastate and interstate was normal nothwithstanding a larger total ton-mileage than the average.

Exhibit 5 of the Iron Mountain (R. p. 2327), gives the tons and ton-miles, intrastate and interstate, for the six months' period and their percentages.

The intrastate ton mile for the six months is 7.25 per cent of the total, and interstate, 92.75 per cent. Exhibit 26, giving the same data for October; intrastate, 8.15 per cent; interstate, 91.84 per cent. (R. p. 2301.) What boots it if the ton mileage is 20 per cent greater in October over one-sixth of the period if it is so nicely represented in the relative movement of the two classes of traffic?

While this difference is slight, nine-tenths of one per cent, it is significant that that small difference is in favor of a larger intrastate movement for the test month than for the six months' period. The gist of the attack on October is that congestion had put an extra amount of interstate traffic moving on local trains; more cotton than normal was moving, etc., and yet here the Iron Mountain's own figures show the movement for October relatively between the two classes of traffic practically identical, what little difference in favor of the interstate, just the opposite of all this testimony attacking the normality of October.

The revenue relation was likewise practically identical for the test month, and the six months; exhibit 5 gives revenue per ton per mile, in mills, intrastate, 13,377, interstate, 6,750.

Exhibit 26 shows for October, revenue per ton per mile, in mills, intrastate, 12,826, interstate, 8.15. Just half a mill difference in revenue per ton per mile intrastate for the six months compared with the test months, and that difference in less revenue per ton per mile in the test month. The interstate is not quite a mill and a half difference between the six months and the test month, and that difference in favor of greater revenue for the interstate for the test month. These statistics absolutely destroy any significance to be attached to larger ton-mileage and larger revenue for October than one-sixth of the period; they show that the ton-mileage is increased, but exactly in the same proportion that it held in the six months' period with slight variance in favor of intrastate, enough to destroy the theory of congestion of interstate over intrastate.

Revenue is always fluctuating and has little significance, but in this instance, the intrastate revenue is nearly constant with itself; indicative of no abnormal movements at least. The interstate is not quite as constant with itself as the intrastate and reverses the relative proportions of increase from the intrastate; the intrastate, October,

being a half-mill less per ton per mile than for the period while the interstate for October is a mill and a half greater than for the period.

After reading the way rates are made, and exist, anything may be expected in revenue statistics.

However, the revenue statistics are of no moment here, other than indication that no violent changes are occurring in October contrasted with the six months, as this is a question of expense, not revenue, under consideration.

The evidence is full of variations from shifting of commodities, due to seasons and trade conditions, but all agree that the commodities and seasons affect State and interstate alike.

The way rates are built up, resulting in the patchwork interstate rate system in existence may account for any sort of revenue charges in interstate traffic, owing to whether the freight originates or is destined to different points, the favor of the tap lines participating in hauls, etc.

But we are dealing now with expenses, not revenue.

Judge Trieber quotes the ton-mile statistics from exhibit 54, giving intrastate ton mileage only.

We have given you the ton mileage of both intrastate and interstate from the railroad's own exhibits, and shown that the increased ton mileage in October over one-sixth of the period accrued alike to intrastate and interstate, and therefore could not affect the problem before us, to find the relative cost of the two classes of traffic.

The ton mileage would not increase cost unless it increased train or car mileage, and as shown in this month, it did not; with the same train and car mile as the period the road achieved greater ton mileage and greater revenue, and no additional expenses could attach for it, and if it did, it attached alike, as their increased ton mileage continued like Siamese twins, as some witness expressed the movement of State and interstate traffic.

*The Lapovers.*

(c) The next attack on exhibit 26 is that there were "lapovers" from October into November which would not be accounted for in the methods pursued. The exhibit was made up from the Auditor's books, which show all freight billed in October, but in the latter part of the month some would not move or complete the movement until November, but would appear as October business. The State's accountants worked up all the local trains from the wheel reports and waybills, and got all the actual movement in the month, and substracted the total local freight from all freight shown on the books. There would necessarily be some inaccuracy in this. Mr. Nay, Mr. Ward and others contending a serious inaccuracy, Mr. Ludlam, Mr. Hamilton and others on the other side, contending it would be negligible and that the lapovers from September into October, which would go into their statistics, would compensate for the lapovers from October into November, which would not go into their statistics. Moreover, the State con-

tended that for the purposes of this case, it would not be important whether the lapovers equalized each other or not, because all the witnesses agreed, and the statistics proved, that intrastate and interstate moved alike, and whatever inaccuracy there might be in this system, would not affect the relative cost, as there would be proportionately as much lapover in one class of traffic as the other.

There is a great deal of evidence on both sides as to this, which was directed to the State's plan of dividing expense, and that is the appropriate place for the consideration of its detail—if it be considered worth while.

Mr. Roth introduced some statistics on it, to which attention is called.

He analyzed one-third of the local trains, as worked up by the State's accountants, and said it would have taken a year to have analyzed all the trains. He says in these analyses that 30.5 per cent of transstate was not included in October, that 15.5 per cent of interstate was not included in October, and 6 per cent of intrastate was not included. (R. p. 1974.)

Mr. Roth was sick and could not be cross examined (R. p. 2250), and we have no information other than the facts stated, but he does not state the other side of it. Considering the movement of the traffic being uniform, if he had examined the same trains for the September lapovers, there would doubtless have been the same relative amount, as there is absolutely no reason why one should not offset the other. Moreover, many of the trains analyzed by him run near the borders where the interstate lapovers would be greater, as he admits. He should have taken all trains, and not selected some, in order to get fair results.

A queer thing is that he found transstate freight on local trains. He does not give the amount of it, but shows a large percentage of it in lapovers.

How Mr. Doddridge's transstate freight, moving through the State "as if on a bridge," could get on a local train is a mystery; or how this transstate freight which only has "a straightaway" movement (McPherson), could stray away on a local is not explained. Whether it was a large quantity or a negligible quantity, only large in percentage of lapovers, is unknown.

The Cannon-Moore-Brown theory will not explain it, for they say the extra interstate was put on local to be carried on that division instead of the through, and this would not apply to transstate.

But such statistics, without giving the corresponding lapover, on the same trains of September in each class of traffic add nothing to the solution of the problem.

Mr. Johnson admits in cross examination that the lapovers only apply to the tons and not the car miles, and to the other percentages used by the State in its plan of dividing expenses. (R. p. 2231.)

A lapover exists in all going concerns. No period can be taken without it. The six months' period has its lapovers. There are lapovers in revenue as well as expense, but when a normal representative month or period is taken, they will equalize themselves.

(d) The accuracy of exhibit "I" is the next, and smallest attack. The plan of making up exhibit "I," a deduction from exhibit 26 has been explained. Mr. Hamilton and a force of trained railroad accountants compiled it and turned over their worksheets to the railroad for verification, and a force under Mr. Roth, spent months checking it over. Mr. Hamilton was cross examined at great length regarding his plan of work, etc., and finally examined as to the detail of many cars, their weights, classification, etc., mistakes being assumed as to each of them concerning which he was questioned. (R. pp. 1553-1570.) He was given time to investigate the alleged mistakes and this was the end of the matter:

*The Accuracy of Exhibit "I."*

"Q. Mr. Hamilton, when you were on the stand before you were cross examined as to various cars you traced up that were put before you in the October movement, exhibit 'I,' I believe it was. Re-direct examination on that was deferred until you had time to look into the matter.

I will ask you if you have gone through that thoroughly and found out the extent of the errors upon which you were questioned in your cross examination?

A. Yes, I have gone over our worksheets since that time. By 'worksheets' I mean the sheets on which we worked up our figures which are condensed into exhibit 'I;' and have given particular attention to the cars referred to by Colonel Moore in cross examination on the subject heretofore. I found there were thirty cars involved which were referred to as making 68 different moves. That is, as appearing 68 times on our sheets. I do not mean that each of the cars appeared 68 times, but the 30 cars represented 68 movements in the local trains.

I found that our weight as shown in tons in our classification as between State and interstate was correct on seven of these movements. I found that we had omitted to locate weights for 43 cars in our statement, which cover some 20,835 cars.

I found that the 61 moves or 61 appearances of cars on our worksheets where we had made errors in ascertaining the weights or in classifying the weights when ascertained, would, when boiled down and applied to paragraph seven on page eight of exhibit K, result in taking $257.68 from the cost of intrastate business and adding that amount to the cost of interstate business.

That would be the net result of making the correction in our figures.

Q. Your error worked out against the State, then, to that extent?

A. Yes, sir.

Q. What percentage of error would that be? Have you ever figured that out?

A. If the changes I have indicated were made in exhibit 'I,' the percentage shown in that exhibit would read in this way:

Intrastate freight on local trains 39.02 per cent instead of 39.10 per cent.

Intrastate freight on through trains (I am speaking of ton mileage now) would read 60.98 per cent instead of 60.90 per cent.

Total revenue freight on local trains would read 11.17 per cent instead of 11.18 per cent.

Total revenue freight on through trains would read 88.83 per cent instead of 88.82 per cent.

Following that in exhibit 'K' it results in the change in dollars and cents to which I have already referred.

COLONEL MOORE: What cars does that result you have just now mentioned apply to?

A. It applies to the car numbers—

Q. To which I called your attention?

A. Yes, sir." (R. pp. 2555, 2556.)

After months of toil on both sides, the result of working the actual movement, freight carried, weights, classification, etc., of 20,835 cars there are errors amounting to $257.68, and that against the intrastate. The overworked term, in this case, "negligible quantity" needs service again.

From every viewpoint, the integrity of the test months should be sustained. Good faith requires it of the railroads which offered them and based their arguments upon them; their accuracy is established; their representative character for the period is proved; the relation of the classes of traffic for the month compared with the period, is indisputably proved; the attack upon them is disproved and the facts contained therein should be considered as proof.

These months, if accepted as representative, serve the purpose of affording a basis in giving details, which has never before been worked out, of the operation of local and through trains, and the respective traffic carried on each, and though that the ascertainment of the cost of traffic carried on local trains and of traffic carried on through trains.

When the cost of each train is ascertained, then the train costs are attributed to each in proportion to the traffic carried of each class, and in this way, the cost of transportation may be worked out, leaving maintenance-of-way, maintenance-of-equipment, traffic and general expenses to be solved.

But when a practical plan of solving transportation expenses is found, the most difficult part of the problem is finished.

This method of division on this basis will naturally follow, but before it is taken up, we want to again call attention to the facts that the actual movement of freight in Arkansas, according to these

test months and the Whitenton test is so radically at variance with the conditions which plaintiffs' extra cost witnesses rested upon that the foundation is gone and the Court is at sea as to what, if anything, under these conditions is the extra cost.

It is absolutely certain that in the face of the 72 per cent of the load of the local train being interstate, and 61 per cent of the intrastate carried on the through trains, that any of this extra cost evidence based on little, if any, interstate on the local, and little, if any, intrastate on the through, is applicable.

When the case is cleared of these inapplicable opinions, then the mind naturally asks what is the extra cost, and how will it be reached?

## THE STATE'S PLAN OF DIVIDING EXPENSES.

As foreshadowed in the preceding discussion, the State worked out a plan of dividing the expenses between intrastate and interstate. To restrict the controverted area the State limited its plan to expenses after the apportionment had been made to passenger and freight by the railroads and applied the return to the property apportioned to intrastate traffic by the railroads and used the railroads' apportionment of these and also used the railroads' figures without change of the many matters heretofore discussed wherein they contained errors and omissions, like the inclusion of both Memphis and Fort Smith terminal expenses, the expenses of the Paragould trackage, etc., and omissions of the Express Company dividends, rental of Pratt's Hotel and Bunch Elevator, etc.

The effort was to drive solely to a plan of apportioning expenses between intrastate and interstate, accepting for the purpose the railroads' amounts as starting points to demonstrate (1) that the expenses could be fairly apportioned, and therefore it was wrong to accept arbitrary bases for apportionment of them when they could be really and practically allocated with approximate accuracy; and (2) to allow for all items of extra cost of intrastate traffic in proper distribution of the costs of each traffic and then ascertain what the actual intrastate extra expense really was instead of accepting opinion evidence of it based on conditions shown to be not existing in the Arkansas traffic, whatever they may be elsewhere.

Mr. Wharton, a certified public accountant, a member of the firm of Haskins & Sells, and manager of their St. Louis office, prepared the plan. His firm is one of the great accounting firms of this country and of England.

Their business is to devise cost accounting systems for large business concerns and to audit accounts. They audit the accounts for many of the largest railroad corporations in the United States and their audits are published as guides to investors and for the information of stockholders.

Mr. Wharton has had no railroad experience. He applied his accounting knowledge, skill and experience to the railroad accounts

just as he would apply them to a packing house plant, automobile factory, a traction company or a great department store.

He had the benefit of the counsel and advice of Mr. Hamilton, one of his staff, an experienced railroad accountant, who had had 10 or 15 years' experience in various minor railroad positions before he was put to work on railroad accounts in the Missouri rate litigation. He had three years' experience in examining railroad accounts and statistics in that case before he undertook the statistical and investigating work of this case. Judge Trieber, in his opinion, says:

"Mr. Hamilton, who was present at the protracted hearing of this case and explained to the court many of the items in the statement filed as exhibits for the State, impressed the court as a man of ability, a fine accountant and a fair witness." (R. p. 2620.)

Mr. Wharton also had the benefit of the advice and opinions of Mr. Charles S. Ludlam, another member of the firm of Haskins & Sells, who is in charge of the railroad audits for his firm. Mr. Ludlam was a witness in this case, his biography is given and his railroad experience shown. He had many years' experience in railroad accounting in various positions in railroad service before he begun his work in the wider and broader field of public accounting. His years of labor devoted to examination, verification and clarification of railroad accounts splendidly equipped him for this work.

Mr. Wharton testified that in addition to assistance from these gentlemen, he gathered information on the subject from other experienced railroad men and made a study of the evidence in the Missouri Rate Case.

He thus explained the point of view with which he approached these problems:

"Q. Did you give that question study, thought and investigation?

A. Yes, sir.

Q. How long were you engaged on the Missouri Rate Case, Mr. Wharton?

A. I believe we started our work on that in June, 1906, and we were engaged on that, I believe, for almost three years. I am not sure as to the exact time, but it was something like that.

Q. During that time were you closely in touch with the issues in the case?

A. Yes, sir; all the time.

Q. And you are familiar with the methods of operation and expenses adopted by the railroads and adopted by the State in that case?

A. Yes, sir.

Q. Was your firm employed by the State of Arkansas in this case?

A. Yes, sir.

Q. State the purpose of your employment by the State of Arkansas in this case?

A. The purpose of our employment was to assist the State in getting at the facts in the case as near as possible, in determining the cost of State and interstate business as near as it could be determined.

Q. When did your firm begin to work for the State in this case?

A. In August, 1908, we were employed by the Traffic Bureau at Little Rock to assist the State in its efforts to resist the granting of the preliminary injunction.

Later we were employed by the State itself to do the work.

Q. By the Railroad Commission acting for the State?

A. Yes, sir.

Q. Do you recall about what time you were employed by the Railroad Commission to undertake this work that you have been continuously engaged in since?

A. I think about last June, May or June, was the time.

Q. Now, Mr. Wharton, begin at that point when you were employed by the State to begin this investigation and state the history and methods pursued by you, giving the reasons for the methods that you did pursue?

A. In our first consultations with the Railroad Commission and with the counsel for the State we discussed at considerable length the plans that had been followed in the Missouri Rate Case, and the plans that we thought might be worked out in this case.

The Railroad Commission and its counsel both desired to get at the actual facts, if possible, without the use of any theories of any kind and we went to work with that in view, from the reading of the testimony in the Missouri case and from—

* * * * * * * * *

From the reading of the testimony in the Missouri case and my understanding of the purport of that testimony, it appeared all the time that the differences in the cost of State and interstate business were mainly the differences in the cost of local and through trains.

The witnesses all seemed to testify that way and we determined that if it was possible we would work up statements showing the cost of local and through business and after getting that cost, we would ascertain in the best manner possible the cost of State and interstate business carried in the two classes of service; in that way getting away from any question of theory, but getting down to an application of the facts and of the testimony given in that case, and subsequently given in this case." (R. pp. 1002, 1003.)

Then Mr. Wharton explains generally the plan pursued, but before going to that we desire to call your attention to the evidence of the plaintiffs' witnesses which furnish authority for the primary bases of the State's plan.

As will be noticed in the croes examination of McPherson, Johnson and Kimbell and other witnesses for the plaintiffs, the State endeavored to obtain from them items susceptible of actual allocation, and, when not susceptible, to obtain some plan by which the particular

item could be approximately allocated between State and interstate. For instance, Messrs. Johnson and Kimbell were required to go over various items of revenue and expense and point out wherein they were capable of actual separation between interstate and intrastate, and numerous of them were found susceptible. (R. pp. 124-128, 164-168.)

But in the main these witnesses were hopeless as to a plan of actual separation other than the arbitrary revenue basis. Messrs. Doddridge and Rawn gave methods and factors which were afterwards used as the primary bases for reaching an actual separation of interstate and intrastate traffic and a method of ascertaining the extra cost was worked out; and to that testimony your attention is invited:

In Mr. Doddridge's cross examination this testimony was given:

"Take the St. Louis, Iron Mountain & Southern Railway alone; is not the traffic on that road the same kind of traffic, whether it is intrastate or interstate?

A. Yes, sir; it is the same kind of traffic.

Q. And take it on the Cotton Belt road; the traffic on that is the same whether it is interstate or intrastate; there is no difference in the traffic made by passing the State lines, is there?

A. Not a bit.

Q. That is the point.

A. That is correct.

Q. Your analysis of the different classes of freight, interstate and intrastate, is based on your experience and knowledge of the operation of the different kinds of trains, local and through, and the proportion of intrastate traffic carried on each, isn't it?

A. Well, the local train is simply one of the incidents of the extra cost. It is not the whole reason. It is one of the circumstances and conditions of the handling of the short haul business of the railroads.

Q. I think I have allowed for that in this question, if you will consider it more fully.

Previous question is here read.

A. Yes, sir.

Q. So we will understand terms correctly, Mr. Doddridge, in talking to each other, I will ask you if there is any such thing as an intrastate train; that is, an intrastate train which carries exclusively intrastate traffic?

A. There is no such train that I have ever heard of.

Q. There may be an intrastate train, but for the purposes of our inquiry it carries interstate traffic, and has to be considered relatively as to the traffic that is upon it.

A. It carries all kinds of business.

Q. That is true also of all trains, isn't it?

A. Yes, sir.

Q. Intrastate or interstate or transstate?
A. Yes, sir.
Q. It is a question of the proportion upon each?
A. It is a question of the proportion upon each.

* * * * * * * * *

Q. I call your attention to this testimony in the Missouri case, which is right in line with that:

'In view of the complicated situation as between through and way points and division points and State lines as they run, isn't it almost necessary to have the judgment of somebody who has practically operated the property itself and is familiar with it?

A. It would seem to me to be necessary to have that kind of judgment to get at anything like a close approximation.'

A. I endorse that.

Q. Is not the only difference in cost of the intrastate and interstate freight carried on the same train, the one of the extra terminals?

A. There is no difference in the cost of one kind of freight or another kind of freight, arising from a distinction in the terms 'State' or 'interstate.'

If the conditions are the same there would be no difference in the cost.

Q. Take freight carried on the same train?

A. Well, I say, if the conditions are the same; that is, the kind of freight, and all of the other elements that enter into it, there would be no difference arising from the terms 'State' or 'interstate.'

But the conditions must be the same to say that there would be no difference in the cost, because there might be a difference in the conditions. The character of the freight, the weight, and other things.

Q. Take it, the same kind of freight and of the same character, carried on the same train, where is the difference, except in the terminals.

A. There would be no difference in the train cost.

Q. I want to read you your testimony in the Frisco case: I wish to read this statement made in answer to a question:

'So far as the particular freight is concerned, carried on those particular trains, there would be no greater cost in transportation for interstate freight than State freight, except the terminal charge.

In order to ascertain the results correctly, you would have to take into consideration the amount of State freight that is carried upon that train, as applied to the total State freight carried on the other train.

In other words, what I mean to say is, we have to take into consideration all the trains and find out what relation the State freight bears to the whole.' That is a correct analysis, isn't it?

A. Yes, sir; I think so." (R. pp. 484-486.)

Mr. Doddridge also worked out a method for ascertaining terminal expenses, both passenger and freight, between intrastate and interstate:

He says after testifying in the Missouri case he made further investigation and study of the problem and obtained further data from the Cotton Belt test, and decided that the best method would be to take the number of intrastate passengers for a given period and double them to compensate for the two station handlings and take the number of interstate passengers counted once, and, dividing the terminal expense in dollars and cents, it is an easy matter to arrive at extra cost per passenger or class of passengers. He says this would be somewhat more than fair to the State as some of the interstate passengers—the transstate—would have no terminal expense in the State, but this is the best method he knows. (R. p. 506.)

The unfairness to the interstate referred to would not exist in Arkansas on account of the large passenger traffic out and in Memphis and Fort Smith, charged with two terminal expenses; these, added to the many changes shown at Little Rock and other junction points of transstate and interstate passengers, would more than overcome the slight unfairness indicated by Mr. Doddridge to the interstate. On the freight side of the problem Mr. Doddridge says that the same method should be used to apportion terminal expenses between intrastate and interstate, using the ton as the unit instead of the passenger. The method is to double the intrastate tons and count the intersate once, and having all the terminal expenses in the State, then divide them in these proportions. (R. pp. 508-510.) He applies this formula for terminal expenses to the expenses of terminal buildings, fixtures, grounds and all terminal facilities. (R. p. 519.)

Mr. Doddridge, in applying his principles in illustration of extra cost of short-haul business, uses ton miles and passenger miles as a factor to measure terminal expenses, again making the same error heretofore pointed out in another connection. That, however, does not trench upon the principle he applies to terminal expenses.

The principle is thoroughly sound. The station expense is not increased or affected by length of haul—passenger or freight, or class of traffic—as the same kind of tons are uniformly found in interstate and intrastate traffic. These expenses are stationary, and result from handling the pound, the ton or the car at its origin and its destination, and therefore the expense should be apportioned in proportion that each ton has been handled. The State adopted this plan of Mr. Doddridge and much criticism was made of it on account of charging the transstate with one station handling as well as the interstate. The ton-mileage of the transstate is 51.16 per cent of all, but the transstate tons are one 33.61 per cent. (Exhibit 26, R. p. 2391). The double terminals increased on interstate in and out of Fort Smith and Memphis and the double and often treble terminal handling of interstate cotton, grain, lumber, etc., would more than

compensate for the 33.61 per cent of transstate, which received none according to plaintiffs' testimony. These elements offset the only injustice indicated by Mr. Doddridge as existed against his plan, which he presents as the best thought on the subject, and better than a plan he presented in the Missouri case (R. p. 506), and which he declares is a method of determining it "with fair accuracy." (R. p. 510.)

On maintenance-of-equipment Mr. Doddridge works out a method, practically, in principle, the same as that adopted by the State increasing the expenses by number of times the car is handled, length of haul, amount of terminal handling, etc. This is a car mile basis with allowances for extra switching and terminal handling. (R. pp. 510-514.) The details of this will be noted later.

Thus it is seen Mr. Doddridge furnishes a plan for train costs, terminal handlings and maintenance-of-equipment. Considering his great operating experience, his past service with these two roads and his advisory capacity to counsel in this and the Missouri case, his testimony on these lines should have great weight. It had great weight with the State's accountants, who used the bases indicated by him were the fair ones for these large items.

He evolved the "bridge theory" in this case, which the facts made ridiculous, but it was doubtless an ideal condition which he imagined exists because he thought it ought to exist, and he confounds ton miles and passenger miles with terminal expenses in arguing extra cost of intrastate. He finds from his bridge theory and this error of figuring extra cost, inflated ideas of extra intrastate cost; but when it comes to considering pure facts of operation and result of operation his views are worthy of the fullest consideration, and far above those of any other operating official who appeared in the case on account of his knowledge of these roads and his study of these problems.

Certainly it lies not with the plaintiffs to question their soundness.

In his direct examination Mr. Rawn, President of Chicago, Indianapolis & Louisville Railway, one of plaintiffs' witnesses, said:

"For the purpose of determining the cost of operation of transportation, the question of State and interstate is not the method of consideration. The method is that of the through and local business." (R. p. 676.)

In cross examination he explained somewhat in detail his method: Transportation cost, wages, fuel, supplies, etc., he says may be accurately ascertained from the books as to the cost of local and through trains. That these could be determined between the trains on the ton miles which is an absolutely accurate measure as between trains. This may be used on maintenance-of-way and maintenance-of-equipment, and between passenger and freight the train mile. (We believe he is the only witness on either side who advocated train mile division between freight and passenger although the railroads used it—to the

disadvantage of the State, as hereinbefore pointed out.) Station expenses he would divide in proportion to the traffic at each station between local and through trains. To illustrate, if 50 per cent was local and 50 per cent through at the given station, he would divide it in those proportions. (R. pp. 684, 685.)

Other than the revenue theory, the plaintiffs presented no method of dividing the expenses between State and interstate, but the foregoing testimony, giving practical lines for such division was developed from the plaintiffs' witnesses, and it alone should be sufficient to show that a better plan than the revenue theory was available, and until that better plan is adopted, the railroads have not made out their case by that clear and decisive proof which this court requires in order to procure an invalidation of State legislation.

The various factors used by the State, excepting their plan for general expenses, are factors in common use by the railroads in their every-day operation and accounting, and are each, as we believe, applied to the particular purpose for which that factor is designed. These are tons, at stations, ton miles to apportion the cost of each train between intrastate and interstate, after the train costs of the train carrying it are found; the train mile to apportion expenses particularly applicable to the train as a unit, such as injuries to persons on track, signalmen, etc.; car miles to apportion expense of equipment between cars and also maintenance-of-way; passenger miles to serve the same office on passenger trains that ton miles do on freight trains. The uses of these factors in railroad operation and accounting is discussed at length by Mr. McPherson (R. pp. 305-307) and Mr. Doddridge to some extent (R. p. 534).

In applying these factors it may be useful to consider the classification of expense accounts as used in these exhibits; this brief statement is taken from a treatise on the subject:

"The operating expenses of almost all the railroads in the United States are classified according to rules prescribed by the Interstate Commerce Commission. The primary accounts are all embodied under five general accounts, as follows:

1. Maintenance-of-Way and Structures.
2. Maintenance-of-Equipment.
3. Traffic Expenses (*a new account*).
4. Transportation Expenses.
5. General Expenses.

1. Under Maintenance-of-Way and Structures fall expenses for the repairs and renewals of machinery and tools, for repairs of roadway and track, for ballasting, for repairs and renewals of switches, frogs, ties, fences, bridges, culverts, stations, shops, buildings, etc.

2. Under Maintenance-of-Equipment fall expenses for the repairs and renewals of locomotives, passenger cars, freight and other cars and of steamboats and for the maintenance of shop machinery, etc.

3. Under Traffic Expenses fall wages of officers directly in charge of traffic, freight, passenger, baggage and other agents, expenses of outside agencies, advertising, fast freight lines, etc.

4. Under Transportation Expenses fall wages of station employees, clerks, yardmen, flagmen, watchmen, enginemen and trainmen, expenses for telegraph and station service, cost of fuel and supplies for locomotives, expenses for water supply, loss and damage, etc.

5. Under General Expenses fall salaries of general officers and office clerks, expenses for legal service, insurance, etc."

The State decided to pursue the methods pronounced as the best thought on the subject by Mr. Doddridge, as they had this high authority and they accorded with the accountants' best judgment on the subject, and find the expenses of the local trains and the respective amount of intrastate and interstate freight carired on them and the expenses of the through trains and the amount of intrastate and interstate freight respectively carried on them, and, in so doing, properly charge the local train with all the extra cost which the plaintiffs' evidence showed it should be charged with; that is, accepting the established items of extra cost, like extra switching service, etc., and find a basis for reaching the extent of it, and other established items, like higher wages, to ascertain the actual wages, and in this way find the exact cost of each train and the exact amount of each class of traffic on it. The idea was simply this: to bring it down to a single example to illustrate the whole.

*The Forming of Exhibit "I."*

A local train carries carload and L. C. L. from one end of its division to the other; it stops at every station; it makes various switch movements in dropping and picking up cars, both for itself and for the through; it handles at each station L. C. L. freight in packages. It is longer on the road, incurs greater wages to its crew; and its frequent stops and starts are fruitful sources of injury to equipment; switching is likewise a fruitful source of injury to equipment. The through train, under ideal operation, goes over the division without stops, save for water, passing trains and orders, and does not incur the switching movements. The through train carries on an average 33 cars and the local 16 cars and the former have an average of 4½ more tons to the car. (R. p. 2516.)

It is apparent that the freight carried over this division on the local has cost more than that carried over it on the through train. It is equally apparent that the intrastate freight on the local has cost, for train expenses only, exactly the same as an equal amount of intrastate handled the same distance. The intrastate freight on the through train has cost exactly as much and no more for train costs as the interstate on it for the same number of tons and miles. Hence the expenses of each train must be ascertained and then those expenses apportioned between the freight carried on the train whose expense has been determined.

When the wages, fuel and supplies are actually ascertained on this local train, as was done by Mr. Kimbell on the Cotton Belt test and by Mr. Hamilton on the Iron Mountain test, then to it must be added the extra mileage it has made in switching, the injury to the way caused by the extra use of it by the locomotive, the attendant injuries from starting and stopping, switching and terminal work, to the equipment, and when all these elements are found, then the actual expense is found and its load must be ascertained and the expense assigned to it according as it has served the intrastate and interstate; and so similarly proceed with the through, but its total expense is simple and not complicated with those expenses peculiar to the local. The basis for dividing the costs of a given train between intrastate and interstate after they are found is necessarily the tons of each and the miles the tons of each class were carried by it.

Mr. McPherson says of the ton-mile basis: "It only attaches as a unit of measurement between two given points, the beginning and the end of the journey, but does not consider the expenses at either end of the road. It can not measure the expense at either end." (R. p. 315.)

But it can and does measure the expense of the journey—the train costs. For that purpose and that alone it is used. Say 50 per cent of the ton mileage of this train was interstate and 50 per cent intrastate; then so far as the cost of moving it is concerned, no one would question that these train costs ought to be equally divided between interstate and intrastate. Even Mr. Whitenton, who puts the extra cost of the local over the through and intrastate over the interstate in the superlative degree, admits that. (R. pp. 759, 760.) Mr. Doddridge says there is no difference in train costs. (R. p. 486.) Mr. Ward admits it. (R. p. 731.) Mr. Rawn says the ton miles would measure it with absolute accuracy. (R. pp. 684, 685.)

Instead of one local train and one through train to be thus simply worked out, the problem here, for one month only, was 1,116 local trains and 2,758 through trains. (R. p. 2518.) The total freight train costs for six months are nearly $2,000,000 (R. p. 2531) out of a total of $4,600,000. (R. p. 2307.)

It was therefore necessary to find the train costs of the local and through trains and the traffic of each class carried on each.

The Iron Mountain put in no statistics containing a separation of expenses of local and through trains nor a separation of the traffic carried on them. The Southwestern put in exhibits 19 and 20, containing results of their test month, October, 1908, which furnished the necessary data for that month and for the period if it be taken as representative of it. It became necessary to have similar data for the Iron Mountain. As heretofore shown, it was requested to furnish such statistics for a three-months' period, but declined, and stated they had prepared statistics of one month, which was a typical month and selected by it as such, and these statistics were fur-

nished and later introduced into evidence as exhibit 26. It was a statement of transstate, interstate and intrastate freight hauled during October, 1907; and that separated into carload and L. C. L. of each class; the revenue, the tons, the ton miles, length of haul, etc.

Mr. Wharton thus explains the necessity of further data and how it was obtained:

"Q. How did you proceed to carry out those plans?

A. The first thing that was necessary was to ascertain the movement of freight on local and through trains; also the car miles, engine miles, the train miles, and all such statistics in reference to the movement of freight on local and through trains, in order that the expense could be properly apportioned between the local and the through service and in order that the cost of that service might be apportioned between the State and interstate business moved in the two classes of service.

The Cotton Belt road had prepared statistics of that kind in a test they made in the month of October, 1908.

On the Iron Mountain it was necessary for us to prepare most of our own figures in that particular. The railroad company had prepared a statement showing in full detail the movement of freight during the month of October, 1907, and we—

Q. I want to identify that now, Mr. Wharton.

It is marked exhibit 26.

A. We did not work up the entire movement of all freight on all trains during that month but we worked up the movement of all freight on all of the local trains on the Iron Mountain during that month, and having that and the total movement of freight, the difference between the two was the movement on the through trains during that month.

Q. As I understand you, then, you accepted the Iron Mountain figures as to the total movement of the freight during the month of October, 1907, as shown in their exhibit No. 26?

A. Yes, sir.

Q. And started with that as your beginning point and then segregated the two classes of traffic by ascertaining the actual movement on all the local trains in the State of Arkansas during that month; was that it?

A. Yes, sir; that is correct.

Q. Do you mean the Iron Mountain in Arkansas and not the entire system?

A. Yes, sir; the Iron Mountain in Arkansas.

Q. Mr. Wharton, explain the method of working up that, without going into detail. I understand Mr. Hamilton knows that better than you do, but explain the plan and how it was carried out.

A. The detail I am not familiar with.

The plan of the work was to take the wheel reports, list of the car numbers, and get the waybills, I believe, showing the freight moving in those cars.

Q. You mean from the records of the Iron Mountain Company?

A. Yes, sir; it was all worked up from the records of the Iron Mountain Company.

Q. Just explain what records and where you found that?

A. I would rather have Mr. Hamilton do that. I made up the plan.

Q. That plan was carried out by others, under your general direction and co-operation?

A. Yes, sir.

Q. Now, Mr. Wharton, have you that statement as worked up?

A. Yes, sir.

Q. I wish you would present it and file it as exhibit "I." (R. p. 2516.)

Q. Mr. Wharton, please take that exhibit 'I' and explain it?

A. The first column in exhibit 'I,' the one marked 'local trains,' contains the statistics worked up by us under Mr. Hamilton's personal direction. The last column marked 'total' contains the total statistics shown in exhibit 26 and in some of the other exhibits filed in this case—I will take the last part of that out—some of these are not shown in the exhibits in the case.

All of the figures in the 'total' column were obtained from the books and records of the St. Louis, Iron Mountain & Southern Railway Company, except the percentages and averages worked out.

Q. The totals there of ton miles were taken from exhibit 26?

A. Yes, sir; from exhibit 26, the mileage statistics as to car miles, caboose, engine and train miles, were taken from the records of the railway company for that month.

Q. Now proceed with your explanation of it.

A. The second column marked 'through trains' is the difference between the column marked 'local trains' and the one marked 'total,' with the exception, of course, of the percentages and averages, which were worked out from the figures in those columns.

The first section of the statement shows the ton miles of freight carried during the month of October, 1907, divided between local trains and through trains.

Following that we have the ton mileage of each class of freight expressed in percentages.

Following that are mileage statistics and other statistics as to train movement and car movement.

Q. Mr. Wharton, I wish you would state what you found in that test of the loading of the local trains as between State and interstate, expressed in percentages?

A. We found from that that the loading of the local trains was 71.49 per cent interstate, and 28.51 per cent State, based on the ton miles carried.

Q. What was the loading of the through trains?

A. The through trains were loaded 94.41 per cent interstate and 5.59 per cent State.

Q. What did you do with the company freight in that case?

A. We originally worked up some statistics on the company freight but finally excluded them from this statement.

Q. This is the revenue freight?

A. This is simply revenue freight. My recollection of the company freight is that a larger proportion, in proportion to the total freight handled, is handled on local trains than on through trains.

Q. I see you have here 'Number of cars handled in and out of terminals where yard engines are maintained;' I wish you would explain those figures?

A. The instructions in relation to working up the cars handled in and out of terminals by local and through trains were that the wheel reports were to be taken and the total cars shown by that wheel report as going into the terminal were to be accounted as going in and the total going out of that terminal was to be accounted as going out. The figures are made up in that way, classifying the wheel reports as between local and through." (R. pp. 1004, 1005.)

Mr. Hamilton explains at great length and in detail how he and a force under him worked up the detail comprising exhibit "I." (R. pp. 1408-1425.) It was a herculean task of tracing 20,835 cars, ascertaining the tonnage of each, the waybill for each, and all data concerning the contents and movement and expense of each of these 20,835 cars, but it was so well done that after months of investigation by Mr. Roth and a force under him, errors were found amounting to $257.68, and that in favor of the interstate. (R. p. 2256.)

In this way exhibit "I" was brought into the case, used and tested and found accurate.

*Passenger Traffic.*

There were no records kept by which it could be ascertained whether a passenger traveled on a local or through train, and hence it was impossible to have divided expenses between the interstate and intrastate by trains, even if it had been the proper course, but in this case that would not have been worth while, even if possible.

On the St. Louis Southwestern Railway Company all the passenger trains in Arkansas are local trains (R. p. 167, and time card exhibit 25). On the Iron Mountain there are 48 local passenger trains and 8 through passenger trains. (Exhibit 46, R. pp. 2412-2430.)

It has heretofore been shown that many of the locals carry Pullmans and one of the through trains is a fast mail, carrying one Pullman and no other passenger equipment. The primary division and essential division on the passenger side is that between passenger traffic and mail and express. The principles applied in the freight side, so far as applicable, are used to separate the passenger from the mail and express, and when that is done, then to divide train costs on passenger mile basis and then divide terminal expenses on the passengers of each class, doubling the number of intrastate pas-

senger so as to charge the intrastate passenger traffic with two terminals to one of the interstate.

## THE DETAIL OF THE STATE'S PLAN.

The following explanation of the detail of the State's plan of dividing expenses are practically the same as those found in the exhibits, but are, in some instances, amplified, and are given without the figures and calculations, and it is hoped in that way the plan may be presented in a more connected way than in following it through the exhibits, which are necessarily encumbered with the amount of each item given, and the result of the calculations and percentages used, etc.:

## STATEMENT "A"—FREIGHT.

### I—MAINTENANCE-OF-WAY AND STRUCTURES.

The proportion of these expenses applicable to the freight business, as shown by the statements in this case, submitted by the company, has been divided between local and through train service on the basis of the total engine and car miles of each class (see exhibit "I") during the month of October, 1907, that month being considered representative of the business for the six months ended December 31, 1907.

The car miles and engine miles (with engine miles reduced to a car-mile basis, as explained hereinafter) have been used as factors on which to divide these expenses between local and through freight trains, because they are the factors which most nearly represent the actual use made of the way and structures that these expenses are incurred to maintain.

The engine mileage shown in exhibit "1" is the actual road mileage, exclusive of switching at stations where no special engines are maintained for switching service. The local freight train engine performs the switching service at such stations and the mileage made by it in such switching adds 50 per cent to its straight road mileage. Therefore, in order to charge each class of freight train engine, local and through, with the actual use made by it of the track, expressed in miles run over the track, 50 per cent has been added to the road mileage of local freight train engines shown in exhibit "I."

It has been assumed that the average freight engine mile is the equivalent of 2½ freight car miles in its effect upon maintenance-of-way expenses, and in order to arrive at a common unit for a division between local and through trains, of these expenses, the engine miles of each class of trains, ascertained as stated in the foregoing paragraph, have been multiplied by 2½, thus reducing them to the basis of car miles.

II—MAINTENANCE-OF-EQUIPMENT.

A. Locomotives.

The expenses under this head are divided between yard and local and through road locomotives on the basis of the locomotive mileage of each class during the month of October, 1907.

Fifty per cent has been added to the mileage made by yard switching locomotives to provide for the extra maintenance expense resulting from the character of the service in which such locomotives are employed, as compared with the service rendered by road locomotives in pulling trains between stations.

The local freight train locomotives perform the switching service at stations where no yard locomotives are maintained and the mileage made in this switching service adds 50 per cent to their straight road mileage. This switching mileage is service of the same character as that performed by yard locomotives and entails 50 per cent additional maintenance expense per mile as in the case of yard engines. Therefore, to cover the switching mileage of local freight train locomotives, 75 per cent has been added to the straight road mileage of such locomotives shown in exhibit "I."

It has been assumed that through freight train locomotives perform no switching service.

The mileage of the three classes of locomotive service having been equalized by the addition to yard and local freight train service of percentages representative of the extra maintenance expense of each, the mileage figures so obtained have been used as factors on which to apportion the total expense of locomotive maintenance charged to freight service.

Yard locomotives render service to local and through freight trains, assembling and distributing cars, received at or forwarded from the various terminals in both classes of trains and accordingly the expense of yard locomotive maintenance ascertained, as stated above, has been divided between local and through trains on basis of the number of cars hauled into and out of terminals by each class of train.

II—MAINTENANCE-OF-EQUIPMENT.

B. Freight Cars.

The total amount of expense for maintenance of freight cars is $477,895.64. This amount is apportioned to Arkansas by the railway company on a car-mileage basis.

The total amount of expense for maintenance of freight cars apportioned to Arkansas by the railway company on a car-mileage basis. In dividing this expense between local and through service, however, we have taken into consideration the element of repairs due to the stopping and starting of trains at way stations, and repairs due to

extra terminal handling of cars in local service. Mr. A. M. Wellington, in his work on "Railway Location" (page 203) says that the stopping and starting at way stations is the cause of approximately 21.5 per cent of the repair expenses of freight cars, and that the terminal handling is the cause of approximately 13.5 per cent of the repair expenses. Taking these elements into consideration, the maintenance expenses may be divided first into starting and stopping 21.5 per cent, terminal handling 13.5 per cent, and other 65 per cent.

In dividing the expense chargeable to "stopping and starting," between local and through trains, it has been considered that the local train stops every five miles and the through train every 20 miles, and that therefore the cars in the local train would receive four times as much damage per mile run, from this cause, as the cars in the through train. Accordingly, the actual car mileage of local trains has been multiplied by four and the resultant figure used as one factor in dividing this portion of the expense, the other factor used being the actual car mileage of the through trains.

In dividing the expense chargeable to terminal handling consideration has been given to the greater number of such handlings received by cars in local trains as compared with cars in through trains. On the St. Louis, Iron Mountain & Southern Railway in Arkansas the average run of a local freight train very closely approximates the average run of a through freight train and it has been assumed that a local train would set out during its run all the cars it had taken out of its originating terminal and pick up a car for every car it set out, making two handlings between terminals for every car in the local train as against no such handling for cars in the through train. Multiplying the car miles in local trains by two results in a figure which, when used with the actual car miles of through trains as the other factor, produces percentages which exactly represent the proportion chargeable to each class of train, of the total number of terminal handlings received by freight cars.

The expense of freight car maintenance, due to all causes other than stopping and starting and terminal handling, is divided between local and through trains in proportion to the number of car miles in each class of train.

### II—MAINTENANCE-OF-EQUIPMENT.

### (C)—Supervision.

This expense is incurred in supervising the expenditure of the amounts apportioned between local and through trains under the heads of Maintenance-of-Locomotives and Maintenance-of-Freight Cars, and has been divided between local and through freight trains on basis of the results of the apportionment, of the direct charges for maintenance-of-equipment.

III—TRAFFIC EXPENSES.

These expenses are incurred in securing and looking after traffic, and have been divided on a gross revenue basis, although this unduly burdens the intrastate business, owing to the fact that a considerable portion of the traffic expense is incurred in the effort to secure competitive business, while the intrastate business is largely noncompetitive.

IV—TRANSPORTATION.

(A)—Station Expenses.

These expenses can not be divided between the two classes of train service, as they are not train expenses. They have been divided directly between intrastate and interstate business on the basis of the number of tons of each class of traffic handled in the State, assuming, however, that each intrastate ton was handled twice and each interstate (including transstate) ton once.

IV—TRANSPORTATION EXPENSES.

(B)—Yard and Terminal Expenses.

Yard and terminal expenses are incurred in assembling and distributing cars received at or forwarded from the various terminals in both local and through trains, and expenses have been divided between the two classes of trains on basis of the number of cars hauled into and out of terminals by each class.

IV—TRANSPORTATION EXPENSES.

(C)—Fuel and Locomotive Expenses; Road.

According to a test made on the St. Louis Southwestern Railway in Arkansas during the month of October, 1908, the local engines consumed 3½ per cent more fuel per engine mile than the through engines. Assuming that the same conditions would prevail on the St. Louis, Iron Mountain & Southern Railway, during October, 1907, the fuel and the miscellaneous locomotive expenses would be divided between local and through service.

IV—TRANSPORTATION EXPENSES.

(D)—Engine House Expenses; Road.

The average run per trip of an engine in through freight service being approximately 12 per cent longer than the average run per trip of a local freight train engine on the Iron Mountain in Arkansas, the local engine would get into the engine house more times, *per mile run*, than the through engine. It has been assumed in dividing this expense that the local engine gets the same attention in the engine house each trip as the through engine, and to equalize the

disparity in engine house service (due to the shorter run of the local engine and its consequent more frequent use of the engine house *per mile run*), 12 per cent has been added to the mileage actually made by the local engines in October, 1907. The figure thus obtained and the actual mileage of through train engines have been used as factors to divide the engine house expense for the six months' period between the two classes of trains.

IV—TRANSPORTATION EXPENSES.

(E)—Road Enginemen and Trainmen.

An actual division of these expenses for the month of October, 1907, was made from the company's time books.

IV—TRANSPORTATION EXPENSES.

(F)—Other Train Expenses.

These expenses are all of those not included in the preceding classifications which are incident to or caused by the operation of trains, such as the expense incurred for watching crossings, signaling, clearing wrecks, stock killed on right-of-way, etc. They have been divided between local and through trains in proportion to the train miles of each class of service, during the month of October, 1907.

IV—TRANSPORTATION.

(G)—Loss and Damage—Freight.

The expenses under this head are divided between intrastate and interstate business on the basis of the actual claims paid during the month of October, 1907.

IV—TRANSPORTATION EXPENSES.

(H)—Supervision.

These expenses are incurred in superintending the operations of the transportation department of the railway, and the direct expense of such operations is the best measure of the supervision necessary for each. Accordingly, the expenses of supervision have been divided between local and through trains and intrastate and interstate business, on basis of the apportionment, to each, of all the other expenses of transportation.

V—GENERAL EXPENSES.

The business of a railroad consists of the production and sale of transportation. The expenses incurred in the general supervision of such production and sale and the accounting therefor are classified as general expenses. They necessarily bear a direct relation to the expenses of production and sale and should be apportioned to the various classes of traffic in proportion to the direct cost thereof.

VI—TOTAL OPERATING EXPENSES.

Total operating expenses are divided between local and through train service, and intrastate and interstate traffic.

The train costs include everything relating to the direct cost of the *movement* of freight trains, with all expenses incident to such movement. Station expenses and other items which do not affect the expense of train *movement* are divided between intrastate and interstate business direct.

VII—METHOD OF DIVIDING TRAIN COSTS.

During the month of October, 1907, 39.10 per cent of all intrastate ton miles and 8.70 per cent of all interstate ton miles of freight were handled on local trains; and 60.90 per cent of all intrastate and 91.30 per cent of all interstate ton miles were handled on through trains. Assuming that these same relative conditions would exist during the six months ended December 31, 1907, the total ton miles of intrastate and interstate freight handled during that period would have been divided between local and through service.

Train costs are divided between intrastate and interstate business in proportion to the volume of traffic of each kind handled in each class of service.

## STATEMENT "B"—PASSENGER.

As nearly all passenger trains on the St. Louis, Iron Mountain & Southern Railway in Arkansas do a local business, no division of expenses has been made on the statement as between local and through trains. The statement divides expenses between, coach service and Pullman service, their auxiliary car service (baggage, diner and cafe observation), and intrastate, interstate, mail and express business. The expense of baggage, diner and cafe observation car service, operated for the use of both coach and Pullman passengers, is subdivided on the statement between coach and Pullman service on basis of the passengers carried one mile in coaches and Pullman cars. The statement divides the total cost of the coach and Pullman service between intrastate and interstate business on basis of passengers carried one mile in coaches and Pullman cars, respectively, and adding the results of this division to the direct intrastate and interstate expenses, it arrived at the total cost of intrastate and interstate passenger business.

*As the primary division of expenses has not been made as between trains (for the reason stated in the second paragraph hereof), but between the classes of cars hauled in the trains, all expenses of or incident to locomotives have been considered as common to all the classes of cars hauled in the trains and have been apportioned to the various classes of cars on basis of the car miles made through the instrumentality of the power furnished by the locomotives.*

With a few exceptions, which are explained in the accompanying memoranda, the car mile is used as the basis for dividing expenses between the various services of the passenger business, viz.: passenger carrying, and mail and express. As passenger equipment mileage varies but little, if at all, from month to month, October, 1907, mileage has been taken as representative of the mileage of the six months' period of which it is a part, and has been used as the basis for division of the expenses of the six months' period under review.

The totals of the passenger expenses, under the various classifications, which have been divided in the manner set forth above, are the amounts apportioned to the passenger business of Arkansas by the railway company, in the figures which it has submitted in the railroads' exhibits.

The inclusion of baggage, diner and cafe observation cars is not in the original exhibits. Heretofore has been explained an error in this connection, and this statement correctly states the plan of division, and following it the intrastate would be reduced about $29,000. The error and its correction is explained at R. pp. 2288, 2289.

I—MAINTENANCE-OF-WAY AND STRUCTURES.

The proportion of these expenses for the six months ended December 31, 1907, charged to the passenger service in Arkansas by the railway company, has been divided between the various classes of cars hauled in passenger trains on basis of the car miles of each class.

II—MAINTENANCE-OF-EQUIPMENT.

(A)—Locomotives.

The proportion of these expenses for the six months ended December 31, 1907, charged to the passenger service in Arkansas, by the railway company, has been divided between the various classes of cars hauled in passenger trains on basis of the car miles of each class during October, 1907.

II—MAINTENANCE-OF-EQUIPMENT.

(B)—Passenger Train Cars.

No expense for the maintenance of Pullman cars is included in these figures, as all such cars are repaired by, or at the expense of, the Pullman company and without cost to the railway company.

The proportion of the expenses of maintenance of coaches, baggage, dining cafe observation, mail and express cars for the six months ended December 31, 1907, charged to Arkansas, by the railway company, on a car mile basis, has been divided between the various classes of cars on basis of the car miles of each class during October, 1907.

II—MAINTENANCE-OF-EQUIPMENT.

(C)—Supervision.

This expense is incurred in supervising the repairs of locomotives and cars in passenger train service, the expense of which has been apportioned, on the statement, between the various classes of cars composing the trains. These directly apportioned expenses have been used as bases for the division of the supervisory expense incurred in connection with the repairs, the cost of which they represent.

III—TRAFFIC EXPENSES.

These expenses are incurred in securing and looking after traffic, and have been divided between intrastate and interstate passenger business and mail and express on basis of the gross earnings of each for the six months' period. This unduly burdens the intrastate passenger business, owing to the fact that the major portion of traffic expense is incurred in the effort to secure competitive business, while the intrastate business is largely noncompetitive.

IV—TRANSPORTATION EXPENSES.

(A)—Station Expenses.

Divided between intrastate and interstate business on the basis of the number of passengers of each class handled, after making an allowance of about 10 cents per day for the handling of mails at certain stations; and assuming that each intrastate passenger makes use of two terminals and each interstate passenger makes use of one terminal.

Included in the 257,950 interstate passengers, charged with one use of a station in Arkansas in the above division of expense, are the transstate passengers, who it has been claimed by the railway company would get no use of the stations. On the other hand, owing to the peculiar location of the Iron Mountain line into the city of Fort Smith, and the fact that Memphis station expenses are charged to Arkansas, the interstate passengers from or to the two cities mentioned make use of two stations, the expense of which is charged to Arkansas, and transstate passengers to or from Memphis would use one station, the expense of which is charged to Arkansas. No additional use of stations has been charged to this interstate traffic in the division of these expenses, and it is believed that this will more than compensate for any burden placed on the transstate traffic by charging all passengers of that class with one use of a station in Arkansas. In addition to these reasons, the few transstate trains run through the State will necessitate transstate passenger net on those trains to use stations service and also necessitate many interstate passengers to use more than one station service in the State.

IV—TRANSPORTATION EXPENSES.

(B)—Yard and Terminal Expenses.

These are the expenses incurred in running passenger train cars over the road in trains, and the cleaning, switching, and other care of them at terminals at the completion of each run to prepare them for their next run.

The expenses of this character for the six months ended December 31, 1907, charged to the passenger service in Arkansas, by the railway company, have been divided between the various classes of cars hauled in passenger trains on basis of the car miles of each class during October, 1907.

IV—TRANSPORTATION.

(C)—Loss and Damage—Baggage.

These expenses have been divided between intrastate and interstate business in proportion to the gross earnings of each.

V—TOTAL OPERATING EXPENSES.

The total operating expenses are, as hereinbefore explained, divided between baggage, diner and cafe observation, coach, Pullman, intrastate, interstate, mail and express business. The amounts charged to intrastate and interstate business are expenses not chargeable to the cost of train service. The expenses charged to mail and express business represent the total operating expenses assignable to those two classes of business. The expenses charged to baggage, diner and cafe observation, coach and Pullman service represent the proportion of train expenses assignable to the hauling of passengers.

VI—DIVISION OF BAGGAGE, DINER AND CAFE OBSERVATION COSTS BETWEEN COACH AND PULLMAN PASSENGERS.

The cost of baggage, diner and cafe observation service, $211,097.20, has been divided between coach and Pullman passengers, for the use of whom these auxiliary service cars are operated, on basis of the passengers carried one mile in coaches and Pullmans during October, 1907. Exhibit "56-A," filed by the railway company, shows that of the total passenger miles during October, 1907, 1,936,121, or 15.41 per cent, were carried in Pullmans, and 10,630,277, or 84.59 per cent, were carried in coaches. These percentages have been used in dividing the expense of baggage, diner and cafe observation service between the coach and Pullman services.

The result of this plan shows a return of 7.69 per cent on the property devoted to intrastate traffic, exhibits at page 2540, on the Iron Mountain; and, after correcting the error as to the Pullmans, reduced to 7.09 per cent. This upon the revenue basis of dividing property, which is unfair to the State, as the intrastate freight reve-

nue is 98.16 per cent higher than interstate, and passenger 3.48 per cent higher, and includes also the unfair train-mile basis, which assigns to intrastate traffic $101,500 more than if the revenue basis had been used for this item. It also includes both Memphis and Fort Smith terminal expenses and is infected with the many other errors discussed in that chapter. Undoubtedly under any sort of fair adjustment of these matters the intrastate is certainly earning more than 8 per cent on the property. Under the same plan, without any of the suggested matters regarding the Iron Mountain, the St. Louis Southwestern is shown to be earning 9.16 per cent on its property devoted to intrastate traffic.

This plan of dividing expenses and the results reached by it, are sustained by a decided preponderance of the evidence.

If the evidence supporting it was sufficient to cast doubt on the revenue basis and the other methods pursued in the plaintiffs' exhibits, then it would have accomplished its purpose as preventing the railroads' case being proved by that clear and decisive proof necessary to invalidate State legislation. But, as we will show, it goes further, and is sustained by a decided preponderance of the evidence; using that term in its best sense; not in number of witnesses only, but in witnesses least interested and best qualified to speak on the particular subject of the testimony.

## THE STATE'S PLAN AS A WHOLE.

*The State's Evidence.*

The plan as a whole was discussed and sustained by the following witnesses: T. F. Wharton, accountant (R. p. 1000); Herbert C. Whitehead, formerly Auditor of Santa Fe System (p. 1075); W. E. FitzGerald, Auditor of Texas Railroad Commission, a former railroad accountant (p. 1080); Henry Willmering, Auditor Oklahoma Corporation Commission (p. 1111); R. D. Parker, Engineer, Texas Railroad Commission (p. 1161); Charles S. Ludlam, railroad auditor and railroad accountant (p. 1309); T. A. Hamilton, railroad accountant (pp. 1402, 1520); Conway W. Hillman, railroad auditor and accountant (p. 1479). In all eight witnesses. That they discussed it intelligently and with knowledge of the subject can not be gainsaid. Messrs. Wharton, Ludlam and Hamilton were employed by the State to ascertain the facts of this case and their testimony should be scrutinized for bias or partizanship. Messrs. FitzGerald and Parker are public officers of the State of Texas. Their State has no litigation with the railroads and is striving as best it can to gather all the light and data possible upon these problems. Their freedom from interest, bias or partizanship is apparent from reading their testimony. Mr. Whitehead is a totally disinterested witness, called upon to give the benefit of his experience and learning on these subjects. Mr. Willmering has no interest in this case, but his State has a rate case with these same railroads, and, notwithstanding he is a

public officer, it is right to consider any bias on this account. Mr. Hillman is employed by other States with similar litigation. Three of the eight witnesses are entirely removed from possible selfish interests. The plan as a whole was discussed and condemned by M. L. Byers, Chief Engineer of Maintenance-of-Way of Missouri Pacific and Iron Mountain System (p. 1695); Frank Nay, Comptroller of Rock Island System (p. 1812); Frank E. Ward, Manager Burlington System (p. 1853); Carl Gray, Vice President St. Louis & San Francisco Railroad Company (p. 1893); Fred P. Johnson, Accountant of the Iron Mountain Railway Company (p. 1981). In all five witnesses. Of these, Messrs. Byers and Johnson are employees of the Iron Mountain; Messrs. Gray and Nay are officers of two roads which secured injunctions with these roads (R. pp. 73, 81), which are practically parties to this litigation, and their roads have similar litigation with Missouri and Oklahoma; Mr. Ward's road is not a party to this litigation, but is to the Missouri and Minnesota rate litigation. Mr. Ward has the same indirect interest which may be imputed to Mr. Willmering. On the score of interest, the State has the best of it.

While interest is a recognized canon of guidance in weighing evidence, we take pleasure in saying that in this case, only so far as environment and point of view is concerned should any discount be made of the testimony of any witness on either side.

One of the few statements of the opinion of Judge Trieber which meets with our full concurrence is this:

"In this connection it is but proper for the Court to say that all the witnesses in these cases impressed the Court as having testified as intelligently and as fairly as is possible. It is true they differ widely in their views, but it is an acknowledged psychological fact that the opinions entertained for years by a man can not be discarded at once, and that all persons are to a certain extent influenced in their views by their environments, as well as the duties they are called upon to discharge for others." (R. p. 2620.)

In view of the high order of the witnesses, their intelligence and grasp of the subject, then even numbers may properly be considered in testing where the preponderance lies. Take such men as Mr. Nay and Mr. Johnson, accountants of ability and character, but their lives devoted to seeing these questions from one standpoint. And contrast them with Messrs. Ludlam and FitzGerald. They have had the railroad experience to equal Messrs. Nay and Johnson in the grasp of the questions, and their work has carried them into broader fields where these subjects may be viewed from many angles—not one.

Much stress was laid in testimony and argument on the superior ability of operating officials to pass judgment on these questions. That operating officials can better pass judgment on questions of operation is readily granted, but that they can pass better judgment on the subject of a fair and accurate apportionment of expenses be-

tween State and interstate traffic than auditors and accountants is emphatically denied.

Every one who has touched the subject says that in operating trains State lines are not considered; it is with the operating man a question of through and local trains and the intrinsic character of the freight hauled and not the legal status of it which is intangibly stamped upon it. He is concerned in the delivery of the freight to the end of his division or its terminal or to a connecting carrier, and it boots not him where it originated or is destined so long as it is properly handled on his division or his road.

The comparative qualifications of the operating men or the accountant to pass judgment on a proper method of apportioning these expenses was discussed by several witnesses on both sides, and we submit this excerpt from Mr. Ludlam's testimony as stating the proportion most convincingly:

"Q. Some questions have been asked from other witnesses, indicating that an accountant would have to be an operating man in a particular business, before he could install a cost accounting system for that particular business:

What is your view about that? What has your experience taught you in regard to that matter?

A. My judgment is that the operating man, as a general proposition, is the last man who is able to figure out his own cost; that is done by the accounting department and by the various cost departments of the different manufacturing concerns.

Naturally, in installing a system of cost, we would confer with the operating man and familiarize ourselves with the operating transactions sufficiently to be able to devise forms and install systems that would take care of all the operating transactions, but we would never depend upon the operating man's opinion of what it cost him.

Q. If an operating man installed the system, the accountants would go out of business?

A. I think also the operating men would go out of business.

There is nothing that is more generally recognized, I think, and coming to be recognized more and more every day, than the absolute importance of separating the operating and the accounting departments, particularly in railroads.

I can remember back in my day when the General Manager would instruct the Auditor how to charge certain expenses, but the financial interests, in so far as they control railroad accounting and railroad investments, have learned that it is imperative that the accounting officer should act exclusively on his own responsibility and be accountable only to the Board of Directors of the corporation, if you want to know the actual facts as to the result of operating the property.

Any operating man could make a very fine showing for his property if he was allowed to direct how the different items should be charged.

Q. Explain why that is, particularly in railroad operation.

A. In order to ascertain the true results, the further you can separate the ascertaining of those results from the man who would be interested in the results shown, the more accurate your results will be, naturally.

Q. Then your object is to get actual conditions and apply your accounting knowledge to those conditions to properly apportion your expense?

A. Yes, sir." (R. pp. 1312, 1313.)

But it matters little to the State which view is accepted, its plan of work is the result of the views expressed by operating men in the Missouri case and in this case, which were applied by Mr. Wharton and find expression in the State's plan. (R. p. 1023.)

The plaintiffs have laid much stress upon the opinions of Messrs. Gray and Ward, both successful operating officials, but if this issue is to be controlled by the opinions of these operating officials, the plaintiffs' case is destroyed by their views. Both condemned the train-mile and car-mile bases as not sufficiently accurate for so important subject as determining rates.

The railroads' exhibits relied upon to show the return on the property to be confiscation, use both these bases—the train mile to apportion passenger and freight (to the detriment of the State compared with revenue basis in the bagatelle of $101.500), and the car mile to apportion the freight and passenger equipment expense between Arkansas and the eight other States composing the Iron Mountain System, resulting in one million dollars being apportioned to Arkansas. It takes the use of both these bases so heartily condemned by these eminent operating officials to bring about the confiscatory return relied on in their exhibits.

Mr. Gray also estops the plaintiffs from questioning the accuracy or representative character of the test month statistics, and, with these accepted, the plaintiffs' case is destroyed without more ado. Furthermore, Mr. Gray says the last six months of 1907 were not "representative enough to apply to a period of years, either before or since." (R. p. 1933.) Therefore, if plaintiffs' argument is followed and these eminent operating officials' opinions are to control, they necessarily walk out of court without relief, as they have not used proper bases to show themselves entitled to relief.

Mr. Doddridge works out the solution of freight train costs, terminal expenses, freight and passenger, and maintenance-of-equipment expenses. There can be no serious controversy over maintenance-of-equipment, as both sides use the car-mile basis for it; the railroads to find the apportionment between Arkansas and the other eight States composing the Missouri Pacific System and the State as between local and through freight trains and coaches and mail and express cars. Mr. Rawn approves the car mile for maintenance-of-way and maintenance-of-equipment. There can be no reasonable

doubt of the car mile or wheelage basis for maintenance-of-way as it is the basis commonly used by the railroads themselves in dealing with each other on this subject. These four great items are practically the whole problem, both in principle and dollars. Certainly the plaintiffs have presented no operating men of greater experience and ability than Messrs. Doddridge and Rawn.

The State's plan, and the evidence supporting and condemning it, can not be grouped other than by discussing each of the subjects.

## MAINTENANCE-OF-WAY.

*Car-Mile Basis.*

This item of expense is divided on the car mile, formerly called wheelage, basis. The origin, and change in name of this basis, may be found in Mr. Gray's evidence (R. p. 1937), Mr. Hillman's (R. p. 1487) and Mr. Nay's (R. p. 2043). The strainght car milage is used on the passenger side between coaches, mail and express. On the freight side the division of expense was on the car-mile basis between local and through freight trains with these additions: Each engine is counted as doing two and a half times more injury to the way than a freight car and the engine mileage increased accordingly.

To the engine of the local train is added 50 per cent to its mileage on acocunt of switching done at stations, thereby to that extent using the way that much the more than if it had made a straight run.

The discussion brought up three questions: (1) The basis used and (2) the allowance for locomotive wear over car wear, and (3) the allowance of 50 per cent of the local engine mileage for station switching.

(1) As to the basis used:

Mr. R. D. Parker, Expert Engineer for the Texas Railroad Commission, is an educated engineer, and has been in the service of the Texas Commission eight years; prior to that he was in railroad construction and maintenance-of-way work, and when he went to the Commission was in charge of 600 miles of line, and had under his supervision maintenance-of-way, bridge and track work. (R. p. 1161.) He is familiar with the bases and units used in apportioning expenses of maintenance-of-way, maintenance-of-equipment and other railroad accounts. Regarding the car mile as the basis of dividing maintenance-of-way expenses between local and through trains and passenger and mail and express cars, he says:

"To my mind, it is about as representative unit as could be applied; that is, a unit that is representative of the service." (R. p. 1162.)

Mr. Willmering was questioned as to this item of expense and this occurs:

"Q. Speaking of the freight traffic, I believe you say you would make it upon the car mile; I would like for you to give your reasons why you think that would be better?

A. I would give it upon the car mile, for, from observation, I find that oftentimes a local freight train would pull more cars, have more cars in the train, than the following through freight train, and I find it vice versa, and, in order to get a fair average, I believe that car mile should be taken in place of the train mile.

Q. You think it is nearer the actual results than the train mile?

A. Yes, sir; in my judgment." (R. p. 868.)

Mr. Wharton says:

"It was our idea, after considering the matter, that a car mile, as between local and through, would more nearly represent the difference in costs.

Q. What was the reason for that?

A. On account of the difference in the two classes of trains, local and through; and the difference in the cars they carry, and the number of cars in the train." (R. p. 1032.)

Mr. Wharton says that personally he would have preferred the gross ton mile, but the data was not available and he used the best method which was available. (R. p. 1007.)

Mr. FitzGerald said that the car and engine mileage is the closest approximation which can be reached for maintenance-of-way expenses, and it is the generally accepted basis for this purpose. (R. p. 1082.)

Mr. Ludlam says:

"We considered that the engine and car miles represent more correctly than any other ascertainable quantity, the use which was made of the track; the use which was made of the property that these expenses represent the cost of maintaining.

Q. There has been evidence in this case to the effect that a large part of that item of expense is due to the elements, wind and water; matters with which the actual operation of the road is not concerned—the actual running of trains is not concerned in the operation of the road, I mean.

What do you say to the justice of dividing those expenses that are not caused by the running of trains, on a car mile basis?

A. I think it is entirely equitable and proper. The question of whether the actual running of trains wears the tracks out, or whether the elements wear the tracks out, and the other property that is put there for the operation of trains, is immaterial. You have to charge the expense which is incurred for the use for which it is incurred. They maintain the track and maintain the property in order that trains may be operated over the property, not on account of the weather or elements wearing the property out. They don't repair it merely to replace the wear and tear of time or the elements, but they do it in order that they may operate trains.

Q. That roadbed is not there for ornamental purposes?

A. No, sir. It is exactly the same as in a case, for instance, of a chair factory: when you would have to repair the roof on a chair

factory it is an expense incurred which you would apportion to the cost of the chairs manufactured in that building, although, as a matter of fact, the actual making of a chair in that building has nothing to do with the wearing out of the roof. But it is a part of the cost of maintaining the property and you charge that cost to the use which is made of the property. That is an ordinary accounting principle.

Q. Is that a principle that is recognized by accountants generally and railroad accountants in the working out of accounting systems and properly distributing costs?

A. Yes, sir." (R. p. 1322.)

Mr. Hillman says that the car mile is the generally accepted basis among railroads for apportioning maintenance-of-way expenses where there is joint use of tracks. (R. p. 1486.)

On cross examination Mr. Hillman said that for a division between either freight and passenger or local and through trains, he considered a basis of car weights better than either train mile or car mile. (R. pp. 1509, 1510.)

*Car Mile In Use by Plaintiff Roads.*

The Iron Mountain leased of the St. Louis Southwestern Railway trackage rights from Paragould, Arkansas (it is 36 miles in Arkansas; distance in Missouri not given.) (R. p. 1000.) Prior to July 1, 1909, the rental was 40 cents per train mile. Mr. Kimbell says: "Subsequent to July 1, 1909, the track was placed on what is known in railroad parlance as a joint track basis, which provides for the St. Louis, Iron Mountain & Southern Railway paying the St. Louis Southwestern a rental on an arbitrary basis and paying its proportion of expenses of maintenance and operation on car mile basis." (R. p. 998.)

The Iron Mountain can only use it for their through freight trains. (R. p. 998.)

Mr. Gray regards their joint track agreements as a matter of barter, but when these roads bartered then they agreed on a rent and then to put these expenses on an equality, agreed on a car mile basis.

*The Attack On The Car Mile.*

Mr. Byers, Chief Engineer of Maintenance-of-Way of Iron Mountain, says the method of dividing this expense adopted by the State could only be accurate by accident. He says it does not take into consideration that (R. p. 1700) 75 per cent of this expense does not accrue by reason of the traffic. (Mr. Parker put 90 per cent as due to elements and time.) He says of the 25 per cent resulting from traffic there is a large proportion not incurred at the time the traffic is handled. His example is the steel rail, which may stay in the track from five to thirty years, and the wear is going on all the time, but the expense of replacement may not be incurred for many years. He objects to it on account of not taking into consideration the difference in size of locomotives. The loading of cars and speed of cars would

also affect this item and is not reflected in this basis. He says repairs of fences, part of these expenses, has nothing to do with the traffic. He says local trains generally have lighter engines. (R. pp. 1700-1703.)

He says these expenses ought to be divided as general expenses are divided, but he says he does not know how general expenses ought to be divided. (R. p. 1705.)

He admits that any factor with which he is familiar would have the same objection as the car mile for cost of replacement, etc. (R. p. 1706.)

In illustration of the ineffectiveness of the criticism of the State's plan, we call attention to these facts in Mr. Byers' evidence: He says the car mile does not account for difference in loading of cars and weight of locomotives. The through car is loaded 4.5 tons more than the local (R. p. 2518), and all agree that the local locomotive is lighter than the through; Mr. Byers admits the effect of the heavier locomotive would be more than the lighter car. (R. p. 1711.) Again the through train gets the best of it.

His criticism of the basis on account of its inapplicability to constant expenses applies to the revenue basis, the train mile basis or an actual division, and applies to any period, one month, one year or a series of years; and yet Mr. Nay (R. pp. 1823, 1824) also uses these arguments against it. Of course he has to admit that like criticism is applicable to any other factor. (R. p. 2042.)

Mr. Ward criticises along the same line (R. p. 1873), principally because from 75 per cent to 90 per cent is due to elements, natural wear, etc.

Mr. Gray criticises it because:

"The car mile is so variable a quantity as to be of no service in any comparison or division which I have ever made." (R. p. 1898.)

Mr. Gray repudiates the principle of taking a factor representing use; he is for the gross earnings apportion everything. (R. pp. 1834, 1835.) However, it is shown these same units are used by the Rock Island in statements to Interstate Commerce Commission, based on exactly the principles, and really much of the detail the same, as adopted by the State here. (R. p. 2033.)

Mr. Gray says that both car mile and train mile are in common use by railroads in dividing maintenance between themselves. (R. p. 1936.)

*Eminent Railroad Officials On Car-Mile Basis.*

The testimony of eminent railroad officials was read both to Mr. Gray and Mr. Byers as to the fairness of the car mile basis and that it was the generally accepted basis. Neither Mr. Byers nor Mr. Gray would agree with them. These were S. T. Emerson, Chief Engineer of St. Louis, Kansas City & Colorado Railway Company (p. 1715); James C. VanDyne, Superintendent Union Depot at St. Louis (p. 1716); A. A. Talmadge,

General Manager for Receivers of Wabash (p. 1317); James T. Howe, General Agent for the Receivers of Wabash (p. 1718).

This testimony was given in a case in the Federal Court at St. Louis over joint use of the Wabash tracks from Forsythe Junction near Forest Park into the Union Station at St. Louis.

It became necessary for the court to fix a fair basis for the maintenance of the tracks between the roads using them. The testimony of these officials was given before the master. The gist of it was:

The wheelage or car-mile basis is the one usually selected as a fair and equitable method of apportioning maintenance-of-way expenses between railroads jointly using a common track.

When contracts are made there is usually an agreed rental for use of the property and then an apportionment of the expense between them on a car-mile basis.

All these witnesses speak of this being the ordinary method among railroads of dividing maintenance-of-way expenses among themselves and regard it as fair and equitable. To these statements, some from men like Mr. Talmadge and Colonel Howe, historic names in railroad operation, Mr. Byers says: "Such division would produce correct results only by accident." (R. p. 1718.)

The master adopted this basis.

*This Court Approves Car-Mile Basis.*

The case came to this Court from the Circuit Court of Appeals and the Circuit Court of Appeals was reversed. The opinion of the Court, written by Mr. Justice Brewer, and adopted by the Court after his death, goes back to, and adopts, the original opinion at circuit, wherein this occurs: "So far as respects the mere matter of keeping up the track, I see no reason to doubt the justice of the rule fixed by the master." St. L., K. C. & Col. R. R. Co. v. Wabash Ry. Co., 217 U. S. 247, on p. 255.

The state of the evidence is this. Approving this basis, Parker, Willmering, Wharton, FitzGerald, Ludlam, Hillman; contra, Byers, Gray, Ward and Nay; but as Nay uses the engine mile in a formula for dividing expenses created by him (R. p. 2034), his action for it speaks louder than his words against it. Parker and Byers have each better qualifications from an operating and technical standpoint than any of the other witnesses on this subject, and they differ widely; none of the other witnesses have special training like them, but all are intelligent and qualified to express opinions on it. It is admitted by Gray and Nay that the car mile is in common use among railroads for this purpose. The testimony from eminent officials in the Wabash case with whom Mr. Byers differs so widely, and the approval of this basis by Justice Brewer and this Court, certainly ought to put this out of the realm of controversy.

To our minds, however, the strongest argument for it is found in the action of these two plaintiffs. One leases the other one of its main line tracks for the use of through freight trains; a contract is

made and expires and a new contract made; the rent is agreed upon as compensation for the use of the track and then the car mile adopted as the basis to apportion among themselves maintenance-of-way expenses. The train mile was discarded, the car mile adopted. It was exactly an analagous use, through freight trains on one road and locals and through on the other, and adding to the difficulty passenger trains on the other road, too, and yet this is the selected factor to fairly divide these expenses. If it is the best method for them in their own affairs, isn't it the best method for them in dealing with the public?

(2) The allowance of 2½ times for locomotive wear over freight car wear is the next controverted item. Mr. Ludlam thus explains why it was used: "That is a basis frequently used by railroads, based somewhat because the average locomotive has twenty wheels and a freight car eight. It is usually roughly figured about two and one-half car miles to an engine mile, on a wheelage basis. (R. p. 1323.) On this subject Mr. Parker gives this reason for using two and one-half times for the engine against the freight car:

*Engines 2½ Times Freight Cars.*

"A. I presume that is calculated on a wheelage basis; a 12-wheel engine and 8-wheel tender would be 20 wheels compared to an 8-wheel car.

Q. Is that about the proportion used in this Southwest country?

A. You might say that is the maximum, except in the new type of locomotives, Mallet compound, which are practically two locomotives connected with one boiler and one firebox; that is called articulated; the locomotive is hinged in the middle.

Q. Where are they used?

A. In mountain division; I believe the Santa Fe has some in use and some of the Western lines; I think the first one was exhibited here at the World's Fair.

Q. You are not referring to that exceptional class?

A. No, sir; there are none in the Southwestern country that I know of." (R. pp. 1163-4.)

This allowance was attacked as insufficient by Mr. Gray (p. 1898), Mr. Ward (p. 1857), Mr. Nay (p. 1826) and Mr. Byers (p. 1700). In addition to Mr. Parker, it was sustained by Mord Roberts, formerly Master Mechanic of this, and of other roads (pp. 2111, 2112); K. P. Alexander, formerly Master Mechanic in charge of power and equipment on several roads (p. 2161), and J. A. Simonds, who had served as Roadmaster for many years on different divisions of the Iron Mountain in Arkansas, also as Division Engineer (pp. 2168, 2169). Mr. Byers attacks the whole idea, Messrs. Gray, Ward and Nay say two and one-half times is insufficient; Mr. Alexander says two times is a maximum; Messrs. Roberts and Simons say a heavily-loaded freight car will do more damage to the way than a locomo-

tive and give very practical and technical reasons for it. On this issue every one of the State's witnesses are entirely disinterested, except Mr. Ludlam, and all the plaintiffs' were interested. Byers' and Parker's experience and training offset each other. Ludlam's and Nay's opinions may well offset each other. Roberts, Alexander and Simonds have better training and experience to pass judgment on this subject than Gray and Ward. In this, as in all other controverted issues, a preponderance in numbers is with the State, and in this instance much better experience to speak on the subject authoritatively.

(3) Allowance of 50 per cent extra engine mileage for switching done by the local trains at stations is the next controverted matter.

*Local Switching.*

The information for this allowance was given by Mr. Maurice Wright, who was assisting Haskins & Sells in some of the work for the State in this case. Mr. Wright had been for seven years a traveling auditor on the Iron Mountain and his duties required him to use all trains, local and through freight as well as passenger, and he was thoroughly familiar with the entire road in the State. From his knowledge of it, and guided by records of the stations and length of side and passing tracks, and his knowledge of the average cars dropped and picked up at these stations, he made an estimate on the amount of switching required in average conditions all over the State. He describes in detail the situation at each station. Then he makes a corroborating calculation based on time allowed by schedules for the two trains, and the extra time of the local was credited to switching. (The witnesses agree that generally the local runs faster between stations than the through.)

Taking the heaviest divisions on the road, Mr. Wright calculates the switching on each and it runs from 32 per cent to 50 per cent of the mileage of the engine. (R. pp. 1383-1388.) The State in its exhibit used—as in all cases—the maximum against itself and put it 50 per cent.

Mr. Nay said it was an arbitrary percentage; he did not know whether it was enough or too much, and he knows of no way by which it could be determined. He regards it as unreliable. (R. p. 1825.)

Mr. Ward questioned the feasibility of determining it. "No operating man that I know of could determine with accuracy whether that addition is correct or incorrect. It may be right or it may be wrong. I do not know." (R. p. 1857.)

Mr. Gray takes the same position; it is arbitrary, he thinks. (R. p. 1899.)

At last something is found upon which the operating men have no opinions.

Mr. F. P. Johnson attacked Mr. Wright's methods and found some supposed errors in them. Then he makes some calculations based

on running time, showing the percentage of switching allowance should be over 50 per cent. (R. pp. 1987-1989.) In cross examination, however, he made calculations on his own bases and the percentages shown were only 30 per cent. (R. p. 2225.) Mr. Wright recalled, showed he was right and not Mr. Johnson on some of the moves criticized. (R. p. 2263.)

In rebuttal, the State went into this matter thoroughly and put on these witnesses on this subject: Walter Nash, formerly brakeman and freight conductor (p. 2083); D. L. McNew, formerly brakeman, yardmaster and freight conductor (p. 2099); J. A. Simmons, who served as roadmaster on Iron Mountain for many years (p. 2168); Hubert F. Jernigan, former freight brakeman (p. 2189); D. Harston, who had served as brakeman and conductor on both local and through freights on the Iron Mountain (p. 2196); and A. Paulette, a former switchman and conductor (p. 2205). These witnesses were all in various business pursuits, all had honorably and voluntarily left railroad service. The General Manager and Vice Presidents who could form no ideas about the extent of switching performed by the local trains and did not believe any accurate estimate of it possible, should have talked with these men who had done the switching of local trains and whose work required them to daily observe it and know all about the subject. They make accurate estimates of average switching based on conditions thoroughly familiar to them. This testimony can not be read without being convinced that the switching mileage is susceptible of accurate approximation and that 50 per cent is in excess of the facts. In all these undefined matters the State resolved the doubts against itself; in this instance undoubtedly by 15 per cent. On this issue the State certainly overwhelmed the plaintiffs.

On the whole maintenance-of-way account it is submitted that the State has adopted a fair basis of division and it has allowed the utmost for the extra expense of the local over the through, which can be attributed to it, under this head. This is a basis which takes the factor applicable to the expense for dividing it, and necessarily and naturally produces fair results. Contrast it with the revenue basis which Mr. Doddridge says is "an arbitrary percentage based upon opinion and judgment," and which he admits is not accurate and not scientific. (R. p. 481.)

It may well be added that the "opinion and judgment" upon which it is based is not qualified opinion and judgment. The men giving it admit they are not rate men and not familiar with rates and unable to discuss rates, and, as the rates produce the revenue, how do they know whether it is a proper factor or not? We venture to say that no one of the three witnesses produced by the plaintiffs to sustain the revenue theory—Messrs. McPherson, Nay and Doddridge—would do so if he was familiar with the interstate rates prevailing in Arkansas as developed in this testimony, which was introduced

after they had given their evidence. We have too much confidence in the honesty and intelligence of these three gentlemen to believe that with a knowledge of the rate situation, as herein developed, that they would now say the revenue basis was the best method known to them. They each proceeded on the theory that, "consciously or unconsciously," rates reflected the cost of the service and assumed there was a cost relation between State and interstate rates. The testimony herein developed, demonstrates, beyond doubt, that the rates in the Arkansas interstate rate system do not reflect the cost of service—they could not with such patchwork system. The cost relation of State and interstate rates is even more theoretical than the "bridge theory" of transstate freight. No system of general averages can save it; there must be a common level to work that out upon, and that is impossible with the prevailing system. The more the intrastate rates are shown to be out of line and improperly constructed, the more the nonrelation between them and the interstate. There is no co-ordination. It is inordination.

This maintenance-of-way account is the stumbling block for a separation of expenses along practical lines instead of theoretical ones, on acocunt of the large percentage of its expense being due to time, natural decay and the elements, instead of the use of it by the traffic; but it is submitted that the difficulty is more imaginary than real, and this basis, when properly equalized, to bring any two classes of traffic on a common level of expense, must reflect actual conditions and afford a sound and safe basis with which to divide the expense. The weight of opinion and the weight of action sustain it, and it has met the approval of this Court as a fair and equitable basis on an analogous issue.

## MAINTENANCE-OF-EQUIPMENT.

*The Car-Mile Basis the Factor.*

There should be no controversy over the car mile being an absolutely fair factor with which to divide freight car repairs between local and through trains on one side and coaches and mail and express cars on the other, because the railroads and the State alike use it. If unfair, as Messrs. Gray and Ward say, then, as they admit, it is unfair for the railroads to use it, and their accounts predicated on it, necessarily fail of proof.

In statement 5, exhibit 3, page 2310, wherein the bases for dividing expense are given, and by which the expenses apportioned to Arkansas are obtained, this is found:

"*Maintenance of Equipment*: This account includes all cost of repairs, renewals and depreciation of cars and locomotives, also shop machinery and tools. The cost of repairs, renewals and depreciation of equipment being of a general nature, and not applicable to any particular State, is divided between all States upon the basis of the

mileage of each class of service in each State. The cost of repairs to shop machinery and tools, stationery and printing and supervision is divided between States upon the basis of the total engine mileage over the territory under the jurisdiction of each shop superintendent. The cost of repairs to freight and passenger cars are compiled separately and all expense of a common nature is divided between freight and passenger upon the basis of the number of train miles in each class of service." (R. p. 2310.)

The method used by the State was approved by the many witnesses called upon the subject, and we will omit reference to this testimony. The attack upon it was unusually weak. It was principally made by Mr. W. H. V. Rosing, Mechanical Engineer of the Missouri Pacific and Iron Mountain System. Mr. Rosing, as becomes a mechanical engineer, is extremely exact. He takes up many questions of car repairs and says that the car mileage will not reflect their cost, and that they can be accurately ascertained and that this basis does not do it and works unfairly for the many technical and minute reasons he gives. (R. pp. 1726-1736.)

It may be noted in passing that Mr. Rosing is a strong advocate of the ton-mile basis for dividing expenses, especially maintenance-of-equipment. (R. pp. 1746-7.) May Mr. McPherson pardon him!

Finally, Mr. Rosing's attention is called to the fact that these expenses are all pooled in the Missouri Pacific System and the proportion allotted to Arkansas obtained on a car-mile basis; and he at first says that the car mileage is fair between States but not between local and through freight trains and passenger coaches and mail and express (R. pp. 1751, 1764-5), but, on the plan being further explained to him, he recedes from this position, and concludes his testimony as follows:

"Q. In other words, is not this a fact: if you use the actual figures in one case you should use them in the other?

A. I should say so.

Q. If you use the unit which is a relatively correct unit, in one case, you would have to use it in the other, wouldn't you?

A. Yes, sir." (R. p. 1769.)

Every one must admit that the actual apportionment is better, and every one must admit that if actual figures are not obtainable for both purposes, and a relatively correct unit used to obtain the total expense for freight car repairs (and on the other side pasesnger coaches, baggage cars, mail and express cars) apportioned to Arkansas that the same relatively correct unit must be used in apportioning that total sum between the classes of cars for which, as a whole, it is obtained.

Mr. Nay also criticises it, but principally because there is a change of units from train mile to car mile from the division between pas-

senger and freight to the division between local and through, and between coaches and mail and express cars. (R. p. 1824.)

Mr. Wharton has heretofore explained that he did not study or consider the train mile division between passenger and freight. He merely used the railroad division to get a starting place to work out his plan of dividing between interstate and intrastate.

Mr. Ward says it is a wrong division, either between service or States. (R. pp. 1888-9.)

He says that its use to divide expenses between the nine States of the Missouri Pacific System as a basis for obtaining expenses to test rates in a rate suit is unsound (R. p. 1875), but finally, while adhering to its unsoundness, says there is "closer similarity" between States than local and through trains. (R. p. 1893.)

He overlooks the fact that between the local and through trains, as hereinafter explained; the dissimilarity is overcome by charging all extra cost of the local over the through to the local train.

Mr. Gray is more emphatic than Mr. Ward in denouncing the car mile decision, but works out a fairness for it between States and an unfairness between trains. (R. pp. 1941-4.) He says in the latter division a distinction enters between long and short haul. (R. p. 1950.) Mr. Ludlam points out the absurdity of such a criticism of the car mile. (R. p. 2273.)

Like Mr. Ward, he overlooked the fact that the difference between the trains is nicely equalized in the allowances mentioned heretofore and which are explained more fully hereafter.

*Supporting Car-Mile Basis For M. of E.*

The first testimony to which we wish to call attention is that given by Mr. Stewart R. Knott, at one time Vice President of Louisville & Nashville Railway Company, and later President of the Kansas City Southern Railway Company; and Mr. S. C. Johnson, General Auditor of the St. Louis Southwestern Railway Company (one of these plaintiffs), and the quoted testimony of Mr. Peabody, "a statistical expert" of the Santa Fe System, before the Postal Commission.

Their testimony was read to Messrs. Rosing and Gray (R. pp. 1747, 1748), 1962, 1963), and they disagreed with it.

The gist of the testimony given by these gentlemen before that high tribunal, investigating the postal service of the United States, and the fairness of mail contracts to be let by it, was this:

Messrs. Knott and Johnson testified that the car mile division of expenses between passenger coaches and baggage cars on one side and mail and express cars on the other was fair and equitable. They say that if this basis is subject to any criticism it is because the mail cars are more expensive to maintain than the passenger and express cars. Mr. Peabody's testimony in another connection was quoted before the Commission; he was advocating between express cars on

one hand and mail cars and coaches and baggage cars on the other, the car mile division of the expenses of the equipment.

Surely the State was justified in adopting the judgment of these eminent railroad officers given before a commission of the United States, wherein they say the car mile is a fair and equitable basis for this purpose, and it was adopted by the State exactly as they said it should be used.

*The State's Experts on M. of E.*

The value of the testimony of an expert, aside from his honesty and fairness, is his experience and technical training on the subject under consideration. Tested by this, by far the weightiest testimony on mechanical and the technical sides of the question now under consideration, is that of Mord Roberts. He says: "A. I am a machinist by trade; learned my trade in the city of Philadelphia, in the Baltimore Locomotive Works; transferred to the Pennsylvania Railroad Company, 1873, as machinist, and after a year and a half's service as machinist went on the road, firing a locomotive ten months; promoted to the position of locomotive engineer; ran a locomotive there until July 12, 1876. Dismissed for collision Centennial Yards in West Philadelphia; reached St. Louis July 16, 1876, and took service with the St. Louis, Iron Mountain & Southern Railway as machinist, July 17, 1876. Continuously in the employ of the St. Louis, Iron Mountain & Southern Railway from that date until May, 1899, as machinist, locomotive fireman, locomotive engineer, traveling engineer, general foreman of shops, De Soto, Missouri; Master Mechanic at Little Rock; for last six months' service, General Master Mechanic, Iron Mountain Railroad, with offices at De Soto, Missouri; two years as General Master Mechanic, Louisville & Nashville Railroad, headquarters Louisville, Kentucky; three years Superintendent of Machinery, Kansas City Southern Railway, part of the time with headquarters at Kansas City and the remainder of the time headquarters, Pittsburg, Kansas; leaving the railroad service entirely, August, 1904." (R. p. 2106.)

We have not quoted at length Mr. Rosing's reasons against the injustice to the coaches of putting them on equal basis with mail and express car because his conclusion finally agreed with the State's basis above outlined; but, while on the subject, we think this excerpt from Mr. Roberts will put at rest any question of the fairness of it. We desire to rely upon the fairness of the basis more than its conclusive effect by reason of its adoption by the plaintiffs:

"A. The cost of maintaining a vehicle in a passenger train varies considerably owing to the size or dimensions of the vehicle; that is, if it was a passenger coach or baggage car or express car; the express cars, baggage cars and mail cars are usually closest to the engine: the greatest amount of damage and expense to maintaining the draft gear, underframing and trucks, is usually applicable to the cars that are handled closest the engine, for reasons that is obvious, I guess

to you; in the first place, those cars have to take all the shock and stress, due to starting of trains, and the damage to roofs and exterior finish, as a result of cinders and gases from the locomotives; but other than those damages, the coach has a damage that does not enter into the baggage car or express car, and that is the damage to interior finish, lamps, and sash locks, and upholstering damaged sometimes by passengers, and, as I said before, they pro rate this cost between the cars; it doesn't take as much labor or varnish to cover a 50-foot car as it does a 70-foot car, and where the dimensions were practically the same, I would not make much difference between the kind of vehicles in the train, for I believe the damage to the cars nearest to the engine, as a result of the items I have just mentioned, is compensated for by the interior damage done to the passenger coach by the traveling public.

Q. Taking it by large and by small, you think one would about equalize the other?

A. I believe they about equalize each other." (R. p. 2115.)

Mr. K. P. Alexander gives his technical experience:

"A. I was a machinist about ten years, part of the time with the Missouri Pacific—machinist at St. Louis, Missouri. Later I was with the Frisco as machinist and Division Foreman at Newberg, Missouri, and at Fort Smith, Arkansas, about fifteen years.

I was then Master Mechanic for the Fort Smith & Western Railroad Company, in charge of all power and equipment, at Fort Smith, Arkansas—office at Fort Smith, Arkansas, for the period of two years." (R. p. 2158.)

On this particular subject Mr. Alexander testified as follows:

"Q. Now, not taking the figures derived from the pool, but upon car mileage basis, per mile run, separating the express and mail from the coach and baggage, what is your opinion on that, that is what I am asking?

A. Covering the matter, what we generally call car repairs, I should think the greatest expense would be on the car nearest the locomotive, on account of it having to absorb the shock of all the loads or cars behind it, which would mean that there would be less damage to the coaches than there would be on the baggage cars or mail cars. Very little cleaning at terminals is done to the mail car, express car and baggage car—

Q. Cleaning, Mr. Alexander, goes in another account, that is not the car repairs, that goes into the transportation account, that doesn't go into the car repair account, so you can exclude that from your consideration.

A. Then you want just the car repairs, everything pertaining to repairs?

Q. Yes, sir.

A. I have no figures; never kept any figures on that point, and from my experience, I doubt if it is usually done, and I would hardly know how to estimate it.

Q. Which goes into the shop more often, the car next the engine or the coach?

A. The car nearest the engine, it would go into the shop oftener, for the reason it would receive all the shock of the entire train, and the gases of the coal burning in the engine, and the cinders, would damage the roof more quickly than it would do further back in the train, but I presume there would be some compensating elements on the other side, about painting, varnishing, putting in glass, and so on, in the coach.

Q. Taking it by large and by small—the general average condition, what would you say as to the division of the car repairs, the mail and express on one side and the coach and baggage on the other—the damage to the baggage and coach as against the mail and express, what yould you say as to the repairs?

A. Well, the coaches are very much longer than the baggage or express cars, and the mail cars are usually also longer, which would require more painting and more varnish than for the shorter cars—the question is a little bit ambiguous.

Q. I will make myself clearer; the question is to separate and get the mail and express expense out of the passenger expense, and they have used the car mile basis and apportioned that expense, taking the mail and express on the one side and the baggage and coach and everything in passenger traffic from the other side—I understand your testimony is, the greatest injury to the cars would be to those toward the front—that is to starting and stopping and to paint and varnish?

A. Yes, sir.

Q. On the other hand, there would probably be more injury to the interior of the coach, the glass, upholstering, of the coach and things of that kind?

A. I think so.

Q. The question is this: treating them alike, has any injustice been done to either traffic—treating them *alike* on the car mile run?

A. I haven't ever kept any data on that; it is a very difficult question to answer; but then from my observation I should imagine that it would be about fair.

Q. The coach would likely get more repairs, but wouldn't get into the shop as often? That would probably be about the situation?

A. Yes, sir." (R. pp. 2164, 2165.)

Summarizing the evidence on this on the basis used for these maintenance-of-equipment expenses, the car mile:

It is supported generally by opinion evidence of many of the State's witnesses, supported by Messrs. Knott, Peabody and S. C. Johnson, in an investigation which would call for the utmost candor. Supported by Mr. Rosing, who says when actual data is not used for the initial sum to be apportioned, but a relatively correct unit, that the same unit should be used for these purposes; supported by Messrs.

Roberts and Alexander, disinterested and thoroughly qualified experts. It is opposed by Messrs. Nay, Gray and Ward; none of them with technical knowledge of the subject possessed by Rosing, Roberts or Alexander.

The preponderance, again, is with the State:

## STARTING AND STOPPING EXPENSES.

A source of much conflicting testimony was the proper allowance to be made against the local trains for additional stops of it over the through and the consequent injury to equipment from this cause.

Mr. Maurice Wright, who served for seven years as a traveling auditor on the Iron Mountain, and whose intimate knowledge of every mile of its road and every train run on it was of great service to the State in getting at actual conditions, testified:

"Taking the Iron Mountain System in Arkansas, I think that five miles average stops for local trains is very nearly accurate, and that twenty miles for through trains is a very fair average; that is my opinion, based on having frequently ridden on through freight trains and very frequently on local freight trains." (R. p. 1388.)

This was the basis used by the State, counting the local as stopping every five miles, the through every twenty, and charging four times as much to the local on this account. While Messrs. Gray and Ward said this ought to be eight times and the plaintiffs, in their correction of the State's plan (their exhibit 56), use eight times, we believe in was a confusion of issues and not of facts. The plaintiffs' witnesses laid much stress on the extra stops of the local over the through and the consequent greater injury to equipment. Especial attention is called to Mr. Doddridge on this point. (R. p. 489.) It is a recognized fact, and one of the elements for which proper compensation must be found.

That the stopping was correctly estimated was admitted by plaintiffs' counsel in a question to Mr. Gray. To it and Mr. Gray's answer your attention is especially directed:

"The State's accountant has made an assumption that each local train makes a stop each five miles, and each through train makes a stop for each 20 miles. That assumption is based upon the evidence of operating men of the Iron Mountain railway and we have no complaint to make of it.

Now, for the purpose of ascertaining the relative expense, the accountants have in determining the starting and stopping expenses, multiplied the local car miles by four, in order to account for the more frequent stops of the local train. Then they have in addition to that assumed that each car in local service requires two terminal handlings, to each terminal handling of a car in through service.

Now, I wish you would look at that and state if you think a sufficient allowance has been made there for stopping and starting of cars in local service?

A. There is as wide a variance as it is possible to conceive between two similar things, between a stop of a local train and a stop of a through train; in every-day practice.

The stop of a through train is most frequently for transportation or operating reasons; that is, it is a stop to take a siding for or to meet and holding the main line for the opposing train. It is usually unaccompanied by any more work than the taking of the sidetrack or holding the main line while the other train takes the sidetrack.

The local freight trains perform the greatest amount of its functions in connection with a stop of that kind. It may be hours' duration, or it may be short. It is all dependent upon the work required at that local station, as differentiated from the through train which has no work whatever to do.

I would say that an allowance of four times, which is predicated solely upon the fact that the stops are four times as frequent, is wholly unfair. I am not prepared to say what it should be, but it should be several times that." (R. p. 1902.)

That Mr. Gray, and likewise Mr. Ward (R. p. 1867), confuses these issues, is apparent from the following quotation from Mr. Roberts and Mr. Ludlam:

Mr. Roberts says, after the above quoted testimony of Mr. Gray was read to him:

"A. It occurs to me, if I might suggest there, that Mr. Gray has got two items mixed; it is the switching that he has reference to, that adds to the expense that the local would have.

Q. I am inclined to think you are right, but I don't know; I am just giving you in his own language, his entire statement on the subject.

A. The damage in stopping the train with the air brake, is to each individual vehicle in the train, which includes the wear on the wheels, brake shoes, and the brasses, and the local trains, as a rule, are light tonnage trains, and not near as many vehicles in the local trains as there is in the through train, and the damage to stopping a local train could not possibly be any greater than it would to a through train, and with the damage based upon each individual vehicle, if the local train had more cars than through trains, the damage would be greater, and if it had less cars, the damage would be less.

Q. For your information, I will state, that the statistics show that the average local train is 16 cars, and the average through train is 32, and on one road, 33. We are referring, of course, not to the expense per train, but the expense per car.

A. The expense per car should not be any greater.

Q. From this cause to any one train over the other?

A. The cost of stopping and starting, the greater expense would be to the train that had the greater number of vehicles in it—the greater tonnage, simply because the strains and stress would be that

much more severe on the cars nearest the engine; that is my way of looking at it, and that has been my experience; I don't think, in the damage to starting and stopping, we can consider the damage or cost of station switching." (R. pp. 2110, 2111.)

This occurs in Mr. Ludlam's testimony in surrebuttal:

"Q. Mr. Ludlam, in an exhibit filed by the railroads, number 56, (this is the exhibit which we term the correction of the State's plan. It is ostensibly an effort to correct the State's plan, using in some particulars, the State's bases, and in others their own), in 'Maintenance-of-Equipment' subdivision (b), under the head of 'stopping and starting,' the railroads have put this in:

'Car miles, same, with local car miles multiplied by eight.'

In an exhibit filed by the State the same factor was used, except the multiple was four, representing (as explained in the testimony), four stops of the local as against one of the through: Now, I assume that this 'eight times' is based upon the testimony of Mr. Gray and Mr. Ward, which I want to read to you." * * *

Then the testimony of Mr. Ward, and the above-quoted testimony of Mr. Gray was read to him, after which he was asked if they were correct in using the multiple eight instead of four, and said:

"A. No, sir. The multiple of four is used to apply to the question of starting and stopping only. The question of the increased cost of the terminal handling on the local train is covered by a separate allowance.

Q. Where is that? Point that out. I think these gentlement just failed to understand that and I want you to point it out.

A. That is on the same exhibit, under subdivision (b) 'Maintenance-of-Equipment.'

We make an allowance just below the allowance referred to for stopping and starting. We make an allowance for terminal handling by multiplying the mileage of the cars in the local trains by two and using the mileage of the cars in the through trains as they were.

Q. What does that represent, Mr. Ludlam?

A. That represents that on the average the cars in the local train will receive two terminal handlings to one terminal handling on a through train. That is in the case of the Iron Mountain, I am referring to.

In the case of the Cotton Belt we allow four terminal handlings on a local train to one terminal handling on the through train.

That is based on the premise that the local train will start out with a load of cars and that it will distribute all of those cars during the course of its run, and that during the same run it will pick up an equal number of cars, which it will carry into the last terminal.

That assumes that every car on the local train will be set out during the course of the run of the local train and another car picked up in its place. As a matter of fact there are some of the cars that

start out of the terminal, on a local train, that go through to the end of the run of the local train without being set out.

Q. That operates as a maximum as against the local train on this terminal handling between division points?

A. Yes, sir.

Q. And it is the very item that Mr. Ward and Mr. Gray discuss, is it not?

A. Yes, sir.

Q. I presume those gentlemen had not studied the exhibit carefully enough to see that that is taken care of.

A. I should assume from their evidence that they did not understand the exhibit.

Q. To take the eight times, as done there, would practically amount to doubling all these cars set out, and every car set out and in, would it not, following your plan?

A. It would be an attempt to provide for the terminal handling under the specific allowance made for stopping and starting, although, as I have already stated, the terminal handling is taken care of in another place.

Q. It occurred to me at one time that probably they were confusing that stopping and starting also with the terminal handling in the division; is not that taken care of?

A. Yes, sir.

Q. And this is merely the terminal handling between the divisions?

A. Yes, what you might call 'on the road.'

In that connection I would like to say before we get away from that, that we consider an allowance of four stops of the local train to one stop of the through train, as being the maximum that could possibly accrue to the local train for the stopping and starting expense.

Q. I think Mr. Ludlam, subsequent developments have proved that it was the maximum.

A. The same remark would apply to the allowance which we made of two terminal handlings for the cars on the local trains. We thought that would be the maximum that could possibly be reached." (R. pp. 2267-2269.)

We have gone into this, probably, more fully, than the importance of the subject justifies, to prove that the State's plan was right, and the criticism of it on this score which was carried forward into exhibit 56, was a palpable blunder on part of the plaintiffs.

Although the correctness of Mr. Wright's basis of a stop every five miles for the local to a stop every 20 miles of the through was expressly conceded, the State took further testimony on it, and showed it was a maximum.

A. Paulette served as brakeman for years on the Iron Mountain in Arkansas, then for five or six years as freight conductor on both

local and through freight trains. He served a long time on the Central Division, from Little Rock to Van Buren, one of the heavy divisions of the road, and takes up this question of the stops of local and through trains in detail.

He shows, through much detail, that on account of stops for water, at junction points and for orders and for passing trains, that the average through train can not make more than 10 miles without a stop; he reduces the stops of the local train to something under one for every five miles, about four. (R. pp. 2204-2213.)

This is the substance of all the testimony on this subject which we can find in the record.

Judge Trieber, in his opinion, says:

"The Court finds from the evidence that while the local train stops every five miles, the through trains stops every 35, and for this reason, the local trains are chargeable with seven times as much for that item as through trains." (R. p. 2624.)

So far as we can find, we have given the substance of all the testimony on this issue, and can find nothing to justify the 35 miles for the through.

Exhibit 46 (R. p. 2412), gives the stops of the through passenger trains as every 36 miles. The testimony of Mr. McPherson (R. p. 319), is that the through passenger trains stop on an average at intervals of 35 miles, while the local trains stop every five miles; and he calculates that the passenger mile division of expenses fails to consider these differences between the two trains, while the expense incident to the frequent stoppage is relatively seven times greater.

Probably in the mass of testimony, the learned Judge overlooked that this was referring to passenger trains, while the subject under consideration was local and through freight trains.

While somewhat a digression to save returning to this subject, Mr. McPherson said the through trains on the Central Division stop every 17 miles. (R. p. 319.)

Later, so as to avoid confusion as to what were local and what were through trains, both passenger and freight, Mr. McPherson was called up to file an exhibit classifying all trains running during the last six months of 1907. (R. pp. 377, 378.)

The State accepted his classifications as official (he was assistant to the General Manager), and it has removed any controversy on this subject. His exhibit 46, made in response to this, shows only eight of these through passenger trains, and those he referred to as through passenger trains on the Central Division, stopping every 17 miles, were local trains.

The starting and stopping on the passenger side is cared for by dividing that expense with mail and express, and the passenger portion divided between intrastate and interstate on the passenger mile basis. The greater intrastate passenger mileage absorbs the greater

part of it, being 58.71 per cent intrastate, and 41.27 per cent interstate. (R. p. 2539.)

The fact that the bulk of the 30,000,000 interstate passenger miles are necessarily made on the 48 local trains, removes, entirely, Mr. McPherson's theoretical objection to this basis for train costs. He was theorizing that the local train was the vehicle of intrastate passenger traffic, while the facts are, practically 85 per cent of the trains are local, carrying the bulk of both classes of the traffic.

Returning to the freight side of the problem, we submit that it is established that a stop four times on the local to one on the through is a maximum allowance against the local, and consequently, resulting, as all maximum allowances against the local ultimately do, in burdening the intrastate with more than its fair share of the expense.

The load of the local freight train is 71.49 per cent interstate, and 28.51 per cent intrastate; the through 5.59 per cent intrastate, and 94.41 per cent interstate. (R. p. 1005, and exhibit "I," p. 2516.)

Yet, the total interstate carried on the local is only 8.70 per cent of all the interstate, while the total intrastate carried on the local is 39.10 per cent of all the intrastate. (R. p. 2615.) Therefore, all these heavy expenses of the local ultimately fall on the intrastate in the proportion that 8.70 per cent bears to 39.10 per cent; and while 60.90 per cent of all the intrastate is borne on the through trains, yet, that only represents 5.59 per cent of the cost of the through.

As seen in exhibit "K," page 2531, there are the percentages ultimately applied for the division of expenses between these trains, found on the data shown in exhibit "I."

Having obtained the relative number of stops for the two trains, then the next problem was to find the amount of injury to the equipment attributed to this cause. The plaintiffs' witnesses, in enumerating the various causes of extra expense of the local over the through, laid great stress on this element, and it was a recognized element and must be properly cared for in any system of distribution of train costs between these two classes of trains.

*The Wellington Table.*

In the State's plan, the proportion of injury for these causes was allocated pursuant to a table prepared by A. M. Wellington, as the result of experiments on the Pennsylvania railroad. It is a text book called "The Economic Theory of Railway Location." (R. pp. 2523 and 1741.) According to this table, 21.5 per cent of the injuries to freight cars is due to stopping and starting, and 13.5 per cent to terminal handling.

The authority of Wellington's work, and its corroboration by recent technical data, was brought into evidence through Mr. Parker, engineer of the Texas Railroad Commission. The testimony is as follows:

"A. Yes, sir; we used it as a text book in my studies in engineering department at college.

Q. How is it regarded among engineers, and men studying the questions that are treated in his work?

A. It is taken as authority.

Q. Some question has been raised as to the date of Wellington and the date of this table from which this was taken; I believe it has been put back as far as 1887, the date when it was made; have you given any consideration to the effect of time upon these items?

A. Yes, sir; some.

Q. Have you any authority that would show any reasons or show any changes in the conditions?

A. I have before me the report of American Railway Engineers & Maintenance-of-Way Association, volume 5, of 1904, and on page 695 is a statement similar to Mr. Wellington's with some slight changes, which was compiled by Mr. G. B. Berry, now chief engineer of the Rock Island System.

Q. Read into the record so much of the statement as is pertinent here?

A. He contributes in table 2, on the page heretofore given, the statement showing the distribution of cost of locomotive repairs on the Union Pacific Railroad, and he applies to freight and work engines 7.35 per cent of the damage due to getting up steam and terminal work, and to switch engines 12.474 per cent.

Q. 12.47 where 13.05 is allowed in Wellington?

A. These figures I have just given apply to locomotive repairs; the figures quoted here from Mr. Wellington are applicable only to freight cars; the figures given by Wellington for damage due to stopping and starting at way stations is approximately 21.5 per cent, and Mr. Berry's table, the repairs to cars due to the same service is 20 per cent, and the repairs due to terminal handling in Mr. Wellington's quotation is 13½ per cent, and Mr. Berry's is 16 per cent.

Q. Makes a total of 36, where Wellington's total makes a total of 35?

A. Yes, sir." (R. p. 1165.)

Mr. Parker expressed the opinion that as applied to local and through freight trains in the Southwest, their percentage more than caused those contributing causes to the injury to freight cars. (R. p. 1166.)

*The Attack On Wellington's Table.*

Mr. Rosing makes a strong attack on the Wellington tables, and gives extended and technical reasons therefor, ending with a table of his own, assigning, according to his judgment, 32 or 33 per cent for stopping and starting, and 24 or 25 per cent for terminal handling. (R. pp. 1727-1731.) Aside from the technical features, which we will not discuss, his argument is this:

Wellington's book was written in 1887, the tables prepared in 1877, that freight cars only had one truck and brakes operated by hand.

Since, then, the brake rigging has been changed, and none of the old brake rigging is applicable today; and air-brakes are applied to both trucks.

The entire brake arrangement is quite different, and the maintenance very much more than stated by Wellington. Drawbars and sills, which Wellington puts at 15 per cent, he thinks should be 35 per cent.

He takes up the technical details of the Wellington table, and discusses them fully, and says they should be charged to fit modern conditions. (R. pp. 1728-1732.) He also brings in another factor adding to greater maintenance expense in modern railroading; that the use of automatic couplers and air-brakes, relieving the trainmen of exposure to danger, render them more careless in operating the trains, thereby causing more injury from these causes. (R. pp. 1731, 1732.)

He says he has always heard Mr. Berry spoken of as a man standing very high in his profession, but he says he is a civil engineer, while he (Rosing), is a mechanical engineer. (R. p. 1740.)

He disagreed entirely with Mr. Berry and seemed unable to understand Mr. Berry's paper and its exact application to the subject in hand. (R. pp. 1740-1758.)

The leading parts of this article which was read in 1904, before the "Railroad Engineers and Maintenance-of-Way Association" (R. p. 1741), is given at pages 1759-1763.

Mr. Berry was at that time Chief Engineer of the Union Pacific Railroad, and at the present time, Chief Engineer of the Rock Island System.

To show the thoroughness of his work, and the scientific basis upon which it has worked out, these excerpts, ending with the table in question, are given:

"In order to determine the relative merits of different locations, values must be ascertained for each detail affecting operating expenses. 'The Economic Theory of Railway Location' by Mr. A. M. Wellington, treats the entire subject fully. In this work Mr. Wellington has given to engineers a logical method of obtaining the values for distance, curvature, rise and fall and gradients, but the modern classification of operating expenses as adopted by the Interstate Commerce Commission gives these expenses in greater detail than could be obtained during the life of Mr. Wellington. This detail is of material assistance in following out Mr. Wellington's general method, as it lessens the chance for error in judgment as to the proportion of each item of expenses which will be affected by changes in the details of location.

Prof. W. L. Webb, in his recent work on 'Railroad Construction' has developed values for the various details, following the general method given by Mr. Wellington, but using the classification and figures given in the reports of the Interstate Commerce Commis-

sion for the entire railway system of the United States. A study of these reports shows that the average cost per train mile in the more populous States is less than in the States west of the Missouri River.

In order to obtain a value of these details of location for the use of engineers in the Western States, the general methods of both Mr. Wellington and Professor Webb are applied in this paper to the operating expenses of the Union Pacific Railroad Company."

* * * * * * * * * * * * *

"Before proceeding to consider the value of gradients, distance, etc., it is necessary to obtain some basis for arriving at the proportional percentages of the more important items that are affected by changes in location. In many of the smaller items judgment alone has to be used, and in most of such cases, a wide variation in judgment will produce but a slight change in the final figures. In the larger items of maintenance-of-way, maintenance-of-equipment and conducting transportation, the reports of the various departments for the four years covered by Table No. 1, have been studied, and the conditions as they exist on the Union Pacific have been considered. The reasons for adopting these percentages are given in detail in Wellington's 'Economic Theory of Railway Location.' Tables Nos. 2, 3, and 4, together with the following notes, give some additional reasons, and also explain those points wherein percentages different from Wellington's have been used."

"*Maintenance-of-Equipment.*—From the annual locomotive performance sheets and statistics of train service it is found that total train mileage is but 75 per cent of total locomotive mileage. Table No. 2 is similar to a table given by Wellington, the total cost of locomotive repairs being prorated between the different classes of service according to mileage. The distribution with reference to contributing causes is changed somewhat to fit the conditions on the Union Pacific, curvature on the Union Pacific averaging 17 degrees per mile, whereas Wellington assumed 30 degrees per mile."

* * * * * * * * * * * * *

TABLE NUMBER THREE.

"*Statement Showing Distribution of Cost of Car Repairs on Union Pacific Railroad.*

| CLASS OF SERVICE. | Total cost per cent. | Distribution of contributing causes in per cent. | | | | | |
|---|---|---|---|---|---|---|---|
| | | Time and exposure. | Stopping and starting. | Switching. | Curvature. | Grades. | Distance. |
| Passenger ..... | 100 | 11 | 20 | 11 | 2 | 20 | 36 |
| Freight and Work. | 100 | 6 | 20 | 16 | 2 | 20 | 36" |

(R. pp. 1759-1763.)

Mr. Nay says:

"The addition of the air brake I am sure would cause quite a change in those expenses. That is to say, in 1877, when a train was stopped it was stopped by the use of hand brakes. The brakeman would climb on top of the cars and set the brakes on one car and then on to the next, and the stop was bound to be gradual, under those conditions. While today, with the use of air brakes, stops are frequently made with great suddenness, such as to cause considerably more damage by stopping than in the days when hand brakes only were used.

Q. You think that per cent would be increased?

A. If it was 21.5 per cent in 1877, I am sure it ought to be much greater now." (R. p. 1829.)

Mr. Ward says he has examined Wellington's Treatise, and he does not know what hypothesis he pursued to reach the conclusions reached, but it was written 30 years ago, and in his "opinion, his figures can not be verified by any test in modern practice, because the repairs due to terminal handling are very much greater at the present day than 13.5 per cent."

As to stopping and starting at way stations, he does not know, but thinks the percentage too low. (R. p. 1860.)

He gives his reasons fully.

Mr. Gray criticises it much along the lines of Mr. Ward: He says these matters can not be ascertained, and such a table is a mere guess, and any tests made prior to 1887 would be valueless. In his judgment, the proportions between starting and stopping and terminal 35 per cent to 65 per cent for other causes, should be reversed. (R. p. 1900.)

Mr. Gray admits he was not familiar with Wellington's book. (It was shown that the one from which the table in question was taken was the 1908 edition.)

He says that he knows Mr. Berry intimately, and he would not give much consideration to the matter, but for the respect he has for Mr. Berry.

He says that "if Mr. Berry has stated, and it is in evidence, how he arrived at those figures, and they are no arbitrary assumptions, they would have a good deal of weight." But he says if Berry agrees with Wellington's proportions, he believes both are manifestly wrong. (R. pp. 1957, 1958.)

Mr. Berry has stated the methods of arriving at the contributing causes, based on tests on his road, reinforced by much scientific data, and they are certainly not arbitrary percentages, but scientifically worked-out results.

His article was read before men of his craft, an audience capable of scrutinizing it with scientific accuracy, and no man of Mr. Berry's position and standing would go before his profession with carefully worked-out "arbitrary assumptions." The operating men like

Mr. Gray and Mr. Ward have their opinions, but they must give way to such data as this.

The State might safely rested its case on Parker, Wellington and Berry v. Rosing, Nay, Gray and Ward, but it did not. Mr. Rosing made the point that a mechanical engineer could best pass on this subject, inferentially (but with due modesty), indicating that his qualification to pass judgment upon this subject was better than civil engineers. The State called two mechanical engineers, Roberts and Alexander, whose training and work furnished the same qualifications as Rosing's. In addition, called a roadmaster and experienced trainmen, who had operated trains under the old order and the new order, and showed that if Wellington's percentages were right at the time made, that the change in equipment instead of increasing, decreased these items of injury to freight cars.

*The State's Evidence on Starting and Stopping.*

So that the Court can grasp the converse of Rosing's proposition we quote that explanation from Mr. Roberts:

"I wish you would express your opinion, based upon your experience, as to the effect of the latter day equipment, to which I have referred, as contrasted with the link and pin equipment and the hand brakes, in so far as it affects injuries to freight cars?

A. Does that refer to the item of stopping and starting?

Q. I have included in my question both of them; probably you had better answer them separately; stopping and starting is one item, which Wellington gives at 21½, and switching, which he gives at 13½; they are grouped together in this exhibit as 35; I expect it would be better to treat them separately.

A. It was my experience, while connected with the railroad, that the application of the vertical plane coupler, with the improved draft gear, and also the completion and application of power brakes, to the train, had eliminated largely the damage accruing from stopping and starting in the train, local or through, and I believe I am familiar with Mr. Wellington's table, and as you stated, we all looked upon that as authority in its day, but that would not apply now to the changed conditions.

Draft gear and car underframing, has been designed and reenforced with a view to eliminating that damage; I remember very distinctly, when at almost any freight yard or at any intermediate terminal along the Iron Mountain railroad, during the days of the link and pin coupler, that at nighttime, you would need a lamp to get through it and keep from falling over drawbars, and draft timbers, pulled out in the ordinary handling of trains.

The item of caboose chains or car chains in caboose—we used to have to re-enforce springs in our cabooses and to carry chains to chain up cars that would be damaged on the road by pulling out of drawbars; that was largely due to the braking of trains, all from the hind end of the train. They used to have a very severe brake in

the caboose, and they would set that up, with the immense amount of slack that there was in the link and pin coupler, and if the train was of any length, it would very often pull out a drawbar, and the contributory damages, as a result of that—of the drawbar dropping down on the ties—perhaps would not come out of the socket entirely —I have known of many very severe and expensive freight wrecks, as a result of that, which is almost, or was when I left the service, an unheard-of thing, and we have knowledge of those things and I believe it is fair to presume that Mr. Wellington's figures today would be 50 per cent too high for the item of expense due to stopping and starting of trains.

Q. Assuming that his table was correct, as near as such tables could be in the day it was written, of 21½ per cent to that cause, you would now ascribe what per cent?

A. Not to exceed 12½, and I think 10 would be nearer the figure.

Q. What do you say on the other proposition—assuming that 13½ per cent would be correct for switching, under the old order of things, what would be the difference now?

A. It is very evident that cars are handled very rough, as a result of switchmen not being compelled to go between the cars to couple them, which applies also to cars broken on the road, but as I stated in the other case, owing to the design of the draft timbers and rigging generally, which was all taken into consideration when the changes were made, the yard damage is not near so great as it used to be; that is due to the fact that the cars are built very much stronger—to take the cars that we used to operate, 15 years ago, and handle them the way they handle them now, why you wouldn't need anybody only the switchmen, to break them up; they wouldn't stand it at all, but the expense to build those cars, to fit them for the purpose of resisting the rough usage, has been very much greater, but with a view, of course, to reducing the cost of maintenance.

Q. That additional expense would be reflected in the capital account, not in the repair account?

A. No, sir; that would not be taken into the repair account, and my judgment is that Mr. Wellington's figures are 25 to 40 per cent too high, as applicable in these days." (R. pp. 2108, 2109.)

Mr. Roberts was cross examined with great thoroughness on that subject, but like all well informed men on his subject, was able to explain his reasons, fully, intelligently, and in detail.

Mr. Alexander thus concisely states the proposition:

"From my observation and practical experience, I would say that the percentage should then be somewhat less, for the reason that all power and equipment was, during that time, and has previously been made much more substantial than it was during the time of the link and pin couplers, and during the time of the hand brake—all parts being strengthened to take care of the additional weights and additional length of trains and the heavier equipment, and I believe

that the percentage would be possible one-half of the percentage of the link and pin percentage." (R. p. 2159.)

Mr. Alexander says there were few changes in equipment from 1904 to 1907 (the former the year both he and Roberts left service, and the latter the period of our inquiry.)

On June 30, 1904, over 90 per cent of the equipment had been supplied with air brakes and automatic couplers. (R. p. 2167.)

Assuming Berry's table to have been prepared on data gathered three or four years prior to 1904, which were transition years from link and pin and hand brakes to automatic couplers, and air brakes, he says the starting and stopping percentage should be materially less since the equipment has been completely modernized. (R. p. 2162.)

Mr. Simmons served as roadmaster and division engineer on the Iron Mountain. He gives many practical reasons based on his observation under link and pin and hand-brakes equipment, and under modern equipment to show why the starting and stopping and terminal injuries should be less under modern equipment than under the old order. (R. pp. 2171, 2172.)

Mr. Paulette served as switchman, fireman, brakeman and freight conductor, his service being from 1885 to 1906. He is familiar with handling trains and equipment under both the old and modern systems, and he explains, practically, why there is less injury to the cars under the present method. (R. p. 2211.)

D. L. McNew was in railroad service from 1882 to 1906, as brakeman, freight conductor, yardmaster. He explains why the Wellington percentages for the stopping and starting should be less now than under the former system. (R. p. 2100.)

By men handling the cars receiving the injuries from these controverted causes; by the master mechanics who repaired the injuries; by the roadmasters and yardmasters gathering up the wreckage from them; by scientific engineers and by practical tests, made by men of the highest professional standing, Mr. Rosing, Mr. Gray, Mr. Ward and Mr. Nay are overwhelmed in their attack on the State's distribution of this expense.

## YARD AND TERMINAL EXPENSES.

Yard locomotives serve both local and through trains, and the expense was divided on basis of number of cars of each class of cars handled by the yard engine during the period. (This falls under maintenance-of-equipment.)

Other yard and terminal expense, after separating the station expenses at terminals, are divided according to number of cars handled in the yards and terminals, using the actual figures from the October test.

This method was criticised by Mr. Nay (R. pp. 1828-1832), and probably other witnesses, and explained fully by Mr. Ludlam (R. pp.

2285, 2286), wherein he showed that Mr. Nay had misunderstood the exhibit.

The justice of counting all cars in division yards equally has been demonstrated by the record of the actual movements of all transstate cars made by Mr. Hamilton and of the breaking-up of all through trains in the terminals. That testimony has been set out in full in discussing the "bridge theory" of transstate freight.

See Record, pages 1432-1442, wherein Hamilton traced all the transstate cars for first half of March and October, 1907, and the terminal handlings in October, showing that, with rare exception, every train into every terminal was broken up and the cars in it, went out to the next division in other trains, varying from two to nine others, carrying the cars brought in by one train—a complete breaking up and re-making of trains.

To meet the force of the plaintiffs in rebuttal, though Mr. Moore, filed a consist of train No. 55, during the month of October, 1907 (R. p. 1773), this was made exhibit 53. This was to show that there was little breaking of this train at division yards, and little switching of the cars detached or attached. He says the train was so made up as to cut off at next division the cars going out of it there, the main train staying on the main track, the other cars, engine and caboose would be added and then go on its journey. This was in effect a modified bridge theory. The purport being that while not a "straightaway movement through the State," yet, there was less yard service for these through trains than the locals.

The State, in surrebuttal, put on practical train men to explain the handling of such a train as No. 55, which is a fast red ball train, a high class merchandise train.

They say that the handling that train gets in terminals is no fair test of what through trains would get in terminals.

This train is classed higher than any through train.

McNew thus explains how it is handled:

"Those fast trains, every preparation is made to save delay to them; where there is any pick-ups, they are always fixed, placed first out, or in a place where they can be picked up with the least delay, even in big yards. Very often a man's position depends on whether he does delay that train or not; while the other trains, ordinary dead freight, it don't seem to have any particular thing to do with the handling of those trains—not so much at least—probably it will be composed of lumber or cotton, or something that is picked up by locals or through freights on the road, brought into the terminals, and used to fill out the engine's tonnage with, on either those fast trains or some other through trains.

Q. And they would all be switched in the terminals?

A. Yes, sir; probably stored; some may stay around for several days.

Q. You have had experience as yardmaster and know how those are handled?

A. Yes, sir." (R. p. 2104.)

Harston says that ordinarily, a good deal of switching was done to train No. 55. But that its class was usually gotten in and out of the terminals as fast as possible.

The exceptional character of this train was explained by Nash, (p. 2089), McNew (p. 2103), and Harston (p. 2200).

H. B. Amouck put in evidence exhibit 52 (R. p. 2434), showing terminal handling of loaded cars in 37 trains out of Hoxie in October, 1907.

He testifies that these 37 trains were selected, as he came to them from Mr. Hamilton's worksheets. He thinks they are representative movement, and that he did not pick out the best ones. Exhibit "I" shows about 2,700 through trains run in October. How less than 1½ per cent of them could be representative of 98½ per cent, is not explained.

There is a great deal of detail in his exhibit, the purport of it all to show the through trains in question got through without complete breaking up in terminals.

These all entered into Mr. Hamilton's report, which shows the average of all, and no value can be attached to a few selected ones, where the minimum breaking up occurred.

Mr. Hamilton thus explained this exhibit:

"Q. Mr. Amouck put in some exhibits on that subject, did he not?

A. He covered practically the same ground as Mr. Moore, taking some 30 trains out of Hoxie as a type.

Q. How did he get the 30 trains?

A. He took them from some worksheets we had prepared, on which we counted the cars into and out of the terminals and on which we showed lapsed or delayed time in the terminals. We simply prepared that to use in a division of expenses.

The other sheets were made—those to which in my mind Mr. Amouck's criticism would better be applied—were sheets in which we showed the breaking up of these trains at terminals and varying delays to the cars.

Q. He did not criticise those?

A. No, sir; his testimony was along the same line as Mr. Moore's as I understood it." (R. p. 2259.)

Returning to Mr. Moore's fast Red Ball No. 55, Moore says his exhibit was made up of the consists of that train (R. p. 1773.) He says the wheel report would not show the relative order of the cars, that it is made up to show system cars and foreign cars and empties, for the assistance of a car accountant, but not in train order. He was shown a form of conductor's wheel report giving direction "cars must be reported in train order commencing with the caboose, to

show the make-up of trains leaving district terminals," and said it was disregarded. (R. pp. 1781, 1782.)

He assumed the consist which he put in evidence gave the order of cars.

Cannon, the Division Superintendent, says the wheel reports show train order of cars, as a usual rule, the exception being the local. (R. p. 1800.)

Harston testified that wheel reports gave the train order. (R. p. 2200.)

Hamilton, as usual, went to the records to settle this conflict between Moore and Cannon, and found from a batch of wheel reports that they was made by train order disregarding system or foreign cars. (R. p. 2258.)

He testified from his minute investigation of this subject, that the wheel reports gave the train order of cars, and it was the only source of that information.

Moore testifies the consists he puts in were not copies of the wheel reports. (R. p. 1782.)

It is evident that as to the movement of even the one fast Red Ball, we have no evidence of value of the amount of switching done on it.

Mr. Moore also testified at great length as to the various switching movements in the Little Rock terminals. It varies but slightly, so far as actual movement was concerned, from McCutcheon's, whose testimony was quoted when discussing the "bridge theory."

He shows some more service in industrial switching than in ordinary shifting for making up through trains; but there would be four movements on grain, into the elevator, and not less than four nor more than six out (practically all interstate), four movements on cotton (all interstate). The switching of cotton being equal to industrial switching; cotton seed products (interstate), four movements. For through trains being iced there would be two or three movements, on through cattle trains, two or three movements. (R. pp. 1781-1789.)

The attempt to rehabilitate the "bridge theory" was weak; more a confession and avoidance than anything else. The total result of it is: On some through trains there is less terminal handling than on the usual through and local trains, but there is on some of the large interstate movements, like grain, cotton, cotton seed products, and on through iced trains and cattle trains, more terminal service than the local or the ordinary through train ever receive.

Hamilton's demonstration of breaking up trains, stands, and considering the matter largely—not by exceptional cases either way, every car should be counted equal in the terminals. When the switch engine takes the cars in any train, local or through, it, on average conditions, renders the same service to make them ready to go out of the terminal, and all other like expense follow this service.

There were many other minor criticisms of the State's plan, but we will not weary with further detail. The great items and bases applicable to them have been considered as fully, we hope, as the importance justifies. None of the other matters which were discussed would amount to anything in general results if these were sustained.

*Minor Criticisms.*

## EXHIBIT 56.

The criticism of the State's plan was put in concrete shape in an exhibit ostensibly formed along the same line, correcting, it was alleged, the errors of the State and changing bases to suit the modified views of the plaintiffs. We have, throughout the evidence, facetiously termed this a caricature of the State's plan. For maintenance-of-way the overhead plan of apportioning general expense is adopted, and general expenses relieved of all share of maintenance-of-way expenses.

*The Caricature of the State's Plan.*

For maintenance-of-equipment, the State's plan is adopted excepting Rosing's table instead of the Wellington and Berry tables for starting and stopping is used, and for stopping eight instead of four for the local over the through (this evidently based on the mistake made by Gray and Ward as to this item, heretofore pointed out).

For terminal handling, the local cars are multiplied by six, and car miles adopted.

Changes are made in station handling, in that the transstate is eliminated, and 10 per cent added to the interstate for two handlings (a revival of the bridge theory).

Yard and terminal are divided on tons handled. Various other changes are made, some large, some small. On the passenger side various changes are made conformable to Rosing, in contradiction of Roberts and Alexander.

Train auditor expense is taken out of the classification the plaintiffs' exhibits made of it and charged direct to passenger, proportionately intrastate and interstate.

The effect of the more important of these changes we will explain in excerpts from Mr. Ludlam, who reviewed them at length:

"Q. Mr. Ward, at page 613, criticises the method used by the State in apportioning the expense in terminals, of counting cars in and counting them out, and says that the proportion chargeable under this method, to through service, would be much greater than is actually the case, and adds this: 'The opinion of myself, or any other operating official, as to the excess cost of handling State over interstate business is on the basis of actual freight and not on the basis of the number of cars passing through the yards.'

*Ludlam on Ton Basis For Terminal Handling.*

I presume from Mr. Johnson's testimony this morning, that is very likely the foundation for his distribution of that expense on the ton basis, in his exhibit No. 56.

I will ask you what is your opinion of that basis which is used here in this exhibit, on the testimony of Mr. Ward, which I have read to you?

A. You are asking what I think of the basis used in exhibit 56?

Q. Yes, which I assume to be based on Mr. Ward's testimony, which I have read to you.

A. I think the basis is wrong, because it assumes that a ton of freight which moves 70 miles would have the same terminal service as a ton of freight that moves 224 miles.

Q. Those are the respective lengths of haul in this case on the Iron Mountain, I believe?

A. Of State and interstate.

I think I have already testified that, speaking generally, every ton of freight that passes through a terminal gets some handling at that terminal. I think also it is a matter of general railroad knowledge that the large and expensive terminals are required more and used more for the through business than for the local business.

Q. What effect would that length of haul have upon the proposition which you have referred to?

A. The effect, as that principle is used in exhibit 56, is that you charge as much for a terminal handling to the ton that moves 70 miles as you charge to the ton that moves 224 miles. You fail to take into consideration the most important element in distributing all expenses, and that is the use which is had from the expense incurred. The ton of freight that moves 70 miles, will, of course, not have the same use of the terminals as the ton of freight that moves 220 miles. Therefore, when you attempt to distribute your terminal expense on the tons handled, you arrive at a false conclusion and your figures are correspondingly unreliable." (R. pp. 2273, 2274.)

The most radical change was maintenance-of-way. The plaintiffs abandon the revenue and car mile and treat it as the accountants do direct expenses, and Mr. Ludlam thus explains the absurdity—if we may be pardoned the strong word, of this misapplication of an useful base.

*Overhead Basis For Maintenance-of-Way.*

"In exhibit 56, made up by the railroads—which I have somewhat facetiously called a "caricature" of the State's exhibit—they adopt many of the bases of the State, but in 'maintenance-of-way,' they have added that, as I understand it, to the general expense, and distributed that item of expense all through the other: I wish you would express your opinion on that. A. I think it is wrong in principle; that there is no accounting practice or procedure that would justify it. It is a well known rule of accounting that you should distribute those expenses

that are specific against the use which it had from the expenses incurred.

In the case of the 'maintenance-of-way' expense, they should be distributed, in my judgment, both the proportion which is direct, and the proportion which is indirect—which has been referred to as being from 75 per cent to 90 per cent—against the use which is made of the 'maintenance-of-way,' and the use which is made of 'maintenance-of-way' is to run trains.

If it is true that only 10 or 25 per cent of the 'maintenance-of-way' expenses apply specifically to the operation of the trains over the track, then that 10 or 25 per cent, if it could be determined, should be apportioned specifically against those trains that cause the damage, and the remainder of the 'maintenance-of-way' expense—which would be the indirect expense of 'maintenance-of-way'—should be apportioned over the direct expenses of 'maintenance-of-way.'

Q. And that was done?

A. The result of our distribution approximately does that.

Q. I believe you have heretofore testified that in your accounting experience you have had a great deal of experience in auditing railroads: Did you ever come across a proposition like this that distributed things like "maintenance-of-way" through all these various accounts?

A. No, sir; the 'maintenance-of-way' is a specific expense and that would be one of the elements used to distribute 'general expenses.'

There is a certain element of your 'general expenses' that applies to your 'maintenance-of-way' expenses. A certain proportion of your President's and Vice President's salaries, the clerks in the Auditor's office, all apply to the 'maintenance-of-way' expenses, and the 'general expenses' would be distributed over all the elements of expense, which, as I stated, would include the 'maintenance-of-way' expenses, as well as the 'maintenance-of-equipment;' 'traffic' expenses; and 'conducting transportation' expense, but there is absolutely, as I see it, no possible reason for adding your 'maintenance-of-way' expenses to your 'general expenses,' and then attempting to distribute those over the balance.

In that way you do not apportion any of your 'general expenses' to your 'maintenance-of-way' expense.

Q. Why is that?

A. Because if you add your 'maintenance-of-way' expense to your 'general expense,' then you apportion them all over 'maintenance-of-equipment;' 'traffic expenses;' and your 'conducting transportation expenses,' which are all that are left of your operating expenses.

I am sure no man who is familiar with railroad procedure, would claim that the officers of a company—and by 'officers,' I mean the

general officers, higher executive officers—have nothing to do with the 'maintenance-of-way.'

I can imagine, for instance, in the case of the panic in October, 1907, the President of this company wiring from New York to reduce the expenses, and probably the first men that were laid off were some of the section hands who would be charged to 'maintenance-of-way.'

I am sure the records of the company, if carefully searched, would show very explicit instructions from the higher executives during October, November and December of 1907, affecting the 'maintenance-of-way' department.

Q. Take the other items in 'general expense' outside of the higher executive officers; take your legal department—claim department, auditor's department, and various items going to make up 'general expenses:' Do not all of them have more or less relation or duties to perform in regard to the way and maintenance?

A. Yes; they all have something to do with the 'maintenance-of-way' expense and it is proper that those expenses should be distributed over the 'maintenance-of-way.'

Q. As I understand you, under this 'grand, gloomy and peculiar method,' that our friends have invented, the 'maintenance-of-way' would escape all of that—all portions of that?

A. Under their method the 'maintenance-of-way' would all be distributed against the other operating expenses.

Q. Now, coming to the practical end of that proposition on this matter: what is the effect when you come to carry out such an abnormal method—as we view it—to distribute it in connection with such abnormalities—as we view them—as is done in 'terminal expenses:' What is the practical effect of that?

A. On the basis followed by exhibit 56?

Q. Yes.

A. The practical effect is to increase the cost of the State freight, as shown by exhibit 56.

In the first place, you improperly apply certain of so-called direct expenses—specifically illustrated in the case of repairs of yard locomotives; in the case of handling and in the case of expense of yard and terminal—by apportioning, as I have said before, as much of that expense to a ton of freight that moves only 70 miles, as you apportion to another ton of freight that moves 220 miles.

If you take all of your 'maintenance-of-way' expenses and distribute them over your direct expenses, the proportion that would apply to those specific items, you are also—in the case of your 'maintenance-of-way'—charging as much to a ton that moves 70 miles as you are to a ton that moves 222 miles. That is, to the extent that the repairs of yard locomotives and the expense of yard terminals represent the total expense over which you distribute your 'maintenance-of-way' expenses; you are claiming it costs as much to main-

tain your property to move a ton of freight 70 miles as it does to maintain your property to move a ton of freight 222 miles.

Q. Are there any other matters in that connection which I have not called your attention to? I want to go into it thoroughly and then pass on to something else.

A. I think that explains the inaccuracy of the principle." (R. pp. 2276-2278.)

We believe this a sufficient consideration of exhibit 56, and the plan upon which it is built to justify our characterization of it.

It starts with this impossibility of treating maintenance-of-way as a general expense, and relieving that great item of all general expense charges, and then proceeds to take such factors as some one or more witness may have suggested totally regardless of the weight of evidence on the subject where the charge was made.

We hardly expect it to be seriously urged upon the Court, but as it is part of the evidence, it must be treated as if earnestly presented.

*The Plan As a Whole.*

On the whole subject of the State's plan, we have this to say: It was handicapped by having to use the train mile apportionment between freight and passenger, and by the use of the revenue basis for an apportionment of the property, and it earnestly endeavored to allow the utmost reasonable limit for all items of extra costs, and to work out fairly a distribution of costs between the two classes of traffic.

It would ill become a State to do this in any way than fairly, and with as just regard to the carrier as to the public, and that we believe was done by the able accountants who prepared this plan.

That its general plan is right was admitted by the learned trial Judge, and that it is substantially right in all of its details is proved by a decided weight of the evidence on every controverted issue.

Under this plan, the Iron Mountain's return on its property is 7.09 per cent after correcting the Pullman car mileage error, and when the inevitable correction is made to revenue or car mile basis for division between freight and passenger traffic, the return will be at least 9 per cent on the property, to say nothing of correcting the other errors included in the figures, like the Memphis expenses, etc.

This is a prosperous road in all its branches of service; if its management lopped off such excrescences as the Pratt Hotel and Bunch elevator favoritism and gave credit for the Express Company dividends in the past as well as in the present, and many other such items, its prosperity would be greater.

Under the facts here, we submit, in any view of the case, it is impossible for the plaintiffs to recover, because, with all the faults in their accounts, under any fair system of distributing the expenses of the two classes of traffic, both classes are making far more than a compensatory return. We sincerely submit that upon the whole evidence, the conviction is left that the intrastate is the more profit-

able traffic. Its revenue is double the interstate, and its extra expense, by the most liberal allowance, not as great as the higher revenue, and the road was paying 10 per cent annual dividends, during the period it complains that these rates are confiscatory.

## THE CRITICS.

The able and successful railroad officers, Messrs. Carl R. Gray, Vice President of the Frisco Lines; Frank E. Ward, General Manager of the Burlington, and Frank Nay, Comptroller of the Rock Island, each appeared in the role of critic of the State's plan of solving these problems.

Judge Trieber says of the plan: "The scheme for obtaining these facts is new, never having been used by any accountants in any of the numerous rate suits which have heretofore been before the courts." And again: "But, in the opinion of the Court, the scheme itself furnishes the best method of solving this problem that has been called to the attention of the Court, depending, of course, upon the correctness of the numerous factors necessary to obtain accurate results." (R. pp. 2620-2621.) Hereafter we think we show that the departures from the scheme by the trial judge were erroneously made, but the point we now call attention to is the difference in point of view of the critics and the judge to the scheme as a whole.

To them it was all obnoxious; no good was in it and no good could come from it. Probably their most pointed arrows were aimed at using the car mile basis for maintenance-of-way expenses, and it was admitted by them to be in common use among the railroads of the country for this purpose. Railroad officers of great distinction had testified as to its common use and equity, and it has met the approval of this Court. The car mile basis to divide expenses between coaches and mail and express cars was to the critics intolerable, but the Vice President of one of the plaintiff roads and the Vice President of the Louisville & Nashville road had advocated it as fair and just for that very purpose before the Postal Commission of the United States.

On the technical questions as to distribution of injuries to freight cars from various contributing causes, the critics aligned themselves against a standard text book, and a paper, carefully prepared by an eminent engineer on the subject, which was submitted to a technical body considering this matter.

The critics placed themselves in direct opposition to the opinions of the plaintiffs' witnesses in chief and could see no inconsistency in the plaintiffs bringing on in chief witnesses expressing certain opinions material to this case and then bringing the critics on with contrary opinions then material to their case, but they saw many inconsistencies in the case of the State.

The critics were especially skeptical of views of accountants on these problems; it was to them problems only for the operating men.

Their criticism operated as a demurrer to an answer, reaching back to the complaint.

They attack the car mile and train mile basis as utterly unsound for apportioning expenses in a matter so important as a rate case; and the plaintiffs had apportioned their $1,000,000 maintenance-of-way expenses between passenger and freight on the train mile basis and had obtained a million dollars of maintenance-of-equipment expenses for Arkansas from the other eight States in the Missouri Pacific System on the car mile basis.

Their demurrer-like criticism reached to the normality of the period of inquiry also. In fact, as critics-general they were as pronounced successes as they are as men of affairs.

## AN ANALYSIS OF JUDGE TRIEBER'S OPINION.

While it is the duty of this Court to determine the facts relied upon as rendering unconstitutional State statutes and State action through a commission, unfettered by findings of masters or conclusions of trial courts, as was so clearly put by Mr. Justice Moody in Knoxville v. Knoxville Water Co., 212 U. S. 1, yet weight will properly and naturally attach to the opinion of the trial judge; and this renders its review and analysis timely.

Specific findings of fact on controverted issues, deduced from conflicting evidence and made the predicate for a decree based upon them, would carry more weight than mere general conclusions of fact made in the course of an opinion whose office is to state the reasons why the particular decree has been rendered. In this case there was no specific findings of fact upon the numerous controverted issues; a final decree was rendered enjoining the enforcement of the rates attacked (R. p. 105) and an opinion filed wherein the judge discussed at length the questions of law and fact and stated his views upon them, resulting in an opinion that the rates in question were confiscatory, wherefore he had granted the perpetual injunction. This opinion is found in 187 Fed. Rep., p. 290, and in this record, beginning at page 2580.

The attitude of this Court towards the opinion of the trial court may be found stated in this excerpt from Loeb v. Trustees of Columbia Tp., 179 U. S. 472:

"Neither is the opinion of the Court a part of the record. Our rule requires a copy of any opinion that is filed in a cause to be annexed to and transmitted with the record, on a writ of error or an appeal to this Court; but that of itself does not make it a part of the record below. That language is not to be taken too broadly or without reference to the particular case then before the Court. What was said may undoubtedly be taken as an adjudication that the opinion of the Court can not, under our rule, be referred to for the purpose of ascertaining the evidence or the facts found below upon which

the judgment was based; but not as precluding this Court from looking into the opinion of the trial Court for any purpose whatever."

The meaning and application of this point of this decision was recently considered in majority and minority opinions in Memphis v. Cumberland Tel. & Tel. Co., 218 U. S. 624. We understand, from them, however, that the principle is unshaken that the opinion can not be looked to for the purpose of ascertaining the evidence, or the weight of evidence, or the facts found; but may, and should, be looked to for any purpose whatever which would aid the Court in reaching a correct conclusion on either the law or facts of the case. See also Egan v. Hart, 165 U. S. 188. Doubtless in performance of the onerous and delicate duty of weighing the evidence as to whether it is sufficiently clear and decisive to invalidate the State's statutory and Commission-made rates, the Court will turn to the opinion for what assistance may be received from it; and, in considering it, your attention is invited to what we classify as the major and minor errors therein.

## THE MAJOR ERRORS IN THE OPINION.

He uses the revenue basis to apportion the property to the State, but we will not rediscuss that subject, as we have presented our views as fully as we are capable of doing heretofore and it is only to his errors in apportioning expense to which this discussion is devoted.

*The Revenue Basis to Apportion Expenses.*

(1) He uses the revenue basis to apportion maintenance-of-way expenses, both freight and passenger, between State and interstate traffic; and uses it also to apportion other items of expense between those classes of traffic.

He says (R. p. 2608): "The straight revenue theory as advanced by the learned counsel and accountants of the railroads is clearly wrong, as none of them takes into consideration the increased rates charged for the intrastate traffic."

When considering maintenance-of-way expenses, he says (R. p. 2623): "The Court is of the opinion that the straight revenue basis will get more accurate results. The difference in intrastate and interstate rates will be taken care of by proper allowance to be made in the final calculation."

Passing, for the moment, the allowance referred to, which is based on an assumption that the difference in rates is ascertained and equalized—an utter impossibility; but even so, the fundamental error of the revenue basis is not removed.

One of the insuperable objections to the revenue basis is its failure to take account, in this case, of the higher intrastate revenue, producing a proportionately higher allotment of expenses to the intrastate, but if that were overcome, and the revenue per ton per mile intrastate and interstate identical, still the revenue basis would

have no value (even as admitted by its advocates) unless the rates of both classes were based on the cost of the service, and a relation, based on cost and reflected in the rates, existed between intrastate and interstate traffic. We will not weary the Court with repetition of the presentation of, as we believe, a great preponderance of the evidence which shows that, so far as the interstate rates prevailing in Arkansas are concerned, that they are not based upon or reflect the cost of service, and that no reduction exists between those rates and the Commission tariff.

The eradication of the one sound objection to the revenue basis leaves untouched these fundamental objections to it.

The fact that the revenue per ton per mile intrastate and interstate may be the same, or made so by a process of equalization, will not make the revenue an applicable factor with which to apportion the expenses between the two classes of traffic unless the rates producing the respective revenues, whatever it may be, is based on cost and there is a proper cost relation between the two. Whether intrastate or interstate revenue per ton per mile is the higher will depend on several concurring causes; the rates fixed interstate in that locality by the railroads and the rates fixed intrastate by the particular State, being the principal ones. But whether the rates of either traffic reflect the cost and are adjusted to each other so that they may be used as yardsticks of equal reliability is quite another question. If an unfortunate lunatic is suffering with tuberculosis and has an attack of appendicitis, the removal of the appendix will likely cure the latter ailment (or kill the patient), but is not likely to restore his mentality or destroy the bacilli.

*State and Interstate Rates and Revenue.*

(2) He attempts to find the difference in intrastate and interstate rates. His discussion of this subject is found at pages 2613-2619 of this record. He concludes that, while the freight revenue per ton per mile intrastate on the Iron Mountain is 98 per cent higher than the interstate and on the Southwestern 141 per cent and the passenger 3.48 per cent, that the intrastate freight rate is only 50 per cent higher than the interstate, including the transstate, and on passenger the rates are the same, while the revenue is 3.48 per cent higher. Many of the matters referred to in the discussion we fail to find in the evidence in this record; but conceding, *gratia argumenti*, that they are all established facts, we contend: (a) That it is a mere guess, not supported by such evidence as is referred to, as to the difference in the rates, and (b) that the difference in rates is not the question. The plaintiffs seek to divide the expenses between intrastate and interstate by the revenue produced from each class, and not by the rates.

(a) That the ascertainment of the difference between State and interstate rates is a mere guess, not susceptible on the evidence in this record of approximation, is unquestionably the case.

Judge Trieber refers to two exhibits put in by Mr. Kimbell. After Judge VanDeventer granted the injunctions in this case, the railroads put into effect both intrastate and interstate tariffs, untrammelled by State regulation. These tariffs of their making were in effect in January, 1909. In its efforts to establish the relation existing between State and interstate rates as understood by the railroads when they had the making of both, a statement of the January revenue, intrastate and interstate was called for. This is exhibit "A" (original page 5758). Mr. Kimbell made a calculation based on that exhibit, comparing the revenue with the six months' period under inquiry, when the State made the intrastate and the railroads the interstate, and he testified that the interstate had been increased 9.4 per cent and the intrastate 96.1 per cent. (R. p. 770.)

In rebuttal, Mr. Kimbell put in exhibit 58, a comparison of rates if the Commission tariff had been in effect during January, 1909, and it showed that while the intrastate revenue was increased 96.1 per cent, the rates were only increased 48.18 per cent. (R. p. 2078.) No showing was made on interstate. The conclusion that Judge Trieber reaches is that it is impossible to adopt revenue for the purpose of ascertaining the difference in the rates. (R. p. 2614.) Revenue represents result of rates, not the rates themselves, and it will fluctuate by different movements without fluctuation in rates is certain. As the unanimity of opinion is that the State and interstate traffic moves hand in hand and is as alike as Siamese twins, if it were possible to get a comparison with preexisting rates interstate for the same period some tangible basis might be reached. Mr. Kimbell was requested to furnish complementary data of the interstate when he furnished the intrastate and declined on acount of the labor. (R. pp. 947, 997.)

Take two extremes—coal, a low-grade commodity, and merchandise, a high grade. The coal intrastate and interstate will naturally move at the same season and the merchandise intrastate and interstate has no cause for difference in time of movement, and every cause for uniformity of movement. Apples from the fruit region of Northwestern Arkansas will go to market in Arkansas and interstate points at the same time.

Speculation as to difference in rates based on rate increases or decreases in intrastate traffic is futile when unaccompanied by data of the other class.

It is utterly impossible to compare State and interstate rates except theoretically. Take some tariffs and work out a careful comparison and then a little examination into movements under the two will show the comparisons to be worthless.

A striking illustration of that is found in Mr. Perkins' exhibit 37 and 37-A. (R. pp. 2406-2409.) These exhibits were to show, along border points, that the interstate rates were higher than intrastate and to establish a relation between State and interstate rates.

Judge Trieber refers to these rates as if they were of value. (R. p. 2615.) The judge evidently failed to read Mr. Lincoln's testimony about these tariffs, brought into the case by the plaintiffs themselves. Mr. Lincoln's attention was called to these tariff selections by the plaintiffs' counsel, and asked to state what they showed to be the relation between those rates; and, taking up one by one the rates, showed that the commodities do not move under the interstate rates set forth, but under commodity rates, and concludes as follows: "The comparisons are not those upon which you can very well base a conclusion, as to the interstate or even as to the State rates in other points, except as a paper proposition." (R. p. 972.)

No one controverted Mr. Lincoln's disposal of these paper rates and their usefulness there ended; and yet the Court, evidently overlooking that they did not represent real movements, considered them in his efforts to find the difference in the two sets of rates.

In another effort to find this difference, the judge tells of going over the minimum carloading prescribed in the Western classification and in the Commission tariff, item by item, and finding a difference of 40 per cent in favor of the interstate. (R. p. 2619.) But what avails that? There is no evidence of what freight has moved under the weights prescribed in the Western classification. Undoubtedly some does; much does not. All the Texas traffic moves under the Texas rate exception sheets to it; every State has its exceptions to it. The Official and Southern classification territory (all territory east of the Mississippi) have different classifications and minimums for all traffic originating in their respective territory from those in the Western. Interstate tariffs have many exceptions to the Western classification. All these facts are stated by the plaintiffs' witness, Mr. Becker, the chairman of the Western Classification Committee. (R. pp. 738-746.) How much of the interstate traffic in or through Arkansas has moved under the Western classification of minimum of carloading is left so absolutely an unknown quantity that even a guess would be impossible. The judge makes explanation of the existence of zone rates, Texas common point rates, etc., and quotes Mr. Perkins' justification of the latter (page 2615), but we are not concerned with the why of these rates, but as to their existence as a fact proving the unreliability of revenue from them to measure cost. But the very rates there explained, the transstate lumber, grain and Texas common points, illustrate the impossibility of ascertaining the difference between interstate and intrastate rates. Hardly any two similar movements of these commodities bear the same rate owing to different divisions of it with connecting lines, while each haul through Arkansas and its attendant cost is identical.

The Court accounts for difference in revenue of the plaintiffs' roads under the same tariffs as due to differences in low grade and high grade commodities carried by them. Possibly that may be true, and, if so, is another obstacle, under the evidence in this record,

to establish the difference between rates intrastate and interstate, because the rates on the low grade commodities are no better guides than on the high grade like the merchandise rates to Texas. Take coal from the Illinois fields to Little Rock and adjacent territory for $2.25 per ton and to Louisiana points, 150 miles longer haul, for $2.00 per ton; and on the other hand, the Arkansas coal moves into Little Rock from a zone 50 miles in extent for $1 per ton and out of Little Rock on a graduated distance scale. With which interstate rate will the comparison as made, the interstate to Arkansas points or the transstate to Louisiana points? No system of averages can be obtained as there is no data of the relative amount of the traffic to each of these consuming territories, other than it is a considerable movement. The expert rate men, though often requested to estimate or define the relation existing between State and interstate rates, fail to do so; and if they can not establish what the relation is or should be, how can the difference between the two be discovered?

The Texas Commission is calling on the carriers for data as to revenue and cost by commodities, intrastate and interstate. (R. p. 1106.) When reliable statistics along this line are furnished then an approximate, if not accurate, measure of difference in rates may be found.

(b) The difference in the rates, intrastate and interstate, is not the question in this case, but the difference in the revenue. It is the revenue—not the rates—which is used by the plaintiffs as the factor with which the expenses between the classes of traffic is apportioned by the plaintiffs in their exhibits. Therefore whatever may be the real difference in the rates is only of academic interest.

If the intrastate is 50 per cent higher than the interstate, as thought by the judge, that has not so far entered into their case, but the revenue resulting from these rates as a whole has been used by them to apportion these expenses, and that revenue is 98 per cent higher than the interstate, and therefore, on that account, apportions correspondingly to the intrastate that much more expense than would be apportioned if the revenue were the same. The issue is on the apparently confiscatory return shown by the plaintiffs using a factor, which, by reason of being thus much the higher than the other factor, assigns this much unreal expense to the intrastate. It may be that the extra expense is 50 per cent or 500 per cent; that is not the question now; the extra cost is added after the basic apportionment to the State is made on the revenue basis; and, in order to get that basic apportionment to which the extra cost must be added, there is used a factor producing unreal expense to the intrastate. Whether the basic sum has unreal expenses represented by 50 per cent or 98 per cent is one of degree; the fallacy of the principle is the same. The effort to find the difference in rates is an effort to correct the injustice to the State, and the finding of 50 per cent higher intrastate rates, convicts the result of the plaintiffs' case to be to that extent wrong.

But the whole theory of trying to find difference in the rates expressed in percentages other than in the revenue resulting from these rates is a mistake.

Thousands of rates are found in filed tariffs; until a shipment moves under one of them, it enters not into this subject. It is not a question of possibilities, but of actualities. One shipment only may move on a given rate in a year and a thousand a month on the next one. This is equally true in either traffic. These dormant rates afford no basis of comparison. A light movement under one and heavy under another may make a difference one way on rates and the other way on revenue. The measure of rates to determine compensation or confiscation is the revenue produced from them, not the rates themselves. The use of the factor on trial to measure the expense is one of the just criticisms of the revenue basis. (R. p. 1482.) The effort to correct the inequality and injustice of the revenue basis only results in minimizing it to whatever arbitrary figure the mind may rest upon as representing the difference in the two classes of rates.

The allowance in favor of the State, so far as we can discover, in the calculations made by the Court and those by the accountants under his direction, has not been given. The Court selected bases and directed the accountants to calculate upon them; that resulted in showing 201.5 per cent extra intrastate freight cost on the Iron Mountain; and to that he added 8.5 per cent and 10 per cent for the intrastate passenger. (R. p. 2630.) In reaching this result, the accountants used the revenue basis for several of the large items of expenses, as directed by the Court; and the injustice of the excessive revenue is, so far as we can discover, not corrected in the results obtained by this method. The system is abstruse, and, we may be mistaken in this statement, but, after careful examination, believe it is correct; and if so, it is doubtless an oversight because the Court intended to make this allowance.

*Train Mile Division Of Freight and Passenger Expenses.*

(3) The judge used the train mile division between freight and passenger expenses of maintenance-of-way. In our chapter devoted to this question, we showed that he condemned it utterly, and yet, doubtless, unwittingly, accepted the apportionment to each branch of the traffic so made. Thereby the intrastate is burdened with $101,500 more expenses than if he had used the revenue basis, and far more than that, if he had used the car mile basis.

This error likely occurred in this way: The railroads used it, and the State took the amount thus apportioned to freight and passenger and begun their work of apportioning between intrastate and interstate at that point. This was fully explained in the evidence, and no one for the State approved it and several on both sides condemned it.

If the State's plan had been accepted this would have been "harmless error," as the return shown was compensatory; but when both plans were rejected and one of his own formulated, then the basis which he expressly condemned (R. pp. 2608, 2623) should not have been used for this purpose.

At one place he says: "The train mile basis is conceded by all as the least accurate." (Rec. p. 2608.) And when discussing maintenance-of-way expenses, says: "In view of these facts (the large proportion due to weather and time) any attempt to apportion this item of expense on the ton, car or train mileage would be an injustice to the roads." (R. p. 2623.)

*Rejection of Test Months Statistics.*

(4) The rejection of the statistics of the test months and substitution of arbitrary percentages for the contents of the local and through trains, was, in our opinion, grave error. We have presented at great length the whole evidence on this subject and will not repeat it. The Court says that the most serious objection to the State's plan is that the calculations are based on the business of one month only. (R. p. 2621.) The local and through trains only are based on one month's performances, the percentages for that month applied to the six months' period, and the difference in a larger ton-mileage adjusted. This latter was criticized, but Mr. Johnson, the railroad accountant, admits the criticism only goes to using one month; not to the method or its accuracy in adjustment. (R. pp. 2236, 2237.) In view of the short period put in by the railroads, and that they put in these test months as representative of it, and the proved normality of that month to the six so far as car and train movements were concerned and the relative State and interstate traffic, we do not question for a moment this Court will accept them. Instead of the actual figures found from these exhaustive tests, the Court assigns to the local train 40 per cent interstate and 60 per cent intrastate, to the through 99 per cent interstate and 1 per cent intrastate.

If possible for the error to be graver than rejecting the test on the Iron Mountain, it was in rejecting the test on the Southwestern. It was all made by the railroads; its accuracy questioned by no one and no congestion even alleged of that month, October, 1908.

## EXHIBITS CORRECTING THE MAJOR ERRORS.

At our request, Messrs. Haskins & Sells have prepared for this brief exhibits "DD", "EE," "FF," which exhibits accept Judge Trieber's basis and findings throughout, except in the particulars herein set out. We even accept, for this purpose, the (1) major error, the revenue basis for property, without deductions; and accept the revenue basis for the expenses where it was applied with the 50 per cent excess allowed, as he said should be on the freight and 3.48

per cent on the passenger. Our correction of his base on this, merely makes clear the allowance of the 50 per cent excess of the intrastate, for which he says credit must be taken. The division of maintenance-of-way expenses between freight and passenger is on the revenue basis instead of train mile basis. It can hardly be doubted that, in the face of the condemnation of the train mile basis, that the Court would have used it if his attention, at the time, had been called to the fact that the sums apportioned where he began his plans were obtained through that basis. Certainly when he decides on the revenue basis as the most accurate between interstate and intrastate, it necessarily follows that it is also the most accurate between freight and passenger.

The actual percentages of October of the interstate and intrastate traffic found on the local and through trains are used instead of the percentages assumed for this purpose by the Court. Except in this respect, this exhibit only carries out the rules of apportionment and findings of fact indicated by the Court as the method to pursue in obtaining the relative cost and return on the property. In taking the actual percentages of October, instead of the assumed ones, we are merely following what we confidently believe this Court will adopt in that regard.

This exhibit may be examined, therefore, as one applying the methods and rules and findings of the Court, with one exception.

## COMMENTS REGARDING EXHIBIT "DD," EXHIBIT "EE," EXHIBIT "FF."

In these exhibits, the expenses have been distributed on bases laid down by Judge Trieber in his opinion, dated May 3, 1911, viz:

First. The total maintenance-of-way and structure expenses and the total value of the property have been divided between "freight" and "passenger" on the basis of the total revenue derived from each class of service as shown by exhibit No. 3.

Second. The "freight" and "passenger" expenses have, in turn, been divided between State business and interstate business on various bases prescribed by Judge Trieber, as follows:

### FREIGHT.

The maintenance-of-way and structure expenses applicable to the freight business have been divided between State and interstate on the basis of the earnings derived from each class of business after equalizing the revenue by eliminating from the State revenue the 50 per cent excess of State revenue over interstate revenue determined by Judge Trieber.

The figures given in Judge Trieber's opinion covering the division of maintenance-of-equipment expenses between State and interstate have been used.

Traffic expenses have been divided on the revenue basis after equalizing such revenue by eliminating from the State revenue the 50 per cent excess of State revenue over interstate revenue determined by Judge Trieber.

The figures given in Judge Trieber's opinion covering the division of the transportation expenses have been used except that in the case of "other train expenses" divided by Judge Trieber on a revenue basis, allowance has been made for the excess of 50 per cent of State revenue over interstate revenue. The item of "supervision and general" under transportation expenses has been apportioned on the basis used by Judge Trieber, but the amounts are somewhat different on account of the change in the direct charges resulting from the adjustment of the figures for "other train expenses."

General expenses have been divided on the basis used by Judge Trieber, but the amounts apportioned to the different accounts have been changed slightly as a result of the corrections made in the preceding figures already mentioned. It will be noted that under this method of distribution, no proportion of the general expenses is charged to "maintenance-of-ways and structures."

The division of the total expense of "local" and "through" trains between State and interstate has been made on the basis of the freight actually handled (local trains 26 per cent State, and 74 per cent interstate, and through trains 4.96 per cent State, and 95.04 per cent interstate) instead of on the basis used by Judge Trieber (local trains 60 per cent State, and 40 per cent interstate, and through trains 1 per cent State, and 99 per cent interstate).

Taxes and rentals have been apportioned on the basis followed by Judge Trieber after making allowance for the excess of 50 per cent of State revenue over interstate revenue as determined by Judge Trieber.

Hire of equipment has been apportioned on the basis followed by Judge Trieber by making an allowance of 30 per cent against the State freight, to cover the additional cost of State traffic; after first equalizing the revenue by allowing for the 50 per cent excess of State revenue over interstate revenue as determined by Judge Trieber.

PASSENGER.

The operating expenses applicable to the passenger business have been apportioned between State and interstate and miscellaneous on the basis followed by Judge Trieber as stated in his opinion by first eliminating from the State revenue the excess of 3.48 per cent of State revenue over interstate revenue as determined by Judge Trieber and then by adding 10 per cent to cover the "10 per cent additional cost" of doing State business as determined by Judge Trieber.

Taxes, rentals, hire of equipment, dining car deficit and value of property have been apportioned on a revenue basis after equalizing such revenue by eliminating from the State revenue the excess of

## STATE OF ARKANSAS—RATE MATTER

## ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY

EXHIBIT "FF"

3.48 per cent of State revenue over interstate revenue determined by Judge Trieber.

The additions made by the Court raises the return on the whole property to 7.59 per cent instead of 7.50 per cent under the former exhibits. This is distributed intrastate 7.16 per cent, interstate 7.84 per cent, mail and express 5.84 per cent.

There are many bases used in this formula which we earnestly insist are unjust to the State, and will be briefly referred to as minor errors. With them included, however, this return of 7.16 per cent is not confiscatory. With them or any of them modified to the relief of the State these percentages of the return will be increased and some of them are quite large items and will materially raise this return if corrected.

## MINOR ERRORS.

(a) The omission to charge the Iron Mountain with fair rent of the Bunch elevator; the charge of fines for crimes to operating expenses; the inclusion of Memphis and Fort Smith terminal expenses, the charge of any part of the various other matters heretofore discussed under the head of Errors in Exhibits are referred to, without repetition, as part of the errors now under discussion.

*Errors in Exhibits Heretofore Discussed.*

(b) Starting and stopping injuries have been discussed, and also the error of assuming that through trains only stop every 35 miles, has been presented.

(c) Terminal handling of transstate cars. While rejecting the "bridge theory," the Court mistakenly, we believe, works out a difference in their favor. We will not rediscuss the evidence which we have heretofore presented on that issue. The judge quotes from the testimony of Moore as to certain switching of a train at Little Rock, but that was Red Ball No. 55, the fast preferred merchandise train, which half a dozen trainmen swore was not typical of the through trains.

*Terminal Handling.*

The judge refers to Mr. Lincoln and Mr. Parker, saying that transstate freight ought not to be charged with terminal expenses.

In distinguishing intrastate, interstate and transstate, Mr. Lincoln stated that there would be no terminal service in the State on the transstate. (R. p. 965.)

No one questions this for a moment; the word is used in many senses; in this one meaning the origin and destination of the shipment.

There is a terminal service in division yards which is thoroughly explained by Mr. Lincoln, Mr. McCutcheon, Mr. Moore, and proved by Mr. Hamilton's records; that is the breaking up of trains there and switching them and remaking trains for them.

These are called yard and terminal expenses under transportation expense and also yard locomotive expenses under maintenance-of-equipment expenses. (See exhibit "M," p. 2521.) These are the expenses complained of when the State counts the transstate cars with the other cars handled in the division point.

Mr. Parker called attention to the difference between terminal handling and station handling, and says that transstate will receive same station service in the State, checking cars, recording passing cars, telegraphing, etc., but not as much as intrastate. (R. p. 1171.)

These expenses are (a) under transportation in the State's exhibits and are divided on the ton basis. The transstate tons are 33 per cent (ton-mileage 51, exhibit 26). It would be unfair to charge this traffic equally with one for the interstate and two for the intrastate if it were not for compensating equivalents. Memphis and Fort Smith tonnage, grain, cotton and lumber, are only counted as one ton as against two intrastate, and they are two (and grain and cotton often three); so by large and small the State's witnesses say where the interstate is overcharged on this item for transstate it more than gains on undercharges for these. We have gone into this tediously because the judge's discussion of these items at pages 2026 to 2028, shows a misconception of the plan adopted by the State. This confusion is followed into the calculations made by the accountants under his direction. (R. p. 2641.) The State's plan for expenses of repairs to yard locomotives is adopted under maintenance-of-equipment, but when the engineer and fireman running them have to be paid, under yard expenses of "conducting transportation," they are split into various percentages, dependent on amount of station service received at the terminals; whereas, the item is not for station service, but for handling the cars at division points where yard locomotives are maintained. He cuts out all the transstate, 51.16, under this. Even the author of the bridge theory admits that the engines and cabooses were changed at division points.

*Traffic Expenses.*

(d) The Court says: "The accountants for all parties agree that these (traffic) expenses should properly be divided on a straight revenue basis." (R. p. 2628.) Mr. Wharton testifies that he had used this basis, but it was not correct and unfair to the State, but owing to the way the statistics were kept he could get no actual apportionment of it; and he was not able to work out any correct method as the books then stood. He merely used the railroad basis in the absence of data for a better one.

He said that the State traffic being largely noncompetitive and not requiring the service of traffic men generally, this basis unduly burdened the State. (R. p. 1010.) Mr. Ludlam testified to the same effect and several other of the State's witnesses, and so did Mr. Ward. (R. p. 1890.)

(c) The Court says station expenses should be divided on the ton mileage charging the intrastate with six terminal handlings. (R. p. 2628.) What connection there is between expenses at stations and the mileage between them is incomprehensible to us. We have heretofore discussed this at length.

*Station Expense*

The Court ascertains in some way the cost of fuel and wages per train mile, on the through and on the local, and a difference of 47 per cent. Mr. Kimbell got accurately the fuel and wages for October, 1908, on his road and Mr. Hamilton found the wages for October, 1907, on the Iron Mountain. The records of the Iron Mountain were so kept that for a period in the past the actual fuel consumed for the month was unascertainable. Mr. Doddridge had been General Manager of both of these roads and, when he was on the stand in behalf of the plaintiffs, he was asked as to whether the actual fuel consumption on local and through trains on the Southwestern would be applicable to the Iron Mountain and said, "I presume that those proportions would be applicable in a general sense." (R. p. 515.)

*Fuel and Wages.*

Mr. Roberts also testified the test on the one road would fairly represent the other in this respect. (R. p. 2114.)

We submit that actual results should be accepted.

(g) The item of other train exepness, such as expense for signaling, wrecks, cattle killed, etc., the State apportioned on the train mile basis; believing that such items as these were incurred by the trains as a whole and in proportion to the miles it ran. This is one item to which the train mile would naturally apply. The Court adopts the revenue basis for this. (R. p. 2629.)

*Other Train Expenses.*

(h) The Court charges 30 per cent extra to the intrastate for hire of equipment on the ground that the cars used in local trains are delayed much more by reason of slow schedules, and shippers allowed 48 hours for unloading. (R. p. 2630.) If this was a charge to the local train and apportioned according to the traffic, it might not be so far amiss as charging it to the intrastate, which is done, and that on the revenue basis. (R. p. 2646.) That in proper operation there is more delay to equipment on local trains than through is unquestionably the case; but, say at Morrilton, there is no more delay on a car of merchandise delivered there which came from St. Louis than a similar car which came from Little Rock. But ideal conditions do not prevail on this road, and the local should not be charged with extra cost in this matter in the face of the undisputed record evidence that the transstate cars in passing through the State were delayed on an average in March, 1907, four days over schedule, and in October, 1907, five days over schedule.

*Hire of Equipment.*

Moreover, the evidence of Mr. Bee for the State and Mr. Whitenton for the railroads show that the interstate movement of cotton entails more delay in equipment than any other movement.

(i) The Court considers what he terms omissions from the State's plan of dividing expenses. (R. p. 2630.) The first is the dead weight on local trains is more than on through trains. This is true, but when the expense of the local train is fairly divided by the traffic carried on it, whether dead weight or wages or other expense it bears, is measured between the interstate and intrastate. This is equally true of the other items mentioned by the Court in this connection. They are all items relating to local trains, and had he added the 8.5 per cent which he finds these items represent to the cost of the local train and then apportion it over its load, we would not complain although his data is insufficient for a basis, but this is added directly to the intrastate.

*Omissions.*

(j) The Court says: "There is no charge on part of the State that these roads are not efficiently, economically and honestly managed." (R. p. 2634.) Surely the State failed to make its position clear to the Court. It put the plaintiffs' allegations in this regard directly in issue in the answer. It denied economy in operation; it denied that no unreasonable salaries or wages have been paid officers and employees. (R. p. 25.) We called for explanations of the high operating ratio of Mr. Johnson and Mr. McPherson. We put in evidence exhibits showing cost of operation had decreased generally and efficiency and power in equipment had increased. We put in evidence the favoritism to Pratt's hotel and Bunch elevator, whereby the revenues were depleted $22,000 per annum. We put in evidence a fine for violating the criminal laws of $10,000 and costs. We put in evidence a salary paid to a man notoriously known in the criminal courts as a corrupt lobbyist, and other salaries paid to men in Missouri, part of which were distributed against Arkansas, whose duties officially in Arkansas were unknown to officers of the company. We put in evidence the improvident contract with the Frisco road for the Van Buren bridge, and we put in evidence the express company contract and proof that the Missouri Pacific had received $144,000 a year and unjustly withheld $30,000 of it a year from the Iron Mountain revenues for 20 years, and the Court so found. (R. p. 2603.) Certainly this evidence is sufficient, at least, to acquit the State of giving the Iron Mountain a clean bill of health on its economical and efficient management.

*Management of The Road.*

## NO RETURN SHOULD BE ALLOWED ON NEW LINES.

The Iron Mountain recently constructed a new line, the purpose and character of it is thus stated in the opinion:

"The main line of the Iron Mountain railroad is practically a water level road; no mountains to cross, no rocks to blast or tunnels to

excavate, and the leading commercial cities and industries of the State are along its line. On the other hand the White River Branch of that road was the most expensive road ever constructed in the State. Miles of it had to be cut out of rock and tunnels cut through rocky mountains; there are no large cities along its line, and the country is sparsely settled owing to the heavy grades and the many curves made necessary by the topography of the country; it can not possibly carry as many cars to a train and transport freight as economically as the main line. The State officials, charged by law with the duty of assessing the property, must have taken these facts into consideration when they assessed those railroads. The White River Branch, in spite of its great cost, was in 1907 valued by that board at $19,000 per mile and assessed on the basis of 50 per cent of its value at $9,500, while the main line was valued at $45,000 per mile and assessed at 50 per cent of that sum at $22,500 per mile." (R. p. 26.)

The evidence shows it was finished in 1906, the year before the period of inquiry, and that it is chiefly used as a through line from the Northwest to the Gulf; most of the grain transstate traffic passes over it.

Should such a branch in its experimental state be considered an integral part of the system, weighing down on one side the expense account with its heavy maintenance account, and on the other the sparse intrastate revenue, and adding its assessment, even if a low one, to the property upon which the return upon the whole shall be compensatory?

We appeal to the principle decided in San Diego Land & I. Co. v. Jasper, 189 U. S. 439, to the effect that where a plant is built on larger lines than immediately needed, that neither the Constitution nor justice require the patrons of the other part of the plant to pay full return on the whole. In discussing the rate of return we have heretofore referred to this matter, and believe that in weighing the whole case, it should be decided that the Iron Mountain eliminate it from its property, and eliminate its revenue and expenses on this expensive new branch before it should be heard to complain of the rates as a whole.

## SWEEPING EFFECT OF FINAL DECREE.

Attention is called to the sweeping effect of the final decree and the assignment of error predicated thereupon.

Any and all rates in Standard Distance Tariff No. 3 are enjoined. Under its terms no rate therein or provision of that tariff can be enforced. If as a whole the rates therein are confiscatory, the injunction should go against a system of rates not producing more revenue than this system, but to absolutely prohibit any and all rates therein from ever being in force is, we submit, too sweeping. The clause for retention of jurisdiction is more broad than the form adopted by Judge Brewer in Ames v. Union Pacific, which met the

approval of this Court in Smythe v. Ames, and to that form it should be restrained, if by peradventure any injunction should be sustained.

## THE VALUE OF THE PROPERTY.

One of the troublesome problems in rate litigation is to establish the fair value of the property, but, fortunately, by terms of the bill and express stipulation of parties, that difficulty is removed from this case.

## STIPULATION OF COUNSEL AS TO VALUE OF THE PROPERTY.

"It is agred by counsel for defendant in these cases that the assessments introduced in evidence at the hearing of applications for injunction in these cases before Judge VanDeventer, and which are set out in the exhibits filed by the acocunting officials of the respective complainants in the evidence taken before the master in these cases, were made upon the basis of 50 per cent of the value of the property and that said asesssments, multiplied by two, respectively, represent the value of the property for the purpose of this case. Counsel for complainants have also introduced the assessments made by the Tax Commission of the State of Arkansas of the property of each of the complainants in the year 1909; which assessments are set out in the respective statements filed as exhibits in these cases by the accounting officials of each of the complainants.

Counsel for defendant objects to the competency and admissibility of said statements, as to the assessments made in the year 1909.

But if said statements are admitted as competent, it is then agreed that they were made on the basis of 50 per cent of the value of the property; and that in order to represent the full value they should be multiplied by two.

It is further understood that the defendants are not concluded by this agreement to object to any consideration of any items included in the assessments which the defendants claim should not be included therein, which has heretofore been brought out in evidence or which may hereafter be brought out in evidence." (R. pp. 655-654.)

In Willcox v. Consolidated Gas Co., 212 U. S., p. 52, the Court said:

"And we concur with the Court below in holding that the value of the property is to be determined as of the time when the inquiry is made regarding the rates."

Therefore the evidence of the 1909 assessment and the numerous calculations based upon it in plaintiffs' exhibits will be disregarded and the valuation considered as of the period of inquiry—1907.

## THE ASSIGNMENTS OF ERRORS.

We have presented the case in what has seemed to be the logical and orderly arrangement of the subjects without following the order of the assignments of errors.

The appellants have properly assigned error for each matter herein presented as error. (See Assignments of Error, R. pp. 2650-6655.)

There are some assignments of errors upon matters not herein discussed, but which are not intended to be waived. There is so much detail in the case that a separate discussion of each point would necessitate repetition, and where matters of like nature are covered in other discussion we have not repeated it in regard to some of the detail upon which error is assigned.

It is respectfully submitted that for the errors assigned that the decree should be reversed, the injunctions dissolved and the bills dismissed for want of equity.

Respectfully,

JOSEPH M. HILL,

*Special Counsel.*

## SUPPLEMENTAL BRIEF FOR APPELLANTS.

Some matters in the brief of the learned counsel for the appellees require answer in order to make clear the facts. We will confine this brief solely to matters that we think are not sufficiently developed in the former brief, and which the brief of appellees require to be further developed, in order that the Court may arrive at the exact facts in issue. Where possible, reference will be made to pages of our former brief, where the evidence is set forth on both sides, instead of to the record, as it will likely be more convenient.

### APPORTIONMENT OF PROPERTY AND EXPENSES BETWEEN FREIGHT AND PASSENGER TRAFFIC.

Appellees state, at page 19, that they—the plaintiffs—in preparing their statistics, apportioned the value of the property between freight

and passenger traffic, and State and interstate traffic on the basis of gross revenue derived from each kind of traffic, and followed the same rule in division of expenses of operation between the several kinds of traffic. This is a mistake.

Plaintiffs' exhibit 3 (R. p. 2294), shows that they apportioned the property on the gross revenue, but statement 5, of that exhibit (R. p. 2310), shows that maintenance-of-way expenses (in round numbers, a million dollars), is divided between freight and passenger traffic on the train-mile basis. It also shows expenses common to repair of freight and passenger cars is likewise divided on the train-mile basis, and also shows other minor items which aggregate large sums, are likewise so apportioned. In our former brief, beginning at page 261, we discussed this subject at length, and therein show that this change of base from the revenue to train-mile on maintenance-of-way alone worked to the detriment of intrastate traffic, $101,-582.92 (our brief, p. 265), and changed the rate of return on the property from 7.04 per cent, which it would have been on the revenue basis, to 4.70 per cent on this mixed basis (our brief, p. 266). The appellees, in their brief, overlook this mixing of bases and mistakenly state that expenses between freight and passenger are divided on the revenue basis.

## PREPARATION OF OCTOBER STATEMENT.

Appellees say, referring to exhibit 26, "which was prepared by the accountant of the railroad company at the request of the State." In a sense, this is correct, yet (unintentionally), it leaves the wrong impression. The Iron Mountain railroad selected this month as a fairly representative month and worked up the statistics of it which constitute exhibit 26, and put the same in evidence in this case in chief.

Mr. Johnson, its accountant, says that he did so in anticipation of a request of the State for such data. He says when the request came it was for three months' statistics, and that he resisted the application for the same before Judge Trieber, but offered the one month's statistics, which he had already prepared, which he stated at the time he regarded as fairly typical of the period of inquiry. The Judge declined to require him to furnish the three months, and this month was furnished and was later introduced in evidence by the plaintiffs, and was frequently used by the plaintffis in the development of their case in chief, and was used by the State's accountants for the purpose for which it was offered when it came their time to offer evidence. The whole evidence on this subject is set forth in pages 305-313 of our former brief.

The impression left from the statement objected to is that this month was selected by the State, when, as a mater of fact, it was

not selected by the State, but was used by the State for the purpose for which the railroad selected and prepared it and introduced it.

## NORMALITY OF OCTOBER.

At page 21, appellees say: "It was also shown that the movements of State and interstate freight on local and through trains, respectively, in that month, was abnormal." Had counsel said that there was some evidence tending to show this, we would not challenge the correctness of the statement, but when it is stated that it was shown that the movement between State and interstate on local and through freight trains in October was abnormal, we must challenge, positively, the correctness of the statement.

The October statistics were prepared by the railroads as representative of the period. Many of the plaintiffs' witnesses testified that it was representative of the period, and that the movement of interstate and intrastate traffic, and of local and through trains could be fairly tested by one month's statistics. After that evidence was in, the State used the data for the purpose for which the plaintiffs' witnesses said it could be used. Subsequently, in rebuttal, the railroads challenged the normality of October and presented some testimony along the line indicated in the above quotation, but that testimony failed to overcome the railroads' previous testimony; even if it had done so, it was overwhelmed in turn by the undisputed statistics which demonstrated that October was normal so far as train and car movements were concerned, and State and interstate traffic were concerned. The evidence on both sides of this qustion is found on pages 297-331 of our former brief.

It is certainly a curious and probably unprecedented situation that all the evidence on a controverted issue in the case (with the exception of the compilation of the statistics from the plaintiffs' exhibits and books—and those were undisputed), is a conflict between the plaintiffs' evidence in chief, and the plaintiffs' evidence in rebuttal.

## THE LAPOVERS.

In the same connection, at page 21, the appellees attack the correctness of the results obtained in exhibit "I," owing to the lapovers from October to November. They assume that on account of these lapovers the result is unreliable, but overlook the fact that there is a great deal of testimony to the effect that the lapovers from September into October would offset the lapovers from October into November. It is indisputable fact that every period contains lapovers, whether the period is long or short. In any going business there are lapovers, but unless something is abnormal, the lapovers will equalize themselves and the period may be accepted as fairly repre

sentative; and there is no abnormality proved here. On the contrary, normality is demonstrated to exist, and, therefore, the lapover is a negligible quantity.

## INTERFERENCE WITH INTERSTATE RATES.

While differing somewhat as to the evidence touching this subject, each brief gives appropriate reference to the testimony where the evidence relied upon is found, and the Court must settle the effect of the testimony upon it, although the difference between the statement of it in the briefs is not radical. But, beginning at page 30 is an argument based on the geographical location of the cities in Arkansas, and statements as to the effect of intrastate rates upon the interstate rates in and out of these cities, and we feel that we can not pass this argument without challenging the assumptions upon which it is based.

The geographical location of the cities is correctly stated, but the evidence assumed in this argument relating to the rates in and out of these cities is not to be found in the record. The argument is evidently to bring this case within the Minnesota rate situation as found by Judge Sanborn in the Minnesota Rate Case, but the evidence as to the rates in and out of these cities, other than the Memphis situation, which is gone into in much detail, is conspicuous by its absence.

## INCREASED COST OF MATERIALS, LABOR, ETC.

Beginning at page 45, it is argued that there has been no acquiescence in the rates now attacked by reason of the long length of time in which they have been in force, because it is said that the increased cost of material, labor and supplies has rendered rates which might have been reasonable ten years ago, unreasonable at the time of this attack.

This argument is bottomed on the evidence of Mr. McPherson which culminated in his graphic chart, exhibit No. 30, in which he pictorially illustrated the evidence which he gave upon this subject. The error of this argument is dual. It is admitted that there has been increased efficiency in operation within the past ten years. There has been developed greater capacity of locomotives, larger cars, reduced curves and grades, enabling more cars to be carried to the train, and more load in the cars. It is admitted that there has been some increase in the cost of labor, supplies and material. Evidence, statistical or opinion, giving one side only, has no value. It is a question, which has produced the greater effect, the increased cost, or the increased efficiency.

There is another factor that is a necessary one to determine correctly the proposition, and that is the proportionate increase or de-

crease of revenue compared with increased cost and efficiency. Mr. McPherson admits that engines have a greater potentiality of 25 or 26 per cent, and that there is an increase of capacity in freight cars of 20 per cent (appellees' brief, p. 50). At other places, he tells of millions of dollars spent on the improvement of the line in Arkansas in the last ten years, which would necessarily give increased efficiency to operation.

The graphic chart shows decreased revenue, which was explained by Mr. McPherson to refer only to freight revenue, and not to passenger or miscellaneous (R. p. 382). It was shown in Mr. McPherson's cross examination (R. pp. 381, 382), that this necessarily referred to a decrease in interstate revenue. The appellees now say (brief, p. 57), that it is a mistake to assume that the decreased revenue referred to interstate revenue in Arkansas as the line on the chart showing this decreased revenue was for the whole Iron Mountain system, which embraced some five or six States. If this be true, the chart is of less value than we had supposed when we cross examined Mr. McPherson upon it, because it will not do to compare the increased cost of material and labor pertaining to all classes of service in Arkansas with the decreased freight revenue of the entire system consisting of five or six States. It is a comparison of the increased cost so far as it affects one-fifth of the whole with the revenue of the whole.

Mr. McPhrson failed to give the other side of the equation, but the State gave it. The State put in exhibit "Z" (R. p. 2569), which contains all of the elements necessary to a comparison of increased cost of material and labor with the increased efficiency and also with change in revenue for the period selected by Mr. McPherson, *i. e.*, 1897 to 1907. It shows that the improved efficiency taken into consideration with the revenue more than offsets the increased cost of material, supplies and labor and shows the ***net*** increase of revenue per mile on one of the pliantiffs' roads to be increased 69 per cent, and on the other one 163 per cent.

Exhibit "F-1" and "Z" (R. p. 2571), shows year by year from 1897 to 1907, in the entire United States railroad statistics of increased efficiency, and also in Group 8; and of these two roads for 1897 and 1907. The average train load in the United States, in tons, increased from 204 to 357, 75 per cent; on the Iron Mountain, 75.6 per cent; on Southwestern, 83.7 per cent. Receipts per ton-mile decreased in the United States 4.9 per cent; in Group 8, 10.5 per cent; on the Iron Mountain 10.4 per cent; on the Southwestern, .7 per cent.

The load increased 75 per cent in tons, and revenue per ton-mile decreased only 10 per cent, and the freight train mileage increased 36 per cent, and the ton mileage increased 139 per cent. The passenger side also shows similar increased efficiency. In the United States, the passengers per mile increased 37.8 per cent; on the Iron

Mountain, 49.41 per cent, on the Southwestern 57.7 per cent, and the revenue increased on the Iron Mountain, 1.9 per cent; on the Southwestern, .8 per cent, while in Group 8, it decreased 1 per cent, and in the United States decreased .4 per cent. These statistics demonstrate slight decrease in freight revenue per ton-mile, and slight increase per passenger mile, and tremendous gains in efficiency of operation and necessarily tremendous savings, if economically administered, of expenses of operation, notwithstanding increased cost of labor and material. They utterly destroy the one-sided picture presented in the McPhrson chart. But it is said these statistics are of no value because they begin with 1897, the worst year for railroads in their recent history, and compare it with 1907, the best year. That is exactly what the graphic chart does, and these exhibits but supplement the one side of the story told in it for the same period. It was the period for comparison selected by Mr. McPherson. He begins with 1897 when everything was at low ebb, and shows the increase in price of material, labor and supplies from then till 1907. The State begins with 1897, and shows the increase in efficiency, the greater loading per train, the greater train for the engine, the greater number of tons and passengers for the train, the greater mileage for the train, and the ultimate end, the *increased net revenue per train-mile.*

Chart 30 is a bald attempt to show one phase of a subject when there are offsetting elements known to exist, and the offsetting elements are omitted. When they are supplied, it is found that the net result is in favor of the railroads, and, therefore, if the rates were remunerative in 1900 when established, they were more so in 1907, the period of inquiry, and having acquiesced in them for over eight years before attacked, acquiescence should be presumed.

It is said the reduction in passenger fares are not shown in the tables of the State; part of it is, as the two-cent passenger act went into effect in the spring of 1907. Mr. McPherson's chart, however, does not deal with the passenger revenue or miscellaneous revenues, and he so admitted. (R. p. 382.) As the passenger revenue is only 26 per cent of the revenue, and the reduction from three cents to two cents per mile is 50 per cent nominally, yet, actually it was admitted to be only 35 per cent, excursion and other reduced fares not prevailing under the two-cent rate, bringing the reduction to 35 per cent actually; the intrastate passenger is 59 per cent of the passenger traffic (see table, our brief, p. 265); therefore, the two-cent fare reduced by 35 per cent, 59 per cent of 26 per cent of the revenue, or a reduction of 5.25 per cent of the whole, and this not taking into account the increased passenger traffic naturally flowing from the reduction of rates.

It follows that the legislative reduction of 5 per cent of the revenue when the increased efficiency far more than counterbalanced

such reduction, left the earning capacity of the road much greater than when the rates were established in 1900.

## DIVIDENDS.

Exhibit 47 (R. p. 2431), shows the Iron Mountain declared dividends from 1904 to 1907 inclusive, of 10 per cent, and for the fiscal year ending June 30, 1908, 5 per cent. It is said (appellees' brief, p. 61), that the latter embraced our period of inquiry. That is true, but the panic began in October, and was seriously felt from November on to and including June 30, the date that this statement was made out. Mr. McPherson thus described the period when it was most felt: "From April to June, it reached the highwater mark of effect." (Our brief, pp. 309, 310.)

It is fair to assume that but for the blighting effect of the panic in the first part of 1908, the six months after our period of inquiry, that the 10 per cent dividend of previous years would have been maintained for the fiscal year ending June 30, 1908, for the 5 per cent was evidently made prior to January 1, 1908.

On page 61, of appellee's brief, this is said: "It also represents all revenue that accrues from investment. The Iron Mountain railway owns a large part of the bonded indebtedness of other railroads, among them, the Texas & Pacific Railroad, and the earnings of the latter contribute to the dividends of the former." In view of the fact that there are seven thousand pages of typewritten evidence in this case, we hesitate to make the broad statement that there is no evidence in this voluminous record upon any given point, but notwithstanding that hesitation we feel called upon to deny absolutely the correctness of the quoted statement.

So far as we are able to discover, and we speak after careful investigation, there is no evidence whatever in this record that the Iron Mountain owns a large part or any part of the bonded indebtedness of any other road; no evidence that it owns the bonded indebtedness of the Texas & Pacific railroad, and no evidence that the earnings of the latter road contributed to the dividends of the Iron Mountain.

We will not combat for a moment the argument made at page 62, that, notwithstanding the railroad may be making money from other sources, that it is entitled to a reasonable return on the property devoted to intrastate traffic aside from the return it may make on the property devoted to interstate traffic. This was settled in Smythe v. Ames. The fact that the road is paying a large dividend is evidence to be considered in determining whether the plaintiffs have proved that they are losing on their intrastate business.

It has heretofore been shown that the Iron Mountain in Arkansas is costing less to earn a dollar of revenue than the Iron Mountain as a whole is costing, and this is true even after spending magnificent

sums in improving the road and buying equipment in Arkansas, and it is also shown that the revenue per ton-mile and per passenger mile is practically the same in Arkansas as on the system, and also shown that the net revenue per mile on the road is much greater in Arkansas than on the system; it is also shown that the freight intrastate revenue is double that of the freight interstate revenue, and the passenger intrastate revenue appreciably larger than the passenger interstate revenue (brief, pp. 56-59), and also shown by plaintiffs' exhibits that the return on all property in Arkansas is compensatory.

Therefore, the plaintiff must prove an intrastate expense so great as to wipe out the greater intrastate revenue and in addition thereto show that its intrastate expenses are so great that after wiping out this excess in intrastate revenue, they bring down the general level to a return below a compensatory one. If the road, as a whole, was a losing venture, or if the expenses in Arkansas were greater than on the system, or if the return on all business in Arkansas was confiscatory, this might not be difficult, but, in view of these proved facts, it is a pretty large order to fill to prove one part of the business is losing so enormously.

At page 63, of appellee's brief, the falling off in dividends in 1908 is ascribed to the facts of increased cost of material and labor given in Mr. McPherson's testimony, and depicted in the chart. In view of the testimony of Mr. McPherson and other officials of the blighting effect of the panic, especially in the first part of 1908, it seems a far cry to ascribe the falling-off in dividends to any other cause than this one; especially, as the statistics in exhibits "Z" and "F-1" prove the enhanced expenses have been overcome by the enhanced efficiency.

## EFFECT OF THE PANIC.

At page 70, it is said that the panic was not felt in time to affect the business in the last part of 1907, and reference is made to the testimony of Mr. Kimball, at page 160 of the record, to bear out this statement. This occurs in Mr. Kimball's testimony, at that page:

"Q. You did not begin to feel it until about November, you think?

A. I think not.

Q. You did begin to feel it then very severely, and from that time up until the close of this year, 1908, your road was suffering from depression in business, probably, as it never suffered before.

A. Yes. I might add, it affected both classes of business (referring to State and interstate), correspondingly, I should say."

Mr. McPherson says the operating department felt it in December. Mr. Johnson says it began in October, but its effect on the earnings began to be felt in November. (Our brief, p. 310.) Mr. Nay says the panic began in the latter part of October, and the "slump showed up in November" (p. 2075.) The testimony of these auditors,

Nay, Kimball and Johnson, who deal with revenue, conclusively show that the panic was severely felt in November and December—one-third of this six months' period by which these rates are to be tested. At page 68, the statement is made that the State's accountants adopted the last half of 1907 in making up their statements and applied their theory of dividing expenses to it. The State's accountants adopted no period; they merely took the accounts presented by the plaintiffs, and applied their theory of allocating expenses to them. After the plaintiffs presented October as a representative month of the six months' period, and stated that the movement of State and interstate, and local and through trains, could be fairly tested by it, they adopted it as representative of that period. The State has always combatted the fairness of testing these rates on that period. The Southwestern road, in addition to putting in this period, also put in the statistics for the year ending June 30, 1908, but that worsted rather than bettered the situation, as no one will contend for a moment that the rates could be tested on the first half of 1908. The Iron Mountain put in both halves of 1907, but the detail was only put in in regard to the last half and this is shown in exhibit 3 and exhibit 3-A. In fact the case was tried on the statistics of the last half of 1907. It is interesting to note that the rate of return shown by the Iron Mountain on the last half of 1907, according to its own method of computation on the revenue basis mixed with the train-mile basis, shows a return on all the business in Arkansas of 7.50 per cent (R. p. 2818), while the first half of 1907 shows a return of 9.97 per cent. (Ex. 8, R. p. 2334; 8-A, R. p. 2341.)

## IMPROPER CHARGES.

Each brief has developed their side of these controverted items. Our side of it is presented at pages 281-294, and attention will be called only to a few of the matters again. At page 70, of appellees' brief, it is seen that they miss the force of our objection to charging the State with 77 per cent of the expense for repairs to tools. Our contention in regard to this is set forth at page 294 of our former brief.

Regarding the Memphis expense being charged to Arkansas, it is said, at page 77, that if they were not charged to Arkansas, they could not be charged to any account as the road terminates at Memphis. We fail to see the connection between the two propositions. It is stated by appellees that there are many division points near the State lines that serve two States. It is true, and also true that the expenses of the division points are all charged to the States in which they are situated, and that is what we contend should be done in regard to the Memphis expenses. Instead of so doing, 13 per cent of the freight expenses are charged to Arkansas intrastate, and 59 per cent of the passenger expenses are charged to the Arkansas in-

trastate passenger when not a pound of the freight and not a single passenger in or out of Memphis was intrastate, but all interstate; and all the revenue is interstate and so carried in the exhibits in this case.

On the other hand, there are terminal expenses at Fort Smith, whether big or little is not the question. They are recognized to be terminal expenses, and yet no part of them was charged to Oklahoma, although Fort Smith is serving Oklahoma just as Memphis is serving Arkansas. It will not do to say that Fort Smith is a way station and the principle does not apply, for, in the testimony of Mr. Johnson, quoted in our former brief at pages 286-288, he recognizes terminal expenses in Fort Smith, not station expenses only, exactly like terminal expenses in Kansas City where the same question was raised as to charging all the Kansas City terminals to Missouri, in the Missouri rate litigation.

It is not a square deal to charge Arkansas with the Memphis expenses, and also with the Fort Smith expenses. As a matter of fact, Arkansas should bear the Fort Smith expenses, and it would be equalized by terminal expenses in other States being used to serve Arkansas. But there is no warrant for charging the terminal expenses, and all other expenses of part of a road in another State to any part of the Arkansas intrastate.

At page 81, the appellees fall into the same error in regard to the ownership of the Bunch elevator, which the trial court fell into; which has been pointed out in our former brief at page 289.

We assume from the silence of the appellees on the subpect, that they do not further question the correctness of charging the Express Company dividends, and the Pratt Hotel rental to the railroad revenue, although they were omitted in their account upon which they base their case.

## THE REVENUE BASIS.

We can not discuss either the authorities or the evidence on this subject without repetition, and merely call attention to the argument made at page 86, of appellees' brief, to the effect that the interstate rates, save in exceptional instances, do not exceed the combination of the local rates, and this is the condition generally prevailing. We think the evidence fails to prove it; but assume for the argument's sake, that this statement is correct; the rate varies with the length of the haul—the longer the haul the less proportionally the rate. In other words, the rate for 100 miles is not double the rate for 50 miles. Hence, in normal and proper rate-making, the rates for the longer haul should be less than the combination of intervening rates for shorter hauls. Sometimes, as is the instance in this record of the sugar rate, a combination of local rates will prevent an unreasonable rate obtaining; but, in proper rate-making, the combination of the locals would not produce the rate for the longer haul, but

the rate for the longer haul would be made on its own basis, irrespective of the intervening rates, which sometimes have a chastening effect, but should, in proper rate-making, never have a basic effect.

## ZONE RATES.

Beginning at page 94 is a defense of the zone and blanket rates. This would be quite forcible if presented to the Interstate Commerce Commission in defense of their existence, but is wholly beside the inquiry here, which is simply: "Does the revenue produced by them so measure the cost of the traffic moved under them that it may be used as a factor with which to divide the common mass of expenses between such traffic and other traffic moving under graduated distance rates." At page 94 it is said that the same conditions prevail in the Commission tariff that were shown to prevail in the interstate tariffs in this respect. This is a mistake. There is only one zone rate made by the Railroad Commission, and that is on coal. There is a zone rate on coal from the coal field of Western Arkansas, an area of 50 miles in extent, into Little Rock, and the movements out of Little Rock are on the graduated distance tariff. Whether wisely or unwisely, coal is always moved on zone rates, the zone embracing the particular mining territory where it originates. This particular zone rate is different from the others in that it is only effective to the distributing point, and out of it, the graduated distance rates apply. If, however, many zone rates were proved to be in the Commission tariff, it would only prove that the intrastate revenue was as unreliable yardstick to measure costs as the interstate revenue.

At page 109, this subject is again referred to, and it is sought to prove that there are other zone rates existing in the Commission tariff. Sugar is mentioned as one, but that is not a zone rate. It is merely a maximum fixed for all hauls of it over 200 miles. There might be, and doubtless are, some movements under this that would have practically the effect as a zone or flat rate, in disregarding distance for a given length of haul, but they would be few and rare, as the average intrastate haul is 72 miles, and the maximum only applies to hauls over 200 miles. The zone rate is where *all* of the given commodity moves under the same rate from a given territory. This maximum merely indicates that occasionally some movements would occur over 200 miles, where for the last miles of it, the distance would not be regarded in the rate. There are probably some other such maximums in the Commission tariff, but in view of 72 miles being the average State haul, they do not affect the general proposition that there are no zone rates in the Commission tariff save the coal zone rate heretofore referred to.

The rough material rate on lumber is not a zone rate, but a graduated rate where the graduation is longer than in merchandise and other class or rates. The graduations in those is usually every five or

ten miles. In lumber, the graduation is 25 and 50 miles distances, while the interstate lumber zone is 600 miles in diameter. No parity can be found there. Then it is argued, at page 102, that the State rates produce different revenue for the same length of haul where the haul is over two or more lines. This is recognized in all rate-making as proper. It cost more to move freight over two lines than over one for the same distance, and the rates are made correspondingly in all properly constructed tariffs, where commercial and competitive conditions are not controlling, and they are not effective in the Commission tariff, which is bottomed on the distance system, whereas, the interstate rates are bottomed principally on the commercial and competitive conditions. The more inequalities, however, that may be found in the Commission tariff, the worse the revenue produced from it is proved to be as a measure with which to divide the expenses incurred in hauling the whole traffic.

## THE RELATION OF RATES.

At page 103, it is said that the plaintiffs' testimony as to relation of rates does not conflict with the graphic charts put in evidence by Mr. Hamilton. Counsel seek to reconcile their testimony with the actual conditions found by Mr. Hamilton, on the ground that there can be no comparison between short-haul State rates and long-haul interstate rates. If that be true, the whole revenue theory is thereby destroyed. The average State haul is 72 miles, and the average interstate 222. A segment of the revenue from the whole interstate revenue, represented by the haul in Arkansas, is taken with which to measure the cost of the traffic, while the cost incurred in the intrastate or short-haul traffic is measured by the revenue produced from the intrastate rates, which, it is now said, can not be compared with the other. This explanation, however, does not explain the nonrelation of the interstate and State rates as found in the tariffs brought into the testimony by Mr. Hamilton from the tariffs themselves, and many of them are illustrated in the charts. Numerous charts are filed; two only of them are published in our brief to illustrate to the eye the effect of the great mass of testimony on this subject. Turning to the first chart (p. 206, of our brief), which is the simplest of all of them, it is seen the interstate rates run level in each instance, while the State rates are seen to be more or less regular in graduation.

The revenue produced from these rates represents the actual dollars and cents in the statistics in this case of the two classes of traffic over the given section of the road.

The next chart shows even greater nonrelation. For instance, take the third and fourth classes, where the interstate are graduated to some extent, but the graduations are so out of relation to the other graduation that it destroys all chance for parity. The various charts

in the record depict 39 per cent of the Iron Mountain system, and practically all the large movements of traffic carried by the road. It was impracticable and unnecessary to print all these charts. The testimony fully explains the facts, and they are merely to illustrate the facts proved in the record to the eye.

At page 213 of appellee's brief is inserted the table of Mr. Roth, which was introduced for the purpose of proving the relation of rates. We have (at page 179 of our brief), discussed this table and believe have shown it is unreliable and inapplicable; but, accepting it for the argument, what does it prove? Mr. Roth says: "The object of this comparison is to demonstrate that the revenue derived from the handling and hauling of all classes of freight traffic bears a very much closer relationship to the cost of handling these commodities than does the tons one mile." (R. p. 1977.) He says these percentage figures show that the construction of rates generally, State or interstate, is based on the cost of doing business, etc. (R. p. 1980.) Yet there is no cost shown in the table, and this is a mere assumption of Mr. Roth, based upon his grouping of the revenue opposite the ton-miles. All the witnesses agree that there are no cost data for specific commodities. There is no pretense that there is any cost in this table. Mr. Roth gives his opinion as to the relation of cost to revenue as compared with its relation to ton-miles. An examination of the table shows the revenue on the different classes received on the Missouri Pacific system, and that received in the intrastate traffic in Arkansas, are so variant and out of proportion to each other that it is impossible to use the two classes of revenue as a measure of the cost of the traffic and expect to get a result bearing any relation to the subject.

## THE STATE'S BASIS OF DIVIDING EXPENSES.

It is said, at page 158, that the State accepted as correct the railroads' apportionment of expenses to Arkansas, etc., with certain exceptions therein mentioned.

The State never accepted any apportionment of expenses to Arkansas; it merely used the railroad figures to demonstrate a sounder method for apportioning a given amount of expenses to two classes of traffic. This is explained at pages 261-281, of our former brief.

It is argued at length, at page 121, that, owing to the way the books are kept, that some business in October would be missed in exhibit 26, owing to the lapovers in the October, and which would not appear on the books, while the wheel reports would show the actual movements during the month.

This argument overlooks entirely the fact that the same conditions existed in September, and that there would be a corresponding lapover from September into October as from October into November. All the witnesses who discussed the subject on either side of

the case, stated, in more or less emphatic language, that State and interstate traffic moved uniformly. Hence, there is no reason why the lapovers from one month would not equalize the lapovers in another month.

The lapovers do not apply to the car-mile or train-miles; they only apply to the tons and ton-miles. Exhibit 56, filed by the plaintiffs in rebuttal, has in it all the vices of the lapovers which the State's exhibit contained, and also some of its own. (R. p. 2234.)

It is to be noted that the lapovers occur in exhibit 26, the work of the railroads themselves, and not in exhibit "I," which is compiled from it by the State. This is shown in the testimony of Mr. Gray (R. p. 1923.) Attention is called to the testimony of Mr. Roth, when he introduced into evidence exhibit 26, which is set forth fully in our brief at page 305. He was questioned closely by the State as to the accuracy of this exhibit, and whether it was compiled by a competent force; whether the statistics therein could be relied upon, and he assured the Court that it was correctly done by a competent force, and was absolutely accurate, save possibly for clerical errors, and he had taken every precaution to avoid them. (Brief, p. 305.)

The lapovers occur in the revenue of the test period of inquiry as found in the plaintiffs' own exhibits, probably somewhat diluted by being of a longer period than one month, but being a much larger proposition, would be as serious an impairment of their accuracy (if it be an impairment), as those of the the tons for a month's period. This was shown in Mr. Gray's testimony. (R. pp. 1923, 1924.) But, as a matter of fact, the lapovers do not impair the accuracy of these statements. They will occur in all going concerns, and, if the period is normal, the lapovers from one end will equal the lapovers from the other; and when the normality of the period is proved, then necessarily is proved that the lapovers are negligible, and the whole railroad case is dependent on the six months being normal.

Beginning at page 125 is a criticism of Mr. Wharton for originating the plan of dividing expenses because he was not an experienced railroad man, and quite an argument is made discrediting his work on account of his lack of experience in railroad affairs. Mr. Wharton is an accountant. He studied the testimony of the operating officials given in the Missouri Rate Case, and got all information possible from experienced railroad men, and then applied his accountanting skill to the problem before him. If the scheme is a good one, it matters not where it originated. Judge Trieber said it was "the best method of solving these problems that has been called to the attention of the Court." (R. p. 2621.) It was supported in its main lines by Mr. Doddridge, chief witness for the plaintiffs, and by Mr. Rawn, president of the "Monon Route," also a witness for the plaintiffs. It was also supported by many railroad accountants, men of vast experience in the problems to be worked out; it was

supported on the different questions, where it was attacked by men thoroughly familiar with the particular question in controversy. On the mechanical questions, it was supported by master mechanics and roadmasters; on engineering questions, by civil engineers and standard treatises; on switching and train movements, by yardmasters and switchmen, brakemen and conductors. It can not be brushed aside because not planned by a railroad man.

It was planned by an expert accountant, applying his knowledge of accountancy to the facts developed by men familiar with the subject. An accountant would not have to be a wagonmaker in order to devise a cost system for a wagon factory; he would not have to be a merchant in order to devise a cost system for a department store; but he would have to have a knowledge of the principles of cost accountancy and information as to the particular business to which it was to be applied; and that was the principle upon which the State's plan was worked out.

It was opposed and criticised particularly by Mr. Gray, Mr. Ward and Mr. Nay, reinforced in some places by employees and officers of the plaintiffs' roads. Their views were in turn opposed and criticised on mechanical and operating subjects by men far more familiar with these subjects than these officials could possibly be, as they were men on the ground and whose everyday work was in the line upon which their testimony was given.

At pages 134, 135, it is argued that the Iron Mountain test should be disregarded because contrary to the views of operating men as to the proportion of interstate and State freight on local and through trains. The Southwestern test month is appealed to also as a refutation of it, and in this connection the Southwestern test month is referred to as a normal month. It will be noted in passing that the trial court disregarded the Southwestern test month as well as the Iron Mountain test month in regard to the proportion of State and interstate freight on the local and through trains and substituted what we respectfully term arbitrary proportions in lieu thereof. The Southwestern test month was submited to Mr. Sewell, one of plaintiffs' expert witnesses and vice president of one of the Northern Pacific railroads, and he said that in view of the facts therein shown, that his testimony as to the proportion usually carried on local and through of State and interstate traffic would not apply. (Our brief, p. 232.) The undisputed facts in regard to the Arkansas traffic we also submitted to Mr. Rawn, another of their operating experts, and he said his views would not apply to such a situation (p. 230). Mr. Doddridge and Mr. Lincoln, each familiar with the Iron Mountain, said that the local freight train carried more interstate than intrastate traffic. (B. p. 285.) Hence, the result of the analysis of these test months should not have been such a surprise and shock to the plaintiffs.

As a matter of fact, the difference in the essential element between the Southwestern test and the Iron Mountain test is not radical, and one corroborates the other. The Iron Mountain test (exhibit "I," page 2517), shows the local train is made up of 71.49 per cent interstate, and 28.51 per cent intrastate, but this 71.49 per cent interstate is only 8.70 per cent of the total interstate, the balances being carried on the through train. The Southwestern test, exhibit "P," (p. 2541), made up from exhibits 19 and 20, filed by the road itself, shows 7.69 per cent of the total interstate was carried on the local (as against 8.70 of the Iron Mountain), and this 7.69 per cent is 67.34 per cent of the total load of the local as against 71.49 per cent of the Iron Mountain. The only material difference is the amount of intrastate on the through trains. On the Southwestern, only 21.48 per cent of the intrastate is on the through (exhibit "P," p. 2541), while on the Iron Mountain, 60.90 of the intrastate is on the through (exhibit "I," p 2516).

Whittenton's test month on the Rock Island showed 18 per cent of the load of the local was intrastate, and 82 per cent interstate. The 18 per cent represented 60 per cent of the total intrastate freight, and 40 per cent of the intrastate was on the through. (Our brief, p. 312.)

To summarize: On the Southwestern, 67.34 of the load of the local is interstate, on the Rock Island 82 per cent, and on the Iron Mountain 71.49. Surely, the Iron Mountain figures are not so out of line with the undisputed statistics of the other two roads, compiled by their own offices, as to cause the Iron Mountain statistics to be discredited. When you examine the maps of the Iron Mountain system which are in evidence in connection with much testimony upon the point, the reason for larger intrastate traffic on the through train is plain.

Little Rock is the great distributing point for the State of Arkansas. The lines of the Iron Mountain radiate out of Little Rock as the spokes from the hub of the wheel. The division points average 98 miles apart. Some are much shorter. Little Rock to Pine Bluff is 42 miles; all the intrastate traffic going out of Little Rock to division points and beyond them properly go on through trains, and the local trains would carry all the intermediate traffic whether State or intrastate. There is striking similarity in the three tests before you of the load of the local and the fact that the actual figures show more intrastate on the through train than the officials of other railroads expected to find there is not an argument against its correctness, but merely against their knowledge of local conditions.

The greatest clash between opinion and facts, however, was over the load of the local. These faraway experts regarded the interstate on it as negligible, and its load almost entirely intrastate and

largely L. C. L. intrastate. The tests of the three roads show the contrary, and the interstate from 68 to 82 per cent of the load of the local.

The evidence shows that months were spent checking over exhibit "I," and out of over 20,000 cars, errors in only 23 discovered.

If the Cannon-Moore-Brown theory be correct, that an undue amount of interstate traffic was loaded on the local train during October, how can they account for this large amount of intrastate traffic being on the through train in October? The through trains are always, in proper railroad operation, loaded to the full capacity of the locomotive. There is supposed to be no waste on them. It is incomprehensible that interstate traffic would be taken from the through train and put on the local, and intrastate traffic taken off the local and put on the through. But some such shifting of traffic would have to have taken place to give any credence to the Cannon-Moore-Brown theory in face of 60 per cent of the intrastate traffic being carried on the through trains.

## RENAISSANCE OF THE CANNON-MOORE-BROWN THEORY.

As anticipated in our former brief, the appellees relied upon the Cannon-Moore-Brown theory to establish the abnormality of train loading in October. We discussed at length this testimony at pages 319-323 of our brief. The inherent weakness of this theory is shown in their own statements. The statistics set forth at page 323, which were undisputed, demonstrate that the train-miles and the car-miles for October were an exact one-sixth of the six months' period of inquiry, and also demonstrated that the State and interstate traffic moved normally in October, in relation to each other, compared to their respective movements for the six months' period, and hence the overloading of the local with interstate traffic was an impossibility.

The Roth's statistics presented by the appellees in this connection were discussed while considering lapovers. (See p. 323 of our former brief.)

We, again, at the expense of repetition, call the attention of the Court to that fact that the trial court, in disregarding the statistics in the case, and giving credence to the Cannon-Moore-Brown theory, swept away the Southwestern test as well as the Iron Mountain test, and substituted 40 and 60 percentage respectively for the interstate and intrastate load of the local trains.

If we try this case on either the Southwestern test or the Rock Island test, it is as conclusive against the plaintiffs as the Iron Mountain test itself, and there is not a scintilla of testimony—not even from Cannon, Brown or Moore—attacking either the normality of the months in which these tests were made, or the accuracy of the results shown by them; they are plaintiffs' evidence and work, not the State's.

## MAINTENANCE-OF-WAY.

In the conclusion of the argument against the State's plan of dividing maintenance-of-way expense, at page 168, counsel made this point: That the transstate freight should not participate equally with other freight in the expense of repairs to building and stations, in the maintenance-of-way expenses. Exhibit 3, statement 4, (R. p. 2303), shows this item: "13. Buildings and grounds, $38,425.50" out of a total expense of $965,445.89, or about 4 per cent of the total. The transstate business used the buildings and grounds, and should participate in these expenses. The statistical evidence showed that the transstate cars are in the State four or five days over their schedule. Telegraph operators, station agents, switchmen, weighmen and other employees using the stations and grounds, are employed in and about the transstate cars while they are thus loitering overtime from division to another; and even when passed through as "on a bridge," some station, telegraph and other house service is rendered this traffic.

On the other hand, the interstate has certain facilities peculiar to itself in which the intrastate does participate: The Paragould trackage, the cattle chutes and pens, cotton platforms, etc.

Next, it is said the transstate makes no use of the switching for which 50 per cent is charged to the local train car mileage. The effect of so charging the local train is to relieve to that extent the through trains, and correspondingly the strict interstate and the transstate of that much expense represented by the added 50 per cent of local car mileage. Certainly, the plaintiff should not complain of this, but many of the State witnesses did complain of it as being an injustice to the State on the ground that much of the switching done by the local train was done in order to permit the through train to have the right-of-way.

## STOPPING OF LOCAL AND THROUGH TRAINS.

Counsel claim, at pages 179 and 180, that we are in error as to the finding of the Court that the through train stops every 35 miles, and the local train every five miles. We have heretofore quoted the Court exactly. There is no warrant for this finding in the evidence of the conductors and brakesmen, as thought by the learned counsel, and an examination of their testimony will so prove; in fact, their testimony tended to reduce the stopping of through trains to less than every 20 miles, which estimate had been made by Mr. Maurice Wright, and accepted by the State in its exhibits. This is just one of those errors which are often made by the most careful men; but that it is an error is patent as is seen by the testimony set forth at page 375 of our former brief.

## WAY STATION SWITCHING.

At pages 182-185, counsel claim that the way station switching is not provided for in the State's exhibits. They quote the critics-general, Messrs. Gray, Ward and Nay, at length on this point. Mr. Ludlam explained that this had been done, and it was merely an oversight of these gentlemen in saying that it had not been done. It is contended by counsel that these critics-general know more of the subject than Mr. Ludlam, "a mere accountant." We readily concede that they may be better authority on way station switching, but do not concede that they are better auhority on what is contained in the State's exhibit than Mr. Ludlam. There is no dispute that this way station switching should be allowed; Messrs. Gray, Ward and Nay made that quite clear. It was made clear to the accountants for the State before they prepared their exhibit, and they provided for it fully. In the hasty examination which these critics-general necessarily made of a rather complicated formula, they merely misunderstand the allowances made. It may be true that the exhibit did not make it as clear as it should have done. There is really no dispute over the fact of the justice of this allowance. The dispute is as to whether the State has accounted for it in its division of expenses.

At pages 375-379 we have quoted Mr. Ludlam's testimony in full, wherein he shows that this is fully accounted for. We have no doubt that if the critics-general had had the benefit of this explanation before they made this criticism, that the criticism would not have been made.

## STATION EXPENSES.

At pages 188 and 189, counsel quote from Messrs. McPherson and Ward on the injustice of the ton-mile to measure station expenses. The State accepted as correct the objections to the ton-mile to measure station expenses on information received before they prepared the exhibits, and did not use the ton-mile as the measure of station expenses, but used the ton. Mr. Ward illustrates the injustice of using the ton-miles to apportion station expenses, with two similar shipments of merchandise, one from Chicago, and one from Little Rock, to Benton, Arkansas. He says that station expense is exactly the same on each, but the application of the ton-mile, one being 25 miles and the other 600 miles, would disproportionately burden one of the shipments with an expense over the other with 24 times for identically the same service. (The quotation in appellee's brief is not full, but is substantially correct. See R. p. 1864.) The State fell into no such error as using the ton-mile for station expense, but the trial court did fall into this error and rejected the State's ton-basis and accepted the ton-mile basis, multiplying the ton-miles by six on account of the interstate haul being six times longer than the State haul. (R. p. 2628.)

Under the head of "Extra Cost of Intrastate Traffic," we have discussed at length the error of using the ton-mile for measuring the station expenses. (See pages 225-227, subdivision 6, of our brief.)

## YARD AND TERMINAL EXPENSES.

The evidence on this subject was discussed in our brief under the head of "Bridge Theory of Transstate State Traffic."

In order to meet this bridge theory, the State went exhaustively into the manner of handling cars in yards and terminals. The evidence is summarized in our brief at pages 238-256. The results of these actual conditions in yards and terminals, as disclosed by the exhaustive examination of them, were made the basis of this division of expenses. It is also explained as compiled in the exhibits at pages 383-387 of our brief. The appellees quote at length the evidence directed against it at pages 190-198 of their brief. The State's theory is founded on the actual facts as found in the yard records and in the train movements, and all theoretical opinions on the subject must give way to the actual facts as they exist.

## OTHER TRAIN EXPENSES.

Counsel, at page 201, say that this item, which includes wrecks, injuries to persons on track, and to stock and various other causes, could have been allocated to local and through trains and criticise the State's using the train-mile basis for this item.

It is pertinent to inquire why the plaintiffs did not allocate this item if it was capable of being allocated. In fact, much of it is insusceptible of allocation to a definite train; for instance, a fire starts in the night time, or stock is killed in the night time, and probably a dozen trains pass, and it is impossible to tell which one of them caused the loss. It seemed to the State's accountants that this was a train expense, and the train mileage should measure it.

## TON-MILE DIVISION OF TRAIN COST.

The appellees, beginning at page 208, criticise rather severely the State's witnesses on account of their lack of railroad experience, when dealing with the evidence sustaining the ton-mile basis for dividing train costs.

Counsel overlooked the fact that this division of expense is largely founded on the testimony of W. B. Doddridge, former general manager of both of these roads, and an expert witness for the plaintiff, and adviser of counsel and witnesses in both the Missouri case and in this case. They can not question either his experience, his ability as an operating man, or his knowledge of the subject, as they feel justified in criticising the State's witnesses along these lines. It is also sustained by Mr. Rawn, president of the Monon Route, another

of their experienced operating experts. Their testimony is abstracted at pages 334-338 of our brief. Mr. McPherson's analysis of the various units of measurement also gives warrant for this use of it. He says: "The ton-mile basis makes no provision for terminal expense, because there are no ton-miles at terminals that represent the expense. It only attaches as a unit of measurement between two given points, the beginning and the end of the journey, but does not consider the expense at either end. It can not measure the expense at either end." (R. p. 315.) It was used by the State only as a unit of measurement between the beginning and the end of the journey. The train cost is incurred between these points, and its justice, fairness and common use for this purpose is so thoroughly established by such an overwhelming mass of testimony on each side of the case that we do not consider it open for argument.

## EFFECT OF THE COURT'S FINDINGS OF FACT.

Counsel for the appellee, at page 254, say that the lower court considered conflicting evidence and made its findings and decree thereon, and that all presumptions are in favor of the correctness of the findings, and they will not be disturbed unless clearly in conflict with the weight of the evidence.

There were no findings of fact in this case in the sense that that term is used in the decisions. We called attention to this at page 393 of our former brief, but, even if there were findings of fact, the rule would not obtain in this class of cases. This was pointed out clearly by Mr. Justice Moody, speaking for this Court in Knoxville v. Knoxville Water Company, 212 United States, page 1. The Court will not fetter its own independent judgment in cases where State statutes are sought to be invalidated by facts, but will weigh the facts according to its own scales, and not by the scales adopted by a master or the trial court.

The authorities cited by counsel to sustain their statement do not sustain it. Kimberly v. Arms, 129 United States 512, the first case cited, is a decision on the effect of the finding of the master in the trial court, and not upon the effect of the finding of a court in chancery on appeal to this Court; much less is it an authority on the effect of the trial judge's opinion in a case attacking a State statute as invalid on account of an alleged confiscatory effect of the same as developed in the evidence. Idaho Mining & Milling Company v. Davis, 123 Federal 396, is a decision of the circuit court of appeals of the Ninth Circuit, to the effect that the findings of the trial court in equity will not be reversed unless clearly erroneous or against the preponderance of the evidence. McKinley v. Williams, 74 Federal 94, is a decision of the Circuit Court of Appeals of the Eighth Circuit to the effect that where the court below has considered conflicting evidence, and made a finding and a decree thereon, the finding will be taken as presump-

tively correct, if the appellate court is in doubt as to the facts found. Snider v. Dobson, 74 Federal 757, is a decision from the same court to the same effect. None of these authorities reach this situation. There are no specific findings of fact, but mere conclusions from the evidence embodied in the opinion in the way of argument or reasons for the rendition of the particular decree. But, if there were such, the rule invoked does not reach to this character of cases. The appellants could safely try their case, however, upon the rules ordinarily in force in regard to the findings of fact by trial courts in chancery and could even treat all the judges' opinions as specific findings of fact, even if we were trying the case on the defendants' plan of dividing expenses, and not relying on the failure of plaintiffs to make their case.

We believe that we have in our former brief and in this one demonstrated that the proportion of State and interstate traffic on the local and through trains, adopted in the State's exhibit, is not only supported by a preponderance of the evidence, but rises to the height of established facts, and the finding to the contrary is against the decided weight of the evidence, and practically against all of the evidence; and is against the undisputed statistics of the plaintiffs' own exhibits, and is supported by the plaintiffs' witnesses in chief. The discarding of the October statistics on the Southwestern road is without any evidence whatever to support it. If the defendants were the plaintiffs seeking to prove the rates were compensatory, all the other adverse findings of the trial court would be but harmless error, as if these months are accepted, the rates are proved compensatory beyond cavil. In fact, the case was disposed of in the lower court as if the defendants failed to prove the rates to be compensatory, when the truth is, the plaintiffs must prove the rates are confiscatory by clear and decisive evidence (almost beyond a reasonable doubt), or else fail. In fact, the rejection by the trial court of the plaintiffs' theory and the trial on the defendants' theory, reversed the relative positions, and practically required the defendants to prove by a preponderance of the evidence that their plan of dividing expenses showed the rates to be compensatory. Really, the defendants can stand that test under the facts, and are entitled to a decree as having established the compensatory return of the rates by a preponderance of the evidence; we can meet this harsh rule, and are entitled to a reversal on it under the authorities cited: Whereas, the rule is the opposite, and more, see former brief, page 48, on quantum of proof necessary to sustain these suits.

However, as we understand the position of the Court in these grave constitutional matters, it will not be troubled by the effect of the findings of the lower court.

Respectfully submitted,

JOSEPH M. HILL,
*Special Counsel.*

GUNTHORP-WARREN PRINTING CO., CHICAGO

IN THE SUPREME COURT OF THE UNITED STATES,

OCTOBER TERM, 1911.

ARKANSAS RATE CASES.

RAILROAD SUGGESTIONS AS TO WHY STATE FREIGHT EXPENSES SHOULD BE ASCERTAINED UPON A REVENUE INSTEAD OF A TON MILE BASIS.

Upon the closing argument in the Missouri Rate Cases, Mr. Justice Hughes asked for the reasons why the state freight expenses should be ascertained upon a revenue instead of a ton mile basis. In those cases the reasons are set forth in Johnson's Exhibit 55, appearing in the original brief therein (pp. 194-197), together with those given by the courts. (Id., pp. 181-194.)

In addition thereto, there has been prepared for use herein a statement of Mr. James Peabody, of the A., T. & S. F. R. Co., of the many reasons why the revenue basis is correct, and it is here submitted as an additional argument herein.

WHY THE REVENUE BASIS FOR THE DISTRIBUTION OF EXPENSES AS BETWEEN STATE AND INTERSTATE TRAFFIC IS BETTER THAN THE TON MILE BASIS.

In the making of freight rates two considerations are always present and consciously apprehended, although, perhaps, not always specifically applied. These are the cost of the service to the carrier and the value of the service to the shipper. The "cost of service"

takes account of weight, distance, bulk, volume, insurance, handling, switching, maintenance of tracks, terminals and equipment, dispatching, hauling, receiving, delivering and accounting, all of which may be broadly divided under two general heads, viz., those costs which relate to distance and those which are incurred irrespective of distance, or, in other words, hauling or movement costs, and terminal or stationary costs. The "value of the service" embraces such items as competition, both of other carriers and of markets, relation to public need as a luxury or necessity, the development of natural resources and the stimulation of trade, all modified by the commercial necessity of distributing the total transportation charge among the different articles of commerce in the ratio that will best facilitate their movement, or, more popularly expressed, assigning to each article the proportion of the total charge it ought properly to bear, having in mind the necessity for an adequate return on the property of the carrier performing the service.

As already suggested, these expenditures involved in the cost of service naturally subdivide under two heads, viz., transportation or movement costs and terminal or stationary costs, the one depending upon distance, the other having no reference thereto. Transportation costs include movement of trains, a portion of the maintenance charges both of track and equipment and also of insurance and accounting. As applied to these items the ton-mile (weight multiplied by distance) constitutes a measure which is more or less valuable for comparative purposes. Under the head of terminal or stationary costs come the remaining expenditures, all of which are constant whether the shipment moves five miles or five hundred and which constitute, for the average distance hauled, by

far the larger part of the outlay. With these items the ton-mile has no connection, distance not being a contributing factor.

It is patent, therefore, that the ton-mile as being wholly unrelated to so material a part of the total cost cannot be correctly employed as a basis for apportioning expenses. The revenue basis, being the resultant expression of the rate schedules, which take into account all of the elements going to make up the total cost, including the ton-mile, is therefore a much more comprehensive and accurate measure by which to apportion expenses. Neither method, however, takes account of the fact that of the large tonnage of the through train, a much greater proportion is interstate freight as compared with state freight than is the case with the local trains hauling a small tonnage. These relative proportions are shown in the two exhibits of tests made by The Atchison, Topeka and Santa Fe Railway. (Rec. #936) *7

(First test November 30 to December 6, 1908, inclusive.)

| | | | | | |
|---|---|---|---|---|---|

| | | | | | 6,496,336 |
| Analysis of local trains—2,234 train miles. | | | | | |
| Interstate tons | 2,204 | ton-miles | 165,553=81.35%) | | |
| State | 863 | | 37,951=18.65%) | 3.13% | |
| | | | 203,504 | 100.00% | 100.00% |

(Second test November 30 to December 6, 1908, inclusive.)

| | | | | |
|---|---|---|---|---|
| Analysis of through trains—11,722 train miles. | | | | |
| Trans-state tons | 23,011 | ton miles | 4,579,108=81.12%) | |
| Interstate | 6,191 | | 1,005,071=17.80%) | 96.60% |
| State | 1,511 | | 60,640= 1.08%) | |
| | | | 5,644,819 | 100.00% |
| Consolidated makes | | | | |
| Trans-state | | | 4,579,108 | |
| Interstate | | | 1,174,664 | |
| State | | | 89,849 | |
| | | | 5,843,621 | |
| Analysis of local trains—2,274 train miles. | | | | |
| Interstate tons | 2,039 | ton miles | 169,493=85.30% | |
| State | 862 | | 29,208=14.70% | 3.40% |
| | | | 198,701 | 100.00% 100.00% |

These Exhibits show that the expense attaching to the state freight was in both cases more than three times as much as for interstate, a result that is readily apprehended when it is observed that 81 per cent. of the movement was trans-state on which no terminal or state expense was incurred in Missouri but only the expense of hauling or moving, that 17.3 per cent. of the movement was interstate on which only one terminal was chargeable to Missouri, while only 1.7 per cent. of the traffic was intrastate on which both terminals accrue to the state.

These exhibits further show that the cost per train mile of through and local trains is estimated the same although the local trains actually cost more to operate, because of higher wages and larger crews, but the cost per ton mile on the local train is very much larger by reason of the much smaller tonnage. It is for this reason that in making an estimate of the cost of state freight something must be added to the average cost of the total to offset this extra expense.

## Missouri State Traffic.

Appended herewith is a section of the class tariff of The Atchison, Topeka and Santa Fe Ry. applicable to Missouri state traffic: I. C. C. No. 5723.

LOCAL FREIGHT TARIFF APPLYING BETWEEN STATIONS IN MISSOURI ON THE ATCHISON, TOPEKA & SANTA FE RY.

| Distances. (In Miles) | Rates in Cents per 100 lbs. Classes. | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|

| 200 miles and over 195 | 60 | 47 | 36½ | 27 | 22 | 25 | 19½ | 17 | 14 | 11 |

## Illustrative Demonstration.

For the purpose of demonstration first class and class E rates, being respectively the highest and lowest of the class rates, have been applied to a car of each class to each of three points the average of which most nearly approximate in distance from the state line the actual average haul on state traffic, 47.4 miles. (Rec. 495.) The average tonnage of first class merchandise, which consists of articles of light weight and large value and which are both loaded and unloaded by the carrier is, on The Atchison, Topeka and Santa Fe Railway, 5 tons per car, while the average loading of class E, carload freight, is 30 tons or six times as much. The rates on these respective classes are as follows:

| | Miles | 1st class per 100 lbs. | Class E per 100 lbs. |
|---|---|---|---|
| State line to Gorin, Missouri | 26 | 25¢ | 5¢ |
| Hurdland | 49 | 30 | 6 |
| Ethel | 75 | 35 | 7 |

An examination of the tariff will show that generally the first class rates increase in the ratio of 5 cents for each 25 miles and the class E rates increase in the ratio of 1 cent for each 25 miles. It is apparent, therefore, that these rates may be taken as representing the hauling or moving charge for each 25 miles for the reason that the terminal charge remaining constant regardless of the length of haul, the changes result from the application of the hauling charge only. It also follows that the remainder of the rate is to take care of the terminal or stationary costs, none of which are affected by distance. Apportioning the rates on this basis we find the charges to be as follows:

| | Miles | Revenue per 100 | Revenue per ton | Haulage proportion per 100 | Haulage proportion per ton | Terminal proportion per 100 | Terminal proportion per ton |
|---|---|---|---|---|---|---|---|
| On 1st class: | | | | | | | |
| Gorin | 26 | 25¢ | $5.00 | 5¢ | $1.00 | 20¢ | $4.00 |
| Hurdland | 49 | 30 | 6.00 | 10 | 2.00 | 20 | 4.00 |
| Ethel | 75 | 35 | 7.00 | 15 | 3.00 | 20 | 4.00 |
| On Class E: | | | | | | | |
| Gorin | 26 | 5 | 1.00 | 1 | .20 | 4 | .80 |
| Hurdland | 49 | 6 | 1.20 | 2 | .40 | 4 | .80 |
| Ethel | 75 | 7 | 1.40 | 3 | .60 | 4 | .80 |

The result of the movement of the six cars would be as follows:

| | Total Revenue | Haulage proportion | Terminal proportion |
|---|---|---|---|
| Gorin | $55.00 | $11.00 | $44.00 |
| Hurdland | 66.00 | 22.00 | 44.00 |
| Ethel | 77.00 | 33.00 | 44.00 |
| | $198.00 | $66.00 | $132.00 |

## Missouri Interstate Traffic.

The average haul in Missouri on interstate traffic is approximately double the average haul on state traffic. (Rec. 49 56) Applying the same tariff on the same commodities from Kansas City, Kan., to points most nearly approximating a distance twice as far as the haul on the state traffic the result is as follows:

| | Miles | 1st class per 100 | Class E per 100 |
|---|---|---|---|
| Kansas City, Kan., to | | | |
| Hardin, Missouri | 48 | 30¢ | 6¢ |
| Rothville, Missouri | 100 | 40 | 8 |
| Gibbs, Missouri | 147 | 50 | 9.5 |

Apportioning these charges between hauling and terminal on the same basis as before we have:

| | Miles | Revenue per 100 | Revenue per ton | Haulage proportion per 100 | Haulage proportion per ton | Terminal proportion per 100 | Terminal proportion per ton |
|---|---|---|---|---|---|---|---|
| On 1st class: | | | | | | | |
| Hardin, Mo. | 48 | 30¢ | $6.00 | 10¢ | $2.00 | 20¢ | $4.00 |
| Rothville, Mo. | 100 | 40 | 8.00 | 20 | 4.00 | 20 | 4.00 |
| Gibbs, Mo. | 147 | 50 | 10.00 | 30 | 6.00 | 20 | 4.00 |
| On Class E: | | | | | | | |
| Hardin, Mo. | 48 | 6 | 1.20 | 2 | .40 | 4 | .80 |
| Rothville, Mo. | 100 | 8 | 1.60 | 4 | .80 | 4 | .80 |
| Gibbs, M. | 147 | 9.5 | 1.90 | 5.5 | 1.10 | 4 | .80 |

It will be observed that this distribution provides for exactly the same terminal charge on the same commodity in each car on both state and interstate, the variable attaching only to the haulage charge. The ton-mile basis ignores this vital feature. The result of the movement of these six cars of interstate freight would be as follows:

| | Total Revenue | Haulage proportion | Terminal proportion |
|---|---|---|---|
| Hardin, Mo. | $66.00 | $22.00 | $44.00 |
| Rothville | 88.00 | 44.00 | 44.00 |
| Gibbs | 107.00 | 63.00 | 44.00 |
| | $261.00 | $129.00 | $132.00 |

As Kansas City, Kansas, is at the state line and there is no haulage in Kansas but only a terminal charge for that state, half of the above terminal charge must be deducted from the above to ascertain the total revenue in Missouri.

| | | |
|---|---|---|
| State | $198.00= | 50.38% |
| Interstate, $261, less ½ terminal | 195.00= | 49.62 |
| | $393.00 | 100. % |
| Assumed operating ratio 70% | 275.10 | |
| State expense 50.38% of $275.10 | 138.60 | |
| Interstate expense, 49.62% of $275.10 | 136.50 | |

The result thus obtained shows that without any allowance for the extra cost of doing the state business, the expense assignable thereto is slightly greater than that accruing to the interstate traffic, but these expenses must of course be readjusted to provide for the extra cost of the state freight haul. Using Judge McPherson's basis, viz., that it costs 50 per cent. more to earn $1 on Missouri state traffic than on interstate traffic, the result would be as follows:

Formula.

| | | | | | |
|---|---|---|---|---|---|
| 50.38% | x | 1½ | = | 75.57% | ÷125.19= 60.36% |
| 49.62% | | 1 | | 49.62% | 125.19 39.64% |
| 100.00% | | | | 125.19 | 100.00% |

| | |
|---|---|
| State freight revenue | $198.00 |
| State freight expenses (60.36% of $275.10) | 166.05 |
| Apparent surplus | $ 31.95 |
| Interstate freight revenue | $195.00 |
| Interstate freight expenses (39.64% of $275.10) | 109.05 |
| Apparent surplus | $85.95 |

If we use a larger factor for extra expense on state freight as, for instance, that adopted by Mr. Justice Vandevanter when circuit judge in the Arkansas case, viz., two times the cost, we would have—

Formula.

| | | | | | |
|---|---|---|---|---|---|
| 50.38% | x | 2 | = | 100.76% | ÷150.38= 67.00% |
| 49.62% | | 1 | | 49.62% | 150.38 33.00% |
| 100.00% | | | | 150.38% | 100.00% |

| | |
|---|---|
| State freight revenue | $198.00 |
| State freight expenses (67.00% of $275.10) | 194.32 |
| Apparent surplus | $ 3.68 |
| Interstate freight revenue | $195.00 |
| Interstate freight expense (33.00% of $275.10) | 90.78 |
| Apparent surplus | $104.22 |

In the last above computation the basis not only appears to be, but is, excessive, as applied to the traffic taken to illustrate the proposition, for the reason that the traffic here used for illustrating the proposition includes no trans-state business which constitute so large a proportion of the actual traffic—81 per cent. as shown by the test figures—and on which only the haulage expenses are chargeable against Missouri. The computation will nevertheless illustrate how the application works out, and not only serves to demonstrate the correctness of the theory, but shows that as always has been done by the courts, existing conditions must be con-

sidered in determining the factor to be used in connection with the added cost.

### The Ton Mile Basis.

Applying the ton mile basis of division of expenses to the illustrative traffic here used, the results show at a glance the absurdity of that proposition.

| | | |
|---|---|---|
| State ton miles | 5250 | |
| Interstate | 10325 | |
| Total | 15575 | |
| Total freight expense | $275.10=1.7663c per ton mile | |
| State freight earnings | | $198.00 |
| State freight expenses (5250 ton miles at 1.7663) | | 92.75 |
| Apparent surplus | | $105.25 |
| Interstate freight earnings | | $195.00 |
| Interstate freight expenses 10325 ton miles at 1.7663 | | 182.35 |
| Apparent surplus | | 12.65 |

Nothing could be more conclusive as to the error of the ton mile basis than these results. Here we have state traffic consisting of identical shipments hauled half the distance with two terminals equal to $46.20 (70 per cent. of one-half of $132.00) more expense, yielding a net revenue over eight times as large as the interstate shipments with only one terminal expense.

The contention that under the revenue theory all that is needed to double the expense on the state traffic is to double the rates is manifestly unfounded as well as absurd. Tariff rates, both state and interstate, proceed, as mileage increases, on the same general scale. The fact that at some point in the tariff an imaginary line fixing a state boundary runs through the tariff makes no difference in the scale of rates. The same rate applies for the same distance whether the haul is on either side of the state line or across it. The reason why the rev-

enue, as measured by the ton mile, is higher on state than on interstate is because the state haul averages much shorter than the interstate haul and therefore the heavy terminal expense which under similar circumstances is the same in both cases is loaded upon a shorter mileage in the one case than in the other. It not only is never the fact, but it would be manifestly impossible that any scale of rates should be doubled simply because of the crossing of an imaginary line.

## BRIEF AND ARGUMENT ON BEHALF OF APPELLEES.

---

### STATEMENT.

These cases represent nineteen suits filed by as many different railroad corporations operating railroads in the State of Arkansas, for the purpose of enjoining freight and passenger rates in force in that State in 1907.

The Legislature of Arkansas passed an act creating a Railroad Commission and defining its powers at the session of 1899. Section 9 of the act provides:

"That every person or corporation operating any railroad or express business in this State is hereby required to furnish said Commission, within fifteen days after notice to do so, with the rate sheet and tariff charges for transportation of every kind over such railroad, it shall be the duty of said Commission to examine and revise said rate sheet and tariff charges for freight or express matter for each railroad in this State, and determine whether or not, and in what manner, if any, such charges and rates are more than just and reasonable compensation for the services rendered, and whether or not, and in what manner, if any, said charges and rates are in violation of any of the provisions of this act; and said Commission will make reasonable and just rates of freight, express and passenger tariffs to be observed by all persons and corporations operating any railroad or engaged in transporting persons or property as express or freight in this State; shall make rules and regulations as to charges at any and all points for the necessary hauling and delivering of express and freight; regulate rates and charges for such service on all railroads as, in their judgment, justice to the public and said person or corporation may require; and so make the same conform to the requirements of this act." (Acts of 1899, pp. 86-87.)

Section 10. "Every person or corporation engaged as aforesaid, shall receive, load, unload, transport, store and deliver to the consignee thereof any and all property offered for shipment, whether as freight or express matters at and for charges not greater than those specified in such schedule, as may at that time be in force, and shall, on demand, issue to shippers, duplicate freight or express receipts, which shall state the class of freight shipped, the weight and charges." (Acts of 1899, p. 88.)

Section 14. "In case any person or corporation, as defined in this act, engaged as aforesaid, shall do, or permit to be done, any act, matter or thing in this act required to be done, or shall be guilty of any of the violations of the provisions of this act, such person or corporation shall be held to pay to the person, firm or corporation injured thereby, double the amount of damages so sustained, and all costs, to be recovered by the person, firm or corporation so damaged, in any court having jurisdiction of the amount, where

the person or corporation causing the damage can be found, or has an agent or place of business." (Acts of 1899, p. 91.)

Section 18. "That if any person or corporation operating a railroad or express company in this State, or any receiver, trustee, or lessee of any such person or corporation as aforesaid, shall violate any of the provisions of this act, or aid or abet therein, or shall violate the tariff of charges, as fixed by said Commission, or any of the rules regarding railroads or express companies, as made by said Commission, and for which there is no other penalty prescribed in this act, such person, or corporation, or receiver, trustee or lessee shall be liable to a penalty of not less than five hundred nor more than three thousand dollars for each violation of this act, or such tariff of charges or rules and regulations, and such penalty may be recovered by an action to be brought in the name of the State of Arkansas, in the county in which such violation may occur. * * * Nothing in this section shall be so construed as to in any manner interfere with the action for damages as provided in section fourteen of this act." (Acts of 1899, pp. 93-94.) (Kirby's Digest of the Statutes of Arkansas, 1904, sections 6802, 6804, 6808, 6813.)

By an act approved April 8, 1903, it is provided:

Section 2. "That all persons, companies or corporations operating any railroad in this State that forms part of a continuous line of railway communication to any point in the State shall issue through passenger tickets and check baggage through to and from points on such continuous line of communication at through rates and fares; that all freight and traffic carried wholly within this State to and from stations on lines of continuous carriage aforesaid shall be waybilled through at through rates and tolls from point of departure to point of arrival without being rebilled at junction points, and in case of carload freights the forwarding carrier shall receive and forward the same in the car or cars in which the freight is tendered without breaking bulk of package."

Section 3. "That in all cases where there is by physical connection of railroads a continuous line of railway communication between railroad stations within this State,

whether such stations be on railroads operated by one and the same company or corporation or on railroads operated by different and independent companies or corporations, it shall be the duty of the Railroad Commission of this State, to and from such stations, to make just and reasonable rates of freight, express and passenger traffic, to be observed by all persons, companies or corporations, operating any railroad or engaged in transporting persons or property as express or freight in this State."

Section 4. "If any two or more connecting lines of railroad in this State shall fail to agree upon a fair and just division of the charges arising from the transportation of freights, passengers or cars over their lines, the Commission shall make the division and shall fix the pro rata part of such charges to be received by each of said connecting lines." (Acts of 1903, p. 220.)

Section 5 of the act provides that any person or corporation violating any of its provisions shall be liable to a penalty of not less than $500 nor more than $3,000 for each violation of the act, or of the tariff or charges or rules and regulations prescribed therein, to be recovered in an action to be brought in the name of the State.

An act approved April 19, 1907, provides that a shipper on whose order a car or cars have been placed for loading shall be allowed forty-eight hours free time for loading, computed from 7 A. M. the day after such car or cars have been placed subject to the shipper's order (section 6). That the consignee of cars containing fertilizers, hay, coal, coke, brick, sand, and lumber in covered cars, and meat, potatoes, grain and grain products, cotton seed and cotton seed hulls in bulk, shall have seventy-two hours free time for unloading from 7 o'clock, A. M., the day fol-

lowing that upon which legal notice of arrival is given, and on all other cars forty-eight hours. Whenever the weather during the period of free time is so severe, inclement or rainy during business hours that it is impossible or impracticable to secure means of loading or unloading freight, or when from the nature of the goods loading or unloading would cause injury or damage, such time shall be added to the free time. A consignee or consignor five miles or more from the depot, whose freight is destined to or from his place of business or residence, shall not be subject to storage or demurrage charges until sufficient time has elapsed after notice for him to remove or load his goods by the exercise of ordinary diligence, but the time limit shall not exceed five days. (Sections 10, 11 and 12.)

Section 22 provides that any person or corporation operating a railroad who shall violate any of the provisions of the act or the tariff of charges or rules of the Railroad Commission in regard to furnishing cars on application of shippers, transportation, delivery and storage of freight, etc., for which there is no other penalty prescribed in the act, shall be liable to a penalty of not less than $500 nor more than $3,000 for each violation, to be recovered in an action to be brought in the name of the State.

Section 6611 of Kirby's Digest of the Statutes of Arkansas as amended by an act approved February 9, 1907, provided the following maximum charges for transportation of passengers by railroads within the State:

On lines 15 miles or less in length, 5 cents per mile;

Over 15 miles and less than 85 miles in length, 3 cents per mile;

Over 85 miles, 2 cents per mile.

Children, in charge of an adult, between the ages of five and twelve years, half the above rates, and children under five years of age, free (Acts of 1907, p. 10).

Sections 6615 and 6618 provide that each passenger shall be entitled to transport on the same train and without any additional charge 150 pounds of baggage, and that no railroad in the State over five miles in length shall charge more than 12½ per cent of the cost of first-class fare between all points in this State per hundred pounds for excess of baggage over 150 pounds; and section 6617 makes a carrier responsible, as carrier, for all baggage or goods checked as baggage for forty-eight hours after the same has reached its destination, and prohibits a charge for storage during that time or a greater charge than five cents per day after the expiration of said time on baggage not exceeding 150 pounds.

Section 6620 provides a penalty of not less than $50 nor more than $300 and attorney's fee, to be taxed as costs by the court, on the carrier, or any officer, agent or employe thereof, who shall knowingly and wilfully charge a greater rate of fare than is prescribed in the preceding sections.

The statute provides that the Railroad Commission shall be composed of three persons, to be chosen, respectively, from certain designated districts in the State. The

first Commissioners were appointed by the Governor, and their successors were elected at the first general election thereafter. In the year 1900 the Commission prepared and put in force a general tariff of rates for the transportation of all kinds of freight within the State. The Commission was composed at that time, as it has ever since been, of men who had never had any experience in connection with the business or operation of railroads. The first tariff continued in force with changes, made from time to time, until the 15th of July, 1904, when the Commission prepared a new and revised tariff, which went into effect and continued in force until June 4, 1908, at which time Standard Freight Distance Tariff No. 3, applying on all classes and commodities and between all railroad stations in the State, subject to Western Classification as adjusted to the traffic, cancelling the tariff theretofore in force, was promulgated, to take effect and be in force on and after July 15, 1908. This tariff contained many of the rates and regulations that were contained in the tariff of 1904, with such changes and amendments as had been made in the former tariff. Said tariff also put in force through joint rates for the transportation of freight over connecting lines of railroad, although under different ownership and management, by adding to the rates prescribed in the schedules for a single line or a continuous mileage certain differentials and by fixing a maximum of through joint rates on classes and commodities to be charged by all railroads over which freight might be transported between stations within the State. At the same time the Commission promulgated

the rates for the transportation of passengers prescribed in in the act of the Legislature of February 9, 1907, aforesaid, although the act was self-executing and the rates prescribed by it had been in force on all the railroads in the State some time prior to the promulgation of this tariff.

On July 18, 1908, the appellees and other corporations operating trunk-line railroads within the State filed their bills in equity in the United States Circuit Court for the Western Division of the Eastern District of Arkansas, in which it was alleged that the rates prescribed for the transportation of freight and passengers by the aforesaid tariff were not sufficient to yield any adequate and reasonable profit or return upon the value of the property used in and about said business or for service rendered the public, after paying the cost of conducting the business, including operating expenses, maintenance and fixed charges properly appertaining thereto under economical operation and management of the properties and conduct of the business; were unreasonable, unjust and confiscatory, and deprived the plaintiffs of their property without due process of law, and of the equal protection of the laws, in violation of the provisions of the Fourteenth Amendment to the Constitution of the United States. It was further shown and alleged that the said lines of railroad were operated in and through different States, and that a very large amount of interstate traffic passed over them respectively; that the rates prescribed by the Commission had a controlling influence on through rates charged on interstate shipments. Many of them were

established by said Commission with the intention and for the purpose, and did, in fact, have the effect, of regulating and fixing interstate rates, in violation of the Constitution and laws of the United States, and were an invasion by the Commission of the powers, rights and duties vested by act of Congress in officials of the United States.

The bills also alleged that the penalties and liabilities imposed by the provisions of the statutes of said State upon the persons and corporations owning and operating railroads in the State and the officers, agents and employes thereof, for the failure or refusal to put in force any tariff prescribed by said Railroad Commissioners, or by statute, or to comply with any of the rules, regulations and orders prescribed by said Commission, were so severe as to constrain persons and corporations operating railroads in said State to submit to such unreasonable, confiscatory and illegal exactions rather than take the risk of incurring said penalties, and that the complainants had in good faith attempted to comply with all the rates, rules, regulations and requirements prescribed by said Commission and by statute rather than to incur the aforesaid penalties and liabilities applying to the corporations operating said roads and the officers, agents and employes thereof; but further compliance would result in irreparable loss and be destructive of the property, rights and interest of those owning and interested in the properties.

The bills were originally filed against R. P. Allen, John W. Crockett and John D. Hampton, as Railroad

Commissioners. The two latter were succeeded during the progress of the case by George W. Bellamy and William F. McKnight, who, upon proper orders of the court, were substituted as defendants in the place of their predecessors in office. Each of the bills also made individual shippers and patrons of the road defendants as representatives of their class, for the purpose of restraining actions by individuals during the progress of the case. The bills contained the usual prayer for relief by temporary and perpetual injunction against the alleged rates and the rules, regulations and orders of the Railroad Commission and the penalties prescribed by the statutes of the State on their enforcement. (R. 1-21.)

Answers were filed on July 25, and applications for temporary injunctions were heard before the Honorable Willis VanDevanter, Circuit Judge, at St. Paul on September 3. The following order of injunction was entered:

"This cause came on to be heard on the motion of the complainant for a temporary restraining order, and after submission of the proofs was argued by counsel; and now upon consideration thereof, it is ordered as follows:

"That as to the complainant, all the rates prescribed by the defendants, the Railroad Commissioners of the State of Arkansas, for transporting and carrying intrastate freights in said State in Standard Freight Distance Tariff No. 3, which was issued by the order of said Commissioners, which took effect on June 15, 1908, and all amendments and supplements thereto, be and are hereby suspended and the enforcement of each and all thereof be and the same is hereby restrained and enjoined until the further order of the Court.

"It is further ordered that the enforcement of the two-cent per mile rate, prescribed in an Act of the Legislature of the State of Arkansas, approved February 9, 1907, entitled, "An Act to amend section 6611 of Kirby's Digest of the Statutes of Arkansas, by fixing passenger rates in this State, and for other purposes," and also prescribed in the order made by the defendants, the Railroad Commissioners of the State of Arkansas, on May 15, 1907, putting in force the rates prescribed by the aforesaid statute, be and the same are hereby suspended and restrained as to the complainant herein, until the further order of the Court.

"It is further ordered that no suit or suits, action or actions, shall, at any time, be instituted or maintained against the complainant, its officers, agents or employes, by any of the defendants for or on account of its failure to continue or keep in force any of the aforesaid inhibited rates, during the time that this order shall continue in force, and that the defendants, the Railroad Commissioners of the State of Arkansas, be and they are hereby enjoined from at any time instituting or prosecuting any suit or action as aforesaid, or causing the same to be instituted or prosecuted by any officer, agent or attorney, of said Commission, or by any officer of the State of Arkansas, or any other person for a failure to keep in effect and observe the aforesaid inhibited rates; that the defendants, Henry Leigh and George McLean, and all other persons and each of them from and after the time that they shall have knowledge of this order, be enjoined from at any time instituting any such suit or action for or on account of any failure of the complainant to keep in effect and observe said inhibited rates or for the recovery of damages by reason of such failure during the time that this order shall continue in effect.

"It is further ordered that complainant execute a bond to the United States of America in the penal sum of two hundred thousand dollars, conditioned that said complainant shall keep a correct account showing as respects every carriage of passengers or freight, the difference between the tariff actually charged and that which would have been charged had the rates inhibited hereby been applied, showing the particular carriage in question, and the stations be-

tween which the same occurred, the name of the person affected, so far as may be practicable, which record shall be made and kept subject to the further order of this court, and further conditioned that if it shall eventually be decided that so much of this order as inhibits the enforcement of existing rates should not have been granted, that said complainant shall, within a reasonable time to be fixed by the Court, refund in every instance to the party entitled thereto the excess of charge over what would have been charged had the inhibited rate been applied, together with lawful interest and damages.

"It is further ordered that this order suspending the aforesaid rates and restraining the said defendants take effect upon the filing of the aforesaid bond and the approval thereof by the clerk of this Court, but not within less than ten days hereof. Nothing recited in this order shall operate to prevent the said Railroad Commissioners of the State of Arkansas from establishing and enforcing any reasonably compensatory and lawful rates in place of those whose enforcement is hereby inhibited." (R. 38-39.)

Replications were subsequently filed.

On July 2, 1909, orders were entered in the cases of the St. Louis, Iron Mountain & Southern Railway Company and St. Louis Southwestern Railway Company, directing the standing master of the court to take testimony, with the usual power to compel the attendance of witnesses and the production of all books, papers, accounts, vouchers and other documentary evidence. The master was not directed nor authorized to make findings of law or fact and did not attempt to do so. The order provided that all testimony taken before the master might be used in each of the cases so far as applicable, as though they were consolidated and heard together (R. 89). The standing master died during the taking of the testimony, and Charles M. Rice

was appointed special examiner to take additional proof, with all the powers and subject to the directions given to the standing master (R. 94). The remaining cases have not been heard, but stand upon an agreement that the testimony taken in the cases now before the court may be used in all of them so far as applicable.

A large amount of testimony was taken and reported to the court by the master and the examiner.

No question is presented as to the total value of the property of the appellees in the State of Arkansas. It was stipulated by the parties that the assessment of the property of each of the respective roads for taxation multiplied by two (assessments having been made upon the basis of 50 per cent of the value) should be taken as the value of the property of each road for the purpose of the suit (R. 653). Pursuant to this agreement double the amount of the assessment was adopted and used by the court and accountants as representing the value of the property of each of the appellees. The basis of dividing the value as between state and interstate traffic was not agreed upon, but was determined by the court, as will be seen in reviewing the ruling. The value of the property of each of the appellees and the division thereof as made by the court is set out elsewhere.

The cases were heard and final decrees rendered on May 11, 1911. The following decree was rendered in each case:

"Now on this day comes the complainant by its solicitors, Moore, Smith & Moore, Esq., and also come the

defendants by their solicitors, Joseph M. Hill and James H. Harrod, Esq., and thereupon said cause having been argued and submitted upon the evidence and stipulations on file and of record in said cause, and having been taken under advisement at a former term of this court, and the court being well and sufficiently advised in the premises,

"It is accordingly ordered and decreed that the defendants, Robert P. Allen, George W. Bellamy and William F. McKnight, as Railroad Commissioners of the State of Arkansas, and Henry Leigh and George McLean and each of them, their agents, employes and successors, as well as all other persons patrons of complainant, either in the shipment of freight or as passengers, or as passengers between stations on complainant's road in the State of Arkansas, are hereby perpetually enjoined from enforcing or attempting, directly or indirectly, by any suit, or in any manner whatsoever, to enforce against the complainant, its officers, agents, employes or servants, any of the provisions of Standard Freight Distance Tariff No. 3 and amendments thereto adopted prior to the institution of this action, prescribing the rate or rates for the transportation of classes and commodities, or any provision of said tariff whereby any of said rates shall be continued in force, or from enforcing or attempting, directly or indirectly, by suit or in any other manner whatsoever, to enforce against complainant, its officers, agents, or servants, any of the provisions of an act of the General Assembly of the State of Arkansas entitled, 'An Act to amend section 6611 of Kirby's Digest of the Statutes of the State of Arkansas by fixing passenger rates in this State, and for other purposes,' approved February 9, 1907, or to enforce the provisions of any other act or acts of the Legislature of said State, providing penalties for noncompliance by complainant with the provisions and requirements of said Standard Freight Distance Tariff No. 3 and amendments thereto as aforesaid, or the aforesaid act of the Legislature of the State of Arkansas, fixing passenger rates in said State.

"It is further ordered that the costs incurred by complainants and defendants, respectively, in procuring the attendance of witnesses before the master, and in payment of the fees of stenographers in the recording of said testi-

mony, be borne by the complainant and the defendants, Robert P. Allen, George W. Bellamy and William F. McKnight, and that neither party recover from the other therefor; that all remaining costs, including master's fees, the complainant pay one-fourth and the defendants, Robert P. Allen, George W. Bellamy and William F. McKnight, Railroad Commissioners aforesaid, pay one-half, the other one-fourth to be paid by complainant in case No. 1637, the payment of said costs to be recovered by execution to be issued by the clerk of this court upon the application of either party in interest.

"It is further ordered that the bond for injunction filed by the complainant herein be released and the sureties thereon discharged from liability.

"And the Court hereby retains and reserves unto itself jurisdiction of the subject-matter of this suit and of all parties hereto, to the end that such other and further orders and decrees may be made herein as may become necessary by reason of any changed condition as to the facts, equities or rights that may hereafter take place or arise." (R. 105-106.)

Defendant Railroad Commissioners appealed from the decree. They assigned forty-six errors, viz.:

(1) The refusal of the court to sustain a motion to dissolve injunction on the ground that the bills were filed without first praying relief against the freight rates from the Commission, (Assignment 1); in not dismissing the bills on final hearing on the ground that Standard Distance Tariff No. 3 sought to be enjoined, had been in force with only minor changes for a period of six years prior to the filing of the suit and complainant had not applied to the Commission for relief, (Assignment 2); that the evidence showed that the general scheme of freight rates had been

in force since 1900, and that plaintiff had acquiesced for that period, (Assignment 3); in finding that the evidence showed an increased cost of operation for ten years prior to the filing of the suit, and that rates that had been remunerative ten years prior to the filing of the suit would no longer be so on account of the increased cost of operation and on such account there was no acquiescence, (Assignment 4); in holding that a reduction of passenger rates from three to two cents per mile was an excuse for complainants to seek relief in the Federal Court prior to applying to the Railroad Commission for relief against the rates. (Assignment 5.)

(2) In finding and decreeing that freight and passenger rates complained of would not afford a reasonable return upon the property and were confiscatory, and in not dismissing the bill. (Assignments 6, 7, 8, 9, 10, 11, 12, and 13).

(3) In finding that the period of six months fairly represented the earnings and expenses, and in not holding that the revenue and expense of October, 1907, fairly represented one-sixth of the said period. (Assignment 14.)

(4) Failure to charge plaintiff with fair rental value of the Bunch elevator. (Assignment 15.)

(5) In holding that the apportionment of expense for the repair of tools and machinery to Arkansas by plaintiff was fair. (Assignment 16.)

(6) In not deducting from operating expenses a fine of $10,000 and costs incurred by plaintiff for issuing passes to members of the Legislature. (Assignment 17.)

(7) In charging the expense of Memphis and Fort Smith terminals to Arkansas, (Assignments 18 and 19); in charging salaries paid to lobbyists and fees paid attorneys outside the State to expense of operation. (Assignment 20).

(8) In holding that any part of the expense for leased lines known as the Paragould trackage and the Van Buren bridge, was chargeable to intrastate traffic, or that any part of the expense of said bridge was chargeable to the State of Arkansas. (Assignments 21 and 22.)

(9) In holding that the railroad was efficiently operated. (Assignment 23.)

(10) In apportioning the property between intrastate and interstate traffic on the revenue basis to ascertain the portion used in intrastate business. (Assignment 24.)

(11) In the bases adopted for apportioning expense between intrastate and interstate traffic. (Assignment 25.)

(12) In apportioning the miscellaneous expense on a revenue basis. (Assignment 26.)

(13) In declaring in the opinion that the State contended for a division of property and expense on the ton mile basis. (Assignment 27.)

(14) In finding that the intrastate freight rates were only 50 per cent higher than the interstate. (Assignment 28.)

(15) In using the revenue basis for dividing any expense, and, particularly, without allowing for the excess of

at least 50 per cent which the court found the state revenue was higher than the interstate. (Assignment 29.)

(16) In not adopting as a whole the plan of division presented by the State. (Assignment 30.)

(17) In not accepting the results of statistics obtained from the months of October, 1907, and October, 1908. (Assignment 31.)

(18) In charging to interstate business only 40 per cent of the expense of local trains. (Assignment 32.)

(19) In dividing maintenance-of-way expense on a revenue basis, and not making allowances for the difference between the intrastate and interstate revenue when using the revenue as a factor in dividing said expense. (Assignment 33.)

(20) In the division of expense between local and through trains in charging 50 per cent extra to yard locomotives as against the local trains and 75 per cent additional for local locomotive mileage. (Assignment 34.)

(21) In charging 25 per cent extra to local trains for stopping and starting and 13½ per cent for terminal handling; in finding that through trains stop every 35 miles against 5 miles for local trains; in not charging interstate and trans-state traffic with the cost of starting and stopping freight cars and in making different allowance for interstate and trans-state traffic. (Assignment 35.)

(22) In not apportioning general expenses according to the plan adopted by the State and in charging the same

on the basis of the supervision and maintenance of equipment and transportation only. (Assignment 36.)

(23) In dividing the item of hire of equipment on the revenue basis and charging 30 per cent to local traffic. (Assignment 37.)

(24) In the basis adopted for the apportioning station expense. (Assignment 38.)

(25) In finding various omissions from the expense apportioned to the State in the State's plan of dividing expenses between intrastate and interstate traffic, and in finding that 8½ per cent should be charged to the local trains for such omissions, and in finding that the dead weight on local trains exceeded that on through trains 14 per cent. (Assignment 39.)

(26) In the basis adopted for apportioning fuel and locomotive expense and "other train expenses." (Assignment 40.)

(27) In charging the state passenger traffic with 10 per cent greater than the interstate passenger traffic. (Assignment 41.)

(28) In holding that the St. Louis Southwestern Railway freight and passenger traffic was more expensive than the Iron Mountain freight and passenger traffic. (Assignment 42.)

(29) In finding that the extra expense of intrastate traffic over interstate freight traffic for the Iron Mountain

Road was 210 per cent and on the St. Louis Southwestern Road 250 per cent. (Assignment 43.)

(30) In holding that the plaintiff was entitled to earn 6 per cent on the value of its property and 1.5 per cent surplus, and that a return of less than 7½ per cent on the value of its property devoted to intrastate traffic was confiscatory, (Assignment 44); and in not holding that a return on the investment equal to the rate of interest prevailing on railroad securities was compensatory. (Assignment 45.)

(31) In retaining jurisdiction of the cause for any other purposes than to permit defendants to show a changed situation which might relieve them of the injunction. (Assignment 46.) (R. 2650.)

Some of the assignments relate to matters that do not affect the merits of the case and are immaterial; some of them are based on a misconception of the rulings of the court; others on assumptions of fact that do not exist, and only a few of them relate to matters that are material on this appeal.

The plaintiffs, in preparing their statistics, apportioned the value of the property between freight and passenger traffic and between state and interstate traffic of each kind on the basis of the gross revenue derived from each kind of traffic, and followed the same rule in apportioning the expense of operation as between the several kinds of traffic, making such allowance for extra expense in conducting

state freight and passenger traffic over interstate as, in the judgment of their operating officials and others experienced in such matters, would cover the increased cost. The statistics used by them were taken from the books of account, records and vouchers kept by the accounting department of each road, which were thrown open to the State's accountants and examined by them, and the correctness of which were not questioned.

The State, through its accountants, submitted a scheme for dividing state freight traffic by first apportioning the cost of operating local and through freight trains. After determining the cost of operating each class of trains, amounting, in the total, to $2,592,298.33 out of the total expense of $3,073,843.40, on various arbitrary assumptions upon which their theories were based, they divided the train cost between state and interstate traffic on the basis of the relative amount of ton miles of each class of freight transported on local and through trains. In order to determine the ton miles of state and interstate freight carried on each class of trains they ascertained the amount of freight carried on local trains during the month of October, 1907, from an examination of the wheel reports of freight trains made by the conductors and the waybills, and after ascertaining the movement on local trains, they deducted the amount so ascertained from the total shown on exhibit 26, which was prepared by the accountants of the railroad company at the request of the State, and contained a statement of the total freight accounted for in the month of October in the auditor's revenue accounts, assuming that

the difference between the freight that moved on local trains as ascertained by them from wheel reports and the entire volume as reflected by the auditor's accounts showed the freight transported on through trains, although it was shown that the auditor's books did not reflect the dates on which freight, and especially interstate freight, moved on the line of railroad in the State of Arkansas, the dates shown on the entries being those on which the freight was received, or delivered to the owner or connecting carrier, which, as to trans-state shipments, occurred altogether outside of the State, and as to interstate shipments beginning or ending in the State, occurred outside the State either at the beginning or the end of the shipment, and which varied very greatly from the time the freight moved through, into and out of the State. It was also shown that the movement of state and interstate freight on local and through trains, respectively, during said month, was abnormal, owing to the fact that there was, during that time, such a congestion of freight in the yards of the railroad company as to disturb the usual and normal loading on the two classes of trains, and to cause a much larger quantity and proportion of interstate freight than was usual and customary to be transported on local trains, by utilizing the local train to its full capacity regardless of its normal functions. After ascertaining the total amount of state and interstate freight carried on each of the two classes of trains during the month and the per cent thereof to the total freight movement for the month, in the manner shown, in ton miles, they applied the per cents to the total ton miles

of state and interstate freight handled during the entire period of six months covering the last half of the year, and divided it between the two classes of service on that basis, and then divided the train cost between state and interstate business in proportion to the volume of traffic of each kind handled in each class of service, on the assumption that the same conditions that existed during the month of October were in existence throughout the six months' period, which was clearly shown, by the evidence, not to be the case.

The court adopted the State's theory of dividing the expense of operation to a large extent, making modifications in the details thereof in accordance with the testimony, and, in that manner arrived at the findings of fact in regard to the net earnings and the return upon the investment, and reached a result so nearly approximating the revenue basis, with 50 per cent added for extra cost, as to make practically no change in the net results as shown by the railroads' exhibits.

It found that the gross earnings of the St. Louis, Iron Mountain & Southern Railway Company, during the six months' period, were $1,726,578.86, the cost of conducting traffic during the same period was $1,688,558.93, the net earnings were $38,020.03. The value of the property apportioned to intrastate traffic was $5,158,266.56, making the net earnings a little under three-fourths of one per cent; that the earnings of the St. Louis Southwestern Railway were, during the same period, $466,476.19, the cost of conducting state traffic was $429,221.07, the net earnings were

$37,255.12; the value of the property apportioned to intrastate traffic was $1,430,321.00, making the net earnings 2.6 per cent on the investment.

A lengthy opinion was filed containing many findings of law and fact on the various questions presented, which is contained in the printed record, but for the convenience of the members of the court we file separate copies of the opinion. The net earnings of intrastate business on the bases of division of expense submitted by the parties and that used by the Court are contained in an appendix at the end of the brief.

## INTERFERENCE WITH INTERSTATE COMMERCE.

This question has been very fully presented in the briefs filed in other cases now before the court, which will be under consideration at the same time as these cases. For that reason, and because the decrees in these cases are based upon findings and rulings on other questions, we do not deem it necessary to discuss the question in its legal aspect in this brief, and will only present such views and considerations as grow out of the evidence and are peculiar to these cases.

The following facts are established by the evidence:

Many of the rates prescribed by the State Commission do, and were, at the time they were put in force, intended, to influence and control interstate rates. Judge J. G. Wallace, a very intelligent man, was chairman of the Commission in 1900, at the time the first tariff was prepared and promulgated by the Commission. He testified that in practice interstate rates were made on the basis of a combination of the local rates, and as a rule could not be higher than the combined local rates. As an instance he referred to the fact that prior to the promulgation of the Commission's tariff, the St. Louis & San Francisco Railroad Company, which had a direct line running from Fort Smith to St. Louis, had put in interstate rates between points in Missouri and North Arkansas that were more favorable than the local rates within the latter State, and under which the jobbers at Fort Smith could not compete with commercial centers in Missouri. The effect of that tariff was to divert the trade

of that section to Missouri points. The effect of the tariff promulgated by the Commission was to reverse the order of things and transfer the trade to Fort Smith, which forced the Frisco to lower its rates from St. Louis and other interstate points in Missouri in order that the jobbers of that State might compete with those at Fort Smith. The same conditions existed in other parts of the State and all through on long lines of railroad. (R. 889, 897.)

J. E. Hampton, who was a member of the Commission after Judge Wallace retired, and was, for a time, chairman, testified to the same effect. He referred to an instance in which the intrastate rate on sugar from Helena to all points in the State was reduced from 15 to 13 cents at the instance of jobbers at Texarkana, for the purpose of forcing down the interstate rate from New Orleans to that place. The interstate rate was 25 cents per hundred pounds. The river rate from New Orleans to Helena was 10 cents, the maximum rate from Helena to any point in the State was reduced from 15 to 13 cents, making the rate via Helena 23 cents, and forcing a corresponding reduction in the interstate rate. (R. 804, 805.)

C. E. Perkins, the General Freight Agent of the Missouri Pacific System, of which the St. Louis, Iron Mountain & Southern is a part, testified that when the intrastate rates in Arkansas were advanced it produced a similar advance in the interstate rates. He cited the condition at Memphis, to which we will refer later, and stated that the raising of the Memphis rates practically affects all the interstate rates into

the State of Arkansas; that Cairo and St. Louis rates would have to be advanced differentially over Memphis; that they were large distributing centers, and it was necessary to preserve a parity in the rates in order to allow the free distribution of business. That the interstate rates from St. Louis into Arkansas and Texas were factors in determining interstate rates from practically all parts of the country into that territory; that it affected Kansas City, Chicago, Pittsburg, and many other points mentioned by him, and when the rate from Memphis was changed, on account of the changes which were made in the intrastate rates in the State of Arkansas, it operated practically to change the entire rate adjustment affecting interstate rates to and from the State. This condition was not confined to the State of Arkansas, but applied practically to all States. As an example, he mentioned an instance in which the intrastate rates in Kansas on grain were reduced, and the reduction effected a change in every rate on grain carried from that State to points in other states. He further testified that the state adjustment fixes the rates from points of origin in Kansas to the Missouri River, the rates to the Mississippi River and Chicago, and that section are made practically on a combination of locals through to the Mississippi River, and the fixing of those rates fixes the rates to all points east and to seaboard territory; and in a similar way the rates from Kansas to Louisiana, Texas, and Arkansas were all affected by the change in the intrastate rates in the former State, and so, by changing one of the factors you have changed all your interstate rates. He testified that the relation of interstate and

intrastate rates is recognized by the Interstate Commerce Commission (Rule 56-B, p. 61, of "Administrative Rules"), in which it is said to be the policy of the Commission "to consider the through rate of fare which is higher than the sum of the locals between the same points as *prima facie* unreasonable, and the burden of proof will be upon the carrier to justify such higher rate or through fare." (This rule has since been enacted into a law. Act of Congress June 18, 1910.) He says: "There is a constant pressure on the part of shippers at all times to keep the two classes of rates in relative adjustment, and many complaints are made to the Interstate Commerce Commission, and we know that we could not disregard the rule because of the power of the Interstate Commerce Commission." (R. 598-603.)

Again, in his testimony on rebuttal, he testified that to stations in Arkansas in the vicinity of Arkansas City and Helena, the rates from Memphis are based on full combination of locals to and from Arkansas City and Helena, using the Commission's schedule from those points, and the St. Louis rates are adjusted differentially higher; conditions affecting the business force them to do so. As an illustration, he referred to the fact that the rates from Memphis to Helena are on a low scale on account of river competition; that a disregard of the state rates would force shipments into Helena and Arkansas City by river, or by the Illinois Central Railroad, which has a direct line to Memphis, from which points they would be reshipped into the interior of the State. (R. 1630.)

J. D. Watson, the Assistant General Freight Agent of the St. Louis Southwestern Railway, testified to the same effect. (R. 1672, 1673, 1674.)

The following exhibit (No. 50), filed by him shows the differentials in the rates on all classes between Memphis and Cairo, Memphis and St. Louis and Memphis and Kansas City:

CLASS RATES TO LITTLE ROCK AND PINE BLUFF.

| From | 1 | 2 | 3 | 4 | 5 | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|---|
| Memphis ... | 70 | 60 | 45 | 32 | 24 | 25 | 20 | 17 | 14 | 10 |
| Cairo ..... | 90 | 75 | 55 | 40 | 29 | 30 | 25 | 21 | 17 | 12 |
| Difference .. | 20 | 15 | 10 | 8 | 5 | 5 | 5 | 4 | 3 | 2 |
| Memphis ... | 70 | 60 | 45 | 32 | 24 | 25 | 20 | 17 | 14 | 10 |
| St. Louis... | 1.00 | 85 | 65 | 45 | 34 | 35 | 30 | 25 | 20 | 15 |
| Difference .. | 30 | 25 | 20 | 13 | 10 | 10 | 10 | 8 | 6 | 5 |
| Memphis ... | 70 | 60 | 45 | 32 | 24 | 25 | 20 | 17 | 14 | 10 |
| Kansas City. | 1.10 | 90 | 75 | 55 | 43 | 45 | 40 | 30 | 27 | 24 |
| Difference .. | 40 | 30 | 30 | 23 | 19 | 20 | 20 | 13 | 13 | 14 |

*Tariff No. 1010.

The differentials shown on the exhibit were used in making the rates to Little Rock and Pine Bluff, and points based thereon, and the rates to points beyond Little Rock and Pine Bluff were adjusted either by combination or differential over the Little Rock rates for the purpose of preserving the length of haul both as to origin and destination as a controlling factor in making the rates. He mentioned in his testimony the rate adjustments in the territory south of Pine Bluff as an illustration of the effect of a change in intrastate on interstate rates. The St. Louis Southwestern Railroad Company, he stated, had no line

of its own into Memphis, and the rate from West Memphis to its territory in the interior did not force them to apply the West Memphis rate, but the reduction of the rates from Pine Bluff made it necessary for his company to reduce the rates from Memphis to the stations south of that point, which was shown by exhibit (No. 51), filed by him. Column No. 1 of the exhibit shows the rates that were in effect from Memphis to the stations named at and prior to the time the standard freight distance tariff promulgated by the Commission in 1900 was made effective. Column No. 2 shows the rates as they were readjusted to the Commission basis; column No. 3 shows the reductions in the interstate rates resulting from the readjustment.

See exhibit 51, following page 2432 of the record.

The Commission tariff contained a larger list of commodity rates than was used in the interstate adjustments. Referring to that, Mr. Watson testified that that change forced a corresponding change in the classifications in the interstate schedules. (R. 1672-1674.)

See testimony of B. M. Flippin, the Freight Traffic Manager of the Missouri Pacific System. (R. 239, 240.)

Fort Smith is situated on the south bank of the Arkansas River; Van Buren is five miles below it on the opposite side, both stations being in the State of Arkansas. The main line of the St. Louis, Iron Mountain & Southern Railway extends from Little Rock, in the State of Arkansas, to

Coffeyville, in the State of Kansas, along the north bank of the Arkansas River in the States of Arkansas and Oklahoma. Trains going eastward in the direction of Little Rock from Fort Smith cross the river on a bridge into Oklahoma, and thence turn eastward into Arkansas. The run in Oklahoma is four miles. The traffic is interstate, and is so treated in the statistics in this case, but is treated as state traffic, so far as concerns the rates, and the State Commission rates are applied to it. All traffic to and from Van Buren, in the State of Arkansas, is intrastate traffic, and is regulated by the state tariff. All traffic north of Fort Smith, on the St. Louis & San Francisco Railroad, to the Missouri line is intrastate, and the rates are regulated by the State Commission. Fayetteville is a city in the State of Arkansas, 63 miles north of Fort Smith, and one of the principal stations on the St. Louis & San Francisco Railroad in the State. Rogers is the next important station, and is 82 miles north of Fort Smith. Magazine and Danville are important stations on the Chicago, Rock Island & Pacific Railway, which connects with the St. Louis & San Francisco Railway at Mansfield, a station on both lines 32 miles from Fort Smith. They are distant, respectively, 58 and 83 miles from Fort Smith, and all shipments originating at Fort Smith are billed and treated as a continuous haul to those and other points on the Chicago, Rock Island & Pacific Railway. Clarksville and Russellville are important stations on the main line of the St. Louis, Iron Mountain & Southern Railway, 63 and 90 miles, respectively, east of Fort

Smith. All shipments out of Fort Smith to those points and all other points on that line of road are interstate traffic. All shipments to all points, including those mentioned on other lines of road referred to, are intrastate traffic. Paris, in Logan county, Arkansas, is the eastern terminus of the Arkansas Central Railroad. Fort Smith is its western terminus. The road is 46 miles in length, is wholly within the State and under the control of the State Commission. If the intrastate rates were not applied to the traffic out of Fort Smith on the St. Louis, Iron Mountain & Southern Railway, and different (interstate) rates were applied, it would result in a discrimination between localities not only as to the points mentioned, but as to all other points on the several lines of railroad equi-distant from Fort Smith.

The city of Memphis is the principal eastern gateway for the business of Arkansas and Oklahoma. Nearly all of the principal lines of railway in the State, either directly or through their connections, enter Memphis and conduct traffic which passes through that gateway. The St. Louis, Iron Mountain & Southern Railway connects the city of Memphis with a very large part of the interior of the State of Arkansas through its main line and branches, extending westerly to and beyond Little Rock, and in a southerly direction to and beyond Helena, McGehee and Montrose, in the direction of New Orleans.

The main line of the Chicago, Rock Island & Pacific Railway extends westerly from Memphis into and beyond

Oklahoma, with branches radiating therefrom in the State of Arkansas. The St. Louis Southwestern Railway through trackage arrangements with other lines of road has an entrance into Memphis connecting its main line, which extends through Southeastern Arkansas, by way of Pine Bluff and Camden, to and beyond the city of Texarkana, with branches to Shreveport, Louisiana, Little Rock, Arkansas, and other points. A considerable amount of business also enters the State from Helena, a city on the west bank of the Mississippi River, in the State of Arkansas, and sixty miles south of Memphis, via the Illinois Central Railway, which enters that city from the east. The St. Louis, Iron Mountain & Southern Railway and the Missouri & North Arkansas Railway, which extends from Helena northwestwardly, to the cities of Joplin and Kansas City, Missouri, conduct a large traffic, both state and interstate, into and out of that gateway. These lines entering the State at Memphis and Helena and radiating in various directions, constitute a network that covers all of Eastern Arkansas.

The cities of Texarkana, in Arkansas and Texas, are situated, respectively, on the south boundary of the State of Arkansas and the east boundary of the State of Texas. The State line divides the two cities. It is the gateway for all traffic handled by the appellees through the State of Arkansas into Texas and a large territory beyond, and of a large amount of traffic into the State of Louisiana, the lines of many of the principal railroads in that section on each side of the State line terminating at that point. The St.

Louis, Iron Mountain & Southern Railway, and the St. Louis Southwestern Railway terminate there, and the lines of the Kansas City Southern Railway, coming from the north, through the State of Arkansas, passes into Texas at that point. The Texas & Pacific, traversing the States of Texas and Louisiana from the south, west, and east, also terminate there. A very large amount of interstate traffic and of intrastate traffic is conducted over the lines of the three railways entering Texarkana in the State of Arkansas from the north, and a large amount of traffic is also brought into the State and conducted within the State on branches radiating from the main lines of those roads.

The St. Louis, Iron Mountain & Southern, and the St. Louis Southwestern Railways, each, enter the city of Little Rock from the south, and are competing lines between Texarkana and that city. Those lines and the Chicago, Rock Island & Pacific are competing lines between Memphis and the city of Little Rock. It will thus be seen that a very large amount of interstate freight traffic is necessarily affected and the rates for transporting the same to a large extent controlled by the rates prescribed by the State Railroad Commission.

C. L. Stone, the Passenger Traffic Manager of the Missouri Pacific System and the St. Louis, Iron Mountain & Southern Railway, testified as to the effect of the State Commission passenger rates upon the interstate passenger rates. He testified that immediately after the change of the interstate passenger rates from three to two cents per

mile, under the act of 1907, a similar rate was applied to interstate passenger traffic, and upon the restoration of the three-cent rate, subsequent to the granting of the injunction in these cases, it was applied to both classes of service. He stated that it was impracticable, if not impossible, to reduce the passenger fare in the State from three to two cents per mile and not change the interstate rates correspondingly. He filed a map (Exhibit 24), which shows the lines of the St. Louis, Iron Mountain & Southern Railway and Missouri Pacific System, of which it is a part, in the States of Arkansas, Missouri, Kansas, Colorado, Nebraska, Oklahoma and Louisiana, an examination of which will demonstrate how difficult it would be to put and keep in force different rates for the transportation of interstate passengers from those applied to local passengers in the several States traversed by these lines of road. Twenty-five copies of this map have been filed to be used at this hearing.

Mr. Stone further testified in this connection:

"The rate per mile in the State of Arkansas was reduced by legislative action from three cents to two cents per mile, on April 9, 1907. This had the effect of making the following reductions between border points in the State of Arkansas:

"Between Moark, on the north, and Texarkana, on the south, the fare was reduced from $9.11 to $6.08; making a reduction of $3.03 in the intrastate fare.

"Between Bridge Junction, on the east, and Fort Smith, on the west, the fare was reduced from $8.60 to $5.73; or a reduction of $2.87.

"Between Bridge Junction, on the east, and Texarkana, on the southwest, the fare was reduced from $8.25 to $5.50; or a reduction of $2.75.

"Between Bridge Junction, on the east, and Mammoth Spring, on the north, the fare was reduced from $4.17 to $2.80; or a net reduction of $1.37.

"These reductions had the effect of reducing interstate rates between the territory as outlined on this map, between the points located in the territory marked '1' and the points located in the territory marked '8' (that is Mexico); a reduction of the local fares between Moark and Texarkana made an average reduction of from $2.25 to $3.03 on each ticket passing over the lines of the St. Louis, Iron Mountain & Southern Railway between Moark and Texarkana.

"The territory marked '8' includes Texas and Mexico (it is marked in blue on the map).

"Between points located in territory marked '3', '4' and '5' on the map, that is routed through the Memphis gateway, the reduction of the fare on the Arkansas lines would average from $1.90 to $2.87 for each passenger carried across the State of Arkansas.

"Between the points shown in the territories marked '2', '3', and '4' on the east and the territory marked '8' on the southwest, when routed via Memphis and Texarkana, the average reduction in the revenue accruing to the Arkansas lines was from $1.75 to $2.75 for each passenger carried between Memphis and Texarkana.

"Between the territory marked '4' and '5' on the southeast, and the territory marked '6' on the northwest, the average reduction brought about by the change in the fares in the State of Arkansas, was from $1 to $1.37 on each ticket.

"In other words, to make this perfectly plain, all of this coloring (indicating map) shows the effect that the reduction in the local passenger fares in the State of Arkansas from three cents to two cents per mile, had on interstate traffic.

"We cannot reduce the passenger fare in Arkansas from three cents to two cents per mile and not change our interstate rates. It is impracticable and almost an impossibility." (R. 266, 270, 271.)

The court below made the following finding of facts on this subject:

"That intrastate tariffs bear certain relations to, and to some extent control interstate rates cannot be doubted. The evidence in this case establishes that fact conclusively, and, even in the absence of such evidence, the court would be justified to take judicial notice of it. No better illustration is needed than the facts and conclusions of law in Gulf, C. & S. F. Railway Co. *v.* Texas, 204 U. S. 403, 413. And this seems to be the rule adopted by the Interstate Commerce Commission since the decision in the Gulf Railroad case. Ambrey Semple *v.* Galveston, etc., Ry. Co., 17 I. C. C. 267, and Rule 56-B of Administrative Rules. Although the Texas case was one involving freight only, the same principle applies to passenger rates. In fact, it is more apparent in the latter than in the former. Even in the absence of a rule to that effect by the Interstate Commerce Commission, or of decisions of the courts, if the States of Arkansas, Texas, and Missouri, each, enact a two-cent rate fare, it would be folly for a carrier to attempt to charge a higher rate for interstate or trans-state passenpers in those States, for passengers would purchase tickets to the State line of each State at the reduced local rate and thus defeat the higher interstate rates, although the state rates are, by the statutes of these States, limited to intrastate transportation solely."

Judge Sanborn, in discussing the effect of the Minnesota law on the rates of cities located in the same vicinity, said:

"Duluth and Superior, Grand Forks and East Grand Forks, Fargo and Moorehead, and Wahpeton and Breckinridge are so situated that each pair must be considered for the purpose of rate-making, as one locality. Both as a practical matter of the operation of a railroad, and in

order that undue and unjust discrimination as between the members of any pair may be avoided, each city of each pair must have rates equal to those accorded to the other city. If different rates, a different classification, or a different basis of rates be lawfully prescribed by one regulating power in or out of one city of any pair to those prescribed by another regulating power in or out of the other city of the pair, the carriers serving them both must, in order to avoid undue and unjust discrimination in fact, as between them, as well as to preserve their own power to transact business with each of them, adopt for each city the lower rates, or basis of rates, or classification, prescribed for either city." 184 Fed. 791.

This view may be applied to the twin cities of Texarkana, in Texas and Arkansas. If the railroads entering that city from the State of Arkansas should not apply the state rates to traffic from Texarkana, Texas, to points in the State of Arkansas, a condition would be created similar to that described by Judge Sanborn, and which would result in a discrimination against that city. The same is true of shipments from stations in Arkansas to Texarkana, Texas. Two rates would obtain on every shipment from and to stations in Arkansas to the two cities. Judge Sanborn says, at page 786:

"Whether discrimination, in fact, exists between rates is determined by comparison of the rates involved. If conditions are substantially the same, rates for like distances should be the same, and, if not the same, undue and unjust discrimination in fact will exist."

Again, at page 788:

"If the companies shall be compelled to maintain within Minnesota the rates prescribed by chapter 232, they will be compelled to reduce the basis of their interstate rates between Eastern Montana and North Dakota points

and Minnesota points, and between Eastern Montana, North Dakota and Minnesota points and Superior to a substantial parity with the basis prescribed by chapter 232, in order to avoid undue and unjust prejudice and disadvantage, in fact, against shippers and localities transacting the interstate business, as well as in order to protect the interstate business of carriers against serious impairment."

We think these statements by the court apply to the conditions existing at Fort Smith. All business from Fort Smith on the lines of the St. Louis, Iron Mountain & Southern Railway into the interior of the State of Arkansas is interstate. Other railroads radiate from that center to a large territory in the State northerly, southerly and westerly. In order to preserve a parity between shippers and localities on the lines of the Iron Mountain Railroad out of Fort Smith into the State with other localities penetrated by other lines of railroad, that company is forced to apply the State Commission rates to all business out of Fort Smith into the State.

Memphis is a distributing center for the State of Arkansas. West Memphis is situated on the opposite, west, bank of the Mississippi River, and is accessible to steamboat traffic on the river. All shipments from Memphis into the State of Arkansas take the Arkansas Commission rates, subject to a small differential for bridge toll. The railroads are forced to apply those rates by the laws of trade and insurmountable conditions affecting traffic. Speaking of a similar condition, Judge Sanborn said, page 793:

"They say that, while the reduction of the local fares and rates may induce the companies to reduce their inter-

PAGES

state rates and fares across the borders of the State to a parity with the local rates, this is the voluntary act of the companies, not directly required by the laws and orders. There are, however, known and inexorable laws of commerce, and one of them is that transported articles will move at the lowest available rates. * * * There is nothing voluntary on the part of the companies in the loss or burden imposed upon them by these reductions. That they must suffer whether they reduce their interstate rates or maintain them and permit the transformation of their affected interstate commerce into intrastate commerce by rebilling and local contracts so that it can pass at the sums of the locals. * * *

"Moreover, the acts and orders making these intrastate reductions necessarily operate to discriminate against interstate commerce and the right of the companies to carry it on, and in that way constitute a direct burden upon such commerce. Mr. Justice White said in the Pullman Company's case, 216 U. S., at page 65, 30 Sup. Ct., at page 236 (54 L. Ed. 378), that, though a power exerted by a State may not abstractly impose a direct burden on interstate commerce, yet such exertion will be a direct burden upon such commerce if the power as exercised operates a discrimination against that commerce, or, what is equivalent thereto, discriminates against the right to carry it on. If the companies exercised their right to maintain, and did maintain, their former interstate rates upon that portion of their interstate commerce affected by the local Minnesota rates, they lost to local commerce that interstate commerce, because it passed by rebilling and local contracts at the sums of the locals. This necessary effect of the local maximum rates was a direct discrimination against interstate commerce and the right to conduct it, and, hence, a direct burden upon that commerce. If, on the other hand, to avoid this discrimination, the companies reduce their rates, that reduction was a like direct burden, and no course was open to them whereby they could exercise their constitutional right to conduct their interstate commerce free from the direct regulation thereof, effected by these acts and orders."

Again, in speaking on the subject of the indirect effect of state regulation upon interstate commerce, the court say:

"Counsel for the defendants argue, however, that this radical discrimination is not forbidden by the interstate commerce law because it is a discrimination wrought, not by an undue difference between intrastate rates, of which they say the State has exclusive jurisdiction, nor by an undue difference between interstate rates of which, they admit, the Nation has exclusive jurisdiction, but by an undue difference between intrastate rates and interstate rates, and they contend that, over the discrimination thus wrought, neither State nor Nation has any power. The argument, however, again disregards the broad and fundamental difference between the power of the State over intrastate commerce and the power of the Nation over interstate commerce. The State may regulate its intrastate commerce so far, only, as the exercise of its power does not substantially burden or regulate or discriminate against interstate commerce, but no farther. A State may not prohibit or regulate discrimination between interstate and intrastate rates in such a way as substantially to burden or regulate interstate commerce, as, for instance, by the prohibition of a higher charge or rate for a short haul wholly within the State than for a long haul that includes the short haul and extends into another State, because such action burdens and regulates interstate commerce. Louisville & Nashville R. R. Co. *v* Eubank, 184 U. S. 27, 42, 43, 22 Sup. Ct. 277, 46 L. Ed. 416. By the same mark, because it is a direct regulation of interstate commerce, the Nation may regulate and prohibit discrimination wrought by an undue difference between interstate and intrastate rates, although such regulation or prohibition may also, to some extent, affect and regulate intrastate commerce. For, to the extent necessary completely and effectually to regulate interstate commerce, the Nation, by the Congress and its courts, may affect and regulate intrastate commerce." (Pages 794, 795.)

We submit that the statement made by the court in these cases that the facts found in the Minnesota case dif-

fer very materially from the evidence in these cases, is not warranted. In many respects, it is true, conditions differ in detail, but many of the conditions shown by the evidence to exist in these cases are covered by the principle announced in the case cited.

The court below, in speaking on this subject, said:

"If then the power to regulate carriers' rates rests upon the police power, which, under the decisions cited, is in fact coextensive with the governmental power of the State, it requires no extended argument to prove that a regulation or statute of a State enacted under that power is not void because it incidentally affects the commerce clause or any other provision of the National Constitution, especially, if it is not in conflict with any act of Congress on that subject, or when Congress has not seen proper to act upon that subject."

And, again:

"Another matter not to be overlooked is, if the State is without the power to regulate purely intrastate transportation because it affects interstate traffic indirectly, where is it vested? Congress is clearly without power to do so, and, of course, it cannot delegate to a commission a power it does not itself possess."

For the purpose of these cases, we submit that the suggestions of the court are answered by the recent opinion of this court in Southern Railway Co. *v.* United States, delivered on October 30, and not yet published. The case arose under the Safety Appliance Acts of Congress, which were passed largely for the protection of life and property, and, insofar as they applied to local trains operated within the State, affected matters within the State's police power. The court, through Van Devanter, J., in disposing of a

BLURRED PA

contention based on the view expressed by the court in the extracts, say:

"We come, then, to the question whether these acts are within the power of Congress under the commerce clause of the Constitution, considering that they are not confined to vehicles used in moving interstate traffic. * * * Is there such a close or direct relation or connection between the two classes of traffic, when moving over the same railroad, as to make it certain that the safety of the interstate traffic and those who are employed in its movement will be promoted in a real or substantial sense by applying the requirements of these acts to vehicles used in moving the traffic which is intrastate, as well as to those used in moving that which is interstate? If the answer to this question, as doubly stated, be in the affirmative, then the principal question must be answered in the same way. And this is so, not because Congress possesses any power to regulate intrastate commerce as such, but because its power to regulate interstate commerce is plenary and competently may be exerted to secure the safety of the persons and property transported therein, and of those who are employed in such transportation, no matter what may be the source of the dangers which threaten them. That is to say, it is no objection to such an exertion of this power that the dangers intended to be avoided arise, in whole or in part, out of matters connected with intrastate commerce."

If we understand the effect of this ruling it is a complete answer to the suggestions contained in the above extracts from the opinion of the court below.

In M. & I. Coal Co. *v.* I. C. R. R. Co., 21 I. C. C. Rep. 39, the Interstate Commerce Commission held that under the Hepburn Act

"It is the duty of the carriers to so unite themselves that they will constitute one national system. They must establish through routes, keep these routes open and in operation, furnish the necessary facilities for transporta-

GES

tion, make reasonable and proper rules of practice as between themselves and the shippers, and as between each other. And the full burden of this great obligation is in the first instance upon the carriers themselves.

"But the power to control and regulate railroad practices is vested in the Commission as between the carriers themselves, as well as the carriers and the public."

It is difficult to conceive how this vast power can be exercised consistently with the exercise of the power of regulation and control by the States as to intrastate traffic and operation, without producing a conflict that would impair the full measure of power assumed by the Federal Government and intended to be conferred on the Interstate Commerce Commission. (See Traffic World, Vol. 8, No. 25, Dec. 16, 1911).

## PREMATURE BRINGING OF SUIT AND ACQUIESCENCE.

It is contended by counsel for the State that the plaintiffs should have applied to the Railroad Commission for relief before they brought suit to enjoin the rates.

This contention is based on the ruling in Prentis *v.* Atlantic Coast Line, 211 U. S. 210. The ruling in that case was based on the peculiar provisions of the Constitution of Virginia. The legislative action had not become final under the laws of Virginia at the time the suit was brought. It was still at the legislative stage, and the rates complained of were in process of formation, and, for that reason, the court held that it was only a just recognition of the care with which the rights of the plaintiffs had been guarded that they should make sure that the State, in its *final legislative action,* would not respect them. Willcox *v.* Consolidated Gas Co., 212 U. S. 19, 40; A., T. & S. F. Ry. *v.* Love, 174 Fed. 59, 62.

Here, the action of the State, through its administrative board, had become complete and final. It was taken after hearing and over the objection of the parties affected. There was no reason to suppose, and the railroads were not required to assume, that they would reverse their action. The Commission had no power to change the passenger rate; the legislative act of 1907 left it no discretion in the matter. It merely registered the will of the Legislature in in the order promulgated in regard to passenger rates. (See opinion of the Circuit Court in this case, p. 24.)

**It is also claimed that the railroads delayed bringing suits for a length of time that implies acquiescence.**

Mr. Hampton, the chairman of the Commission, testified that the railroads appeared before the Commission when invited to do so and objected to the changes, and that the reductions were made over their protest (R. 802). All the traffic men of the railroads testified to the same effect. He also testified that about seventy-five changes were made in rates during the time he was a member of the Commission, and all of them were reductions. Besides this, the Commission made many changes in the classification by enlarging the list of commodities which carried a lower rate and operated as a reduction of the rates. They changed the minimum carload prescribed in the Western Classification, which was used by the railroads, materially, making many reductions in that respect which effected a reduction in the revenue. The reduction in passenger rates made by the act of the Legislature of 1907, produced a very material reduction in the revenues of the roads.

The cost of material and labor employed in the maintenance and operation of railroads was materially increased during the time the Commission rates were in force, and the expense of operation was constantly increasing by reason of statutory requirements involving large outlay; the installation and maintenance of new equipment and appliances, the employment of additional employes by shortening the hours of labor of certain classes, the increase in the number of employes engaged in certain departments of

the service—for instance, by the statute requiring three brakemen on certain classes of trains. These changes are set out in the testimony of C. J. McPherson, who was Assistant to the General Manager of the Missouri Pacific System and the St. Louis, Iron Mountain & Southern Railway Company, to which we will now call attention at some length, more on account of its general importance and bearing on other questions that may arise hereafter, than on account of the particular matter we are now discussing. It shows conclusively that the condition of the railroads in the State of Arkansas had continually grown worse until they had reached a point where the revenue produced by the rates in force was entirely inadequate to meet ordinary operating expenses and afford a reasonable return to the owners of the property. As pointed out by the circuit court in the opinion in this case, acquiescence could have no greater effect in a case of this character than to raise the presumption that the rates are reasonable if the conditions are unchanged. It would not be conclusive nor produce an estoppel. None of the elements of estoppel arise. Leaving out all other questions, the passenger rate statute had only recently gone into effect at the time the suits were brought, and that alone produced such a serious diminution in the revenues of the railroads as to justify legal proceedings. But there has, in fact, been no acquiescence. All the testimony on the subject in the record shows that the railroads were at all times objecting, protesting, and doing all they could to prevent the reductions complained of.

(See opinion of the Circuit Court in these cases, p. 26, and the cases cited.) Love v. A., T. & S. F. Ry. Co., 185 F. 332.

FOR A PERIOD OF TEN YEARS BEFORE THE INSTITUTION OF THESE SUITS, THERE HAD BEEN A CONTINUOUS INCREASE IN THE EXPENSE INCIDENT TO THE OPERATION OF RAILROADS IN THE STATE OF ARKANSAS, GROWING OUT OF THE INCREASE IN THE COST OF LABOR AND OF ALL MATERIAL USED IN MAINTENANCE AND OPERATION, AND THE LARGE BURDENS IMPOSED ON RAILROADS IN COMPLYING WITH THE REQUIREMENTS OF THE RAILROAD COMMISSION AND STATUTORY REGULATIONS AND REQUIREMENTS AND A LARGE INCREASE IN ALL CLASSES OF TAXES.

Mr. McPherson testified that the cost of operation had increased enormously since 1897, caused by various forces, the principal of which is (1) the increase in wages paid to all classes of railroad employes, (2) the increased cost of material, (3) the increase due to compliance with various laws, (4) the increase in taxation (R. 287). At page 286, he gave a detailed statement of the increase in wages of a large number of employes, and filed exhibit 27, showing the average daily rates of pay for classes of service per day and per 100 miles (in freight service) during various years, from, and including, 1897 to 1909. The increase ranges from 13.2 per cent to 61.9 per cent.

The amount paid to the classes of employes referred to in the exhibit, and in his testimony, for the fiscal year ending June 30, 1908, was $11,196,767.00. He testified that had the wage scale prevailing prior to 1902 prevailed in the fiscal year of 1908, the amount would have been $7,803,951, showing an increase in wages, alone, of the ten classes of employes enumerated, to be $3,392,815 in the year 1908. These figures apply to the Missouri Pacific System, but of the increase Arkansas would bear more than her relative proportion because of greater volume of business, density of traffic, and the Three Brakemen Law. The increase had extendeded to all classes of employes as well as those enumerated, particularly since 1902. The amount in the unclassified service could not be exactly stated prior to 1907, but in that year, because of the increased cost of living, an advance in wages was made to many persons in the unclassified service, which, including the classified service previously referred to, averaged 6.7 per cent of the entire labor roll for the fiscal year, 1908. The ratio of increase in wages did not show the increased cost of labor, owing to changes in duties imposed upon certain classes of employes—for instance, firemen, who formerly wiped their engines above the running board had been relieved of that duty since April 1, 1907, making it necessary for others to perform that service at an approximate annual cost of $60,000. Switchmen formerly worked twelve hours a day as a unit of the day's work; they now receive 61.9 per cent increase in the wages and their hours of service have been reduced to ten as a unit of a day's

work. Since 1890 the classification of railway employes has been sharply defined, and has resulted in a gradual increase in the number of employes. The increased cost brought about by advances in the price of materials entering into railroad construction, operation and maintenance was greater than that brought about by the advance in labor cost. One of the largest items in maintenance-of-way and structures is crossties, the cost of which has increased from 108 to 129 per cent over that of 1897. Up to 1900, the company paid 24 cents per tie for first-class crossties in the State of Arkansas. He then gives the increase from that time to 1908, the cost being 55 cents per tie in the latter year, or an increase of 129 per cent, north of the Arkansas River, in Arkansas, and 50 cents per tie, or 108 per cent increase south of the river. That item alone has increased the cost $250,000 a year. He made a comparison of prices paid in 1898 with prices paid during the current months of the year 1909, which is condensed in exhibit 28, filed by him, and shows an increase in prices ranging from 7.7 per cent to 147.7 per cent in articles that enter largely into operation and maintenance. He filed a statement compiled from bulletin No. 75, issued by the Department of Commerce and Labor in March, 1908, which he testified exhibits the range in prices of some material entering into railway maintenance and operation, from 1897 to 1907. This is made exhibit 29 to his deposition, enumerates different articles from those contained in exhibit 28, and shows an increase ranging from 15 per cent to 171.4 per cent in prices between the years mentioned. He referred to and

enumerated certain statutory enactments which he testified had largely augmented the cost of operation in the State of Arkansas. Among them was the installation of headlights on locomotives, the Full Passenger Crew Law, the Three Brakemen Law, and other enactments. He showed that the total expense incident to complying with these laws in the current volume of business, under current conditions, was $217,987 per annum. He testified that the railway company, that is, the Missouri Pacific System, including the St. Louis, Iron Mountain & Southern, had expended $4,748,231 to equip its locomotives with air-pumps and driver-brakes and its freight cars with automatic couplers and air-brakes, and that the cost of their maintenance was $250,000 per annum. The increases referred to in his testimony, except where otherwise mentioned, are on the St. Louis, Iron Mountain & Southern, alone. He states that the increase per mile for taxes during the nine years was 96.6 per cent, growing largely out of the increase in the assessment of the value of the property. Another source of expense in first cost and maintenance is the erection of stations under laws passed by the Legislature and orders of the Railroad Commission. Many stations have been erected in that way which would not otherwise have been established, not only the cost of erection, but the cost of maintenance of the structures, and of agents and operators at such stations, involve material expense. He filed a graphic chart as exhibit 30, showing comparative prices of material and labor during the period covered by his testimony and the ton mile return for service in freight traffic, that is, the

revenue per ton mile. The chart shows that there was a decrease of 12 per cent in the revenue per ton mile from 1897 to 1909. The chart is explained and its meaning pointed out in the testimony of the witness at page 296 and the following pages. It shows that the producing power of the railway had decreased, relatively, for the volume of business done, approximately 12 per cent. He further testified that the conditions described in his testimony and shown on the chart, applied generally to railroads operated in the State. His testimony further shows that in 1906 all the organizations connected with train service formulated demands on railroads west of the Mississippi River and northwest from Chicago, for radical changes in the labor status. It included demands for reduction in the unit time of labor to eight hours, and also for an increase in the rate of wages. A compromise was effected between the railroads and the labor organization, which resulted in an increase in wages amounting, for engineers and firemen to 8.2 per cent, and of all trainmen to 10.2 per cent. The wages of the yard men had been increased in the preceding November 13.4 per cent. These increases, as to trainmen, took effect on April 1, 1907. In the meantime, demand was made and an increase in wages granted to all the crafts —the shopmen, boiler-makers, machinists, blacksmiths, etc., as follows:

Machinists and boiler-makers...8.8 per cent
Boiler-maker's helpers.....8.3 per cent
Blacksmiths and their helpers....9.7 per cent
Car department employes.....6.1 per cent
Tinners, coppersmiths, and pipe-
fitters ..... .4.8 per cent,

and, later in the year, it was also necessary to increase the wages of unskilled labor, because of the increased cost of living. The total increases that were made, including crafts, he testified, affected 19,811 out of a total of 37,000 employees in the service of the Missouri Pacific System, and amounted, during the six months' period, in the State of Arkansas, to $215,204, or 6.7 per cent of the entire labor rolls. 65.9 per cent of the entire operating expenses in the State is for labor, and it was on this proportion of operating expenses that the increase of 6.7 per cent was made during the early part of the year 1907. He introduced two extracts from bulletin No. 75 of the Department of Commerce and Labor, issued in March, 1908, showing a very material increase in the cost of material used in operation in the years 1906 and 1907. This enumeration is contained at pages 299, 300, of the record. He testified that the tendency of prices of labor and material used in maintenance and equipment, judging from his observation during the last ten years, is upward; that increases in wages made by a railroad company are permanent, and there is no probability of any abatement or recession in the price of labor. His testimony on this subject will be found in the record, beginning at pages 286-300.

He was asked what the railroad company had done to improve efficiency in operation, beginning with the year 1900. His answer to that question, in full, was as follows:

"The railway company has made extensive grade revisions and changes in its alignment and purchased heavier

equipment. That is, locomotives of greater tractive power, and cars of larger capacity, and made other improvements to increase the efficiency of its train service. The grade between Moark, near the State line between Missouri and Arkansas, a distance of 307 miles, is now six-tenths of one per cent, and this involved the reduction of the maximum grades between Moark and Little Rock, 35 feet to the mile, and between Little Rock and Texarkana, 26 feet to the mile, these reductions bringing the maximum grade to 31 feet to the mile, or six-tenths of one per cent.

"Between Knobel and Helena, a distance of 140 miles, the maximum grade was reduced from 91 feet to the mile, southbound, to 62 feet to the mile. And, northbound to 83 feet, involving the cutting down of the maximum grade 28 feet to the mile, southbound, and 8 feet, northbound.

"Between East Little Rock and Pine Bluff, a distance of 42 miles, the maximum grade has been reduced from 52 feet to the mile to 26 feet, which was a maximum grade reduction of 26 feet to the mile, and leaves the present grade one-half of one per cent.

"Between Little Rock and Van Buren, a distance of 152 miles, the maximum grade, prior to the revision, was 85 feet to the mile, eastbound, and 81 feet to the mile, westbound. These grades have both been reduced to 31 feet to the mile, or six-tenths of one per cent. This involved a reduction of maximum grade 54 feet to the mile, eastbound, and 50 feet to the mile, westbound.

"This, with other work in the way of improvements, improving the efficiency of the property, caused an expenditure of $8,684,411.00 for the eight fiscal years, 1901 to 1908.

"It does not embrace some of the expenses, however, as the figures chargeable to 1899 and the first half of 1900 were not accessible at the time that this compilation was prepared.

"This reduction of grade increased the efficiency of the railway in its tonnage road haul.

"As a further improvement, the company purchased, during the period mentioned, 323 locomotives of large tractive power, and 6,680 freight cars of large capacity, at a cost of $9,660,372.00.

"This heavier power likewise contributed to increasing the average tonnage road haul and thus increased the efficiency of the service.

"This increased efficiency of operation, however, has been overcome and far outrun by the forces working against it. That is, the increased rate of wages and the increased cost of material, the burdens imposed by legislation and the increase in taxes." (R. 331, 332.)

His statement that the increase in efficiency is overcome and far outrun by the forces working against it, was not contradicted, and is corroborated by a comparison of the percentage of expenses to revenue during the period covered, which shows that the net earnings decreased, and this decrease was unquestionably traceable to the fact that the cost of operation, growing out of the increase in the expense of operation and cost of material, outran and was greater in proportion than the effect of improvement in efficiency. The net earnings are the result of all the forces that were at work during this period,—increased efficiency on one side and the increased cost of everything that enters into railroad operation on the other. We know of no higher test for the purpose of demonstrating the correctness of Mr. McPherson's views.

Mr. McPherson had been engaged in railroad operation for thirty-two years at the time he testified. His service covered a vast field, ranging from telegraph operator,

station agent, general yard master, master of transportation, chief clerk to the general manager, and assistant to the general manager. He was more closely in touch with the conditions in regard to which he was examined than any official connected with the Missouri Pacific System, and far more than any witness who testified in the case on either side. His duties required him to deal with and study economies in operation, and he was peculiarly well qualified to give information upon those matters.

On cross-examination, Mr. McPherson testified that the graphic chart introduced by him (Exhibit 30) did not reflect the increased efficiency of locomotives, car capacity, etc., and was asked if it would reflect the actual conditions without that. He said it was not intended for that purpose; that it would be difficult for any graphic illustration to be made that would embody those elements. (R. 392.)

In response to a question on cross-examination, he stated that the purpose of the chart filed by him was to show the increasing trend of the cost of the articles the railway must buy, and the decrease in the trend of its purchasing power, and the fact that it did not show the increased efficiency of locomotives, cars, etc., did not impair its value for that purpose. (R. 394.)

He was then asked if the railroad secured any more efficiency for its purchasing power now than it had at the beginning of the period referred to by him. His answer was that it did not; that it is doubtful if the company today secures the labor efficiency that it formerly did, or gets the

same efficiency for its expenditures for labor that it formerly did. He stated, in answer to a cross-interrogatory, that the increased efficiency of locomotives measured by the average tons of revenue freight per ton mile in 1909, over 1900, is substantially 26 per cent; that with this increase of 26 per cent, there goes a heavier expenditure for maintenance. The maintenance of the present-day locomotive is very much greater than the average locomotive of 1900. The average increase of tractive power of locomotives as between 1902 and 1908, is substantially the same, 26 per cent. The increase in the average capacity of the cars is 43 per cent. When asked what the increased efficiency produced by the movement on the line of the Iron Mountain in Arkansas was, he stated that it would be difficult to put in the shape of figures beyond what he had given, but he said: "We get a 25 per cent to 26 per cent larger train haul than we formerly did, but the increased capacity of cars has not helped us very much because, while it has been 43 per cent, the increased use of those cars has been only about 20 per cent, that is, the average tons per loaded car mile, due to various reasons, partly the Commission tariff, on account of the low minimum. Our freight cars have an average tonnage capacity of 33.62 tons; their minimums on very many articles are not one-half that amount, and my recollection is there is no minimum in Arkansas (under the Commission tariff) that is higher than 30,000 pounds. We have those difficulties to contend with." (R. 392, 394.)

Counsel, at the hearing below, contended that the lower line of the chart, showing diminution in revenue, repre-

sents fluctuations in interstate rates in the State of Arkansas. He is obviously mistaken in that. The chart represents the revenue on the St. Louis, Iron Mountain & Southern System, including five or six States, and not in the State of Arkansas, alone, and could not, therefore, represent fluctuations in interstate rates in that State. The chart, in truth, however, largely reflects conditions that are independent of, and not connected with, the tariff of charges—results growing out of the changes in the cost of labor, material and everything that enters into the cost of operation, increased taxation, and burdens imposed by legislative requirements. Every element of increased expense enumerated by Mr. McPherson would have a direct bearing on the relation between earnings and revenue, without any regard to the rates that were charged for the service. The effect of the conditions described by him would necessarily require higher revenues for the purpose of meeting the increased expenditure, and as the revenue depends on the rates received for service rendered, it may well be that a rate that would have produced a reasonable return in 1900 would not do so in 1907. But that fact is not illustrated nor represented on the chart. Counsel labor under a misapprehension. (Twenty-five copies of said chart are filed, it having been omitted from the printed record.)

## THE STATE'S EXHIBIT Z OF NO VALUE.

The State, for the purpose of meeting the testimony of Mr. McPherson, filed exhibit Z, which is a comparison of revenue and expenses per train mile for the years ending

June 30, 1897, and 1907, as shown by the Interstate Commerce Commission's reports for those years.

Examination of that exhibit in the light of the conditions existing in the year 1897 will show that it is of no value for the purpose for which it was used. It shows that on the Iron Mountain Railroad System the operating revenues for the year ending June 30, 1907, was 50 per cent greater than in the fiscal year of 1897, and that the expenses were 40 per cent greater; the net revenue per train mile being 69 per cent greater, in the latter, than in the former year.

But the year 1897 was so exceptional that it cannot be made the basis of a comparison. It was a period of great depression and falling off in the business and in the earnings of all railroads, and that accounts for the difference that is shown in the figures that appear in the exhibit.

Mr. F. P. Johnson, an expert accountant in the employment of the St. Louis, Iron Mountain & Southern Railway Co., testified that the statistics shown by the exhibit were taken from the annual report of the Interstate Commerce Commission for the year 1897, that the opening statement of that report contained the following statement as to its statistical value:

"A review of statistics of operation since 1890 would disclose the fact that each year ending June 30, from 1890 to 1893, inclusive, closed with an increase in net and gross earnings as compared with the previous year.

"The year 1893-1894, however, proved to be a disastrous one for railways, the gross earnings being less than

$147,000,000 and the net earnings $50,000,000, than the corresponding items of the previous year.

"The year 1894-1895 showed practically no recovery from the depression of the previous year.

"The year 1895-1896 closed with an increase in gross earnings of $74,000,000 and net earnings of $27,000,000. But this movement toward better conditions did not continue during the year covered by the present report, which, as compared with 1896, shows again a decrease in gross earnings of $28,000,000 and in net earnings of $7,000,000.

"It was not until June, 1897, that is to say, the last month of the twelve covered by this report, that the railway earnings showed a healthy revival of commercial conditions. This fact indicates the character of the year covered by the present report *and must be held in mind by one who endeavors to interpret the figures about to be presented.*" (R. 2003-4.)

Continuing, Mr. Johnson testified that the year ending June 30, 1907, was one of the best in the history of the railroads, and that fact is not controverted. (R. 200-203.)

Exhibit F-1, filed by the State in this case, was also referred to by counsel for the purpose of showing heavier train loading in 1907 than in 1897. Mr. Johnson, referring to this exhibit, stated that it was subject to the same criticism as exhibit Z; that it compared two periods entirely different in their character, and in addition to that, so far as the passenger service on exhibit F-1 is concerned, it gives no consideration to the change in revenue produced by the two-cent passenger fare. (R. 2004.)

We submit that no just or fair comparison can be made between the two years taken for that purpose, on ac-

count of the great dissimilarity in the conditions. Learned counsel asserted, in argument below, that McPherson's exhibit 30 contained a similar comparison. He was mistaken. It does not purport to make any comparison as between periods, but was solely intended to show the continuous increase in the prices of labor and material from 1897 to 1907.

## DIVIDENDS.

Exhibit 47 shows the dividends paid by the St. L., I. M. & S. Ry. Co. from 1904 to 1909 inclusive. The Company paid 10 per cent dividends from 1904 to 1907. In 1908 the dividends dropped to 5 per cent and in 1909 to 4 per cent. The dividend for 1908 represented the fiscal year ending June 30, 1908, and embraces the period covered in this suit. The total track mileage of the St. Louis, Iron Mountain & Southern Railway during the period covered, was 2,599 miles, that in Arkansas 1,353 miles, constituting 52 per cent of the total track mileage. (Statement No. 3, Exhibit No. 3.)

Dividends to a certain extent represent earnings from operations, but not wholly, because every conceivable source of revenue, not only from freight and passenger and mail and express business in Arkansas, but in Missouri, Illinois, Oklahoma, and Louisiana, contributes to it. The dividends represent every class of business on the system, interstate as well as domestic, in each one of the several States in which the system is operated. It also represents all revenue that accrues from investments. The Iron Mountain

Railway owns a large part of the bonded indebtedness of other railroads, among them, the Texas & Pacific Railroad, and the earnings of the latter contribute to the dividends of the former.

The fact that the railroad company may be earning sufficient to cover operating expenses, meet the interest on its bonds, and provide a dividend on the entire system, does not affect its right to earn reasonable compensation on its state business, which is a very small part of the business of the Iron Mountain Railway System. The intrastate earnings in Arkansas for the last half of 1907 were $1,476,000, or less than 12 per cent of the total earnings of the system, and much less if the revenue from the investments is considered. So it may well be that a loss on that small proportion of the business made up of short hauls and the more expensive classes of business to handle, would not affect the result of the entire volume of business to the extent that it would prevent the earning of dividends on the total business and the profits accruing from investments.

The court, in the case of Smythe v. Ames, 169 U. S., p. 466, discussing that question, said this:

"It is further said in behalf of the appellant, that the reasonableness of the rates established by the Nebraska statute is not to be determined by the inquiry whether such rates would leave a reasonable net profit from the local business affected thereby, but that the court should take into consideration, among other things, the whole business of the company, that is, all its business, passenger and freight, interstate and domestic."

That is what is represented by the dividends introduced in evidence here, the whole business and receipts from every source on the entire system.

"If it be found upon investigation that the profits derived by a railroad company from its interstate business alone are sufficient to cover operating expenses on its entire line, and also to meet interest, and justify a liberal dividend upon its stock, may the Legislature prescribe rates for domestic business that would bring no reward and be less than the services rendered are reasonably worth? Or, must the rate for such transportation as begins and ends in the State be established with reference solely to the amount of business done by the carrier wholly within such State, to the cost of doing such local business and to the fair value of the property used in conducting it, without taking into consideration the amount and cost of its interstate business, and the value of the property employed in it? If we do not misapprehend counsel, their argument leads to the conclusion that the State of Nebraska could legally require local freight business to be conducted even at an actual loss, if the company earned on its interstate business enough to give it just compensation in respect of its entire line and all its business, interstate and domestic. We cannot concur in this view. In our judgment, it must be held that the reasonableness or unreasonableness of rates prescribed by a State for the transportation of persons and property wholly within its limits must be determined without reference to the interstate business done by the carrier, or to the profits derived from it. The State can not justify unreasonably low rates for domestic transportation, considered alone, upon the ground that the carrier is earning large profits on its interstate business, over which, so far as rates are concerned, the State has no control. Nor can the carrier justify unreasonably high rates on domestic business upon the ground that it will be able only in that way to meet losses on its interstate business. So far as rates of transportation are concerned, domestic business should not be made to bear the losses on interstate business, nor the latter the losses on domestic business. It is only rates for the transportation of persons and property between points within the State that the State can prescribe; and when it undertakes to

prescribe rates not to be exceeded by the carrier, it must do so with reference exclusively to what is just and reasonable, as between the carrier and the public, in respect of domestic business. The argument that a railroad line is an entirety; that its income goes into, and its expenses are provided for, out of a common fund; and that its capitalization is on the entire line, within and without the State, can have no application where the State is without authority over rates on the entire line, and can only deal with local rates and make such regulations as are necessary to give just compensation on local business."

The falling off in the dividends during and after the fiscal year, 1908, may be accounted for by the conditions developed in the testimony of Mr. McPherson. It would be the natural and necessary consequence of the facts and conditions shown in his testimony. He showed that there had been a gradual increase in the cost of material, supplies, and labor from 1898 to 1908; that in the early part of the year 1907 increases were made affecting the wages of nearly 20,000 employes in the various departments of service, which item, alone, amounted to $215,214.00 during the last six months of the year 1907, or 6.7 per cent of 65.9 per cent of the entire operating expenses in the State. That during the same period the cost of materials made a substantial advance; that the cost of operation in Arkansas was increased $48,053 under the new classification of operating expenses issued by the Interstate Commerce Commission under the Hepburn Act, which act became effective in August, 1906, and $67,104 under an act of the Legislature of Arkansas requiring railroads to employ additional brakemen on all trains composed of more than twenty-four cars, the increase having been made in May, 1907.

The validity of the act was upheld by this court in C., R. I. & P. Ry. Co. *v.* State of Arkansas, 219 U. S. 453.

## COMPARATIVE COST OF OPERATION.

Exhibit 6, filed by the railroad companies shows that it cost 36 cents less to earn $100 on the St. Louis, Iron Mountain & Southern Railway in the State of Arkansas during the six months ending December 31, 1907, than it did to earn $100 on the entire line during the preceding fiscal year; that it cost $9.54 more to earn $100 in the State of Arkansas than it did upon all of the lines of railroad in group 8, which is composed of the States of Oklahoma, Kansas, Missouri, south of the Missouri River, parts of Texas, Colorado, New Mexico, and Arkansas, during the same periods. Counsel in the argument at the hearing below drew the conclusion, and based an argument upon that showing, that was unfavorable to conditions on the Iron Mountain Railroad in Arkansas as compared with other lines, both with regard to the revenue and manner of operation. The figures referred to show the ratio of expense to the gross earnings. Counsel cross-examined Mr. McPherson as to these statistics. He testified that the ratio of expense to gross earnings is not an index of much value for comparative purposes. (Record, p. 298.) It depends upon several factors, on conditions, favorable or otherwise, that may permanently differ between railroads; conditions that may come about in the same year and different years on the same railroad. It depends on traffic and on expenses, also on the standard

of maintenance; the maintenance observed by the different railroads compared, or upon the same railroad in different years. It is entirely possible for that ratio to vary between railroads as much as 10 per cent from the maintenance put upon the property by different roads or upon the same railroad in two different years. Taken independently, without analysis of its factors for comparison to determine the efficiency of operation, the road that expended less than a sum sufficient to preserve its standard of maintenance would apparently be better operated and more favorably conducted than a road that preserved its standard of maintenance by expending a large sum.

Again, speaking of exhibit 6, he says it is between two different periods; one the fiscal year ending June 30, 1907, the other the six months' period ending December 31, 1907. The conditions that existed during these periods were unlike. The cost of operation during the latter period was increased largely for various reasons—increased cost of labor, increase in the cost of material, etc. Then he gave in detail some of the increases in the cost of labor, and stated further that during the same period the cost of all materials used by the railroad in its operation and maintenance made a substantial advance, quoting in support of the statement from bulletin No. 75 of the Department of Commerce and Labor, issued in March, 1908, heretofore referred to in connection with his testimony.

He says at page 301, that the ratio of expense to earnings on the Iron Mountain as a system for the fiscal year

ending June 30, 1907, was 62.8 per cent, and the ratio for the United States was 67.53 per cent, 4.73 per cent greater than on the Iron Mountain, and in group 8, 64.34 per cent—1.54 per cent greater than on the Iron Mountain. He then makes a comparison of the operating ratios of railways touching Arkansas, and those operated under similar conditions for the fiscal years ending June 30, 1907, and June 30, 1908, taken from published annual reports for the purpose of showing that the increase in the ratio of operating expenses was not confined to the Iron Mountain Railroad alone. This comparison will be found at page 301 of the record. The similarity of conditions grows out of the fact that similar wage conditions affected all the railways used in the comparison. Since exhibit 6 was filed, he had obtained the advance bulletin of revenues and expenses of systems of railroad issued by the Interstate Commerce Commission, which enabled a comparison to be made of the six months from July to December, 1907, inclusive, the result of which is shown in exhibit 31 filed by him, and bears out his statement as to the general ratio of increase of operating expenses on all lines of road in the country.

Counsel assume that exhibit 6 shows a larger earning from passenger business on the Iron Mountain than on other roads in group 8, and throughout the country generally, but exhibit 31 shows that the ratio of earnings on the St. Louis Southwestern Railway and the Iron Mountain during the last half of the year 1907 is lower than on other lines, and

in fact, that the passenger business on these roads was not as large as the average of the United States, or as a large number of other railroads operating in the same territory. The two-cent rate during the period involved was in force in Missouri. The percentage on the Illinois Central Railroad, where the two-cent rate applied, was the same as the Iron Mountain in Arkansas, both being 21.05 per cent. Counsel fell into the error of making this comparison and illustration from exhibit 6, which covers the fiscal year ending June 30, 1907, as to the States in group 8, and the last six months in 1907 as to the St. Louis, Iron Mountain & Southern system, and that part of the line in Arkansas, while the bulletin from which exhibit 31 is compiled makes the comparison upon the same period. The information as to the earnings and expenses for the last half of the year 1907 was not accessible at the time exhibit 6 was prepared, and that exhibit is unreliable for the purpose for which it was used by counsel.

## THE PERIOD COVERED BY THE ACCOUNTS AFFORDS A FAIR TEST AS TO THE REASONABLENESS OF THE RATES.

The accounts introduced by the St. Louis, Iron Mountain & Southern Railway cover the calendar year 1907. They are stated separately and the earnings for each six months' period is shown.

The accounts of the St. Louis Southwestern cover the fiscal year ending June 30, 1908, divided into two periods and showing the earnings for each half of the fiscal year separately.

The State's accountants adopted the last half of the year 1907 in making up their statements and applied their theory of dividing the expense of operation between interstate and intrastate traffic, based on the performance in the month of October. They had access to, and investigated so far as they wished to do so, all the accounts showing all earnings and expenses of both companies for previous years.

The business and gross earnings of both roads were shown to have been larger during the six months ending December 31, 1907, than in any other similar period, and the gross earnings per mile above the average of the eight years preceding it. These facts sustain the court's finding that:

"In view of these facts there is no substantial ground for the claim that the period selected by complainants was unfair to the State or insufficient to enable the court to determine the issues in these cases, or that the earnings and

expenditures for these periods do not show a fair average of the business of complainants, at least fair to the defense. The fact that the able counsel for the State, and expert accountants did not call for data of other periods than those produced by complainants and in evidence, is, if not conclusive at least persuasive that they considered the evidence offered sufficient for a just determination of the issues involved." (P. 23.)

The panic that came on in the latter part of 1907 was not felt in time to affect the business of that period. This is abundantly established by the evidence of R. E. Kimbell, the Assistant Auditor of the St. Louis Southwestern, who testified that the panic began in November, but was not seriously felt until the early part of 1908. (R. 160.)

The best evidence on that point is a comparison of the earnings of that period with previous years. The evidence shows that the gross earnings of the St. Louis Southwestern Railroad for the last half of 1907 were $5,427,121.82. During the same period in 1906 they were $5,341,994.91; 1905—$4,594,748.99; 1904—$4,753,032.78; 1903—$4,-064,853.19. On the St. Louis, Iron Mountain & Southern road the gross earnings for the last half of 1907 were $12,385,947.00; 1906—$11,833,245.96; 1905—$10,395,-654.67; 1904—$10,334,596.81; 1903—$10,128,966.95. (Exhibit 45.) These statistics we submit settle any question as to the effect the panic may have had on the last half of the year 1907.

## ALLEGED IMPROPER CHARGES AGAINST THE EXPENSE OF OPERATION AND OMISSIONS FROM EARNINGS IN INTRASTATE BUSINESS.

The State contends that certain charges were improperly made to intrastate business by the court. Statement No. 4 filed with exhibit 3 is a statement of operating expenses during the six months in question. Under the head of "Maintenance-of-Equipment" there appears a total charge of $63,288.35 for repairs to tools and machinery, 77 per cent of which, or $48,671.67, is charged to the State of Arkansas and is divided between intrastate and interstate expenses. It is contended that this sum is expended at the Argenta shops because they are the largest of the system, that the shops in Missouri and Kansas are smaller. The court found that there was nothing in the evidence to indicate what would be a proper sum to be charged, which is undoubtedly correct. The ground of the State's contention in the court below was that a larger ratio was charged to the State on that item than on other items. The average ratio of the charge of "Maintenance-of-Equipment" to the State was 55 per cent of the total. The items vary, ranging between 53 per cent and 77 per cent. The State contends that it should not exceed 55 per cent, that is the average ratio chargeable to the State. The same contention might be as logically made by the railroad companies as to any item that dropped below 55 per cent. The exhibit was filed by Mr. F. P. Johnson of the auditing department of the railroad company. He was examined in regard to it and

testified that the item related to repairs of tools and shop machinery and heating and lighting, and is charged to the operating division, that is to the jurisdiction of each master mechanic. In Arkansas the principal machine shop is at Little Rock, which entails a heavier expense than at any other division point because it is larger than any other division point in the State. Miscellaneous shop expenses, such as this item, are not apportioned over the entire Missouri Pacific System, but are localized to the particular division, on which each shop is located. The general repair accounts applying to locomotives and cars is apportioned over the system. If the shop accounts were apportioned over the entire system in like manner, Arkansas would be compelled to stand a proportion of the expense incurred at shops located in other States. "If we were to pool this amount on the same basis that we pool the repairs to locomotives and cars, I think the amount charged to the State of Arkansas would be just as large." The shop account is of a local nature. (R. 142.) The evidence shows that the system is uniform and has been in existence for a long time on the Missouri Pacific Railroad. The $63,000 contained in this item applies to the Iron Mountain and the $48,000, which is charged to Arkansas accrues at the shops in that State. Mr. Johnson testified that they were larger and of more importance than any other shops on the Missouri Pacific system, except those at Sedalia, Mo.

The method of dividing operating expenses, taxes and fixed charges on the St. Louis, Iron Mountain & Southern Railway System between states and between freight and passenger business is set forth in statement No. 5 to exhibit 3. (See R. 2310.) This method has been in use a long time and presumably has commended itself to the operating officials of the system as the best that could be applied for that purpose. We submit that it should require something more than mere criticism of persons without knowledge or experience to justify a finding that the method was not adopted in good faith or did not result in a fair and proper distribution. The best evidence of the propriety and reasonableness of administrative methods in the operation of large and complicated business or properties is the practice of those charged with the responsibility of operation, the methods adopted by whom are presumably the result of knowledge based on experience and observation, and will not be lightly set aside.

## RENTAL OF ST. LOUIS SOUTHWESTERN TRACKS AND VAN BUREN BRIDGE.

The St. Louis, Iron Mountain & Southern Railway has trackage rights over the rails of the St. Louis Southwestern Railway from Paragould, in the State of Arkansas, to the Thebes bridge in Missouri, a distance of 110 miles, 34 miles of which is in the State of Arkansas, and the operation of which is chargeable to that State. The expense was charged in the railroad accounts as an operating expense, and divided between intrastate and interstate business.

The tracks of the St. Louis, Iron Mountain & Southern Railway cross the Arkansas River to the north side at Fort Smith, and run to Van Buren on the north side of the river, a distance of eleven miles. The main line of the St. Louis & San Francisco Railway crosses the river at Van Buren, and runs directly to Fort Smith, the distance being five miles. The St. Louis, Iron Mountain & Southern Railway has a contract with the St. Louis & San Francisco Company for trackage rights over the bridge of that company crossing the river at Van Buren, under which they contract to pay for locomotives $2.00, freight cars $1.50, passenger cars $2.00, with a minimum of $1,000 per month. Two passenger trains a day crossed the bridge during the time in controversy.

The State objected to both these charges. Their objection in regard to the tracks leased from the St. Louis Southwestern Railway was that no part of it should be charged to intrastate traffic, inasmuch as the track was used exclusively for interstate traffic. The objection to the rentals for the Van Buren bridge urged at the hearing below was on the ground that the use of that bridge was unnecessary to the traffic. The court found that the interstate business was benefited by relieving the tracks of the company of the intrastate trains, thereby facilitating the movement of all classes of trains and business on the line of that company. (Opinion, pp. 41, 42.) Mr. McPherson was examined in regard to these charges and the propriety of distributing them among the different classes of traffic. He said:

"The Iron Mountain Railway found from the enormous volume of traffic between Bald Knob and the State line, that it must make further provision to handle it expeditiously. There were two things that might be done; one was to build a double track, and the other was to ascertain if a track already existing could not be secured at a reasonable cost to relieve the situation, and the latter arrangement was made.

"No local business is done on that line between Paragould and the State line. It is merely a through line. After this arrangement had been completed, it was found as a practical business proposition, that it would be better to use it for interstate traffic, and that is the present practice.

"It results in expediting the traffic from Bald Knob and the State line over the main line of the St. Louis, Iron Mountain & Southern, and is to all intents and purposes the same as a double track.

"Q. In view of the fact that it is used exclusively for interstate business, do you regard it as proper that any part of expenses should be charged into the intrastate traffic of Arkansas?

"A. Yes sir; because it is the same as a second track or double track, located on our right-of-way, and the purpose of that double track would be to expedite the business of that division.

"An enormous amount of local business is handled between Bald Knob and Knobel, and the relief that it gives to the main line makes it one of the instruments of aiding transportation, making it possible, in effect, to conduct the transportation of the intrastate and interstate business, both freight and passenger." (R. 285, 286.)

Referring to the Van Buren bridge, he testified:

"Whatever aids in the facilities of the railway is a charge to the entire traffic that it handles. It may be that that added facility would handle only freight business; or, that would handle only passenger business. But a necessity

existed for relieving the entire operation. Otherwise, the facility would not have been added to the railway company's development.

"Now, the Van Buren bridge adds to the general facilities of the company in that way. It expedites the movement of all traffic.

"Likewise, the Little Rock Junction Railway. It may be used only for freight purposes, but it is necessary in order to facilitate the handling of all trains.

"Freight trains can go in there and get out of the way of passenger trains, thereby aiding the passenger trains.

"They are the material aids to all of the traffic that the company would handle." (R. 286.)

Mr. F. P. Johnson testified that:

"The Cotton Belt (St. Louis Southwestern) track is practically a double line, and when we secured the privilege to operate over the Cotton Belt to Paragould, and to the State line and north of that, it benefited our main line from Texarkana to St. Louis to the extent that it gave us more use for other than through freight business."

Referring to the rental of the Van Buren bridge, he testified:

"It was in line with other rentals. We have not attempted to divide our rent at all for freight and passenger service based upon the actual facilities we rent any more than we attempt to divide our taxes." (R. 177-179.)

The above is all the testimony in explanation of the charges, and we do not think anything need be added to what the witnesses have said.

## AMOUNTS PAID TO ATTORNEYS OUTSIDE OF THE STATE, LOBBYISTS AND TEN THOUSAND DOLLAR FINE.

These assignments are based on the following facts:

The evidence showed that a fee was paid by the St. Louis, Iron Mountain & Southern Railway Company, to Mr. Leake, an attorney at Dallas, Texas, for legal services rendered the company; that salaries were paid certain agents for services in connection with matters pending before the Legislatures of the States of Arkansas and Missouri, and that a fine of $10,000 was adjudged against the company on account of the issuance of passes to members of the Legislature of Arkansas. The state of the evidence on those points is summed up by the Court in its findings:

"Another claim is that the State of Arkansas is charged with part of the salaries paid to Messrs. Phelps and Seibert, shown by the accounts of the Iron Mountain to have been connected with the legal department at the headquarters in the city of St. Louis, Mo., and of Mr. Cox, who was, during the year 1907, residing at Little Rock. It is claimed on the part of the State that the services of these parties were for lobbying and therefore not a proper charge. But there is no evidence to sustain the claim that the salaries were paid for such services. The failure of the railway company to show what the services were for which they were compensated does not justify the court in finding upon a mere suspicion that they were for services which are unlawful and against public policy. The burden to prove an unlawful act is upon the party charging it, and will not be presumed in the absence of evidence to that effect." (Opinion, p. 41.)

This applies also to the small fee of $800 paid to Mr. Leake.

Referring to the fine, the court, in its findings, says:

"The evidence fails to show whether this was done with the knowledge and approval of the higher officials of the company, or by the inferior officials for whose acts the company is, under the statute, responsible. As there is no presumption of an unlawful intent, in the absence of proof, the court is not inclined to sustain this claim without determining whether it could under any circumstances be sustained." (Opinion, p. 40.)

## MEMPHIS AND FORT SMITH TERMINALS.

The St. Louis, Iron Mountain & Southern Railway has a terminal yard at the city of Memphis, in the State of Tennessee. Its line of road terminates at that point. The extent of its tracks is 2.07 miles. It is the end of the Memphis Division, just across the State line. The cost of operating the yards is charged to Arkansas, and in the accounts of the railroad company it is divided between state and interstate traffic as other accounts are. All the facilities in the Memphis yards are necessary for operating the trains and doing the work for the Memphis Division, which extends from that city to Bald Knob, in the State of Arkansas. All the roundhouse work for that division is carried on in the Memphis terminals. If it were not charged to Arkansas, all the expense of maintenance growing out of the work of that division could not be charged to any account, as the road terminates there. If the line extended beyond Memphis, in the State of Tennessee, it would be proper, and conform to universal usage, to charge that expense to the State of Tennessee. This charge does not include the expense of traffic. That is charged to traffic, and not as an

operating expense. The matter is clearly explained in the testimony of Mr. McPherson, who was entirely familiar with the conditions. He testified:

"There must of necessity be a terminal on the Memphis Division; and it is immaterial whether it is on the east or on the west side of the Mississippi River. The fact that it is on the east side of the river is an accident of convenience.

"If there were no terminal on the east side of the river there would of necessity have to be a terminal on the west side.

"The expense of the bridge transportation and of the interchange of cars, with other railroads at Memphis, is not an operating expense; it is an expense that traffic bears directly.

"It costs no more to operate the terminal on the east side of the river than it would on the west side. And if no part of the expense of the Memphis terminal were charged to state traffic or intrastate traffic, then the expense of caring for locomotives and cars, supplies, fuel, would not follow the local work that was done by the trains on the Memphis Division.

"The trains between Bald Knob and Memphis handle a great deal of local freight, and unless a part of the expenses were chargeable to intrastate traffic, no expense for handling that freight would appear in the operating accounts, as a charge against them.

"The expense of handling the intrastate freight should be a charge to that freight, regardless of where the terminal may be." (R. 280, 281.)

"The Iron Mountain Railroad does not operate any lines in the State of Tennessee. There are substantially no earnings on that business in Tennessee that the Iron Mountain receives, and so far as the accident of location is concerned, it would be the same to the railway company whether delivery was made to it on the east side or on the west side of the river." (R. 349.)

There is where the distinction arises. If it operated a line in the State of Tennessee, then the railroad would treat that expense just as it does elsewhere—it would charge it to the State of Tennessee. But there is no operation in the State of Tennessee, and for that reason, if we are to meet the conditions that exist here, it is bound to be charged to the State of Arkansas.

Its yard trackage in that State is 2.07 miles, including the bridge, more than two-thirds of which is in the State of Arkansas. If its lines extended into the State a different proposition would be presented. It would then be proper to treat Memphis as a Tennessee terminal, and to charge expenses to it as incurred in that State. That is the manner in which operating terminal expenses are carried on the Missouri Pacific-Iron Mountain System, wherever their lines are operated in a State.

If we were to eliminate from the accounts all of the expenses incurred at the city of Memphis, we would not be charging to the trains that operate in this State any of the terminal expense incurred at the end of their runs into Memphis or at the beginning of their runs out of Memphis; the roundhouse and yard accounts would not correctly reflect the actual cost of operating those trains in this State. It is not a terminal expense charged to traffic like the handling of freights carried; it is an operating expense.

In this connection, let us see the situation at Fort Smith. Counsel for the State stated in the argument at the hearing that he would not object to either one of these

charges if they were consistent, but it was inconsistent to treat Memphis and Fort Smith both as Arkansas terminals, because Memphis is in the State of Tennessee and Fort Smith in the State of Arkansas.

There are some minor repair shops at Van Buren of small importance, but there are no shops at Fort Smith, and it is simply a way station on the line of the road, which extends into Oklahoma and points beyond Fort Smith for a considerable distance, and the expense at this point is small. If Fort Smith is regarded as a divisional terminal, it should be treated as every other terminal station where operating terminal expenses are incurred on the Iron Mountain system. There are shops and much larger terminal facilities at Poplar Bluff which serves Arkansas territory just as it is claimed that Fort Smith serves Oklahoma. All that expense is charged to Missouri. But the fact is, as stated before, there are no repair shops at Fort Smith, and there are no operating terminal expenses of any great amount. The situation is the same at Carthage, Mo., on the White River branch and at Coffeyville, on the Kansas and Arkansas Valley Line. There is no more reason why Fort Smith should be treated as in Oklahoma than there is that Coffeyville should be treated as in Arkansas. The same condition exists in regard to Monroe, La., which is in a comparatively short distance of the Arkansas State Line, and is an important terminal. The operating expenses, however, are all charged to the State of Louisiana. This is a universal practice in the division of terminal operating

expenses throughout the entire Missouri Pacific and Iron Mountain systems, and no good reason can be given why Fort Smith should be treated as exceptional.

## BUNCH ELEVATOR.

This is an elevator located partly on the right-of-way of the railroad yards at Argenta, Ark. It was operated by the T. H. Bunch Company, who claimed to own the improvements. The records show that a nominal rental for the elevator was carried in the account of the railroad company. The State introduced evidence to show that the plant (that is the elevator building and machinery) had a rental value of $20,000 per annum, but there was no evidence as to the ownership of the property other than it was partly situated on the railroad's right-of-way. The State has assigned as error the failure of the court to credit the plaintiff with an annual rental in accordance with the value of the plant. There is not a scintilla of evidence in the record that would have justified the court in doing so. See the court's findings at page 38 of the opinion.

## VALUE OF PROPERTY.

The witnesses for the State and railroad company expressed conflicting views as to the proper method of division. The State contends that the property should be divided with reference to its use and that the use is represented by the ton miles rather than by the revenue. In settling this question the court will be guided by the general rules applicable to all classes of productive property and the rules of reason, rather than by the opinions of witnesses. It is not a matter to be determined by the opinions of experts, but rests on the application of sound reason and the results of experience in determining what is the proper factor upon which to estimate the value of property, whose value consists in its earning capacity. A railroad company like a storehouse or a manufacturing plant, has no intrinsic value aside from the return it is capable of producing in its operation. The earnings is the test universally applied, so far as we know, for the purpose of determining the value of that class of property. This is the view taken by Judge Hook in M. K. & T. Ry. Co. *v.* Love, 177 Fed. 497, and by Judge Sanborn in Shepard *v.* Northern Pacific Railway Co., 184 Fed. 765, 811:

"The issue is between the apportionment by use without regard to the worth or value of the use and apportionment according to the value of the use. The latter basis seems to be more logical and rational. Capitalization is founded on the worth of use, not on mere use. The value of property and investment in every form is measured by the value of its use, not by its use divorced from the value thereof."

The principle is nowhere better expressed than in the following statement by Judge Trieber in his opinion in this case:

"In estimating the value of property its net income, if not the most important, is certainly a very important factor. A building in New York City is valued much higher than a building exactly like it, and an erection of which cost the same price, situated in Little Rock. The reason therefor is that the income from its rentals is much higher in the former city than in the latter. So a building in Little Rock, or any other city, on its main business street, is of much greater value than if standing in the suburbs, although both buildings may be exactly alike, put to the same uses and cost the same. That the same rule should and does apply to railroads is shown by the market value of the stocks. While the share of a railroad whose earnings enable it to pay a 6 per cent dividend annually will command a premium on its face value, those of a railroad earning no dividends, and whose income is barely sufficient to earn the fixed charged are practically worthless, or will sell for a very low price, and that only on speculative grounds.

"Take two roads, one in a level country with practically no grades, inexpensive to maintain, and constructed by reason of these facts, at a low cost, while another road built in a mountainous, rocky country where it was necessary to do a great deal of expensive blasting of rock, building tunnels, with heavy grades and many curves. The latter road cost probably three or four times as much to build as the former, yet, ow[illegible] to the level grades, absence of sharp curves and more productive lands along its line, the earnings of the former are much greater than of the latter. Not only that, but owing to the grades, the one road can carry only half as many cars as the other; the consumption of fuel; added to these the greater outlay for wages to employees, cause expenses to be so great as to leave small net earnings for that road whose cost was greatest, while the net earnings of the other are sufficient to pay large dividends. Can there be any doubt that the value of the first will be much greater than the latter, and that its shares will sell for a much higher price? The value of every investment or property is measured, to a large extent at least, by

the value of its use, not by its use divorced from its value. The value of a railroad for taxation, it has been uniformly held by the courts, may properly be determined by the values of its bonds and stocks. Without citing the numerous cases decided by the courts, both State and National, approving this method of assessing railroad, telegraph and other property of this nature, the following may be referred to:

"State Railroad Tax Cases, 92 U. S. 575; Kentucky Railroad Tax Cases, 115 U. S. 321; Western Union Telegraph Co. *v.* Massachusetts, 125 U. S. 530; Pullman Company *v.* Pennsylvania, 141 U. S. 18; Columbus, Southern Railway Co. *v.* Wright, 151 U. S. 470; Pittsburg, etc., R. R. Co. *v.* Barkus, 154 U. S. 421; Adams Express Co. *v.* Ohio, 166 U. S., where the court said:

" 'Whatever property is worth for the purpose of income and sale, it is worth for the purpose of taxation.'

"And this is the rule sanctioned by the Supreme Court of Arkansas. Wells Fargo Express Co. *v.* Crawford County, 63 Ark. 576.

"This is evidently the rule recognized and acted on by the railroad assessing board of the State of Arkansas as shown by the evidence in this case. The main line of the Iron Mountain Railroad is practically a water level road; no mountains to cross, no rocks to blast or tunnels to excavate, and the leading commercial cities and industries of the State along its line. On the other hand, the White River Branch of that road was the most expensive road ever constructed in the State. Miles of it had to be cut out of rock and tunnels cut through rocky mountains; there are no large cities along its lines, and the country but sparsely settled; owing to the heavy grades and the many curves made necessary by the topography of the country, it can not possibly carry as many cars to a train and transport freight as economically as the main line. The State officials, charged by law with the duty of assessing the property, must have taken these facts into consideration when they assessed these railroads. The White River Branch, in spite of its great cost, was in 1907 valued by that board at $19,000 per mile, and assessed on the basis of 50 per cent of its value at $9,500.

while the main line was valued at $45,000 per mile, and assessed at 50 per cent of that sum at $22,500 per mile.

"For these reasons, the earning capacity of a railroad is the most important factor to be taken into consideration in determining its value. As shown above, it has been taken into consideration by the assessing officers of the State, and should be taken into consideration for the purpose of determining the apportionment of values in this case. If by reason of the higher rates allowed by the state tariff, the net earnings of the property are increased, the value of the property is correspondingly increased, and the assessment for taxation made accordingly." (See Opinion, pp. 46-49.)

"Capitalization is founded on the worth of use, not on mere use alone. The value of property, of investment in every form, is measured by the value of its use, not by its use divorced from the value thereof. Railroad rates are founded primarily on the worth of the use of the railroad machine by the various classes of freight and by the passengers, and not on the amount of the use only. In fact there is no proportioning or measuring relation between the various uses of property and its value when no regard is given to the values of the uses. On the other hand, the values of the uses of property, which its gross earnings substantially represent, present a natural and logical basis for apportioning its value to these uses." Love v. A., T. & S. F. Ry. Co., 185 Fed. 329.

"The value of property results from the use to which it is put and varies with the profitableness of that use." Postal Tel. Co. v. Adams, 155 U. S. 688, 697.

BLURRE

## DIVISION OF EXPENSE BETWEEN INTRASTATE AND INTERSTATE BUSINESS.

### REVENUE BASIS.

This question has been before the courts in a number of cases, and the great weight of authority is in support of the use of the gross earnings as a factor for dividing the expense of conducting traffic between the two classes of business. The question arose and was determined favorably to the revenue basis in Ames v. Union Pacific R. R., 64 Fed. 165, approved in Smythe v. Ames, 169 U. S. 466, C., M. & St. Paul R. R. Co. v. Tompkins, 176 U. S. 167, Nor. Pac. R. R. v. Keyes, 91 Fed. 47, 53, Arkansas Rate Cases, 163 Fed. 141, Buell v. C., M. & St. Paul R. R., Wisc. R. R. Comm. (1907), M., K. & T. R. R. Co. v. Love, 177 Fed. 493, Love v. A. T. & S. F. Ry. Co., 185 Fed. 329. The court is familiar with the rulings and it will not be necessary for us to review the cases in detail. Their weight and authority can not be impaired, or the cases brushed aside upon the ground that the question is one of fact, to be determined according to the evidence in each case, because the conditions affecting the question are general and prevail throughout the country. The same rule as to the relation of cost of service between state and interstate freight and passengers is bound to apply on different railroads and in different parts of the country. It is true that state rates differ, some being prescribed by state authority and others, where that authority has not been exercised, adopted by the railroads themselves, but in all cases and in

PAGES

all parts of the country and on all railroads conducting interstate traffic the interstate rates as a rule are based on the local rates to the extent that they do not and can not, unless perhaps in exceptional cases, exceed the combination of local rates. In view of the similarity of conditions applicable to all railroads in all parts of the country, the rule *stare decisis* might well be applied.

A large amount of testimony was taken on both sides as to the proper basis of division. Many railroad officials of large experience in the operation of railroads and the management of railroad traffic were introduced by plaintiffs. Mr. W. B. Doddridge, whose life had been spent in railroad operation, and who had been general manager of both the railroads involved in this litigation, including the Missouri-Pacific Railway System, testified:

"There is no unit or basis that I am aware of by which such a separation or apportionment can be made with mathematical accuracy. For the reason that all classes of traffic are carried in the same cars, intermingled, over the same rails, in the same trains, handled by the same employees, using the same terminals, a definite separation of common expenses is impossible.

"To be fair and equitable a unit must be used that will reflect all of the average conditions under which transportation is furnished and charge each ton mile or each passenger mile with its proper proportion of all the expenses.

"In the establishment of rates many elements are considered, such as the physical cost of service, the weight, the distance, the competitive conditions, the space occupied, the character of the service, and the value of the service to the shipper. It is, therefore, necessary to use an arbitrary unit.

"In my judgment the best method that has been suggested for this purpose is what is commonly known and called the gross-earnings basis.' That is, the gross earnings derived from each class of traffic for the given period, being accurately known, the total expense for the same period being accurately known, the expenses between state and interstate traffic may then be divided and apportioned upon the per cent each class of gross earnings bears to the whole.

"The aggregate of gross earnings is made up of thousands of small units, each of these units representing the amount received for the transportation of individual shipments. The sums charged for transportation bear some definite relation to the cost. These sums vary being governed by circumstances and conditions; such as weight, distance, classification, and the commercial conditions under which the transportation is furnished. I refer to competition and other like conditions, which enter into and influence the rates charged on many classes of commodities and traffic.

"For instance, the railroads charge a much higher rate on many articles where the value is large and liability great, than they do on other articles where the weight and bulk is similar, but they are of less value.

"There are a great many considerations of this character that enter into and influence railroads in determining the proper rates to be charged for transportation.

"The gross earnings reflect all of these conditions and by allotting the expenses in proportion to the amount which each shipment produces in the aggregate, seems to be the most reasonable and equitable method by which expenses can be apportioned between state and interstate traffic.

Q. "Does the difference in the value of the articles transported and the liability incurred enter to any extent into the difference in rates and affect the difference in cost?

A. Yes, sir; these things are always taken into consideration as one of the factors to be considered in the establishment of rates.

"However, there are many other considerations that also affect the establishment of rates; such as competitive conditions between producing sections and consuming markets.

"The following example illustrates the general theory which I have in mind:

"The interstate rates upon the products of the forest, which constitute a large proportion of the tonnage of Arkansas, to the consuming markets in other states are established mainly upon the value of the service to the shipper and to the consumer, based upon existing commercial conditions.

"The physical cost of transportation in individual cases being a secondary consideration, as a whole the traffic yields a profit either directly or indirectly.

"Changes in rates are necessary from time to time and would affect the allotment of expense as between state and interstate traffic to that extent, while it is not contended that the actual physical expense would be changed.

"Interstate rates frequently extend across several states and if below normal by comparison with other rates, for the reasons stated each state would bear its pro rata in the reduced expense thus allotted.

"Other interstate rates as compared to the total may be abnormally high, which would tend to equalize the condition in the example pointed out.

"Interstate rates into and out of Arkansas must be so adjusted as to enable its products to find markets in competition with other producing sections. This principle is essential to the prosperity of both State and the railroads. Intrastate traffic depends upon this condition being maintained.

"Trans-state traffic as a whole being carried on at a much lower cost than short haul traffic, low interstate rates applied to that class of traffic in some cases work no injus-

tice to the intrastate traffic in the apportionment of expenses as a whole.

"The gross earnings method of apportionment of expenses deals with all of the intrastate traffic as a single unit and with all of the interstate traffic as a single unit, upon a system of general averages, without reference to individual shipments or particular rates." (R. pp. 455, 456.)

Mr. Frank Nay, Comptroller of the Chicago, Rock Island & Pacific Railway Co. (R. 632); W. M. Whittenton, General Manager of the Chicago, Rock Island & Pacific Ry. (R. 757), and others testified to the same effect.

Mr. McPherson testified:

"The revenues of the railway are derived from different sources; the transportation of passengers and freight, and from miscellaneous services rendered; rentals, etc.

"A division of these earnings can be exactly ascertained and, naturally, they reflect the value to the railway of each class of the service it performs.

"The passenger and freight revenue consist of both intrastate and interstate traffic; the 'revenue basis' is reflective of the efforts of the traffic men who made the rates, to consider, in a measure, the value and character of commodities, and the risk and distance attached to their transportation. This is apparent in the classification of commodities into classes and the different rates established for their carriage.

"The revenue derived represents the well established and generally recognized elements considered in fixing rates of the railway for the service it performs. The rates on first class freight are higher than on second class, on second class higher than on third class, and so on through the general classification and established schedule of rates.

"Differentiation in the commodities and rates is recognized by the railways, by the public for whom the com-

modities are transported, and by all of the railway commissions.

"The revenue, therefore, expresses value, character, risk and distance rather than quantity; and likewise considers, to no little extent, the question of cost, as it is obvious that it costs more to transport some commodities, and commodities in small quantities, than it does other commodities, and commodities in larger quantities.

"A consideration, therefore, of cost on the mere basis of quantity, would mean the blending of all classes of freight; a reduction of all classes of freight to a common unit, and the assumption that the cost of their transportation was equal. Also that the length of haul and other conditions affecting the cost were equal or the same.

"For these reasons, in my opinion, the revenue basis is a proper basis on which to apportion the cost, or to divide the cost of operation as between intrastate and interstate traffic." (R. 320.)

## THE STATE DENIED THAT THERE WAS ANY RELATION BETWEEN THE RATES AND THE COST OF THE SERVICE, OR BETWEEN STATE AND INTERSTATE RATES, AND CONTENDED ON THOSE GROUNDS THAT THE REVENUE WAS NOT THE PROPER BASIS OF DIVISION.

It was shown that all freights are classified by committees representing groups of railroads for the purpose of grading commodities with reference to the various conditions and elements that enter into and affect their transportation; that the element of cost enters largely and is a dominating influence in the classification made by those committees; that the Western Clas-

sification prevails in the territory west of the Mississippi River and was used largely by the Arkansas Railroad Commission. The testimony of Mr. F. O. Becker, the chairman of the Western Classification Committee, was taken, and he testified at length as to the methods pursued by that committee in making its classification and showed that it was made with reference to the element of cost. That they considered the density, the value, the character of the risk with reference to susceptibility to damage, and the volume. (R. 738.)

J. D. Watson, Assistant General Freight Agent of the St. Louis Southwestern Railway, testified that the purpose of classifying the various articles that are transported by the railroad companies is to determine the rates, that the classification fixes the rate to be applied. He further testified that the value of the service is a dominating and controlling influence in fixing the price of transportation. He described in detail the manner in which the classification is used. (See R. 555.)

C. E. Perkins, the General Freight Agent of the St. Louis, Iron Mountain & Southern Railway, testified that the object of the classification is to assign to one of the classes the various articles which are offered to a railroad for transportation; with the thousands of different commodities, any one of which may be offered to a railroad for transportation, we must have some guide as to the rating which would be applied on each particular article. The commodities have been gathered together by the classifica-

tion committee after years of work, and have been assigned to one of the various classes prescribed in the classification. Upon these various classes or ratings we base our freight rates. The classification does not give the rate on commodities; it assigns each commodity to a class upon which we publish rates. They run from 1 to 5 and from A to E; the highest class articles are in the first class except in the cases where ratings are made double first and so on.

He also testified that railroads make commodity ratings to meet special conditions. They are not controlled by the Western Classification, but in making them the cost of the service is always regarded, as far as the circumstances will permit it to be done and where the conditions, growing out of competition for instance, are such that they are compelled to disregard the cost of service, they would not attempt to meet them. (R. 585 and 592 and following pages, where he treats the subject in great detail.) See also evidence of B. M. Flippen, the Freight Traffic Manager of the Missouri-Pacific System. (R. 239.)

## ZONES AND BLANKET RATES.

The State introduced exhibits 38-42, showing certain zones in which blanket rates were applied, and contend that the blanket rates within territory covered by the zones are inconsistent with the testimony of our witnesses. The reason and necessity for the establishment of blanket rates in zone territory, and especially in the Texas lumber adjustment, which covers a large territory and about which a good deal is said, was shown in the testimony of traffic

men introduced by plaintiffs. Mr. Perkins, at page 595, gave a history of the condition that led to the blanket rates on lumber in southern territory. He showed that the lumber traffic moved in very large quantities and long distances, affording long hauls, that the cars that carried the lumber north as a rule returned loaded with other commodities, and thus gave a steady movement to commodities in large quantities and steady employment to the motive power, enabling them to load their trains to the maximum carrying capacity in all cases and furnishing tonnage on a wholesale basis. He and other witnesses also testified that in view of the volume of traffic and the reciprocal movement growing out of it, the length of the haul and other incidents of the large lumber traffic from the Southwest, the railroads could afford to make low rates and realize a reasonable profit on the business; that while the rates might appear to be low from that part of the zone territory farthest removed from the market and high on the opposite side, these discrepancies were neutralized and the rates fairly equalized throughout the entire territory, and the revenue accruing from that business fairly represented the cost of the service.

The testimony shows that commercial necessity, for the protection of trade centers in various parts of the country, have rendered it necessary to establish zones within which similar rates are applied both in producing and consuming territory. Pittsburg and the surrounding country constitutes a zone, as does Chicago, Kansas City and various

commercial centers, with the adjacent territory, to and from which freight is transported at what is termed blanket rates; that is, a similar rate prevails within the territory embraced in a given zone. The rates are based on the rating from the common point, or commercial center of the zone, and on freight transported from the various sections into Arkansas the rates are fixed on differentials, taking Memphis and St. Louis as the basing points, and are on a uniform scale. The traffic men testified that such an arrangement was necessary on account of competition between different lines and for commercial reasons, that is to protect commercial centers. It is an evolution of trade and commerce. The testimony on the subject is too voluminous to be referred to in detail within the limits of a brief.

The same conditions growing out of the zones and blanket rates obtained in state traffic under the state commission rates. Blanket rates are applied by the State Commission in numerous cases; as, for instance, to coal from Coal Hill and all points west of there in the State of Arkansas, to Little Rock and to all points north and south of that place. Coal Hill is about one-half the distance from Little Rock to the western coal fields of the State.

We refer more in detail to this subject infra page 100.

C. S. Ludlam, a witness for the State, referred to Texas tariff 1-DD, which he testified covered 2,600 stations in Texas and represents a movement that may vary as much as four hundred miles in the length of haul, in which he says

the classification is disregarded. Mr. Perkins, referring to that condition, testified that the Western Classification governs in Texas traffic as well as all other traffic west of the Mississippi River; that there are exceptions to the classification applicable on Texas interstate traffic which change to some extent the rating or minimum weights as the case may be.

"While I do not feel that the zone basis of rates mentioned detracts to any great extent from the statements already made with respect to the cost of service, that element being present in a somewhat modified form, it is true that this basis is used only where commercial conditions fix it, or in cases where the mileage is great and the zone rate will yield approximately the same rate per ton per mile on account of the length of the haul. Our general basis of rates is to a large extent on a mileage scale, that is, the rates increase with the mileage, the increment being smaller as the distance increases. Our rates, as an example, from St. Louis to Arkansas, are 70 cents per 100 pounds, on first class, at Moark, the first station in Arkansas, and grade up as the distance increases to $1.22 on first class at Fulton, in Southern Arkansas. This is also true in Louisiana, the rate to Jones Spur, the first station, being $1.15 on first class and grading up to $1.37 at Fenton, in the southern portion of the State." (R. 1623-4.)

For the purpose of further showing that the Western Classification was disregarded in the application of rates from St. Louis to Texas, Mr. Ludlam cited a number of instances in which he claimed that higher rates were applied to low class articles than to those of a higher class, comparing such articles as beer in glass and bar iron, excelsior and potatoes, hollow building tile with pig iron, etc. Mr.

Perkins in rebuttal reviewed this testimony and explained in every instance the ground upon which the apparent inconsistency in the application of the rates existed.

He showed that a low rate had to be applied to beer on account of large breweries located at various points in Texas, which necessitated a lower rate on that commodity in order to prevent the exclusion of beer from other states. He further stated that the rate on bar iron represented a fair and reasonable rate, and that they were obliged, on account of the conditions referred to, to accept a lower rate on beer. He then went through the entire list of commodities mentioned by Mr. Ludlam, there being some eighteen or twenty of them, and showed similar and exceptional conditions in each case, accounting for the apparent disregard of the classification in fixing the rates on those articles. For instance, excelsior, which he says is more or less a paper adjustment and is a very cheap commodity manufactured in the South; potatoes, which represent a relatively large movement and are a necessity of life, which, regardless of their perishable nature, will not stand as high a rate as horseshoes, with which Mr. Ludlam compares them. Pipe iron coils for refrigerating machines were compared by Mr. Ludlam with bar iron. Mr. Perkins explains that if the railroad company was not limited by factors beyond its control the rate on the iron pipe would undoubtedly be higher than the rate on bar iron, but the Texas Commission, on account of pipe being manufactured at the penitentiary at Rusk, in that State, established an ex-extremely low rate in the State, which forced correspond-

ingly low rates from interstate points. This fact, he said, only emphasizes what has been said with respect to the effect of state rates upon interstate rates. He reviewed all of the exceptional rates mentioned by Mr. Ludlam, and further testified that the tariff from which Mr. Ludlam testified covered practically all the articles which can be shipped—thousands of them in number; that it is governed by the Western Classification, a copy of which was in evidence, except where exceptional conditions made it impracticable to apply the classification. (R. 1625, 1626 and 1627.)

See also evidence of J. D. Watson, Record 1674.

One of the most intelligent witnesses introduced by the State, and the only man of any practical experience in railroad traffic, was Mr. J. C. Lincoln, manager of the St. Louis Traffic Bureau. He first stated that the cost of service is not the factor that controls in making rates, but on cross examination he testified:

"The results of operation necessarily as to the revenue would have to have some regard to the cost of service or you would go into the hands of a receiver. If the railroads disregarded it and handled its business without regard to the cost of service, it would either have to get a receiver or rules in that respect that all other industrial institutions are they ought to be The Western Classification Committee considered a great many things in the development of proper rating, the cost, the risk, the density and the volume of traffic. They take into consideration the cost of handling those different commodities. Their classification is the best prepared document of the relations that should exist between different commodities. The classification shows the rela-

tion that should exist, not the rates. Railroad statistics are kept as an index to the business handled by your railroad, the operating cost of service, cost of handling business over certain divisions." (R. 980.)

These statements clearly bear out the evidence of traffic officials of the railroads. They have before them the information referred to by Mr. Lincoln, and naturally they use that information and apply it in adjusting rates.

## RELATION BETWEEN INTRASTATE AND INTERSTATE RATES.

Counsel in their argument at the hearing of these cases in the court below commented at some length on the effect of the testimony in regard to rates from St. Louis to Texas common points upon the question as to the relation between state and interstate rates, contending that there could be no parity under the conditions disclosed. But in truth the record shows that the same conditions existed under the state commission rates. An examination of their schedules will show a blanket rate on coal from Coal Hill and all points west of there in the State of Arkansas to all points north and south of Little Rock, embracing a territory of hundreds of miles. Coal is the largest commodity moved under the commission rates, and the conditions in regard to the rates are in all respects analogous to that shown by the testimony and exhibits of the State referred to. Under the commission tariff sugar carires a flat rate of 13c for 200 miles and everything in excess of that. So it is with regard to rice. Rough material has blanket rates from one to 50 miles, from 50 to 100 miles, from 100 to 150 miles, and from 151 to 250 miles. The rates operate in the same way in regard to the state traffic that the blanket rates do in the zones shown on the exhibits referred to. The Texas zone is quite large; that relating to lumber covers 500 miles, but a comparison of those distances with the average haul in the State of 72 miles with a blanket rate of 25 miles, 50 miles, 100 miles and so on will disclose some pretty close

analogies running through them. On cotton in the state movement there is a maximum rate of 40c on all hauls 150 miles. Cotton seed hulls, coke, coal slack, cord wood, all have the same rate under the state tariff for from one to 50 miles; flour in carloads from 90 to 150 miles; rice from 100 to 150 miles; iron, wire, nails, from 25 to 75 miles; rails and fastenings from 60 to 100 miles; live stock from 180 to 250 miles. Packing house products take the same rate for the first 35 miles in carloads; in less than carloads the same from 35 to 75 miles. These are all important commodities, and are only referred to as representative of the entire rate situation under the State's schedules in regard to blanket rates, as will be seen by an examination of the distance tariff, copies of which are filed for the use of the court.

It can not be maintained, therefore, that there is any ground upon which a distinction between state and interstate rates can be made on account of the creation of zones and the application to them of blanket rates.

In this same connection it was shown in evidence by the State that a different revenue is reecived on the same commodities shipped across the State of Arkansas from points north or east into Texas. The same condition exists in the state traffic under the joint tariff. To illustrate: Take a shipment from Hope to Camden by the Iron Mountain Railroad, a distance of 65 miles. The Iron Mountain receives 38 cents on first class, 34 cents on second class, 30 cents on third class, and 25 cents on fourth class. Now, on a shipment

from Hope to a point on the St. Louis Southwestern Railway, 65 miles beyond Camden, making 130 miles—just double the distance from Hope to Camden—the Iron Mountain will get for its part of the shipment 32.5 cents on first class, on second class 28 cents, on third class 24 cents, and fourth class 20 cents. The inequality in the revenue from the same commodities referred to in the testimony of the State's witnesses grows out of the fact that it is handled by connecting lines. It is a joint haul, and the example shows that a similar condition prevails in the state traffic, where there is a joint haul over connecting lines.

T. A. Hamilton, a witness for the State, for the purpose of showing inequality between state and interstate rates, filed an exhibit marked "L-1," containing a comparison of the rates on that part of a haul from St. Louis to various stations in Arkansas which is wholly within the State with the Commission rates between the same stations. For instance, the first sheet of the exhibit shows the haul from St. Louis, Mo., to stations in Arkansas beginning at Moark and running to Peach Orchard, and compares that with the distance tariff of the Arkansas Railroad Commission, which contains graduated rates between the two points. The distance from Moark to Peach Orchard is 17 miles. The distance from St. Louis to Moark is 186 miles and from St. Louis to Peach Orchard 202 miles. There are three intervening stations, distant from St. Louis, respectively, 192, 195 and 198 miles. The rate from St. Louis to these five stations in Arkansas is the same.

There is no testimony in this case with which the facts illustrated by the exhibit conflict. Our traffic men have testified throughout the case that you can not make a comparison of a long distance interstate haul with a state haul in that way. They are bound to vary. It results necessarily from the effect of the long and short haul on rates. The stations referred to illustrate the effect of the exhibit throughout. The second sheet contains a comparison between shipments from St. Louis to stations in Arkansas beginning at Joly and going to Wynne, that is a distance of 80 miles. It compares the state rate from the state line with the portion of the interstate rate from St. Louis that is located in Arkansas. It is an attempt to compare the rate charged on a haul from 200 to 280 miles with a haul of 80 miles within the limits of the State.

Exhibits "C-1" and "D-1" are intended to show that the testimony of the railroad's traffic men to the effect that the interstate rates on the St. Louis, Iron Mountain & Southern Railway from St. Louis and Memphis are influenced by the State Commission's rates is incorrect. Exhibit "C-1" shows that the interstate rate from Memphis to Gum Springs, a station situated on the St. Louis, Iron Mountain & Southern Railway, 70 miles south of Little Rock, runs level from Little Rock to Gum Springs, while a graduated rate to all stations between Little Rock and Gum Springs is applied by the State Commission. Exhibit "D-1" shows the same conditions from St. Louis, and covers the same territory south from Little Rock. The following extract

from the testimony of Mr. Perkins, the general freight agent of the St. Louis, Iron Mountain & Southern Railway, will explain the conditions developed by these exhibits. He said:

"From a casual glance at the exhibit ('C-1') mentioned, it would not appear that there was any relation whatever as between the state and interstate adjustment. As a matter of fact, however, our rates from Memphis to all points in Arkansas were made by using three factors, one of which was the Arkansas Commission's local rates.

"At the time these rates were in effect the St. Louis, Iron Mountain & Southern had an agreement with the city of Memphis as to the rates which we would carry from that point to Arkansas as compared with rates in effect locally in Arkansas. That agreement provided that to points in Arkansas on the main line and branches south and west of Little Rock, except Fort Smith, Van Buren, the Greenwood Branch and the K. & A. V. Division, rates from Memphis would be published the same number of cents per hundred pounds higher than the local state rates from Little Rock to destination, as the rate from St. Louis was higher than the rate from Memphis to Little Rock, or the following figures in cents per hundred pounds." (R. 1628.)

Then follow the figures in cents per hundred pounds. That differential is 30 cents on first class, 25 cents on second class, 20 cents on third class, etc., between St. Louis and Memphis. He says:

"With the further provision that the rates from Memphis to Little Rock would apply as minimum figures."

The point is just this: The rates from Memphis to Little Rock were applied in those cases because of that provision in regard to the minimum.

Mr. Perkins further says:

"To illustrate this basis we will check the adjustment at Gum Springs, 70 miles south of Little Rock (that is one point mentioned in the exhibit).

"The first class rate under the Commission's tariff is 40 cents, adding the differential (between Memphis and St. Louis rates) for first class mentioned, namely, 30 cents, produces the rate as shown in the chart, or 70 cents.

"Second Class—The rate from Little Rock is 35 cents plus second class differential of 25 cents, or through rate of 60 cents.

"Third Class—Local rate from Little Rock is 31 cents, plus differential of 20 cents, or 51 cents, and so on down through the entire list.

"In cases where the interstate rates are shown to be the same to the points mentioned in the chart the Memphis to Little Rock rate has been applied as a minimum, these minimum figures applying only to the stations directly south and west of Little Rock, which it will be seen were selected by the State to disprove our basis. Gum Springs is the most southerly point to which it applies. That is the most southerly point at which any of the rates apply on that basis. All of the rates are not blanketed even as far as Gum Springs." (R. 1629.)

That chart covers a distance of 148 miles from Asylum, but the real point of difference is from Little Rock to Gum Springs. The rate from Memphis to Little Rock plus the differential is the maximum that could be charged on those shipments, because that is the charge which in the agreement between the Iron Mountain Railroad and the city of Memphis was to control as a minimum charge and they can not go above that. For that reason that rate will apply to Little Rock and all the way down to Gum Springs

and that holds the rate level from Little Rock to Gum Springs. They are comparing it there with rates for the same distance, but the territory that really is covered by that is the territory from Little Rock to Gum Springs on the Iron Mountain Railroad. It was caused under the arrangement that they could not charge a greater rate from Memphis to that point than the Memphis rate to Little Rock plus the differential.

On November 9, 1908, some two months after the injunctions in these cases were issued, the railroad companies put in a new tariff of rates on commodities transported within the limits of the State. They also began immediately to readjust their interstate rates to conform to the change in the State's tariff. Mr. Flippen, the Traffic Manager of the Iron Mountain Railway, and the traffic officials of the St. Louis Southwestern Railway, testified that they began, immediately after the November state tariff was put in, to readjust interstate rates, but considerable time elapsed before the effective date of the readjustment, on account of the difficulties of the compilation, the delay in publication, the checking of proof, and the notice required by the rules of the Interstate Commerce Commission; also negotiations with connecting carriers for their concurrence in the changes. (R. 238.) This witness and Mr. Watson and Mr. Bragg, all testified that the change in interstate rates was necessary in order to preserve the parity between the state and interstate rates. Mr. Flippen further testified that the increase in the interstate rates was from 15 to 20 per cent;

that they could not be advanced proportionately with the state rates because the adjustment of the interstate rates, by reason of recent increases, was relatively higher than the rates within the State for equal commercial conditions and service. He and Mr. Bragg also testified that the railroads were forced to increase their rates in February, 1907, and again in September, 1908; that these increases in the interstate rates rendered a larger increase than that mentioned by Mr. Flippen in the state rates unnecessary. (R. 263 and 840.)

The State sought to impeach the correctness of this evidence by exhibits "G" and "A," filed at their request by Mr. Kimbell, Assistant Auditor of the St. Louis Southwestern Railway.

Exhibit "G" showed an increase of 96.01 per cent in the intrastate revenue in January, 1909, as compared with the last six months of 1907. Exhibit "A" showed an increase in revenue per ton per mile during the same periods of 96 per cent in state business and between 9 and 10 per cent in interstate business. These exhibits were filed on the theory that the increased revenue was based on the increase in rates, which was incorrect. Mr. Kimbell explained in his evidence at the time that the variation in revenue did not follow variation in rates, but grew largely out of the shifting of commodities carried at different times and changes in conditions affecting traffic, rates being only one of the factors. Exhibit 58 filed by him shows that the increase in revenue in January, 1909, on the application of

the rates in force in the latter half of 1907 to the intrastate business of 1909, would have been 48.18 per cent. This exhibit is accompanied by the following explanatory note:

"Exhibit 'G,' filed at the request of Judge Hill, assumed an increase of 96.1 per cent in the intrastate freight revenue for six months ending December 31, 1907, based on that percentage of increase in the average intrastate revenue per ton per mile, for January, 1909, over a like average for the six months named."

"Testimony has heretofore been given in this case to show that an increase in the average revenue per ton per mile is not absolute evidence of an increase in the rates; that this average could change materially, due to shifting in the character of tonnage handled, without any change whatever in the rates, and that there was a material change in the character of tonnage handled in January, 1909, as compared with the six months ending December 31, 1907.

"The correct way to determine the percentage of increase in revenue for the six months ending December 31, 1907, had the rates in effect in January, 1909, been in effect during those six months, would be to apply the latter rates to the actual movement for the six months' period and figure the increase in the revenue so obtained over the actual revenue.

"On account of the magnitude of the task this has not been done. However, under the order of this court this company is keeping a record of amounts collected under the current freight and passenger tariffs, pending a decision in this case, and by applying the inhibited rates to the actual movement for each month, we are able to arrive at the actual revenue increase and the percentage of increase under the current over the inhibted rates.

"It will be noted that for the month of January, 1909, the percentage of increase is 48.18 per cent, or about one-half the percentage which Judge Hill requested exhibit 'G' be based upon. Even this percentage is, no doubt, greater than the percentage would be, based on an application of

the railroad rates, to the actual movement for the six months ending December 31, 1907." (R. 2078.)

A similar exhibit for the Iron Mountain Railroad was filed by Mr. Johnson. (See exhibit 54 and his evidence.) (R. 2000, 2001.)

In this connection Mr. Kimbell testified:

"Since this question was raised by Judge Hill a few weeks ago I have investigated in a general way the character of the principal commodities handled during the two periods referred to and find these important changes in the commodity movement, which would under any set of rates have the effect of increasing the average revenue per ton per mile:

"Coal, a low rate commodity, constitutes 5.5 per cent of the total state movement for the six months ending December 31, 1907, and but 1.02 per cent for January, 1909.

"Forest product material, another low rate commodity, constitutes 29.40 per cent for the six months ending December 31, 1907, and but 13.96 per cent for January, 1909.

"Now, on the other hand, the following important commodities which are rated higher than coal and forest product material show a proportionate increase in volume handled as follows:

"Grain and grain products for the six months, 3.87 per cent, and for January, 1909, 5.86 per cent.

"Hay, for the six months' period, 13.30 per cent, and for January, 1909, 18.56 per cent.

"Cotton seed products for the six months' period, 5.58 per cent, and for January, 1909, 15.67 per cent.

"This marked shifting in the character of tonnage handled would in itself make a radical change in the average revenue per ton per mile, even though there was no

change in the rates, and in my opinion accounts in a large measure for the difference in the averages of state business during the two periods.

"The length of haul of the differently rated classes and commodities is also an important factor to be considered in a comparison of this kind.

"Exhibit 35, which covers the six months' period, shows an average haul of 43 miles for state freight and 232 miles for interstate freight.

"Exhibit 'A,' which covers the month of January, 1909, shows an average haul of 41 miles for state and 222 miles for interstate freight.

"It is a recognized fact that as the haul increases the average revenue per ton per mile decreases. It is, therefore, to my mind, misleading to make a comparison of the average revenue per ton per mile for one period with another unless the character of tonnage carried and the haul for each kind of tonnage is identical." (R. 942, 943.)

The rate of increase in the interstate rates is explained by the testimony of Mr. Flippen and other witnesses referred to. It must be borne in mind that this comparison was made between January, immediately after the voluntary railroad rate had gone into effect, and before the adjustment of interstate rates could have been made effective. It was just beginning at that time. The delay was unavoidable, and is explained by Mr. Flippen in his testimony cited above, and it is apparent that the raise in interstate rates in February and September preceding the increase in the state rates, rendered a larger increase in interstate rates after the change had been made in the state rates unnecessary.

Mr. Kimbell was requested to file an exhibit based upon a hypothetical statement of earnings from state and interstate business and the total cost of producing a given revenue. He was asked to calculate the amount of expense chargeable to state and interstate business, respectively, on the revenue theory, on the assumed earnings, and then to further assume that the intrastate rates are increased 33⅓ per cent without any increase in the interstate rates, and make the same calculation showing the amount of expense that would be chargeable to each class of business under the latter assumption. He did so, and filed the example as exhibit 23. The State sought to show by this that the revenue theory of division was impracticable because of the effect that would be produced by a change in one class of rates without a corresponding change in the other.

Such an example is not entitled to any force unless it is found to represent conditions that do or may exist. A number of witnesses were examined on that subject. Mr. Nay, an old accountant and traffic man, Mr. Kimbell and others all testified that such a condition was impossible, because it is contrary to all the principles upon which state and interstate rates are constructed. (See the evidence of R. E. Kimbell, R. 236; Nay, R. 656.) The State did not produce a single witness to the contrary, nor show a solitary instance, except their attempt to show a large increase in the ratio of intrastate over interstate earnings by a comparison of the revenues accruing between the six months ending December 31, 1907, and January, 1909,

growing out of the change in the intrastate rates following the granting of the injunctions in these cases; the explanation made by the traffic men not only destroys all the force of the illustration for that purpose, but supports the testimony of Nay, Kimbell, Johnson and others as to the practice in preserving parity of rates and the impracticability of a radical increase in state rates without a corresponding change in interstate rates.

But the most convincing evidence in the record on this point is certain tables prepared and filed by Hubert Roth, as a part of his testimony, containing a comparison between the percentage of the total revenue accruing from the handling of commodities and the percentage of total ton miles. Mr. Roth is clerk to the General Auditor of the Iron Mountain Railway. He is an expert accountant and statistician. The various commodities are graded in six groups according to character, loading, risk, damage, etc., the first group consists of that class of commodities which bears the highest rate. The second is the next lower grade and so on down through the six groups. The description of the groups gives sufficient information as to the classes of commodities upon which they are based. For instance, group one consists entirely of less than carload merchandise, which is the most expensive class of freight that is handled by the railroads. Group 2 represents carload commodities the loading of which is, on the average, light; many of them have the same characteristics of less than carloads, making them liable to loss, damage and subject to extra handling

Group 3 represents commodities generally carried in light loads and on which the risk from loss and damage is less and which require no handling. It consists of hay, packing house products, etc. Group 4 represents the medium grade commodities, with little, if any, risk from loss and damage, such as salt, brick, lime, etc. Group 5 consist of lower grade commodities carried in heavy loads with little, if any, risk from loss and damage, consisting of lumber, brick, salt, lime and cement.

Group 6 represents the lowest grade commodities and the cheapest to handle, cars loaded to full capacity, several cars usually moving together and at times in train loads It includes coal, ore, sand, stone and gravel.

The following table, based upon the aforesaid grouping, shows the percentages of tons one mile and revenue on the Missouri Pacific System and Iron Mountain Railway in the State of Arkansas for the calendar year, 1909. Mr. Roth stated that he was unable to make the comparison between the intrastate traffic on the Iron Mountain in the State of Arkansas with the interstate traffic in the State or on the Iron Mountain system, because he did not have the figures and could not obtain them without a very great deal of labor. He was, however, able to obtain the percents of tonnage and revenue on the Missouri-Pacific System and also within the State of Arkansas. We do not regard the fact that the Missouri-Pacific System, which includes the St. Louis, Iron Mountain & Southern Railway, is used as material in determining the difference in expense

of handling, and that is what creates the difference between the commodities as they are grouped. It is as fair to take the entire line as the Iron Mountain alone for the purpose of comparison, because the same conditions precisely, in regard to the effect of classification, apply to the one as to the other. It would be the same with the Great Northern or any other system of roads, for it is a general and broad proposition that the cost of handling commodities is influenced more largely by this classification of carload and less than carload than by any other consideration, and you have the same relation between carload and less than carload, whether the traffic is dense or light. It is a matter of relation. Relatively speaking, the Pennsylvania Railroad has the same difference between carload and less than carload in the cost of handling. For instance, it will be conceded that the same conditions exist as between brick and stone and basket and fragile glassware on the Missouri-Pacific System as on the Iron Mountain. Such conditions exist everywhere. They are general, underlying conditions that apply on every railroad.

*Percentage of Tons One Mile.*
Calendar Year, 1909.

| | Mo. Pac. & I. M. & S. System. | | Arkansas Intrastate. | |
|---|---|---|---|---|
| | Tons 1 Mile. | Revenue. | Tons 1 Mile. | Revenue. |
| No. 1..... | 4.61 | 19.12 | 6.02 | 27.65 |
| No. 2..... | 16.20 | 21.12 | 4.19 | 5.79 |
| No. 3..... | 4.24 | 4.92 | 1.04 | 1.79 |
| No. 4..... | 14.77 | 12.53 | 10.52 | 12.27 |
| No. 5..... | 35.80 | 25.94 | 47.98 | 37.94 |
| No. 6..... | 24.38 | 16.37 | 30.25 | 14.58 |
| | 100.00 | 100.00 | 100.00 | 100.00 |

The table shows (1) that the proportion of the revenue per ton mile diminishes in proportion as the grade of the commodities embraced in the different groups is lower, as it should do according to the testimony of the railroad traffic men. The reason is that it costs more to move and handle the commodities embraced in the higher than in the lower groups. It shows how evenly the revenue derived from the rates applied to the classification of the Western Classification Committee runs with the classification made by that committee. (2) It shows that the same relation that exists on the Missouri-Pacific System as between ton miles and revenue is found in the intrastate movement in the State of Arkansas. The difference on the interstate traffic is greater. That is accounted for by the difference in the length of the haul. The average haul on the Missouri-Pacific System is very much longer than on the intrastate haul in Arkansas. (3) It further shows a parity between intrastate and interstate rates by the relation shown between the ton miles of the several groups of commodities handled and the revenue derived therefrom as between the Missouri-Pacific System and the Arkansas intrastate business. The ratios between the ton miles and revenue accruing therefrom are preserved to a large extent as between the two classes of business. It is particularly observable that the higher grade commodities yield the higher revenue in both state and interstate traffic. (See the evidence of Mr. Roth, Record 1977.)

In connection with the above is another table which gives all the principal commodities transported, and devel-

ops facts that are very significant in this connection. Grain, for instance, is 13.43 per cent of the total tons one mile. The revenue produced from that commodity on the Missouri-Pacific System is 11.15 per cent. Lumber is 29.94 per cent in tonnage and 21.14 in revenue. Cotton, which it is shown is much more expensive to handle than grain or lumber, which are among the lower grade commodities, is 1.03 per cent in tonnage and 2.43 per cent in revenue. Merchandise, which is the highest grade in point of cost of handling, is 4.61 per cent of tonnage and 19.12 per cent in revenue. (R. 1979.) These differences in the relation of tonnage to revenue grow out of the difference in cost of handling the several commodities, and we submit demonstrates the correctness of our contention that there is a relation between the cost of performing the service incident to the different commodities and the rates that are paid for the service. The result is reflected in the comparisons contained in the tables. Many other commodities are included in the last table referred to, but those we have mentioned are sufficient to show their effect. The comparison is based on statistics for the year 1909, because those for the year 1907 were not accessible, but the effect is the same without regard to the period of time covered by the comparison.

The court used various bases of dividing expenses between the two classes of traffic. The result of the findings on the bases adopted by the court was, however, practically the same as if our views had been followed. The appel-

lants having themselves propounded many of the theories upon which the court acted in making the division and determining the expense of intrastate business, are not in an attitude to question its correctness. If it is erroneous it is invited error, and they are within the rule which precludes a party from taking advantage of an error induced by his own action. Elevated Railroad Co. v. National Bank, 135 U. S. 432; Water Works Co. v. Barret, 103 U. S. 516; Railroad Company v. Estill, 147 U. S. 591.

On the other hand, if this court should find error in the views by which the circuit court was guided and should take the view that the revenue was the proper unit of division of expenses between the two classes of business, then we submit that the decree should be affirmed on the showing made by the railroad companies, under the rule that a judgment will not be reversed on the ground that it was based upon a wrong view if it can be sustained and affirmed by the application of correct rules.

"A just judgment, which is warranted by the record and facts, will not be reversed because it was based on a wrong reason." Smiley v. Barker, 83 F. 684, affirmed in 169 U. S. 736.

## THE STATE'S BASIS IS AN ARTIFICIAL BLENDING OF ENGINE MILES, CAR MILES, TRAIN MILES AND TON MILES. IT IS BASED ON ARBITRARY ASSUMPTIONS THAT ARE INCAPABLE OF PROOF AND FOREIGN TO ALL KNOWN RULES AND PRACTICE IN RAILROAD OPERATION OR ACCOUNTING.

The State filed certain exhibits containings formulas for dividing the expense of conducting traffic between state and interstate business.

They accept as correct the railroads' assignment of the amount of expense properly chargeable to the State of Arkansas, except the expense at Memphis and at Fort Smith, and the items of legal expense already mentioned; they also accept the amounts reported under the various operating expense accounts prescribed by the Interstate Commerce Commission and the division of those expenses between the freight and passenger traffic.

They first assume that it is competent to divide the expense of operating local and through freight trains, and when they have done that and ascertained the relative cost of those two classes of trains, they attempt to ascertain the amount of state and interstate freight carried on each class of trains and divide the train cost between state and interstate on the basis of the relative amount of ton miles of each class of freight on each class of trains.

This is an outline in short of the mode they have adopted.

One of the prime and unanswerable objections to their scheme is that it is impracticable, as the railroad operating men have testified in this case, to make the division between trains on the basis attempted by the State.

If that could be done, another difficulty is met right at the threshhold; that is, that it is necessary to ascertain how much freight was carried on local trains, and how much on through trains, in the six months in controversy, before they could make an apportionment between state and interstate business.

Recognizing the necessity, they attempted to do it in this way: They took the month of October, 1907, and an exhibit made by Mr. Johnson at the request of the State and filed in this case as exhibit 26, that contained, among other things, a statement of the tonnage and ton miles taken into the auditor's revenue accounts in the month of October, 1907. It did not separate it between local and through trains, but contained simply the aggregate amount of freight carried in the accounts for that month.

They next obtained what is called the wheel reports of all local trains—not of the through trains, but only the local trains—that operated in the State during that month.

The wheel report is the record kept by the conductor as he goes along from station to station, of the cars he picks up; he gives the car numbers and where picked up and where left off, and all that sort of thing. It is intended to be a sort of rough history of the cars handled on the train,

and may be taken to be reasonably correct. Of course, they may contain mistakes, and we think they do. They contain also the loading of the cars among other things.

Then they got the waybills covering all shipments that moved on local trains during the month. That gave them pretty correct information as to the movement of freight on local trains in the State in the month of October, 1907.

When they had gotten that together (and it took them four or five months to work up the one month, which gives an idea of the magnitude of the task), they wanted to know what the movement on the through trains was. To ascertain that they simply deducted the amount they found was carried on local trains from the total shown on exhibit 26. They said, that is the freight that was carried on the through trains.

Now it is important right here to pause and see to what extent the information contained in exhibit 26 should be relied upon for that purpose, because upon that depends everything so far as the attempted division by the State is concerned.

The total freight taken into the accounts in that month, as shown in exhibit 26, does not represent the actual movement of freight on trains in the State of Arkansas during the month.

The accounts of the railroad company do not and could not have shown how much freight was handled on trains, local and through, in the State of Arkansas in the month of

October, and the company's accountants could not obtain that information without devoting the same relative amount of time to the investigation for each of the six months, as the State gave to the investigation of the local trains for one month, and then as much more as would have been necessary to work out the very much larger proportion of freight carried on through trains, for the same period, in the manner the State worked it out as to the local trains for one month.

It could not be ascertained, because no account is kept of such matters.

The Iron Mountain Railroad is a part of a large system which operates in eight States. The accounts from which exhibit 26 was compiled are made up in this way:

(1) Freight originating on the Missouri-Pacific System lines and destined to points on that system, including the Iron Mountain Railway, is taken into account as of the date it is received at the station where it is taken in charge by the railroad company.

Now, freight received in Kansas or Colorado, or Nebraska, in the month of September, or in the month of August, might be, and the testimony of Mr. Nay and others shows is frequently delayed, just the natural delays incident to rail transportation might cause that freight to move in or through Arkansas in October, and yet it would be entered in the auditor's accounts of September or August, the month in which it was received by the railroad company

at a distant station in another State, and not be taken into account in the month of October, or represented in exhibit 26 in this case.

(2) All freight which is received on the Missouri-Pacific System lines and billed to points on other lines of railroad, is taken into account in the same manner; that is to say, at the time it is received for shipment.

Suppose a shipment should be received in Kansas or Nebraska or Missouri, destined to a point in Arkansas or Louisiana, off the line of the Missouri-Pacific System, and that occurs every day. It goes into the auditor's accounts as of the date it is received at the station where it originates. For instance, if it is received at Pueblo in September, it goes into the accounts of the auditor as of that date, regardless of when it moved in Arkansas, or when it arrived at destination, and necessarily so, for the tonnage and revenue must be handled in a uniform manner, and it is impossible to divide the revenue from each shipment between months on the basis of its movement in trains over approximately seven thousand miles of road. In order to know whether a shipment that moved over the line in Arkansas in October entered into the accounts, you would have to trace it back and see if it was received in October. If it was received in September or some other previous month, it would not enter into the accounts for October.

Or, take it the other way. It might be received in October and not move until a later period, a later month.

(3) There is another kind of business called "Interline received;" that is, freight received from other lines. That is taken into account at the time it is reported at destination. If a shipment is made from Chicago to a point on the Missouri-Pacific System, say Kansas City or Little Rock, it gets into the auditor's account at the time it is received at destination.

Another class of business handled by the railroad company is what is called "Interline Through" business, originating, say at Chicago, destinated to Galveston or San Francisco via the Missouri Pacific Iron Mountain lines, the Iron Mountain being merely an intermediate carrier. This class of business is taken into account when reported by the agent at final destination; in other words, when reported by the agent at Galveston or San Francisco; all of these classes representing more than three hundred and fifty thousand separate and distinct consignments per month.

Thus, it will be seen what wide scope for error the taking of this account as representative of a month's physical movement affords, when it is borne in mind that 51 per cent of the ton mileage in Arkansas is trans-state freight, and not more than 11 per cent of the total ton miles, according to the State's figures, is carried on local trains. There might be large quantities of freight moved in October which would not reach Texas or California or Louisiana or Arizona, or freight that originated in those States that did not reach Nebraska, Missouri, or the States north, until November or December. None of that movement got into exhibit 26.

They did get the actual movement of the local trains, but did not in any manner get the movement of the through trains, and that is nearly all interstate freight. So there is a large amount of interstate freight that is left off on this through train movement, because it moves on the through trains almost altogether.

The details of the October movement of freight worked out by the State's accountants is contained in exhibit I, filed by Mr. Wharton, which is based upon exhibit 26, as explained in the foregoing statement. Having separated the freight carried on the two classes of trains to their satisfaction, they assume that that month correctly represented the six months' period, and used certain arbitrary bases, confessedly adopted without any investigation except such as the accountants who prepared the formulas were able to make, to segregate and divide all train cost as between local and through trains, and then apportioned the cost of each class of trains to the state and interstate freight carried thereon on the basis of the ton miles. Transportation expense was also divided on arbitrary allowances for extra cost made here and there, and based wholly upon the views of the accountants and persons whom they say they consulted, but who were not witnesses and whose names were not even given by them.

After they had ascertained the cost of local and through trains for the six months' period, and the ton miles of state and interstate freight carried on local and through trains, in the manner indicated, for one month, they applied the per-

centages of the ton miles thus obtained to the total ton miles for the six months' period to determine the number of ton miles of each class of freight on each class of trains and apportioned the train cost of each class of trains between the State and interstate freight carried on them respectively in proportion to the ton miles of each (exhibit K, p. 78). This assumes that the relative proportion of state and interstate freight on local and through trains is exactly the same for each of the six months, which is manifestly wrong for the reason that even in a normal period, the month of October is the heaviest month of the year for all southwestern roads, and especially so in this particular year on account of the congestion and abnormal use of the local trains.

The manner and the details of their division are contained in exhibit K. The statistics contained in exhibit I are the foundation of their schemes of division as between state and interstate freight. If that month is not representative, or if the statistics of operation as used by them for that month are incorrect, or if the arbitrary assumptions upon which they proceeded in making their division of train and transportation cost, or any or either of them, are incorrect, the results shown in their exhibits can not be correct and the relation of cost obtained in that way would be worthless. The correct application of their scheme of division, therefore, depends upon whether the bases and the numerous hypotheses upon which they acted in its preparation are correct.

It is a remarkable fact that not a single witness who had had any experience in railroad operation that would qualify him to pass upon the merit of their scheme of division was called. Their principal witnesses were public accountants, whose only experience in railroad accounting was such as they had acquired through the occasional examination of railroad records in their capacity as accountants. Mr. Hamilton, as we now recall, was the only man among their accountants who had had any experience in railroad service, and his experience was not such as to qualify him to pass upon the many radical assumptions made in the formulation of their plan. The scheme was devised by Mr. T. F. Wharton, the manager of the agency of Haskins & Sells, in St. Louis, who had been employed as a public accountant for about eight years, prior to which he was a printer and business manager in a newspaper office and city clerk of a small town in Wisconsin. During his employment as a public accountant he was principally engaged in checking accounts of various business and industrial concerns. The only work he had ever done involving railroad accounting was in connection with the Missouri and Arkansas Rate Cases, which are now pending in this court. He only had general charge of that work, however, and did not make any investigation in the offices of the companies, or give it close personal attention, and did not testify in the Missouri case. His first real work in connection with the cases was in May or June, preceding the time he testified, in the spring of 1910. He testified that he

devised the State's scheme of division; that the ideas originated with Mr. Hamilton and himself after reading the testimony in the Arkansas and Missouri cases, and particularly that of the operating men. He admitted that the division of expenses made by him was not based on any knowledge as to the actual operations of railroads, also that he was not prepared to be examined on the details of his scheme. He was asked if he felt that he was qualified to testify as to the manner in which the expense of operating railroads should be divided, and said that he was not, except from the point of view of an accountant. He was asked on cross examination if the division of expense between freight and passenger traffic which appeared in the exhibits filed by him was correct, and said that he would not care to pass a personal opinion on them because he had not studied it sufficiently to form an opinion as between freight and passenger traffic. That is the very basis and groundwork of any intelligent division of expense. He was asked if he could make an intelligent or satisfactory assignment of the expense of either freight or passenger traffic as between the several branches or departments of each kind of traffic without having before him a correct statement of the total of each. He said he could approximately, but admitted that it was necessary to have the total cost of freight and passenger service before you could go into details, and finally said that he accepted the railroad company's division as between freight and passenger service, and that it was not necessary to give any particular consideration to a division between those two branches of the business.

Is it not remarkable that a person who undertakes to make a division which he claims is more nearly in accord with actual conditions than any other method, would not give it further thought? His testimony shows that at the very foundation of his work he is undertaking it without that investigation that a man who wanted to arrive at actual results should have made.

He was asked this question:

Q. "In adding 50 per cent to the engine mileage on local trains on account of station switching, did you make any distinction between that part of the traffic that was trans-state, and the other part?

A. No, sir.

Q. Well, do you think there is any difference between the amount of switching done for trans-state and interstate freight?

A. I couldn't say as to that on local trains.

Q. What is your opinion about that?

A. I wouldn't express any; I have none as to that."

Here is a very important element of division that is made upon an arbitrary assumption, and the man who originated it says he knows nothing about it and has no opinion about it. He was asked:

"Q. Wasn't that a very important feature to know?

A. Not as I understand between local and through train service—no, sir.

Q. Now, let me see; I don't mean to make a difference just now between local and through trains; I mean when you come to divide expense like the difference between state freight and interstate freight. Wouldn't it cut a figure then?

A. It would in the final division between state and interstate.

Q. Did you make any allowance or give any attention to that in making your final division between state and interstate after you had apportioned the expense to local and through trains?

A. No, sir.

Q. So if there was any distinction it was not taken into your statement?

A. If there was any distinction, it was not taken into consideration."

In connection with his division of the expense of "Maintenance of way and structures," which is the largest item of train cost, he was asked why he added 50 per cent to the engine mileage of local trains on account of station switching. His answer was:

"That percentage was worked up after consultation with Mr. Hamilton and others, and was simply an arbitrary percentage added.

Q. You have no qualifying knowledge or information?

A. Except such as I have just stated, discussing the matter with Mr. Hamilton and others.

Q. You don't know whether 50 per cent or some other figure should be added?

A. No, sir.

Q. Then you added 150 per cent for each engine mile to make it equal a car mile? Why did you do that?

A. We added 150 per cent to each engine mile also after consultation with Mr. Hamilton and others as representing the difference in the weight of the engine and the cars.

Q. Did you weigh an engine and car for the purpose of ascertaining from actual weight what the difference was?

A. No, sir.

Q. Then what reasons were given in your consultations for adopting that per cent? I ask this because it is the foundation of your figures.

A. Well, if hearsay testimony is not competent, I would not be able to say.

Q. So you are unable to make an explanation?

A. Except upon information I gathered from consultation with men who were qualified to pass on that."

We give this as an example of the character of his testimony as to the division, and the arbitrary assumptions contained in the exhibit. (See R. 1033-1036.)

We have dwelt somewhat on Mr. Wharton's testimony as to his knowledge and qualification because he is put forward as the originator of the scheme of division developed in the State's exhibits.

The plaintiffs, for the purpose of determining the feasibility of the State's scheme and the correctness of the assumptions on which it was worked out in its several parts and details, took the testimony of a number of witnesses who it was thought, from their experience in operating rail-

roads and in connection with railroad accounting, would be qualified to form opinions based on knowledge, and thus to pass intelligently upon the scheme in its entirety and in detail.

Mr. Carl Gray, Senior Vice President and General Manager of the St. Louis & San Francisco Railroad Company, who had had large experience in operating railroads in Missouri, Arkansas and Texas, Mr. F. E. Ward, who from 1898 to 1907 was the General Superintendent and General Manager of the Great Northern Railroad System, and was at the time he testified General Manager of the Chicago, Burlington & Quincy Railroad Company, Mr. Frank Nay, Comptroller of the Chicago, Rock Island & Pacific Railway, who was in the service of the Missouri-Pacific and the St. Louis Southwestern railways in various capacities in connection with statistics, freight accounts and as traveling auditor, and with the Minneapolis & St. Louis and Chicago, Rock Island & Pacific Railway systems as auditor and comptroller, who testified that he had studied operating conditions on railroads in connection with his duties in the auditing department, Mr. F. P. Johnson, who had served for 21 years in the auditing department of the St. Louis, Iron Mountain & Southern Railway and the Missouri-Pacific System, and for nine years had been in charge of operating statistics, were examined. All these men are eminent in their several departments of railroad service, and were qualified by their knowledge and experience, as the reading of their testimony will show, to pass upon the various matters involved in the State's scheme.

Mr. Ward testified as follows:

"In my opinion, such a method would not be accurate and reliable for the purpose of accomplishing the object sought. In the first place, the taking of any one month would not, in my opinion, be safe for determining so important a thing as the cost of performing service, when it is to be used for determining the revenue of the company." (R. 1854.)

A number of witnesses testified you could not take the month of October or any one month, and apply those particular results to six months. That the conditions affecting the traffic were such that no one month could be applied to six months, for the purpose of effecting the distribution of expense as between state and interstate business.

Continuing, Mr. Ward testified:

"The months vary very greatly, one from the other. The month of October, on most railroads in the West, is a month of very heavy business.

"By reason of the difference in the method of taking record of the tonnage, part of it being taken from billing, and part from the date of receipt, there would be a very great opportunity for tonnage to be omitted that was actually carried in that month. Or, on the other hand, there might be a great deal of tonnage included in the figures which would not move at all on the rails of the company during that month. Therefore, the great uncertainty as to the accuracy of the tonnage would make the first grave doubt as to the accuracy of the method for computing the cost."

Q. "Would the incorrectness that would result from that method of ascertaining the relative proportion of freight carried on local and through trains be cured by the fact that the omissions and the inclusions to which you refer would occur from month to month and would be about the same in each month?

A. It would not, in my opinion. I do not believe that any one month should be taken or could be taken as a basis upon which to determine an accurate computation. Any month might be a high one or it might be a low one, and if it should happen to be correct in any given case, it would be so purely by accident and not by reason of the inherent accuracy of the theory. No short period of a day, a week, or a month would be safe. They would all give opportunity for variations sufficient to destroy the value of the method as a means of determining the separation of cost.

Q. What effect, if any, would a change in the character of the tonnage have upon the correctness of that method of ascertaining the total tonnage?

A. By character of tonnage, do you mean the character.

Q. I mean the character of the business, and the character of the freight, and all the characteristics that enter into and form an element in determining whether the method of keeping accounts by the auditor would give a correct result.

A. A variation in the character of the business handled—that is, business of kinds that had different origins or destinations during that time—for instance, if, during the month that was used as the basis of these computations, there should be any material change in the class of business handled, there might be a very material opportunity for a variation in the time at which those tons would be recorded, and they might be omitted in that month, or other tonnage might be included. It would have a bearing on that same opportunity for inaccuracy." (R. 1854, 1855.)

It was shown that during the month of October, 1907, that there was a congestion of freight in this State and elsewhere, which had an effect upon the movement of freight. Freight was delayed very considerably in transit, and in the delivery all over the country by reason of it. The attention of Mr. Ward was called to that condition:

Q. "What effect would congestion during the period that is covered by this investigation and during the month, or a congestion which was at its height during the month selected as a representative month, and in which the relative tonnage is sought to be determined in the manner I have described, have?

A. If congestion existed in the State of Arkansas during the month that was used in this theory, undoubtedly the same congestion existed in States outside of Arkansas" (and that is shown by the evidence) "on lines connecting with the lines that are being considered here. That would mean in any such period of congestion the business would all move more slowly than at a time when business was being handled in a normal way. That would mean that business would be delayed outside of the State and inside of the State, and the margin for such inaccuracies would be greater. There would be a greater spread between the tonnage actually moved in that month and the tonnage that was recorded by the method described.

Q. Would such a condition have a tendency to change the proportions of tonnage carried by the two classes of trains mentioned; that is, the local and through trains?

A. Yes, sir; it would, for this reason, among others: That in a time of congestion, when a railroad is hard-pressed to move its business and keep its terminals clear, it would use to the fullest possible extent the capacity of the engines on its local trains, and the proportion of long haul, or interstate business, handled on its local trains would increase during such a time. And the local trains being ordinarily such light trains, the addition of comparatively few cars to their makeup would materially alter the perecentage of given tonnage that was carried in those trains.

Q. What do you think of the practicability of apportioning the expense of interstate and intrastate traffic by separating and ascertaining the cost of operation of through and local trains, as the State has done in exhibit K?

A. I have given the matter of finding an accurate method of dividing that cost considerable thought, and have heretofore expressed myself as being of the opinion that

there was not any practicable way of determining it by any mathematical calculations or any exact method; and I am now of the same opinion. I do not think the State has yet solved the problem. I think the plan outlined in exhibit K is not a practicable one.

Q. In introducing this scheme of division, the State assumes that it has presented a method which is not based upon theory, but upon actual conditions; and they advance it here as an apportionment based on actual facts. In that view, what is your opinion of its merits as presenting a division based either actually or approximately on facts?

A. As I read the State's exhibit K, the basis used is one that is not based upon facts, but to a very large extent upon assumptions of facts which, in my opinion, have no proper basis in fact. My idea of the office of an accountant is that he should record accurately things that occur, and not undertake to formulate theories to prove one thing and another. It would be quite possible, by not very serious modifications of this particular theory, to make a very wide variation in the results that would be obtained from it." (R. 1855, 1856.)

There is other testimony in the case which establishes clearly and beyond reasonable controversy, that the apportionment which has been made of state and interstate freight between the two classes of trains, in the method adopted and followed by the State, is incorrect.

It will be observed that all the witnesses who have testified in the case, and they are men who have been engaged all their lives in railroad operation, and who ought to know about these problems if anybody could, have testified that the larger amount of the State freight is carried on the local trains. We have heard that from all the witnesses. And yet the State produces an exhibit here, made up partly from exhibit 26, which shows that 61 per cent of the intrastate

ton mileage was on the through trains and 39 per cent on local trains. That is contrary to the testimony of all the operating men in this case.

A test was made on the St. Louis & Southwestern Railroad just one year later, that is in October, 1908, when conditions affecting traffic were normal, and that test showed that the relation was just the reverse; in other words, 22 per cent of the state freight was carried on through trains and 78 per cent on local trains. We could not understand how these conditions were reversed, until we came to look into it and understand how those accounts were made up, and until the effect of the congestion referred to was explained by the operating officials in charge at the time.

Mr. Cannon, who is a superintendent of the Iron Mountain Railway, came to the State and gave his personal attention to the conditions caused by that congestion. He testified that when the movement of freight became congested it was necessary to utilize every possible means of moving the freight and getting it out, particularly the interstate and trans-state freight going beyond the terminal points; that in order to accomplish this they loaded the interstate freight on the local trains at the terminal points, to the full capacity of the engines to pull it. (R. 1795, 1796.) Mr. Ward's and Mr. Gray's testimony as to the general practice under such conditions corroborates his statements.

There is, under normal conditions, a great difference in the make-up of local and through trains. The local train

does not haul half the tonnage the through train does. But under these circumstances, this congestion existing, they loaded the local trains to their full capacity; Mr. Cannon testified that they loaded thousands of tons of freight on the local trains each day, in order to move it. The yardmaster at Little Rock testified to the same thing.

Mr. Cannon was asked, without any knowledge of the State's exhibit I, what he thought the relation of state and interstate freight on local trains during that month, growing out of that congestion, was. He answered that he expected it would show that 75 per cent of the freight was interstate. He was asked how it would be normally, outside of that congestion, and he said, "Just the reverse." Mr. Brown, who was the assistant yardmaster at Little Rock, said practically the same thing—his figure, instead of 70, was 65 per cent. (R. 1798, 1806.) These conditions destroy the value of the methods pursued by the State.

Now, let us trace that a little further. If it took four or five months to ascertain the actual freight hauled on local trains for one month, which was 11 per cent of the tonnage, how much time would it have taken to go through and ascertain the tonnage carried on the through trains, for that month, and the tonnage on both classes of trains for the other five months? It was practically impossible to do it.

Mr. Roth, an expert accountant employed by the Iron Mountain Railway, took 16 trains and ascertained from the waybills what freight was carried in them. The result of

his investigation is shown by the following extract from his testimony:

Q. "Mr. Roth, you are familiar with exhibit 26, filed on the part of the railroads, and with exhibit I, filed on the part of the State in this case?

A. Yes, sir.

Q. The first exhibit referred to covers all freight taken into the account of the Iron Mountain road for the month of October, 1907: Have you made any investigation of the local trains that ran during October, 1907, for the purpose of ascertaining whether there was any freight hauled on those trains that was not included in the auditor's accounts, and in the statements contained in exhibit 26 and exhibit I?

A. Yes, sir; I made such an investigation.

Q. Please state what that investigation was and what it showed. First, how did you make it, and what did you investigate, what trains, and so on?

A. We investigated 16 trains in all, 13 of which were on the Arkansas Division; one westbound on the Memphis Division; one northbound on the Valley Division (that is from Monroe to McGehee), and one eastbound on the Central Division. We compared the State's detailed sheets with the waybills, and made corresponding sheets, in which we inserted the dates of the waybill as an index of the account that that particular freight would have gone into in auditing our accounts. We also made a notation if it was received at a period subsequent to the month of October. We found that all of the freight on those 16 trains, of the trans-state freight, about 30.5 per cent was not included in our October account, and about 15.5 per cent of the interstate was not included in our October account or our exhibit 26. Of the state freight, a fraction over 6 per cent was not included.

Q. As I understand you, those proportions you have mentioned of trans-state, interstate and state freight you found on those 16 trains, were not included in the auditor's accounts of freight handled in October, or in the statistics

on exhibit 26, and consequently not in totals of the State's exhibit I, which is based on the railroad's exhibit 26?

A. That is correct.

Q. You investigated about one-third of the local trains for October?

A. Yes, sir; about one-third.

Q. Why did you not extend your investigation over the entire 46?

A. It would have taken too much time. I believe we could not have completed that under a year's work.

Q. So it was impracticable to extend it beyond the trains you did investigate?

A. Yes, sir; it was.

Q. Did you have any data from which to investigate the through trains?

A. No, sir; there was nothing in the shape of data which would enable us to do that.

Q. If the same conditions that developed on the 16 local trains you investigated in regard to freight not included in the auditor's accounts, had existed on the through trains, what would have been the amount of tonnage, actually handled in the month of October, omitted from the auditor's accounts and from exhibit 26?

A. There would have been a difference of about twenty-seven million ton miles.

Q. It would have swelled the tonnage for October about 27,000,000 ton miles?

A. Yes, sir.

Q. Where did you find the percentage of business not included on the trains you investigated was heaviest with

regard to the division or territory in which the trains operated?

A. We found it was heaviest on the trains nearest the borders of the State, and not so heavy on those running central in Arkansas.

Q. What effect, in your judgment, would that have upon the percentage which would have developed if you had been able to analyze the entire 46 trains?

A. I think if we had been able to analyze the 46 trains the three percentages I have mentioned would have been considerably increased." (R. 1973-5.)

(Mr. Roth filed exhibit 26, and testified that it was correctly taken from the records; when asked if it was a correct statement of the operations represented on the exhibit during the period covered by it, he stated he thought it as correct as figures of that kind could be. (R. 279.) We refer to this because of comments made by counsel at the hearing growing out of the fact that the exhibit was filed by this witness. The fact is that exhibit 26 was prepared in anticipation that it would be called for by the State; later a statement covering three months was called for at chambers, and it was agreed that a statement covering one month would answer the purpose, and it was in fact prepared and filed for the State's use. [F. P. Johnson, R. 1878.])

Mr. Carl Gray testified as follows:

He had examined the exhibits introduced by the State, and the method pursued by the Iron Mountain Railroad in keeping its revenue account.

"Predicated upon that, I would say that to subtract an absolutely determined amount from one which was not arrived at in any wise by the same manner, is entirely misleading, for the reason that the gross which is represented in the auditor's net ton miles includes business that may have been billed for some months before; certainly a very con-

siderable portion of it is billed the month before, and excludes a great deal of business that was actually handled in this month.

"That is such a variable quantity, varying as the proportion of the last two days may bear to the first two, that in my opinion it is unreliable.

Q. "Would the variations you speak of be cured by any equality in the lapovers from month to month, and make it representative in that way?

A. It would not, as applied to any reasonably short period. It might, if applied to a five or ten-year period.

Q. I mean for one month, say the month of October.

A. One month as applied to what?

Q. To six months?

A. No, sir.

Q. Have you had any experience on your line of railroad that furnishes you with any information in that respect?

A. At one time, in endeavoring to provide statistics of value in determining the relative performance on the several divisions of the road, we took the ton miles from the auditor's reports. We found them to be unsatisfactory, for the reasons I have stated, and for the additional reason that the auditor assumes, naturally, that freight travels through a certain prescribed route.

"The operating department may not handle it via that route, for reasons that are good, and sufficient to them; such as interruption of the line or a more economical routing to a certain class of business, or a handling that would conserve time. Therefore, we were compelled, in order to have reliable statistics, to adopt the method by which we arrive at the net ton miles handled on any division of the road,

from the conductor's wheel reports, which represent actual conditions. And we have been satisfied with that.

Q. The tonnage handled on local trains on the Iron Mountain road during the month of October, 1907, in question here, appears to be only 11 per cent of the total tonnage: In that view about 89 per cent of the tonnage was ascertained in the manner I have indicated from the auditor's revenue accounts. What effect would that small proportion of located tonnage, so to speak, have? As between the two classes of trains, it would leave a very large margin for inaccuracy and incorrectness as to the other part of it, would it not?

A. It would add to the possibility and probability of that, in the greater proportion it bears to the amount accurately determined.

Q. What effect would a congestion of the business in October have upon the correctness or incorrectness of such a method of dividing the ton miles carried on those two classes of trains?

A. It would have this effect: It would distort those conditions which prevailed under a more normal situation. To make myself clear, in order to satisfactorily handle local business, the local freight trains running upon something like an established daylight schedule should handle the preponderance of that business. In time of congestion or stress that is of necessity lost sight of, and under those conditions, there can be no doubt that a greater proportion than normal of through business would find its place in the local trains.

Q. Why is that, Mr. Gray?

A. Well, you have a certain given amount of power, and it is human nature, if not good practice, under those circumstances to make it count just so far as you can; and in that case they would load down the local freight trains to the full efficiency of the engine, even in some instances knowing it would be very seriously delayed, and the service materially hampered, in an effort to get out from under. (R. 1895-1897.)

"From my knowledge of the conditions on all southwestern railroads in October, 1907, I would say that in my opinion for a comparison of this kind, it would have been difficult to have selected a month in which the results would have been more misleading as applied to a longer period, for the reason that the congestion reached its flood during that month, and the conditions which were distorted by reason of the efforts of the operating department to move this unprecedented tonnage would reflect themselves through all of the remaining months, and the proportion of tonnage included which really did not move in that month, and the proportion of tonnage excluded which did move in that month, due to the auditor's method of keeping his ton miles, would equally distort and perhaps distort more greatly, all of the other months. (R. 1898.)

Q. What do you think of the merits of the plan adopted by the State's accountants for ascertaining and dividing the relative cost of handling interstate and intrastate business?

A. I feel it is an unsatisfactory basis for the reason that it is not a consistent theory. That is, not consistent in itself, in that it has used a number of varying methods. Those methods being the car mile, ton mile, arbitrary assumptions as to the relation between the locomotive mile and the car mile; and that it has applied over a six months' period a result determined upon in one month; and that result in itself, and in the nature of things, is an unsatisfactory one and an indefinite one. That at any point throughout its deductions, an error or a switch of the business in the other months would very materially affect the final result.

"That it is objectionable because it is difficult of understanding. It assumes conditions which, in practice, we are not able to verify. But above all, remains the fact that there is not a proper allowance that has been made for the relative cost of the two classes of business.

Q. Mr. Gray, speaking of this plan of separation from the standpoint of the State, as to the arbitraries that have been allowed in these various subdivisions, if those arbitraries were correct, and there was any way to arrive at

what division would be proper, and you could say these allowances would be proper in favor of the local trains, would that account for the excess cost of handling intrastate over interstate freight?

A. No, sir." (R. 1909, 1910.)

Mr. Nay testified in regard to the State's theory:

"My opinion is, that it does not reflect true conditions or true relative cost of the two kinds of service. After examining these exhibits carefully, I am unable to find any results—that is, any assignment of expense between local and through, or between state and interstate, that is an actual fact, or based on actual facts. The method subdivides the total operating expenses into various subdivisions, and treats of each subdivision separately.

"The expenses that are grouped in these subdivisions are divided on various bases, many of which have little or no relation to the expenses that are subdivided thereon. The method is complicated, and is capable of being adjusted in different ways throughout the details, that might bring entirely different results in different cases. The attempt is sought to divide what are termed train expenses between local and through, and those which are not train expenses between state and interstate. And then after the total local and through train expenses are ascertained, by a series of approximations, without any actual results being obtained, or without being based on any actual results, the entire expense of those trains is then apportioned between state and interstate on a ton mile basis, which is another approximation of this summary of approximations. It might or might not produce a fair result. If it did produce a fair result, I think it would be a coincidence or an accident. (R. 1814, 1815.)

"My understanding of the method used by the State's witnesses in ascertaining the state and interstate tonnage one mile on local and through trains is as follows:

"They took the conductor's reports, commonly known as 'wheel reports,' of all the local trains that were run during the month of October, 1907, and drew from those wheel

reports the numbers of the loaded cars. They then traced from those car numbers the waybills covering as many as they could find. I understand they were unable to find all of the waybills covering those cars. After locating the waybills, the separation was then made between state and interstate shipments, and the tons one mile, state and interstate, were computed for car load freight only. I understand that all of the less than carload freight was considered to be state business; that is, less than carload freight that was hauled on local trains.

"Having obtained those results, which purported to show state and interstate tons one mile, transported on local trains in October, 1907, they deducted those results from the total tons one mile for October, 1907, state and interstate, as compiled by the railroad company. What was left was assumed to be the tons one mile, state and interstate, that were transported on through trains.

"However, the total tons one mile for the month of October, 1907, as computed by the railroad companies covers only shipments that were taken into the accounts of the companies in October, 1907, regardless of whether the shipments actually moved over the rails in that month or at some other time. I do not think a correct result can be reached by that method for the reason that the business of the company is not taken into account according to when it actually moved in the trains, but is taken into account as follows:

"System business, which covers shipments moving between points on the Missouri-Pacific System (including the Iron Mountain), is taken into account on what is known as the 'forwarded basis;' that is, all system waybills dated in the month of October, 1907, were taken into account for that month regardless of whether the shipments were actually hauled on the trains in that month or not.

"Under that plan system waybills dated during the latter part of October, 1907, and which started to move in October, but finished their journey in November, 1907, would be taken into account by the company in October for the full journey. But the State's accountants in compiling the tons one mile (on local trains), from the local con-

ductor's wheel report, would include only that portion of the journey that actually moved in October.

"The same condition prevailed at the beginning of the month. That is to say, the waybills dated during the last few days of September, 1907, which were en route at the end of the month, were taken into account by the companies for the full journey in September, 1907; while the State's accountants would have in their reports for October the ton miles covering the completion of the journey in October. The railroad's figures would include nothing whatever in October accounts covering such shipments.

Q. "The result would be, if a shipment was made and billed in Missouri or Nebraska or Oklahoma, in October, 1907, it would go in the auditor's accounts as an October shipment, without regard to when it passed through the State of Arkansas?

A. Yes, sir; if the waybill is dated in October. If a waybill on any part of the system covering the several States, is dated in August or September, it would go into the auditor's accounts as of August or September as the case might be."

"The interline business represents business covered by waybills reading to or from points on other railroads, and is divided into three classes: Interline forwarded, interline received, and interline through or overhead.

"The interline received business covers waybills made by other railroads reading to stations on the Missouri-Pacific System, and is taken into account when such waybills are reported by the agent at destination.

"In that way waybills which reach destination during the early part of October, which travel part of their journey over the Iron Mountain in the month of September, would be included in the company's tons one mile, but that portion of their journey which was traveled in September would be excluded from the figures compiled by the witnesses for State.

Q. "Suppose a shipment which passed through Arkansas in the month of October was received in Texas or Louisiana in November or even in December. In what month would it be entered in the auditor's accounts?

A. It would be entered on the auditor's account in either November or December, according to when the shipment reached destination." (R. 1816, 1818.)

"And, furthermore, if that shipment, or any shipment of like character moved part of the distance on through trains across Arkansas, and part of the distance on local trains, the State's witnesses would have entered the figures only for the mileage that actually moved on the local train and would omit the mileage moved on the through train.

"The next class of interline business is known as 'interline forwarded,' covering shipments that are waybilled at stations on the Missouri-Pacific System going to points off that line and on some other railroad. The waybills for such shipments are taken into account by railroads when they are reported by the destination carrier, and the destination carrier reports them when the agent at destination reports the receipt of the shipment to his accounting department.

Q. "That may be weeks after it has passed through the State, may it not?

A. It may be a long time. In actual railroad practice, I think every railroad in the country has a large number of waybills of that kind, which are being constantly traced. The Rock Island has several men tracing waybills that are not reported until some time after the close of the current month. In case there is a congestion, it sometimes happens that such waybills are reported several months after they have actually moved over the rails of the original carrier.

Q. What effect would a congestion in the traffic have in the way of delaying the entries in the book of the auditor of that class of shipments?

A. On all interline business, it would serve to increase the delay. The system business being taken up on a for-

warded basis, congestion would delay the actual movement. But on interline business, which is taken up by the receiving carrier, when it reaches its destination, any congestion delays the reporting of that business, and, consequently, the taking of it into account. This interline forwarded business is subject to perhaps the greatest delay of any (except perhaps the third kind of interline business, which is 'through' or 'overhead') because the company which originates the business has no control of when it is reported, and usually a large portion of the interline forwarded business of any carrier is not reported until after the close of the month in which it actually moved over the line."

"In this case waybills would be taken into account for October, 1907, which covered the actual movement in months prior, say in September or August, or even the months prior to August. While those shipments would not actually move in October, they would be omitted from the figures compiled by the State's witnesses, so far as the movement on local trains is concerned. Likewise, at the other end of the month a large amount of traffic would actually move in October, which would not be taken into the company's accounts until a subsequent month, but such shipments, if they moved on local trains, would be included in the figures compiled by the State's witnesses.

"The third class of business is the interline through, or overhead, covered by the waybills made at stations on other roads, which passes across or over the Missouri-Pacific, and has destination on some other road, the Missouri-Pacific being the intermediate road. This business is taken into account on a 'received' basis; that is, reported by the destination carrier in the same manner as the interline forward business."

Q. "In view of the conditions you have just described, can a correct division of the amount of freight carried on through classes of trains for a given length of time, say the month of October, 1907, be obtained in the way the State's witnesses have attempted to obtain it in this case?

A. No, sir; I think not." (R. 1816-1820.)

"In arriving at the actual number of ton miles hauled on the through trains by deducting the tonnage actually hauled

on the local trains, from the company's figures, which were compiled without reference to the tons actually hauled, unless it should happen (and it would be a coincidence or accident), that those tons actually hauled should really agree with the tons taken into account as hauled on the local trains, the result left as to the tons on the through trains would be erroneous. It is scarcely conceivable that the number of tons actually hauled on the local trains in October, 1907, would be the same as the number of tons that were taken into account in October. I might add, that in my own experience on the Rock Island, we ran across this discrepancy several years ago in compiling operating statistics for our superintendents and general superintendents and operating men. We found that the so-called 'lapovers' from month to month did not equal each other—*in fact, they were entirely different, and were so very different as to distort our monthly averages.*

"Beginning with March, 1906, the Rock Island Railway has been computing the tons one mile used in connection with operating statistics for our operating men, from the conductor's wheel reports, thereby obtaining the tons actually hauled during the month over each division, because we were unable to obtain the tons actually hauled, from the waybill figures.

"We have made comparisons each month of the total tonnage one mile, ascertained from the conductor's wheel reports, and from the total tons one mile as compiled from the waybills, and they are quite different from month to month. *I think they will average a difference of ten per cent or more.*"

Q. "From your experience in the effort you made on the Rock Island, do you think that the inequalities and defects in this system would be remedied by any uniformity in the 'lapovers?'

A. No, sir; and certainly not for one month. The lapovers for one year when compared with the business for a whole year, have only one-twelfth of the effect they would have on the business for one month. Of course, it is evident to any one that the lapovers at the beginning of the

year will be the same as the lapovers for the first month of a year; and what I am trying to say is, that the effect of the lapovers when applied to the business of any one month, is very much greater than if applied to the business of a long period—say a year. That was the difficulty we had in our operating monthly statistics. In one month the tonnage that was omitted from our waybill account made the divisor into the expenses so small that the cost per ton mile was largely increased. Then the next month we would have tons in our account in excess of what was handled, and the reverse would be true—the expense would run away down.

"As those figures are used almost entirely for comparative purposes, *the comparisons were destroyed on account of these lapovers being so unequal.*"

Q. "And you found it so impracticable that you abandoned it, did you?

A. We abandoned it for our monthly operating statistics, by divisions, and ever since have been making those compilations, based on the tons actually hauled in the trains.

Q. What would you say of the month of October as compared with other months, as to its effect upon lapovers, considering the character of the business done in Arkansas in that month, and any changes made in the character of the commodities at that time from that which might have prevailed in the succeeding month?

A. I am familiar with traffic conditions on the Rock Island (in Arkansas), and presume in that period there was a similar condition as on the Iron Mountain.

Q. Are not the general conditions the same throughout the State as to the character of traffic affected by the change from the summer to the autumn business?

A. Yes, sir; I think that is true. I spent about 15 years on the Cotton Belt, and that was true on that road. And I know that on the Rock Island Road the October business is usually the heaviest of the entire twelve months.

Q. What effect would those conditions have upon the lapovers you speak of?

A. October being the heaviest month, there would be a greater congestion during that month, which would tend to emphasize these lapovers. I should say that no month is representative of any six months, or any twelve months, and, certainly, if I would choose a representative month, I would not choose the heaviest month in the year. An average month might be more nearly representative than either the heaviest or the lightest month, but I think where actual results are desired, no one month should be taken as representing the period." (R. 1820-1822.)

Mr. F. P. Johnson testified:

Q. "Will you state what you think of the correctness of the method adopted by the State for the purpose of ascertaining the tonnage carried on local and through trains in the month of October, 1907?

A. So far as the method used by the State is concerned in ascertaining the business handled by the local train, and then deducting those figures from the total figures shown by exhibit 26 (which was filed by the railroad), is concerned, I do not believe it is fair, and I do not believe it is a system which would be used by any railroad official. The figures compiled in exhibit 26, representing the total business for that month, are compiled from one source. The figures representing the movement of local trains are compiled from another source; the figures purporting to represent the local train movement are not figures that are included entirely in the total figures. I do not believe it is a fair assumption to make such deduction, or that correct information as to the relative tonnage carried on these trains could be ascertained in that way.

Q. It has been shown in that case that there is a large amount of tonnage moving in the month of October which is not included in the auditor's accounts for that month. Do you believe that omission could be accounted for or made up by any system of lapovers from month to month that might exist in the relation of auditor's accounts to the actual movement of the freight handled?

A. I have no idea how the lapovers from month to month will run. But in order to make this statement of any service we are compelled to assume that whatever business moved on the locals in the month of October, and did not get into our accounts, was offset exactly by the proportion of business that got into the accounts but did not move. That proportion must be exactly the same, *not only in volume as to ton miles, but as to commodities themselves.* It seems to me a violent assumption that the lapovers from September to October and October to November and November to December would be the same. To verify that would mean as much labor and time upon each of those months as was spent in compiling this exhibit I. It is a work which is practically impossible. I can not imagine how the lapovers could equalize mistakes of that sort, or rather the misleading effects of comparisons of that kind. (R. 1984.)

Q. Were you in any way connected with the Missouri Rate Case, and if so, state in what way?

A. I either compiled or was connected with the compilation of all of the exhibits that were furnished by the Missouri-Pacific Railway in that case. I attended all of the hearings before the master with the exception of one week at Chicago, and all of the hearings in the circuit court with the exception of one day.

Q. Mr. Wharton testified that the testimony in the Missouri case indicated that the main difference in the cost of state and interstate traffic was the cost of the local and the through trains. Is that your understanding of the testimony in that case, that the main difference was in the cost of local and through trains, to the exclusion of other elements of increased cost of state traffic?

A. No, sir; I think there were a number of reasons given for the extra cost of state freight as contributing very largely to that extra cost, in addition to the local train expense.

Q. Has the Iron Mountain Railroad ever made a practice of dividing expense of maintenance-of-way between local and through trains in such manner as has been adopted in this case?

A. No, sir; I do not remember any case where the Iron Mountain has ever had occasion or ever attempted to ascertain the cost of an individual freight train, whether it be local or a through train.

Q. What do you think of the State's method of dividing the expense of maintenance-of-way between local and through trains? If the separation had to be made, do you believe the manner adopted by them, the car mile basis, is proper from your standpoint as an accountant, and from your experience in railroad accounting?

A. I do not see that the basis adopted by the State, so far as the maintenance-of-way and structures is concerned, brings about any closer relation to the expense of those two classes than any other arbitrary method would, and I have no idea how the exact expense of either local or through trains or of one individual train, could possibly be ascertained with any degree of accuracy.

Q. You have heard the testimony in this case that a large proportion of the expense of maintenance-of-way and structures is not due to operation, but to other causes?

A. Yes, sir.

Q. In that view, do you think the method adopted by the State is a proper one?

A. No, sir; the larger the proportion of that class of expense that is due to the elements the less accurate would be any unit, either a car mile or a train mile, because, as has been stated by other witnesses, neither the train miles nor car miles would have any effect upon that class of expenses. It goes on regardless of the volume of business.

Q. It is more or less of an overhead expense than otherwise?

A. It seems so to me, and it is more of a general expense than any other item in the operating department. It is not a regular expense. By that I mean that the expense which is incurred this month is not taken into the account

this month or next month, or possibly not this year, and the traffic or the car movement has no bearing upon the amount of money which is taken into maintenance-of-way expense in the month in which the car movement is made." (R. 1986.)

Mr. W. B. Doddridge, an old railroad operating man, was examined by plaintiff during the production of their testimony in chief. Counsel for the State by way of anticipation (their method of division not having been developed at that time), tried very hard to force him into an approval of the method of division on the basis of train expense. Mr. Doddridge did not at the time understand the significance of the questions, but his views, as expressed in his answers, are in harmony with those of other operating men. The The following are his statements on cross examination:

Q. "Your analysis of the different classes of freight, interstate and intrastate, is based on your experience and knowledge of the operation of the different kinds of trains, local and through, and the proportion of intrastate traffic carried on each, isn't it?

A. Well, the local train is simply one of the incidents of the extra cost. It is not the whole reason. It is one of the circumstances and conditions of the handling of the short haul business of the railroad." (R. 484.)

At page 511, counsel asked him if, everything considered, a car mile basis would be fair between local and through trains, with reference to the expense of maintenance-and-equipment. He testified that a car mile basis, it seemed to him, would be very similar to the ton mile basis. (He had condemned as impracticable the ton mile basis.)

Q. "I don't suppose there would be any practical difference?

A. It would be an average, and it would not take into account the extra handling. It would simply measure the miles. The mile would be the unit the same as the ton mile.

Q. If you take the car mile as the basis, would you add anything, and if so, how much for the local?

A. Yes, I would have to add this element of handling.

Q. I want to know how much you would add to that?

A. I believe that it is demonstrated in these statistics to be about ten to one. Take the average haul, the difference between the miles.

Q. We are taking the difference now, as I understand it, between local and through.

A. Take the difference in the mile in state and interstate freight; those are the only statistics we have.

Q. You are getting away from the question. As I understand it, we are now discussing the question between local and through, and you derive your intrastate and interstate by dividing the proportion on those. But the primary division must be the division between a local and a through train.

A. Judge, I do not know how to figure that out from the way you put the question. To ascertain the relative difference you would have to take the lengths of the haul; that is, the state and interstate haul."

Being further pressed, he said:

"I do not want to make any wild statements on that point unless I have the number of the relative handlings that the cars receive; then my judgment would be predicated on that. (R. 511, 512.)

The foregoing testimony shows that no one month can be taken as reflecting the business for the six months' period; that it is impracticable and misleading to attempt to ascertain the tonnage of each class of traffic on local and through trains by taking the tonnage actually handled on one class of trains and deducting that from the total amount taken into the auditor's accounts in order to ascertain the tonnage on that class of trains; that there was a congestion of freight in the month of October, 1907, in this and other States, which materially affected the loading of the local and through trains, and caused a very much larger proportion of interstate freight to be handled on local trains than is usual and customary. We will later on in this argument call attention more in detail to the testimony as to the effect of that condition on the proportion of state and interstate freight carried on local trains during the month of October. It has so distorted the relation as to the quantity of state and interstate freight carried on the two classes of trains in the figures prepared by the State as to produce a result just the reverse of natural and normal conditions, thereby greatly increasing the ratio of state freight and diminishing that of interstate freight carried on local trains in that month, which error was carried into the six months' period by applying the per cents obtained from the figures in October, thereby multiplying and increasing the effect of their mistake in a degree that is startling. These matters will be discussed when we come to consider the question of the state and interstate tonnage on local trains.

An exhibit (E-1), filed by the State, shows that the percentages of freight taken into the books of the St. Louis Southwestern Railway Company during the month of October, 1908, corresponded with the movement of state and interstate freight during that month. It was filed by Mr. Hamilton for the purpose of showing that the lap-overs from month to month equalized and corrected any difference that might exist between the auditor's revenue accounts and the actual tonnage. In order that the exhibit should have any force or bearing on the accounts of the Iron Mountain railway it was necessary for the State to show that the conditions on the two lines of road were similar. They not only failed to do that, but Mr. Hamilton himself testified, at page 1597 of the record, that a different system of keeping the revenue account of freight handled obtains on the St. Louis Southwestern from that used on the St. Louis, Iron Mountain Railway. He was asked:

Q. Do you know what system (of keeping the auditor's accounts of freight moved) is in vogue on the Cotton Belt System?

A. No, sir; not in detail. They have abandoned the antiquated freight journal system, which is still in vogue on the Iron Mountain, and are checking one agent against the other.

And again, at page 1595, he was asked if the St. Louis Southwestern Railway's accounts were not all kept on the received basis, and in answer stated that it might develop; he was not prepared to say. The test on the St. Louis Southwestern Railway was made in October, 1908, when transportation conditions were normal. The test on the St.

Louis, Iron Mountain & Southern Railway, from which the State took its figures, was made at a time when transportation conditions were abnormal on account of the congestion of freight that existed in the month of October, 1907, which all of the witnesses who have had experience in handling trains and transporting freights testified would materially affect not only the tonnage of the local and through trains, but the movement of freight in the State. This congestion existed in other States, and would necessarily derange and interfere with the ordinary, normal movement of freights on the lines of all the roads in the territory where it existed. The evidence showed it existed in Chicago, Memphis, St. Louis, and in fact, all over the Southwest. Again, if conditions were normal and the same system of keeping accounts obtained on the two roads, there could still be no comparison between them because the one is a small, compact system operating in a comparatively limited territory, while the other is a large system operating in eight States.

Exhibits 9 and 24, which are omitted from the printed record, but copies of which are filed under the stipulation in the cases, are maps of the Missouri Pacific and St. Louis Southwestern or Cotton Belt systems, and show the extent of the territory in which each line operates. The total mileage of the St. Louis Southwestern railway is 773 miles, of which 452.2 is located in the State of Arkansas, and 259 miles in Missouri (exhibit 10). The total mileage of the St. Louis, Iron Mountain & Southern Railway proper is 2,599.15 miles, of which 1,355.09 is located in the State of Arkansas, and 1,244.06 in Missouri (exhibit 2).

The total mileage of the Missouri-Pacific-Iron Mountain system is 7,000 miles (R. 2076); of the Cotton Belt system, which includes the St. Louis Southwestern Railway, is 1,558 miles; but the lines of that company in Arkansas and Missouri are operated separately from the Texas lines, while the entire Missouri-Pacific system is operated together under one organization (R. 2077).

St. Louis is the chief station and the northern terminus of the St. Louis Southwestern Railway in Missouri. It is 202 miles from St. Louis to the Arkansas State line, and 349 thence to Texarkana in Arkansas, which is the southern terminus of the main line. The road crosses the Mississippi River into Illinois at Thebes, and its line terminates at East St. Louis. There is a short branch to a point on the west bank of the Mississippi River opposite Cairo. These are the principal initial points beyond the limits of the State of Arkansas, and it can readily be seen why the accounts kept by the auditor would correspond very closely with the actual movement of freight, and why any small amount of lapovers would be the same from month to month. There could in the nature of things be but little, if any, perceptible variance in the movement of freight on a line of that character.

The condition of the Chicago, Rock Island & Pacific and the St. Louis & San Francisco Railway systems are more nearly like those on the Missouri-Pacific-Iron Mountain. The former has a mileage of something over 8,000 miles, the latter over 7,000 miles. Like the Missouri-Pa-

cific-Iron Mountain system, they each cover a large extent of territory in different States. Mr. Nay, the comptroller of the Chicago, Rock Island & Pacific, and Mr. Gray, the vice president and general manager of the St. Louis & San Francisco Railway, testified that an effort had been made to keep an account of the tonnage on the system with which they were severally connected in the method followed by the State in these cases, and that they were forced to abandon it because the monthly accounts did not correctly reflect the actual movement of freight during the month. See extracts from their evidence, *supra*, 141, 149. Mr. Nay testified that there was a variance of 10 per cent or more between the accounts and the freight handled. He and Mr. Gray both testified that they had abandoned that method in order to obtain reliable satistics; that the lapovers were so unequal that the statistics so obtained could not be used for purposes of comparison.

## EXHIBIT K, PREPARED AND FILED BY THE STATE.

We will now take up exhibit K, which contains the formulas prepared by the State's accountants for making the division between local and through freight trains, and state and interstate freight traffic on the St. Louis, Iron Mountain & Southern Railway. The same method was followed in the St. Louis Southwestern Railway.

We must in the beginning crave the indulgence of the court if we go somewhat into detail in discussing this exhibit. It deals separately with every item of expense connected with the maintenance and operation of the railroad and equipment. The findings and rulings of the court can not be reviewed without discussing many of the details.

### MAINTENANCE OF WAY AND STRUCTURES.

This is the first division of expense contained in the exhibit. The exhibit divides the expense between local and through trains on the basis of the total engine and car miles of each class during the month of October. Fifty per cent is added to the engine mileage of local trains on account of additional mileage made by them in station switching, and it is assumed that each engine mile is equivalent to two and one-half car miles. After ascertaining the engine and car mileage of each class of trains and the ratio that each bears to the total, the percentages are used in dividing the expense, with the result that 16.98 per cent is charged to local trains, 83.02 per cent to through trains.

The expense incurred in the maintenance of way and structures is treated as an operating expense, and is carried in that way in the current accounts of the railroads. It is not, as a rule, incurred concurrently with the causes that necessitate it, and does not run evenly from year to year. It involves large expenditures, and for that reason is incurred as the revenues of the company will best enable the expenditures to be made. Unlike all other current repairs this class of expense is provided for by annual appropriations, the amount depending upon the business conditions and outlook at the time the appropriation is made; they are frequently cut down in case the business should fall short of that anticipated at the time the appropriation is made, without regard to the necessity to repair, beyond what may be actually required for safe operation.

If a good year is anticipated, an adequate appropriation in view of the business anticipated will be made. It may amount to several hundred thousand dollars per month. It is incurred for the purpose of conducting the business that is anticipated, consisting of state, interstate and trans-state. It is charged in the current accounts and should, in any division of expense as between the classes of traffic handled, be charged ratably to the several classes in proportion to the revenue realized from them. It is more nearly a revenue account than almost any other carried by the railroads under their system of accounting.

M. L. Byers, who is the Chief Engineer of Maintenance of Way and Structures of the Missouri-Pacific System, a

man of ability and probability as familiar with questions of that sort as any one, testified in substance as follows:

"The method adopted by the State in dividing maintenance of way expenses between local and through trains, and the traffic on those trains could be accurate only by accident; the plan does not take into consideration a number of the factors which affect the cost of operation of those two classes of trains, and it fails to consider that there is at least 75 per cent of the expense that does not vary with the changes in the amount or character of the traffic at all." (R. 1700.)

(The State's witnesses testified that 90 per cent of that expense was not affected by the traffic, but was caused by the elements, and matters of that kind. (C. W. Hillman, R. 1521; R. D. Parker, R. 1162, 1163.)

Mr. Byers further testified:

"Of the remaining 25 per cent, there is a very large proportion that, while it varies more or less with the traffic, yet, those expenses are not necessarily incurred at the time the traffic is handled; it may be incurred a great many years after that—so long after as to apparently destroy the value of the data obtained in the method proposed.

"Steel rail renewal is brought about by the wear and tear of passing trains. That steel stays in the track from five to twenty or thirty years before it is renewed, and the expense incident to the wear and tear in the rail today may not be actually incurred by the railroad company until a great many years afterwards. A division of this expense on a car and engine mile basis does not take into consideration the varying size of the locomotive, the varying amount of the lading of the car. Under this method, by changing the character of the service in one class of trains, the actual expense of that class of tonnage would be increased or decreased. For instance, a heavier locomotive on the through freight service would not change the mileage, yet, it would change the amount of expense for maintenance-of-way. The 25 per cent of expense affected by the traffic

would be influenced by the loading of cars and by the speed of trains. By far the greater proportion of the maintenance-of-way expense is not affected by the traffic and the small proportion that is affected is much of it affected in such a remote way that it would be much more accurate to consider the maintenance-of-way expense in the same way as the general expenses are considered and distributed. The repair of fences, one of the items of this account, bears no relation to the amount of traffic or to the character of the traffic. In certain portions of the maintenance-of-way expenses the weight of the engines has appreciable effect. If one class of service were equipped with heavy engines and the other with light engines, there would be a change in the relative expense brought about by the two classes of service. The general practice of railroads is to use their lighter engines in local service and the heavier in through service.

"The wear and tear produced in the items of maintenance-of-way that is brought about by the traffic is a matter of gross traffic or of the total weight on the rails rather than the amount of freight which happens to be in the car. The formula does not establish any relation between the amount of weight and the amount of revenue tonnage. It is not fair to divide the expenses of a train, either local or through, between the two classes of freight carried on it—state and interstate—on the basis of the number of tons carried on the train without discriminating as between the tonnage of the lighter loaded and the more heavily loaded cars.

"The proportion of maintenance expense not due to traffic varies with the conditions; it might be as high as 90 per cent, and is at least 75 per cent. The character of the maintenance expense is similar to that of general expense, and whatever method is proper and fair for the division of general expenses would also be fair and proper for the maintenance-of-way." (The State's witnesses placed it at 10 per cent. R. 1700-1703.)

That is the testimony of a civil engineer of recognized ability and large experience.

Mr. Carl Gray testified:

"Fifty per cent added to local engine mileage for station switching is not enough to compensate for the extra maintenance occasioned by switching. A proper allowance can not be determined. The car mile is so variable a quantity as to be of no service in any comparison or division. It makes no distinction between classes of loading, between weights or between the difference in tare to load. It assumes that the cost is equally proportioned for a car handled five miles or 500 miles." (R. 1897, 1898.)

The accountants, in referring to this proposition, cite contracts between railroad companies. Mr. Gray and some other witnesses were examined in regard to that. They testified that was a matter of convention. Sometimes the train miles were used and sometimes the car miles. There was no universal rule; it was always a matter of arrangement between the two companies interested.

Mr. Ward:

"No operating man could determine with accuracy whether 50 per cent added to local engine mileage for station switching is correct or not. Switching by local trains varies very much from day to day, in fact, with every trip."

(That is a fact developed from the testimony of the State's witnesses in a striking manner.)

"A local train as a part of a day's work, may be engaged almost exclusively in peddling out less than carload freight; on the other hand, it may have very little of that to do and may be engaged in doing the local switching, or it may be engaged in it in varying quantity.

"The assumption that 'each engine mile is equivalent to two and one-half car miles,' is one that has no proper basis in fact. The effect of a locomotive on the track is very much more than two and one-half times the effect of a

car. The effect can not be measured by the number of wheels. The blows which the roadbed receives from the improper balancing of the reciprocating parts of a locomotive might run 2, 3 or even 500 per cent as great as those of a car or train of cars. A strip of track has been known to have been enormously injured by a trip over it of one engine. A piece of soft track might be damaged to thousands of dollars by one trip of an engine, while that same engine could run over the same piece of track on a dry day and cause very little damage so that two and one-half times is entirely insufficient. (R. 1857.)

"Neither the ton mile or the car mile will afford a proper division of maintenance-of-way expenses; a large part of the expense is not caused by train or car movement."

Mr. Johnson:

"The basis adopted by the State in dividing maintenance-of-way and structures between local and through trains does not bring about any closer relation to the expense of those two classes of trains than any other arbitrary method would. The larger the proportion of expense that is not attributable to the movement of traffic, the less accurate would be the car mile or train mile because neither the train or car mile would have any effect on that class of expense. It goes on regardless of the volume of business." (R. 1986.)

Counsel say the car mile is the proper basis because it represents the use. If the Court please, keeping up the track is a matter that preparation is made for in advance, in anticipation of business that is to come, and with reference to the volume of the business that is to be conducted over it and the resultant earnings therefrom. The damage that causes the mischief to which the money expended is to be applied, does not occur concurrently with the period in which it is applied. It may be expended for renewing tracks that have been there for a great many years, as explained by Mr.

Byers. It is intimately connected with the revenue of the company, more closely than with the operation and use. You can not connect it with the operation because a large part of it is not brought about by that, but is the result of natural causes. You can connect it closely with the revenue, and that is done constantly in the manner in which it is treated in the ordinary administrative processes of the company. They make a monthly appropriation of $100,000, say, or $500,000, for the fiscal year for the maintenance and repair of way and structures. If they think the business is going to be good, if they anticipate a large business and a corresponding revenue, they make a larger appropriation than if good business is not anticipated. If their expectations are not realized, then they will cut it down and not use the full appropriation. That shows how intimately it is connected with the revenue and with the volume of business. It is not a question of the use, because much the greater part of it is caused by conditions independent of use, and it is very intimately connected with revenue in the ways pointed out by the witnesses.

Speaking on this subject in the Oklahoma case the Circuit Court of Appeals for the Eighth Circuit said this:

"But there was a large percentage of the cost of doing all the business of each of the companies in Oklahoma, like the cost of the maintenance of way and structures, which was incurred for the common benefit of its interstate business and its intrastate business, and there is no method of dividing these items of common cost between these classes of business which is sure to be methematically accurate. Many methods have been and still are suggested. The question was: Which was the most equitable, the most likely

to produce a fair and just division? And upon this subject there was much testimony of many witnesses, whose long experience in the practical operation of railroads, exceptional opportunities for extensive observation, and peculiar knowledge qualified them to form and express opinions. The Circuit Court examined all this evidence, considered the arguments of counsel, and adopted the revenue basis, and assigned these items of common cost to the classes of business in proportion to the gross earnings of these respective classes. * * * There is no basis of division that is free from objection and criticism. But the decisive preponderance of the evidence is that the revenue basis is the most likely to be just and fair. Much that has been said concerning the use of this basis for the apportionment of the value of the property is applicable to its employment for the division of items of common cost. No reasons for the use of either of the other bases that seem to us so cogent and persuasive as those given by Judge Hook, at pages 498, 499, of 177 Fed., for his adoption of the revenue basis have been called to our attention or occur to us. The use of that basis is sustained by many decisions, and it can not be held to be erroneous or mistaken."

Love v. A., T. & S. F. Ry. Co., 185 Fed. 330.

This is perhaps the largest separate item of train expense, amounting to $553,375.11 for the six months' period. The court below found that the overwhelming weight of testimony showed that but a small part of the expenditures was caused by the operation of trains, and that the attempt to apportion it on the ton, car or train mileage basis would be an injustice to the railroads; that the straight revenue basis would produce more accurate results and divided it on that basis. (Opinion 76.)

Part of this expense is in connection with repairs and maintenance of stations and other buildings used for the handling of freight, and the testimony of the State's ac-

countants shows that there were 2,224,437 ton miles of trans-state freight on local trains in the month of October, 1907, or about 23 per cent of the total interstate ton miles. This class of traffic makes little or no use of such buildings, nor will it cause any of the station switching, for which the State has allowed 50 per cent to the car mileage of local trains. And when it is remembered that after the cost of the local train is ascertained, that cost is divided between state and interstate traffic in proportion to the ton miles of each class of traffic on those trains, it will be readily seen that the trans-state and long haul interstate freight is charged with a full *pro rata* share of all of the expense assigned to the train, and the expense of intrastate freight reduced to that extent although no part of such expense was properly chargeable to the trans-state freight.

## MAINTENANCE OF EQUIPMENT.

### (a) Locomotives.

The expense under this head was divided between yard, local and through road locomotives on the basis of the locomotive mileage of each class within the month. 50 per cent is added to the mileage made by the yard locomotives to provide for extra maintenance due to yard service; 50 per cent to the mileage of road locomotives in local service to provide for extra switching mileage, 50 per cent to the switching mileage of the local train engines, thus ascertained, to provide for extra maintenance due the switching service (making 75 per cent added to the local engine mileage.)

On this basis the mileage of the locomotives engaged in the three classes of service, respectively, was ascertained and the ratio that each bore to the total mileage was used in apportioning the total expense. The amount charged to each class was as follows:

Yard locomotives.....$69,135.80=37.64%
Local locomotives ..... 43,733.35=23.81%
Through locomotives ..... 70,807.25=38.55%

The expense of maintenance of yard locomotives is again divided between local and through train service on the basis of the number of cars of each class of service handled by yard engines during the month, viz.: Local service $13,453.83; through service $55,681.97.

This method of division was approved and followed by the court. (Opinion 77, 108.)

Referring to the arbirtrary allowances in favor of locomotives engaged in yard and local service, Mr. Gray testified:

"There is nothing in my experience which justifies either of those assumptions. They are entirely arbitrary. They may be fair; they may be too large. One objection to it is the fact that the word 'mileage,' to begin with, is an assumption, and 50 per cent added to an assumption does not strengthen it." (R. 1899.)

Mr. Ward testified:

"This is another assumption. I do not know where they found the basis for adding 50 per cent; that may be too much or too little. The mileage of yard locomotives is not kept accurately. It is the custom of most roads to credit yard locomotives with mileage, but, as a matter of fact, the

basis of hours worked would be more accurate. It is customary to assume that the yard engine makes six miles an hour, but those mileage figures, when applied to yard locomotives are estimates only, and are made only for the purpose of comparison, to determine the comparative cost of maintenance, and to ascertain whether the engine is performing service enough to justify 'shopping.' They should not be used, in my opinion, in connection with the determination of anything so important as the rates which should be charged for carrying freight." (R. 1858.)

In the first place, to provide for possible extra switching mileage, they add 50 per cent, and then they add another 50 per cent for possible maintenance. He says:

"In my opinion, it is no more feasible to separate the cost of handling local and through business than for a general storekeeper to determine the cost of selling one article as compared to another. Those are assumptions for which I can find in my experience, no basis in fact. I could not determine accurately whether those things are right or whether they are not, and I do not believe any accountant can do so." (R. 1858.)

We will take up the apportionment made by the court of the expense of maintenance of yard locomotives when we come to discuss "Yard and Terminal" expense under the heading of "Transportation," as a similar question is involved in both charges.

**(b) Freight Cars.**

The total amount of expense involved in this item is $477,895.64. The method of division is described in the exhibit as follows:

"In dividing this expense between local and through service, we have taken into consideration the element of repairs due to the stopping and starting of trains at way

stations, and the repairs due to extra terminal handling of cars in local service. Mr. Wellington, in his work on railroad location, says starting and stopping at way stations is the cause of approximately 21½ per cent of the repair expense to freight cars, and that the terminal handling is the cause of practically 13.5 per cent of the repair expenses. Taking these elements into consideration, the maintenance expense may be divided as follows:

| | | | |
|---|---|---|---|
| Stopping and starting | 21.5% | $102,747.56 | |
| Terminal handling | 13.5% | 64,515.91 | $167,263.47 |
| Other expenses | 65. % | | 310,632.17 |
| Total | | | $477,895.64 |

Having separated this expense between the three elements "Stopping and Starting," "Terminal Handling," and "Other Expenses," the State next divided each class between through and local trains on the following basis:

"Assuming that each local train makes a stop, say each five miles, and each through train a stop, say each 20 miles, the local service should be charged with four times as much as the through service, in proportion to car mileage, for the expense due to *stopping and starting*. Assuming also that each car in local service receives two terminal handlings (including handling at local stations), to each terminal handling of a car in the through service, the local service should be charged with two times as much as the through service, in proportion to car mileage, for the expenses due to *terminal handling*.

"The balance of the expenses of freight car maintenance *(other expenses)* is divided between local and through service in proportion to the number of car miles made in each class of service."

The court approved and adopted the general scheme of division between "Stopping and Starting," "Terminal Handling" and "Other Expense."

There is a sharp conflict in the evidence as to the proportion of expense of maintenance properly chargeable to "Stopping and Starting," and "Terminal Handling." The witnesses on the part of the plaintiff were Mr. Ward, Mr. Gray and Mr. Rosing, who is the mechanical engineer of the Missouri-Pacific System, at the head of the mechanical work and shops of that system, and a man of very broad experience in that department. He deals intimately day by day with these problems. He, and the other witnesses named, testified that Mr. Wellington's formulas, which were prepared in 1877, had become antiquated on account of the great changes in machinery and mechanical devices used in coupling cars, and in the construction of cars and engines. He introduced a formula prepared by himself, in which he charged 32 per cent of repair expense to "Stopping and Starting," and 23 per cent to "Terminal Handling," which he testified was based upon his judgment from investigation and experience in supervising work of that character for a number of years. His testimony on this point is voluminous, but we will not discuss it, as the court found that 25 per cent was a proper charge for stopping and starting, and 13.5 per cent for terminal handling, practically adopting the table prepared by Mr. Wellington. The testimony was conflicting, and we concede that the finding of the court is binding at this hearing. (Opinion 77.)

The testimony of Mr. Rosing will be found at pp. 1727, and 1730-1732. Mr. Ward, at p. 1860, and Mr. Gray at p. 1900.

In dividing the expense of "Stopping and Starting," and "Other Train Expenses" (not including "Terminal Handling"), the court followed exhibit K, and used the same percentages, dividing these expenses on the car mileage basis.

It divided the expense of terminal handling between trans-state, interstate and intrastate freight on the basis of the ton mileage for the month of October, 1907.

A clear statement of the court's findings is contained in the following extract from the opinion:

"In making the calculations on these items the accountants for the State assume that while the local trains stop every five miles each through train stops every 20 miles, and therefore that the local service should be charged with four times as much as the through service in proportion to the car mileage for expenses due to stopping and starting; they also assume that each car in local service receives two terminal handlings to one terminal handling of a car in through service, and for that reason the local service should be charged with two times as much as through service in proportion to car mileage for expenses due to terminal handling. The court finds from the evidence that while local trains stop every five miles, the through trains stop only every 35 miles, and for that reason the local trains are chargeable with seven times as much for that item as the through trains. In charging the through trains with one terminal handling in the State, they include the trans-state freight, and charge that with one terminal handling. As the trans-state business of the roads constitutes a very large percentage of the business, over 51 per cent of the entire freight business in the State of Arkansas for the Iron Mountain and nearly 65 per cent of the Southwestern business, it is a matter of considerable importance to determine what should be properly charged to this item. The trans-state business, which merely passes through this State, both of the terminals, that of the starting and destination, being in other states, it will be seen that there should

be a difference in the charge of terminal expense in this State.

"A great deal of evidence has been introduced on the part of the State to show when through trains carrying this trans-state freight come into division yards, they are broken up and handled in the same manner as the interstate business, and for this reason it is very earnestly argued that it should be charged with one terminal. On the other hand, the evidence leaves no doubt in the mind of the court that while there are some yard expenses connected with the trans-state business, it is entirely free from the great expense caused by terminal handlings. It is true the handling of these trans-state cars at terminal points differs very materially from the 'crossing of a bridge,' a figure of speech indulged in by one of the witnesses for complainants, still, the evidence leaves no doubt in the mind of the court that the work connected with the trans-state cars is not of that nature, which should properly be called and charged as a terminal handling at any other place except that of starting and destination. The switching necessary for delivering and receiving the cars is saved. It is true there is considerable switching at every division point, but, as established by the evidence, in making up a through freight train, the trans-state cars are placed in such position in each train that all cars intended for a certain territory or for a certain branch road that they can be moved at one time and placed in a solid mass on the track from which they are to be finally moved. Besides, it is admitted that local freight originating at and destined for a point not a terminal, but which must pass an intermediate terminal yard, receives at such yards the same service as trans-state cars do. As the trans-state business is much heavier than either the interstate or local, the number of cars in these trains merely passing through the terminals is naturally larger. From the exhibits filed by Mr. Moore, who was night yardmaster at the Little Rock terminal in 1907, the trans-state freight in these trains would average from 60 per cent to 70 per cent; the cars would be moved in one body to tracks on which they were to be transported further; interstate business intended for that point would have to be taken to the different commercial tracks, and from there hauled to the industries to which they were consigned; they are handled by carrying

them in small lots of from one to three cars; they would be carried in some instances a distance of several miles, and after having been emptied, they would have to be sent for and switched back to the freight yards of the company. If intended for other points in the State, they would be handled like trans-state cars, being switched over to the track on which the trains for these localities would be made up. The same expense would be incurred and the same injury to the cars caused in receiving and handling as local freight passing through these terminals. Mr. Moore filed with his testimony (exhibit 53), what is called a 'consist' of the through freight trains handled during the month of October, 1907, which shows the movement of the cars after they reached the Little Rock division yards. He takes for illustration, the movement of one train and thus explains it in his own language:

" 'It is shown by this consist that the cars destined to Texas are in the train beginning from the caboose, including 42 cars destined to Texas, and ahead of that are the cars for the Valley Division and Little Rock proper, and local south on short points beyond Little Rock. The first car mentioned in the consist at the top is the car next to the caboose at the rear of the train. The last car on the list is the car which is next to the engine. Those 42 cars destined to Texas would remain on the train on which they were received, and the 16 cars (there were 58 cars in the train), would be taken off the head of the train and put on such tracks as are designated for that purpose. The 42 cars would remain on the track on which they were received, and there would be added to that train more tonnage and forwarded from the track on which we received it; they would not be switched; they would be sent out on the day they came in.'

"This consist shows that a very large percentage of the cars on all through freight trains and trans-state were moved as testified by Mr. Moore. Mr. Cannon, who, in 1907, was Superintendent of the Arkansas Division of the Iron Mountain, testified to the same facts, and also that at the Hoxie Division yards, the percentage of through freight is still greater and subject to less switching than at Little Rock. On the other hand a former yardman of the Iron Mountain testified that as a rule the number of cars intended

for trans-state transportation constituted a small percentage and are handled almost as much as those intended for local transportation.

"All agree that the injury to freight cars incident to delivering and hauling them back to the yards is not incurred for the trans-state cars. When cars are received from other lines for trans-state transportation, there are no terminal expenses except the yard charges, and that is so well known that all of the witnesses who testified on that subject, those for the railroads as well as those for the State, agree that when the transportation is over three or more lines, in the division of earnings, extra allowances are made to the terminal roads, receiving as well as delivering, while a smaller proportion is paid to intermediate carriers for the reason that there are no terminal expenses. Mr. Lincoln, one of the witnesses introduced by the State, who has had a great deal of experience as a railroad man, and although at present not connected with any railroad, occupies the position of manager of the St. Louis Freight Bureau, which necessarily requires that he keep himself fully informed in all matters of this nature, agreed with the witnesses of complainants on that subject that there should be no expenses charged in Arkansas for the terminal service of trans-state business.

"Mr. Parker, a witness introduced by the State, who is an expert engineer for the Texas State Railroad Commission, also testified that while trans-state business would have the same expense as interstate attached to it in the yard service, there is none at the terminals.

"But there are some items of the interstate business which are only charged with one terminal, which, in the opinion of the court, should be charged with two. The evidence shows that all the cotton handled in the State is credited to interstate earnings. While 30 per cent of that is transported uncompressed and therefore has only one terminal handling in the State, the other 70 per cent has two terminal handlings in this State. The evidence shows that cotton is brought to the concentrating points either on local trains or on what is called 'pick-up' trains, trains which during the cotton seasons are used exclusively for picking

up the cars loaded with cotton along the line, and before it is transported out of the State it is compressed. These cars are taken to the compress, there unloaded, the empty cars hauled to the yards, and after the cotton is compressed, empty cars are carried to the compress for reloading. That part of the interstate traffic has two terminal handlings as much as the local business, except that it is carried in train loads to the compress instead of being hauled in small lots, but that is fully made up by the additional expense caused by first delivering the cotton to the compress and then delivering the empty cars for the purpose of transporting it out of the State after having been compressed. The evidence shows that cotton constitutes about 7 per cent of the interstate business, or about 2.5 per cent of the interstate and intrastate business of the Iron Mountain. It is, therefore, proper that of the 34 per cent of the interstate business, 2.5 per cent should be charged with two terminal handlings instead of one, for this cotton.

"Another item of interstate traffic which receives, to a great extent, two terminal handlings in the State, is lumber and forest products. The evidence shows that a material part of forest materials, especially staves and headings, are brought in the rough to the mills and then, after having been finished as manufactured material, are reshipped on the interstate rate for the entire haul and the earnings credited to interstate traffic. Many of the larger mills have short roads which carry the rough material to the mills; these are called 'tap lines.' Allowances made to them for these hauls will be considered by the court and included in determining the difference in rates between interstate and intrastate business and for that reason need not be considered in determining this item.

"A small proportion of the grain brought in from other states is also handled twice. From all the evidence the conclusion reached by the court is that 2 per cent of the interstate business should be charged for the transportation of lumber and grain with two terminal handlings in the State.

"Another item of interstate business which should be charged with two terminals is the Memphis and Fort Smith freight for the State of Arkansas. As has been stated here-

inbefore, all of the Memphis business for points in Arkansas and most of the Fort Smith business destined to points in this State, is treated as interstate business, but the entire expense thereof charged to this State. It is hard to determine from the evidence how much this business amounts to, but a liberal estimate will make it 2 per cent, and this should also be charged with two terminals.

"This item of terminal expense should therefore be divided upon the following basis:

| | |
|---|---|
| Trans-state receiving no terminal handling..... | 51.16% |
| Interstate receiving one terminal handling..... | 34.19% |
| Interstate receiving two terminal handlings..... | 6.50% |
| Intrastate receiving two terminal handlings..... | 8.15% |
| | 100.00%" |

(Opinion, pp. 78-85.)

See table containing the division made by the court at pages 108-110 of the opinion.

And the evidence of B. W. Moore, R. 1773; John Cannon, R. 1796, 1801, 1802; H. V. Brown, R. 1804, 1805; J. C. Lincoln, R. 965, 991.

Appellants assign as error that the court erred, (1) in estimating that the through trains stopped every 35 miles, as against five miles to local trains; (2) in not charging trans-state and interstate traffic with the cost of stopping and starting freight cars, and (3), in making different allowances for interstate and intrastate traffic, when the evidence shows that this is an element of expense from the physical starting and stopping of freight cars unconnected with the class of traffic carried on said cars. (Assignment, 35.)

Counsel wholly misconceive the action of the court.

(1) It did not divide the expense of stopping and starting on the basis that through trains stop every 35 miles against five miles to local trains. Counsel were evidently misled by a statement at page 78 of the opinion, that the court finds that fact from the evidence. This statement was based on the testimony of conductors and brakemen introduced by appellees, and an exhibit filed by appellants as to the number of stops made by through trains. That and other testimony showed that the through trains only stopped for water and passing trains, making about three regular stops between divisional points, which would average a stop every 35 miles, while the local trains stop at every station, the average distance of the stations apart being five miles. For instance, A. Paulette, a witness for appellees, testified that a local train running from Argenta to Russellville would make 23 regular stops, a through train would make three stops for water; this without meeting other trains. Each class of trains would have to stop occasionally at sidings to allow other trains to pass. (R. 2212.) That the through train between Russellville and Van Buren made five regular stops, viz.: Mulberry, Coal Hill or Denning (depending upon which line the train follows), Clarksville, Hartman, and Mill Creek. (R. 2207.) The local trains make 30 regular stops, each of them stopping occasionally for passing trains. (R. 2210.) But it is unnecessary to go into the evidence on this point, as the court will see by a comparison of the division of expense

caused by stopping and starting trains, found in exhibit K, with that made by the court. In exhibit K, 41.81 per cent is charged to local and 58.19 per cent to through trains, and in the appendix (p. 108, of the court's opinion), the same percentages are used in dividing that class of expense. The difference in amount charged to local and through trains respectively, is as follows:

The court's figures increased the expense of the local trains $6,993.29, and of the through trains $9,733.06. This increase is accounted for by the action of the court in attributing 25 per cent of the expense of freight car maintenance to stopping and starting instead of 21.5 per cent, the percentage used in exhibit K. This was an increase of 4.5 per cent above the amount charged to that item in exhibit K, and makes a difference in the total expense resulting from stopping and starting of $16,726.35, which corresponds exactly with the sum of the differences charged by the court to through and local trains, respectively, thus demonstrating that the only change made by the court grows out of the per cent of increase of the expense of stopping and starting from 21.5 per cent to 25 per cent.

What we have just said is also true of the item designated as "Other Expenses." This is by far the largest item embraced in this class of expense, being $310,632.17. It will be seen by comparing the table at the bottom of page 109 of the court's opinion with the division as shown on exhibit K, that the same per cents are used, viz.: Local trains,

15.22, through trains 84.78; that the relations are the same in all respects, the only difference being in the total amount of the item which in exhibit K, is $310,632.17, and under the court's method of separating the elements of expense of freight car maintenance is $293,905.82, being, as in the case of "Stopping and Starting," the exact difference brought about by changing the per cent of this class of expense attributable to the stopping and starting from 21.5 per cent to 25 per cent, which amounted to the sum mentioned, $16,726.35, adding that amount to the expense of "Stopping and Starting," and deducting it from "Other Expenses."

(2) The expense of stopping and starting freight cars is included in and divided between local and through trains in the division of this item of "Starting and Stopping," in which we have shown that the court followed exhibit K. It assuredly does not lie in the mouths of appellants to object to the action of the court in following their own method of division, and yet, that is what they complain of.

(3) The different allowances for interstate and intrastate traffic referred to in the assignment of error, we take it, relate to the method of dividing the expense of "Terminal Handling," adopted by the court. This item amounts to $64,515.91. The court apportioned it, as we have seen, between the classes of freight and not on the basis of the car miles. The ground upon which it acted is explained in the extract from the opinion, and is supported by the evidence cited in the opinion and by us.

BEFORE LEAVING THIS BRANCH OF THE SUBJECT, WE WILL CALL THE ATTENTION OF THE COURT TO A VERY IMPORTANT ELEMENT OF EXPENSE CHARGEABLE TO THE LOCAL TRAIN SERVICE FOR WHICH NO ALLOWANCE WAS MADE BY THE STATE OR BY THE COURT. WE REFER TO THE EXPENSE OF REPAIRS TO FREIGHT CARS CAUSED BY WAY STATION SWITCHING.

The allowance of four to one, made in exhibit K, on the ground that local trains are chargeable with four times as much as through trains on account of more frequent stops and starts, does not cover it because it does not embrace the switching done by the local trains at way stations, which is a far more important element of expense than stopping and starting. Mr. Ward testified:

"I assume that these average distances (stops) as stated, are approximately correct. But that does not constitute a proper measure of the expense of handling local as against through service, because the through train in starting and stopping simply takes the siding, and after it has met the train, which has the right of the road, it then proceeds; or, in many cases its stop is only for the purpose of taking coal and water and it does not have to stop even while the man turns the switch. On the other hand the local train goes into the siding and after it is there it has its work to do by taking out the cars or placing in cars at various industries or on the house track at that station, and it must pick up other cars and place them in the train, to an extent that constitutes, for all practical purposes, a terminal handling for all of the cars in that train at practically every station along the line of its run. So the multiple of four to one for the through service. on account of the assumed difference of five miles and twenty miles would

not be correct. It would be more nearly eight times, although I don't know that eight is accurate. However, it is more nearly eight than it is four.

"For that reason the local, in my opinion, under this theory is not charged with nearly as large a proportion of the car repair expenses as it should be.

"Apparently the accountants who worked this plan up counted this handling at local stations as a service of the same character as the terminal handling, and this multiple of the two times for one is wrong. I think I covered that in a general way in my statement in regard to the stopping and starting each five miles instead of each twenty miles. They all come under the same class. The whole method, it seems to me, fails to take into account that feature that the handling of the cars in the local service is very much greater than in the through trains." (R. 1861, 1862.)

Speaking of terminal handling, Mr. Ward testified that there is a very great difference in handling and in the destructive effect on cars in through service from the local service, "a car in through service simply being put from one train into another, or having its engine and caboose changed, as comparatively little is done to it and in many cases nothing whatever.

"But a car switched in industrial switching has to be handled a number of times, depending upon the conditions. It has to be taken from one train and put on another track and sometimes there are a group of cars going into the same track or territory, and, depending upon conditions, they are perhaps rehandled again, to be placed at the proper end of the switch tracks. These run in all directions, and the cars have to be dropped from the head of the train to the rear of it; and there are many movements which go to increase the risk of injury and the cost of maintaining those cars, which do not apply to the cars passing through terminals in through service." (R. 1890, 1891.)

Mr. Ludlam criticized this testimony by saying that the extra work done by local trains is taken care of by the allowance of two to one for "terminal handling." He is mistaken. "Terminal handling" only includes such work as is done in making up trains at terminal stations.

Let us turn to Mr. Wellington's formula. His distribution between these items is "stopping and starting," "terminal; make up of trains." Learned counsel in the court below assumed that the terminal make up of trains was intended by Mr. Wellington to include way switching. His view was based on the punctuation, the presence of a semicolon after the word "terminal." We do not regard that as very material, because an examination of Mr. Wellington's formula makes it manifest that it was included in one or the other of these items. His total distribution, excluding the foregoing items, consists of "Effect of Time and Age," "Curves and Grades," and "Distance and Straight Track." Inasmuch as switching at way sations could not be included in any of thes items, it was of necessity included in the other two, unless Mr. Wellington committed the oversight of omitting it altogether. Mr. Ward, Mr. Gray and Mr. Nay included it in "stopping and starting," and we believe we are justified in assuming that the interpretation of these operating men is of greater weight than that of Mr. Ludlam, an accountant. At any rate all of the operating men testified that an additional charge of 8 to 1 should be made against the local train service on account of way switching. It is immaterial whether it is placed in the "terminal handling" or "stopping and starting;" it was not

allowed for by the court. At the time Mr. Wellington's book was written (1877) the method of operation was very different from what it is at present. Through train service was on a different basis. Railroads had not been organized into large systems providing continuous lines of interstate transportation, but interstate shipments were cut up into short hauls on separate and disconnected lines. The separation of the functions of the different classes of trains out of which the through and local train service as it now exists has grown, had not then been made, nor large terminal divisions and stations established, and under the conditions that prevailed at the time he wrote, Mr. Wellington was justified in making a smaller allowance for stopping and starting and terminal make-up of trains in his distribution of expense than would be required at this time.

Mr. Gray testified: "That the stopping of a through train is most frequently, for transportation or operating reasons, done to take a siding to meet a passenger train, and is not accompanied by any more work than the taking of a side track or the holding of the main line. The local train performs the greatest amount of its work in connection with the stops. The allowance should be several times four." (R. 1902.)

*Supervision and General*—Was apportioned by the State in exhibit K, between local and through service, on the basis of direct charges for maintenance and equipment as ascertained under the assumptions made by the State's accountants.

*Traffic Expense*—Was apportioned on a straight revenue basis. The court followed the State's basis of apportionment in both of these items.

## (4) TRANSPORTATION EXPENSES.

### (a) Station Expenses.

This class of expense is divided in exhibit K between intrastate and interstate business in proportion to the volume of traffic of each class handled in the State; that is to say, on the basis of the number of tons of each class of traffic, estimating that each intrastate ton was handled twice and each interstate ton once. The State later filed exhibit Y, in which they excluded the trans-state tons.

This division disregarded some most important elements of difference in the expense of handling state and interstate freight at stations. Mr. Gray on this subject testified:

"It assumes that the cost of handling forwarded business per ton is the same as the cost of handling received business per ton, while practically there is a great difference; a forwarded ton is billed by the agent; he is not responsible for the correctness of the bill or the rate used. Upon business received he is responsible for the correctness of the bill or the rate used. Upon business received he is responsible for the application of the correct rate and correct accounting.

"It assumes there is no difference in the expense of handling a ton of brick or coal, car loads, as contrasted with a ton of classified merchandise, the one involving a very minor amount of work, the other involving a very intricate knowledge of rates, accounting and handling." (R. 1903.)

Mr. McPherson, in speaking of terminal or station expense, testified that the terminal expense, referring to station expense, attaching to any shipment, either carload or less than carload, is as great for five miles as it is for five hundred miles, and the multiple between will show the increasing expense that attaches to short hauls.

He said:

"The terminal expense incident to shipping a ton of merchandise from Little Rock to Jacksonville, thirteen miles, is as great as shipping a ton of merchandise from Little Rock to Van Buren, 153 miles, and, as the terminal expense forms 18 per cent of the total operating cost, the ton mile basis of division of expense would eliminate just that percentage of the cost from consideration." (R. 315.)

When you come to consider the long and the short haul, is where that becomes important and material.

Mr. Ward testified that the terminal handling of short haul intrastate freight is much more expensive per ton mile than long haul interstate freight. Many more car miles are required to handle a given number of short haul intrastate ton miles than the same number of interstate long haul ton miles.

And yet it is divided according to the tonnage in these apportionments made by the State.

He said:

"A larger amount of property and facilities is required to handle a given number of short haul ton miles than of long haul ton miles. A ton of freight of a given kind, received at a given station, will not cost any more to unload from a car and deliver to a consignee if it had originated in

the State than if it had originated in another state, but when the cost of handling is divided by the ton mile applicable to it, it makes a much heavier charge to the short haul intrastate ton than to the long haul interstate ton.

"I might illustrate by comparing two shipments of the same class of merchandise, the one from Chicago to Benton, Ark., the other from Little Rock to the same destination. The station expense at Benton in each case is exactly the same; each operation is precisely the same as the other, but when you measure the expense by ton miles you have twenty-five miles to apply to that ton that comes from Little Rock and approximately 600 miles on the ton that came from Chicago, so that there is perhaps 24 times more chargeable to the state than to the interstate, of that station expense." (R. 1864.)

If the Court please, this statement by Mr. Ward shows how unreliable either one of the bases adopted by the State for dividing that class of expense is, either tons or ton miles. You can not divide it so as to apportion the relative expense by either method without disregarding the effect of the long and short haul. There is the advantage of dividing it on the revenue basis. The revenue represents every element that enters into and forms a part of the expense that is embraced in "station service."

The court below, recognizing the importance of the long and short haul in the division of that class of expense, apportioned it on the basis of the ton mileage of each class of traffic, charging each intrastate ton with six handlings, the interstate with one handling, and the trans-state with one-half handling, upon the view that the intrastate is chargeable with six station expenses to equalize the difference in the length of the haul, taking into consideration only the difference in this State, which on the Iron Mountain is three

times as long for interstate as for local. (Opinion p. 85.) The effect of the difference in length of haul on station as well as many other elements of expense is illustrated in the testimony of Mr. McPherson and Mr. Ward, infra 214 and 221, 224.

**(b) Yard and Terminal Expense.**

There are on the main line of the St. Louis, Iron Mountain and Southern Railway in Arkansas running north and south, three terminal stations at the end of operating divisions, viz., Hoxie, Argenta (Little Rock) and Texarkana. On its main line running east and west are Van Buren, Little Rock and McGehee, and Wynne on the Bald Knob branch between the cities of Little Rock and Memphis. (The yards at Little Rock are situated on the north bank of the Arkansas River, partly in Baring Cross and partly in Argenta, and are referred to in the testimony under those various names.) On the St. Louis Southwestern Railway Company's main line are Paragould, Pine Bluff and Texarkana. Cars are distributed and trains made up at these terminals.

Two classes of yard and terminal expense are provided for in exhibit K. One class consists of the expense of repairs to yard locomotives and freight cars in terminal service, and is provided for under the head of "maintenance of equipment;" the other under the head of "transportation expense."

This expense is "divided between local and through business on the basis of the number of cars handled at ter-

minals, as explained under the charge of maintenance of yard locomotives (2-a)," in exhibit K, and charged to local and through trains in the same proportions.

Exhibit I shows that 165,714 cars were handled in and out of terminals on the St. Louis, Iron Mountain & Southern railway in the month of October, 1907, of which 32,232, or 19.46 per cent of the total, were in local service and 133,482, or 80.54 per cent, were in through service. These percentages are used by the State in dividing the expense of maintenance of yard locomotives and yard and terminal handling. The court followed the method used in the exhibit. (See tables at the end of opinion, pages 108-111.)

The two items were properly treated alike, but the division on the basis of cars in and out of the terminal stations was erroneous.

We will cite the material evidence for the purpose of showing that the court manifestly erred in favor of the appellant.

The manner of handling and distributing cars at terminal stations is described in the extracts from the opinion copied at page 175 of this brief, which shows that there is very great inequality in the amount of the service rendered as between local and through business. On this subject Mr. Ward testified:

"If I understand this correctly, it means that the expense of maintaining yard locomotives is divided on the basis of an account of all cars passing through the yards where yard engines are employed.

"It is customarily the case, in counting cars handled through yards, that they are counted coming in and going out, that is, two counts for each car. If they counted each car passing through a yard twice, they give the local cars no more credit for the services of the yard engine than they do a car passing right through the yard on the through trains. Therefore, the proportion chargeable under this method to the through service would be very much greater than is actually the case.

"The opinion of myself, or any other operating official, as to the excess cost of handling state over interstate business is *on the basis of actual freight and not on the basis of the number of cars passing through the yards.* I might illustrate that position of mine by pointing to the fact that in practically—in fact, I might say in all railroad terminal yards, a very large percentage of the cars on through trains pass through without any handling. The trains run in on to a yard track, and if there is a change in the tonnage by reason of a difference in grade or a difference in motive power on the next division, a few cars will be taken off or a few cars put on that train. Or, there may be a few cars taken off that train, which are destined to that particular station, or to stations on the next local run. But the great majority of cars are not handled in those terminal yards.

"On the other hand, cars that run in local trains are all handled; they all have to be placed in their trains by the yard engine; and after they reach their destination or the distant terminal they are again handled and placed at industries, or on a house track, or in train yards, to go out on through trains going beyond. So that a method which would count the cars handled in local trains and in through trains on the same basis would be very inaccurate in determining the proper proportion of cost of maintaining yard locomotives to apply to one service as against the other." (R. 1859, 1860.)

Mr. Gray testified:

"It assumes to divide the expense of yard locomotives between local and through on the basis of the number of cars of each class. It is to be assumed that customary practices were followed in arriving at the cars handled at terminals, that is, a car in and out counts twice.

"The assumption that a car in local service requires no more switching than a car in through service, is not sound. It is a very frequent thing in practice for the through train to require one switch. That is, the caboose is taken off and a caboose put on the train. One cut is made to reduce, or one switch is made to add tonnage, where a reduction or increase in the train load is caused by physical conditions; while, on the contrary, a local train is the one which requires the most switching, and particularly in proportion to the haul. The local train will in ordinary practice be composed of cars that have been picked up at the local stations, which, when it reaches a terminal, will go in all the different directions; or at that point are switched together for the through trains.

"Another factor which this does not take into account is the fact that the car which passes through that yard, and is never touched individually by an engine, counts just the same in expense as a car which is switched to an industry, where it occasions a switch in some instances even of several miles; it may be handled by itself or handled in conjunction with several others, but it carries in proportion a great many times the expense of a car that would pass through that terminal in a through train. The difficulty about it is that it assumes that the cost of switching one car is the same as switching another car. It may be a good theory, but my experience does not justify me in the conclusion that it is." (R. 1899.)

See Mr. Nay's evidence, R. 1828.

The unsoundness of the State's basis is further illustrated by the fact that a car that passes through the yard and is never touched by a switch engine is counted as two cars, one car in and one car out, while a car that is destined to the station and switched to an industry, sometimes a distance of several miles, is counted as but one car.

Exhibit 52, prepared and filed by H. B. Aumocek, a clerk in the auditing department of the railroad company,

shows the movement at division terminals of the principal through trains on the main lines of the St. Louis, Iron Mountain & Southern Railway during the month of October, 1907. He prepared thirty-seven sheets, representing as many different trains, which he testified were representative of the movements of all trains. Six of the statements were filed, constituting the exhibit referred to; the others were not filed in order to avoid unduly swelling the record, but were submitted to the attorneys and accountants for the State for inspection.

The first sheet shows that the through freight train coming into Hoxie from the north, which is the first division terminal station south of St. Louis in Arkansas, on October 1, 1907, arrived at 3:35 p. m.; that there were 49 cars in the train, which was No. 2-71, that is the second section of train No. 71. The same train went south on the main line as No. 55 at 11:20 p. m. the same day with 42 of the 49 cars it brought into Hoxie, arrived at Argenta at 2:20 p. m., October 2, with 60 cars, and pulled out of Argenta at 6 p. m. with 50 of the same cars that it brought into the station. Similar conditions are shown on all of the sheets at the same and other division points. The manner in which this exhibit was prepared and what appears on the face of the several sheets is explained by Mr. Aumocek. (R. 1769.)

Exhibit 53 is made up of the consist of freight train No. 55, the principal through freight train from St. Louis south on the main line of the St. Louis, Iron Mountain &

Southern Railway, during each day in the month of October. It was filed by B. W. Moore, the trainmaster. He was night yardmaster at the Argenta terminal in October, 1907, and his duty was to make up, receive and handle all freight trains. An extract from his testimony describing the arrangement with reference to the order and grouping of the cars as shown by the consist will be found in the extract from the opinion of the court, *supra*, 175.

He also describes the service rendered to various classes of cars in switching. Those for city delivery "would be switched to an assigned track in the terminal yard and then transferred to the industrial tracks either at East Little Rock, Little Rock proper, or Argenta, according to the location of the industry. If one or more cars were assigned to one industry and they were to come in a cut or group, they would remain intact; otherwise there would be a switching movement for each car. Cars destined to Alexandria, McGehee, and Monroe, on the Valley Line (the east and west main line) would be switched to an assigned track in the receiving yard and transferred from there to the Valley yard, about three-eighths of a mile distant, where they would be made up in train order. Cars destined to East Little Rock are first cut out of the train and placed on a make-up track in East Little Rock. That involves two switching movements. They are then switched to an assigned track or the transfer engine gets hold of them —that is a third switching movement. They are then transferred to the track from which they are unloaded, making four switchings. Cars that come in on through

trains going to industries have four times as much switching as those transferred to trains going east and west on the Fort Smith and Valley Divisions (being the east and west main line) of the Iron Mountain Railway. For instance, an industrial engine will operate on 75 cars as against 300 to 450 cars handled by the train line engine in ten hours' service. The average will run 75 industrial cars against 300 train line cars, and it costs from $2.50 to $3.00 per car for industrial switching. The distance is much greater. We receive our trains on receiving tracks convenient to the intersection of main lines, and our trains are handled as they are received, cutting out the industrial cars lined for such assigned tracks as we assign them for, and then our transfer engines are used for the purpose of moving them from those tracks to the industrial tracks." (R. 1773.)

He also testified that grain usually came in in solid trains, and a good deal of cotton designed for compression was brought in in pick-up trains, that is, a train made up at Little Rock to go out and pick up all the cotton loaded on cars distributed for that purpose at way stations. The switching of these grain and cotton trains to the elevator and compress was made in one cut and one switching service would frequently move 20 or 30 cars.

H. V. Brown, terminal clerk of the Little Rock terminals in October, 1907, and now assistant yardmaster, referring to the through trains, testified:

"If they have sufficient tonnage into the Little Rock terminal and no deductions are to be made from the inbound train, there is nothing done to the train except to change the engines and caboose, provided there are no bad orders. Through cars are all en bloc. They are all switched in one operation of the train, to save switching at the various terminals. We receive the consist of these trains (at Little Rock) from a conductor frequently before they get very far out of Hoxie, by telegraph. If they have not sufficient tonnage into Little Rock, we arrange sufficient freight to fill out. That is usually done before the arrival of the train; the additional cars are either set on the hind end of the train or placed at the head end as the inbound engine is removed, as conditions will permit. In some instances it is handier to put them on the hind end of the train with the caboose and in other cases the cars might be so located that it would be quicker to put them on the front end of the train. The cars that come in on the train would be received and handled off the same track, and without any extra handling, barring bad orders, those cars going through to Texas." (R. 1804.)

John Cannon, who was superintendent of the Arkansas Division, testified:

"A through train starting out of St. Louis is made up of all the Texas loads switched together, all the Arkansas loads switched together, and all the Louisiana loads switched together. The short loads to be distributed to points out of St. Louis are arranged in station order. Those that are set out at Poplar Bluff are set out together.

"Train 55 out of St. Louis is a Texas train, filled out with Arkansas and Louisiana freight, which would be cut out at Little Rock." (R. 1801.)

In view of the statements of the witnesses, we submit that any division of yard and terminal expense on the basis of the number of cars handled at terminals in and out, putting all cars on an equality of service, is unwarranted.

The question as to how the division should be made seems to have been largely a matter of speculation among the State's experts. Mr. Willmering, one of these witnesses, testified that the expense of maintaining yard locomotives should be divided on the basis of yard engine mileage, repairs to freight cars on the car mile basis. Mr. Hillman, a public accountant and witness for the State, testified that the idea of dividing the maintenance of equipment expense between yard, local and through trains with certain percentages added "is a new one on me." The cost of yard service should be ascertained directly between state and interstate on the basis of the tons instead of dividing that item between local and through trains.

F. P. Johnson, chief accountant, St. Louis Iron Mountain & Southern Railway:

"If the total yard service, which amounts to $293,000, were divided between state and interstate business, it would then result in the same percentage of that total expense being charged to state business as was used in the case of station service; or practically one-third of all the yard expense upon that basis would be charged to intrastate freight. And that would assume that every ton of interstate and every ton of trans-state freight received a full yard service within the State of Arkansas. In an amended exhibit (exhibit Y) the State has changed this method of dividing station service by eliminating trans-state freight, and if this was done to yard service as well it would result in a charge of almost 50 per cent of the total terminal expense, or practically $140,000, being charged to state freight. The result would tend to very materially reduce the percentage of return upon the value of the property so far as the state freight is concerned.

"The yard and terminal expense is divided by the State in exhibit K first as between local and through trains, then

the expense apportioned to each class of trains is divided between state and interstate tonnage on the ton mile basis. The result of that is that $26,560.81 has been charged to state traffic on account of yard service. (This amount is incorrectly stated as $23,468.64 in the printed record. The figures quoted are those given by the witness in his deposition on file.) If we were to adopt the tonnage basis, Mr. Hillman's plan (Mr. Hillman was a witness for the State and testified that the cost of yard service should be ascertained directly between state and interstate traffic on the basis of the tons, instead of dividing it between local and through trains) and charge to interstate and trans-state freight one full terminal handling, then the proportion of the total expense that would be assigned to state freight would be $97,782." (R. 1990.)

These differences fairly illustrate the elasticity of the State's theories and how easily they may be moulded to accomplish a desired end.

Transportation expenses involved in yard and terminal handling are analogous to station expense. They both relate to traffic rather than train expense and should be apportioned on the same basis.

**(c) Fuel and Locomotive Expense:**

**(d) Road Enginemen and Trainmen Expense:**

The test made on the St. Louis Southwestern Railway for the month of October, 1908, which has heretofore been referred to, showed that the cost of fuel and enginemen on through trains was 34 mills per train mile and on local trains 50 mills. The result of this test appears in exhibit 20, on pages 2376, 2377 of the record. It will be observed that the two items are consolidated and the combined cost

as above stated shown on the latter page. In preparing exhibit K, the State's accountants adopted the result of the test referrred to, which showed that the local engines consumed 3½ per cent more fuel per engine mile than the through engines, and divided the fuel cost on that basis; they divided the wages of trainmen on the railway company's records for October, 1907. They pursued the same method with regard to the St. Louis Southwestern Railway, except that they used the October, 1908, test in dividing wages of trainmen.

The court, following the line pursued by the State in regard to fuel and wages, took the consolidated cost of the two items as shown on exhibit 20 as the basis of its division, and found that the cost of fuel and wages, combined, per train mile on local trains is 50 mills and on through trains, 34 mills, a difference of 47 per cent, and charged the local trains with 47 per cent greater cost for those items. (Op. 86.)

The difference is too small to be of much importance, but if the court erred it was in favor of appellants in the application of the ratios obtained from the St. Louis Southwestern Railway in the test made in October, 1908, to fuel and locomotive expense on the St. Louis, Iron Mountain & Southern Railway. If it were worth while we could show by reference to the evidence that there was not that similarity of condition which justified the view upon which the State and the court acted, but inasmuch as the amount involved is not large we will not consume time in

pointing out the evidence. The appellant at least can not complain of the court's action, for if it is fair for the State to use a ratio applicable to fuel and locomotive expense as ascertained by the test of October, 1908, on the St. Louis Southwestern Railway, why is it not proper to use the same method with reference to both items as was done by the court?

The fact is, no accurate division can be made for any period of six months on the basis of one month's operation, on account of the difference in operating conditions brought about by the difference in the traffic handled in different periods and during different months. The record is full of evidence on that subject, and even a casual reading will impress any one with the dissimilarity in the conditions affecting operation at different periods.

As to all the remaining items of transportation expense except Other Train Expense, viz., Engine House Expense, Loss and Damage to Freight, Supervision and General, and General Expenses, the court followed the plan of division contained in exhibit K.

*Engine House Expense*—Is divided on the basisof the engine miles of each class of service during the month of October, assuming that the local engines require 12 per cent more engine house service per engine mile than the through engines. All the operating men who were examined upon the subject testified that that basis was wrong, because the engine house expenses are not in proportion to the mileage made by the engines, and the addition of 12 per cent to local

engines was inadequate because those engines do the larger part of the switching, are subject to harder usage, are longer per mile on the road, and for those reasons there is a considerable excess cost incident to engines engaged in local service.

**Loss and Damage—Freight:**

Loss and damage is divided between intrastate and interstate business on the basis of the actual claims paid during the month. It is interesting and instructive to note that the actual allocation of loss and damage to freight results in a charge of 24.29 per cent of the entire expense to intrastate freight, which is a larger percentage than the revenue basis would show, even with 100 per cent added for extra cost.

*Supervision and General* and *General Expenses*—Are apportioned to local and through, intrastate and interstate business, on the basis of the direct charges of each class.

The greater portion of general expense consists of salaries and expenses of employes in the general auditor's office, and in turn the larger part of the duties of that office is the accounting for the revenues of the company. It also includes the freight claim department and the legal department. The cost of maintenance-of-way and maintenance-of-equipment has nothing to do with this expense. A large part of it is legal expense, and an increase or decrease in the expense of the law department bears no relation to the expenses of the several operating depart-

ments. (See the evidence of F. P. Johnson, R. 1992, and C. R. Gray, R. 1906-7.)

**Other Train Expenses:**

This item is divided in exhibit K in proportion to the train miles of each class of service during the month of October. It includes, and the greater part of it is made up, of such items as wrecks, injuries to persons, damage to stock on right of way, fires set out by sparks, and could have been allocated to the local or through trains with the same degree of exactness as the loss and damage to freight was. The train mileage obviously has nothing to do with that class of expense, and it was a mistake to apportion it on train mileage. The court divided it on the basis of the gross earnings of each class of traffic during the six months' period, which was a far better method than that adopted by the State.

## METHOD OF DIVIDING TRAIN COST BETWEEN INTRASTATE AND INTERSTATE BUSINESS.

In dividing train cost between intrastate and interstate business the State arpplied the ton mile theory.

They took the proportion of the ton miles of each class moved on local and through trains in the month of October, as shown in exhibit 1, as follows: On local trains 39.10 per cent of all intrastate and 8.70 per cent of all interstate; on through trains 60.90 per cent of all intrastate and 91.30 per cent of all interstate. Assuming that the same relative conditions would exist during the six months' period, the total ton miles of intrastate and interstate freight handled during that period was divided between local and through service in the proportions ascertained for the month of October, and in that way they determined the aggregate ton miles of each class of freight carried on local and through trains, and divided the train cost between intrastate business and interstate business in the proportions that the ton miles of each class bore to the total ton miles handled on local and through trains during the six months' period. The result was that they charged 26 per cent of the cost of local trains to intrastate business and 74 per cent to interstate business, and 4.96 per cent of the cost of through trains to intrastate business and 95.04 per cent to interstate business.

The percentages used by the State in dividing the cost of local and through trains are inconsistent with the scheme

of division as applied to detailed items, and work an injustice to the intrastate business.

In dividing the separate items of train cost between local and through trains for the six months' period, the factors obtained from the traffic in October were used. To illustrate: In dividing "Maintenance of way and structures" they found that 16.98 per cent of the engine and car miles of October was chargeable to local trains and 83.02 per cent to through trains, and they say "that month being considered representative of the business for the six months ended December 31, 1907," we will divide the total expense for the six months' period between the two classes of trains on that basis. In dividing the expense of locomotives under the head of "Maintenance-of-equipment" they ascertained the percentage of locomotive mileage chargeable to each class of service during October and divided the total expense for the six months on the same ratios as the mileage of each class bore to the total.

The average ton mileage of each class of trains expressed in percentages is shown on exhibit I, and is as follows: On local trains 28.51 per cent of intrastate and 71.49 per cent of interstate; through trains 5.59 per cent intrastate, 94.41 per cent interstate.

In the final division of train cost they change their factors by taking the proportions of the aggregate ton miles for the six months as the percentage upon which to divide train cost, thereby charging 26 per cent of local train cost to intrastate business and 74 per cent to interstate

business; to through trains 4.96 per cent to intrastate business and 95.04 per cent to interstate business. This results in a reduction of practically 2½ per cent in the total expense of intrastate business on local trains and two-thirds of 1 per cent on through trains, and applied to the large figures makes a material difference in the amounts.

But assuming, for the sake of argument, that the State's method in dividing the train cost is correct down to this point, it must next be determined if that cost was properly apportioned between intrastate and interstate freight carried on the two classes of trains.

## THIS QUESTION INVOLVES THE RELATIVE COST OF TRANSPORTING STATE AND INTERSTATE TRAFFIC.

It is conceded by all intelligent railroad officials and has been found and held in a number of decisions that there is a material difference in the expense of conducting the two classes of business. This was referred to in Ames v. Union Pacific Railway, *supra*, and C. M. & St. P. v. Tompkins, *supra*, where Mr. Justice Brewer said the testimony of experts familiar with railroad business is not to be disregarded simply because it can not demonstrate by figures the exact amount or per cent of extra cost. C. M. & St. P. Railway v. Keyes, *supra;* In re Arkansas Rates, *supra*, where Judge Vandevanter said that the extra cost of freight was at least one hundred per cent more and that of passengers at least fifteen per cent more.

Judge Hook, in M., K. & T. R. R. Co. v. Love, 177 Fed. 493, 499, said:

"Bearing on the division of expense is the much controverted question of extra cost of the local business as compared with the interstate. That the former costs much more than the latter is beyond doubt, but the difficulty is in applying the measure of difference. There is a general accord among practical railroad men of high standing and long experience that the cost of local freight traffic is from two to eight times as much as that of interstate traffic, and of local passenger traffic from twenty-five to fifty per cent more than the other. Though not altogether clear from the proofs here it is probable the difference mentioned in the freight traffic should not be fully applied in addition to a division on the revenue basis, for, as already seen, the difference finds expression, in a measure, in the relative revenue proportions themselves. A cogent reason for selecting the revenue basis in preference to the ton mile is that the former gives some effect to the known differences in cost."

Judge Trieber in the opinion in these cases said:

"That there is a material difference between the expense of state and interstate business is conceded by all.

"The lowest estimate made by any witness for complainants seems to be that it is at least 200 per cent greater, while some estimate it as much as 700 per cent. The witnesses for the railroads do not base their opinions upon itemized statements, as no records were kept by either of the roads for the purpose of dividing the expenses between the state and interstate business, but as all these witnesses are men who have been engaged in railroad work and connected with railroads from their earliest manhood, starting at the bottom of the ladder and now occupying most responsible positions, some as general managers, comptrollers, auditors, superintendents and other high positions, it is claimed that their testimony, based upon their great experience, should be controlling." (Opinion, pp. 69, 70.)

F. E. Ward, General Manager of the Chicago, Burlington & Quincy Railway, testified that the extra cost of intrastate freight service was more than five to one. (R. 729.) I. G. Rawn, President of the Chicago, Indianapolis & Louisville Railway, testified that the intrastate freight service cost at least three and a half times more than the interstate. (R. 676.) E. D. Sewall, Assistant to the President of the C., M. & St. P. Railway and Vice President of the Chicago, Milwaukee & Puget Sound Railway, testified that the extra cost of freight service was four to one. (R. 707.) W. M. Whitenton, the General Manager of the Chicago, Rock Island & Pacific Railway Company, in Oklahoma, Arkansas and Louisiana, said it cost from four to seven times more to conduct intrastate freight service. (R. 757.) W. J. McKee, General Superintendent of the Missouri-Pacific Railway Company, said that the intrastate freight service cost from four to five times as much as the interstate. (R. 694.) C. J. McPherson testified that the extra cost was five times as much. (R. 327.) W. B. Doddridge, four to six times as much. (R. 463-4.) Carl Gray, Vice President and General Manager of the St. Louis & San Francisco Railroad, three to five times as much. (R. 1908.)

These witnesses are all men of great practical experience in railroad operation. All of them rose from subordinate positions, and their experience covered all phases of railroad operation. No witness was produced on the part of the State who had had experience in operation that would qualify him to testify as an expert.

The State's witnesses were H. Wilmering, who was cashier and afterwards agent at a local station in Oklahoma, and was at the time of testifying auditor of the Oklahoma Corporation Commission since the latter part of 1907; C. S. Ludlam, an accountant connected with Haskins & Sells, public accountants representing the State in these cases, and who had never had any experience except in a limited way in the accounting department in railroad service; T. A. Hamilton, an accountant in the employment of Haskins & Sells; he was employed while quite young in the accounting department of a railroad, was afterwards employed by the Illinois Central Railroad and Louisville & Nashville as a bill clerk and for a time as chief clerk to the commercial agent of the latter road. G. W. Hillman, a public accountant. C. B. Bee, a young man about thirty years old; at the time he testified the rate clerk of the Oklahoma Corporation Commission. He had had some experience on Mexican railroads as stenographer, voucher and damage clerk, as handy man to the superintendent of the road, and was a short time commercial agent. He was engaged in this service from five to seven years, and testified that he was very familiar with all operating conditions. He came to Little Rock, the chief terminal division point in Arkansas, for the purpose of investigating operating conditions on the Iron Mountain Railroad in order to qualify himself as a witness in these cases. He spent a day and a half there, but testified that he did not visit the shops or yards where operations were conducted. W. E. Fitzgerald, the auditor and expert accountant of the Railroad Commission of the State

of Texas since 1909, and who previous to that time had been employed in the accounting department of the Texas railroads in the capacity of voucher clerk, general bookkeeper and chief clerk in charge of disbursement accounts; and R. D. Parker, a civil engineer by profession, and employed by the Texas Railroad Commission as expert engineer since 1909. He was thirty-two years old, had taken a course in the Texas University in engineering, and been engaged in railroad location and construction prior to the time he entered the service of the Texas Commission. He testified that he had for the last four years of his railroad service been engaged in directing the maintenance-of-way forces, and it was necessary for him to be practically two-thirds of his time on the road riding on passenger trains or freight trains and in and about yards and terminals.

These were the witnesses examined by the State on this point. We have taken some pains to call attention to their qualifications, as it was described by themselves, because they were introduced as experts upon a subject which of necessity required great familiarity with operating conditions, without which no one is qualified to testify in that capacity. We feel that the testimony introduced by plaintiffs on this subject is practically uncontradicted, because, without impeachment of the integrity of the State's witnesses, it may be fairly said that not one of them was qualified from experience and training to speak as an expert upon the subject.

Mr. F. E. Ward's testimony will be found at pages 725-729.

C. J. McPherson, pp. 321-327.

Mr. Sewall, pp. 703-709.

Mr. Rawn, pp. 672-678.

Mr. Whitenton, pp. 751-758.

Mr. Doddridge, pp. 457-466.

Mr. McKee, pp. 689-695.

Conditions affecting the relative cost are clearly and fully set forth by the plaintiffs' witnesses. We call attention particularly to the testimony of Mr. Ward and Mr. McPherson. Mr. Doddridge testified in regard to a test made under his direction on the St. Louis Southwestern Railway during the month of October, 1908, for the purpose of determining the relative cost. He describes the result as follows:

"The test shows on the basis of gross earnings the intrastate freight train expense for labor and fuel costs 5.5 times greater than the interstate. It shows that the cost of service and fuel for running the local train per mile to have been 47 per cent greater than the cost of running the through train per mile.

"It shows that the local train produces 129 ton miles of commercial freight for each mile run; and the through train produces 399 ton miles of commercial freight for each mile run.

"The average number of loaded cars per train mile in through trains was 23, or 72 per cent of the total train.

"And in the local trains 11, or 69 per cent of the total train.

"The average number of empty cars per mile in the through train was 9, or 28 per cent of the total train; in the local trains 5, or 31 per cent of the total trains.

"The average number of all cars per train mile in through trains was 32, and in local 16.

"Seventy-eight per cent of all intrastate business was handled on local trains. The remaining state freight, 22 per cent, was handled on through trains; 92 per cent of the total interstate business was handled on through trains, 8 per cent of the total interstate freight was handled on local trains. Of company freight, 49 tons to each mile run was carried on through trains; 21 tons for each mile run was carried on local trains.

"The average tons of all dead weight (that is non-revenue weight), which includes the weight of the locomotives, cabooses, company freight and all cars per train mile, was 734 tons on through trains and 397 tons on local trains.

"The through trains carried more than three times as much commercial business per mile run as the local trains, but required less than two times as much dead weight.

"The average tons of dead weight to a ton mile of commercial freight was:

"Less than carload, through trains, 4.50 tons.

"Local trains, 9.44 tons.

"Carload, through trains, 1.62 tons.

"Local trains, 1.90 tons.

"Both, through trains, 1.84 tons.

"Local trains, 4.09 tons.

"The per cent of dead weight to gross weight on through trains was 65 per cent.

"On local trains, 76 per cent.

"The per cent of overtime to total wages of train and enginemen was 5 per cent on through trains and 19 per cent on local trains." (R. 459, 460.)

IN APPORTIONING TRAIN COST BETWEEN INTRASTATE AND INTERSTATE FREIGHT CARRIED ON LOCAL AND THROUGH TRAINS ON A STRAIGHT TON MILE BASIS, WITHOUT ANY ALLOWANCE FOR EXTRA COST, THE STATE DISREGARDED MANY IMPORTANT ELEMENTS OF EXTRA COST THAT ARE INDEPENDENT OF TRAIN COST AND GROW OUT OF DIFFERENCES IN INTRASTATE AND INTERSTATE TRAFFIC, AND ARE NOT PROVIDED FOR IN THE STATE'S SCHEME OF DIVISION.

Learned counsel conceded that the ton mile was not a proper unit for dividing total expenses, and said that under no circumstances would he use the ton mile for dividing the total expenses, and yet that is what was done under this division of the exhibit. The entire train expense, both local and through, amounting to $2,592,298.35, or 84 per cent of the total operating expense, is thus divided.

Counsel further said that the objection to the ton mile basis, as to its inequalities and disregard of the character of the tonnage, has been met and provided for in the State's scheme of division.

No attempt was made in dividing train cost to provide for any element of extra expense except that growing out of the difference in the service for which the equipment is used in local and through service. The arbitrary allowances made under the several headings used in the exhibit in connection with train cost has no application, even the most

remote, to that difference in expense which grows out of the traffic and does not result from or depend upon the physical handling of trains. Mr. Wharton's attention was specially directed to this question while on the stand, and he was asked if, in the division of the expense, he had made and difference between state freight and interstate freight, and he testified that he had not; if there was any distinction it was not taken into consideration. (R. 1036.)

All the testimony in the record agrees that there is a difference in the cost of transporting different classes of commodities, growing out of the volume, space occupied, degree of care necessary for preservation, liability to damage, and various elements of that sort characteristic of different classes of commodities.

Witnesses were examined and a good deal of testimony taken on this proposition, to which we wish to call the court's attention. Mr. Ward's views were expressed as follows:

"The State has attempted to determine what is a proper method of distributing train and car costs between local and through trains. And when they have done that, according to the method adopted, they undertook, by taking into account the tonnage of state freight handled on local and through trains respectively, to ascertain the ton mile cost of handling such freight; and have assumed that the cost of handling a ton mile of state freight on a local and on a through train is the same as that of handling a ton mile of interstate freight on the same train. This assumption, in my opinion, is an erroneous one. It fails to recognize the fact, which I endeavored to point out in my previous testimony in this case, that the terminal handling of short-haul intrastate freight is more expensive per ton mile than of long-haul interstate freight. Many more car miles are re-

quired to handle a given number of intrastate, short-haul ton miles, than the same number of interstate, long-haul ton miles. A much larger amount of property and facilities is required to handle such a quantity of intrastate short-haul ton miles than of interstate long-haul ton miles.

"By this I mean that the station facilities at the local stations through any state, so far as my observations go, are, when measured by the ton miles, used to a very much greater extent than is the case with other business passing those stations, or even originating at or destined to those stations. In order to make myself clear on this point, I might explain that a ton of freight of a given kind received at a country station will not cost any more to unload from a car and deliver to a consignee if it has originated in the State than if it has originated in another state. But when the cost of handling that ton of freight is divided by the ton miles applicable to it, it makes a much heavier charge per ton to the short-haul intrastate ton than to the long-haul interstate ton.

"I might illustrate it by saying that I suppose the people of Arkansas, as in other states, buy a good deal of merchandise from mail-order houses like Sears, Roebuck & Co., and Montgomery Ward, of Chicago; let us imagine, if you like, the purchase by a man at a country station 25 miles south of Little Rock; say he buys a ton of merchandise of Sears, Roebuck & Co., and it is carried down to his station and is delivered to him from the same car and at the same time as is a ton of the same kind of freight which he needed in a hurry and purchased in Little Rock. The station expense at the delivering station, in such case, is exactly the same; each operation is precisely the same as the other. But when you measure it by the ton miles you have 25 miles to apply to that ton which came from Little Rock, and approximately 600 miles on the ton that came from Chicago; so there is, perhaps, 24 times more chargeable to the state ton than to the interstate ton in that station expense.

"Continuing in that statement of the matters that were overlooked in this assumption of the State's accountants, I would like to say that the various allowances made by the State's accountants, as shown in detail in exhibit K—such for instance, as extra mileage for engines on local trains on account of station switching, extra and excess cost of re-

pairs to yard engines, extra cost of repairing cars running in local trains, extra wear and tear on road-bed and structures through operation of local trains, etc., are to a large extent made necessary by the handling of this short-haul intrastate business.

"In fact, the assumptions made by the State's accountants omit some of the most essential factors, which, in my opinion, go to make up the large difference between the cost of handling the two classes of business.

"Referring to the long and short haul, I think that effect is illustrated by the example I gave of a ton of freight from Chicago compared with one from Little Rock, going to the station 25 miles south of Little Rock. The interstate long-haul ton has so many more miles to divide into that the expense per ton per mile is very, very much less.

"In the case in point, my recollection is that the average haul per ton of state business in Arkansas is 70 miles, and of the interstate per ton 224 miles. Both of those are the number of miles in the State of Arkansas, as I understand it. Whereas, as a matter of fact, the interstate and trans-state freight must move a very considerably greater number of miles than 224. So that the proportion of three to one does not actually hold good as applied to the whole situation.

Q. "Does the addition of 50 per cent to the car miles of local trains for switching at stations, as made under the head of "Maintenance of Way and Structures," provide for the actual expense of state over interstate business growing out of the fact that the larger part of the switching is chargeable to state freight?

A. It does not. It seems to undertake to determine the cost of handling cars in local trains as against the cost of handling cars in through trains, but does not touch at all the cost of handling the freight in those trains, as between state and interstate.

Q. Would the allowance made there as between the two classes of trains cover the extra cost of handling the state freight over the interstate?

A. No, sir; in my opinion it would come very far from doing it.

Q. There is a similar allowance made under the head of "Maintenance of Locomotives." They have added 50 per cent to the mileage of yard locomotives to provide for possible extra maintenance due to yard service, and 50 per cent to the mileage of road engines used in local service to provide for switching in local service. The same is true of that, I suppose, is it, Mr. Ward?

A. Yes, sir.

Q. Allowance is made for starting and stopping and terminal handling. Is there an added element of extra cost on state over interstate freight that is not provided for in that allowance between local and through trains?

A. It seems to me that one great difficulty about the State's plan is that an attempt has been made to determine the cost of handling a local train as against a through train. In determining that, and in trying to determine it, a great many assumptions have been made which I cannot accept as being correct. But, after that is done, there still remains a number of very important factors which are not taken into account at all.

"If the State's method of determining the cost of the local as against the through trains worked out right, there still remains to be determined the question of how much more it costs to handle the state or short-haul freight in that train than the interstate or long-haul freight in that train. In fact, there is practically another question.

Q. "You testified when you were on the stand formerly in this case, that in your opinion it cost five times as much to transport state freight as interstate freight?

A. I expressed that as my opinion as applied to this case.

Q. Are there any facts developed in this exhibit K (and the other exhibits filed in connection with it for the

purpose of developing the theory upon which the State is seeking to divide these expenses) which would change or affect your views in that regard, Mr. Ward?

A. I have given the subject a good deal of thought from time to time, because it has come up not only in this case, but in other states, in which I have been interested as a railroad man, and the more I think about it the more I am inclined to think that estimate was low and not high, as to the excess cost of state over interstate.

"The conditions, as they seem to me, point to the fact that I have stated it in quite low terms, and not at all too high. I certainly have not modified my opinion as to its being as much as that.

Q. "Mr. Ludlam, who is one of the State's accountants and whose firm prepared these exhibits we have been discussing, testified that the extra expense as developed by the method of division adopted by the State was 87 per cent; how do you account for the difference between the 87 per cent developed by the State under its method and the views expressed by you, and to which your attention was called a moment ago, that it costs five times as much?

A. It is due in part to the erroneous assumptions that have been made here, in undertaking to divide the cost of local train service and through train service, and in part to the omission of those other elements to which I have referred. My opinion is, as it was before, that this is not a matter which can be determined by any proper system of accounting. It is one very difficult of solution, and the closest approach to an accurate result in the matter can be secured, in my opinion, by getting the views of operating officials who are in contact with this kind of work every day of their lives, and who are watching it, and who have had every opportunity to see under what conditions the various classes of traffic are handled. (R. 1864-1867.)

Q. Assume a case in which the average haul of state freight is say 70 miles and of intrastate 224 miles; how many cars would be required to move a given tonnage of state freight over the length of haul (224 miles) of interstate freight of equal tonnage?

A. Bearing in mind the conditions under which railroad cars are moved, there would be a greater use of the cars necessary than the mere difference in the mileage would indicate on its face. In that case there would be practically eight times as many cars required to handle the same tonnage in state as in interstate business.

"I have in mind, in making that statement that on each one of the short hauls, comprising the total required to equalize the ton miles for the state and interstate, that there would be a free time allowance for both the loading and unloading of the freight; and in that case almost universally throughout the country that free time is 48 hours.

"So, there would be not only a difference in the mileage but a difference in the time, because of the necessity for getting additional cars, and the time the cars were delayed by reason of the free time allowance under ordinary railroad regulations.

Q. "You stated a moment ago it would require eight times as many cars for state freight to carry the tonnage that would be required for the interstate freight; does that cover the free time or does the free time you speak of, 48 hours for loading and unloading, have any effect in increasing that disparity?

A. I think that would just about double it, because without the free time there is the stoppage at each of the short-haul points and the 48 hours added in each case, would more than double it. It would need a pencil and paper calculation to know exactly what that means, but it would run a good deal more than double.

Q. I simply want to get at the facts in a general way. What difference is there in the terminal service as between state and interstate freight, and what effect does that difference have upon the relative cost of the handling of the two kinds of freight?

A. In state business there is necessarily two terminal handlings; the freight has to be loaded and unloaded twice; and all of the expense in connection with the billing and checking and expensing is double in case of the state freight.

"The interstate freight never has more than one handling and if it happens to be trans-state freight there is no handling in a given state. And then the difference in the length of haul would make a marked difference, because wiping out state lines altogether, the longer the haul the less the cost per ton per mile would be for station service, because you have a much greater figure into which to divide that cost." (R. 727, 728.)

Mr. McPherson, referring to a number of the elements of extra cost that can not be included in the method of dividing between local and through trains as proposed by the State, testified:

"First: There is a greater use of the railway facilities in proportion to tonnage by the intrastate freight traffic, a greater cost of maintenance, and a heavier terminal cost, than for interstate freight traffic. The railway secures less efficiency from its cars used in intrastate freight traffic, in proportion to the relative tonnage, than in the interstate freight traffic; a greater investment in cars is necessary, and there is a larger cost for maintenance of cars in intrastate traffic than in interstate traffic, in proportion to the respective tonnage.

"My opinion is formed from an application of the facts to the exhibits in this case, from years of personal observation, from reports made periodically in my office, which I study and compare.

"Exhibit No. 26 shows that 51.16 per cent of all the ton miles of freight traffic moved by this railway in the State of Arkansas, in the period named, consisted of trans-state traffic, traffic that originated outside of Arkansas and passed through that State into other states. This is more than one-half of the entire freight traffic on the ton mile basis, that the railway moved during the period." (R. 321.)

In discussing Mr. McPherson's testimony, counsel assumed that he disregarded almost entirely the use of the facilities in connection with trans-state freight; on the con-

trary he made a liberal allowance for the use of the state facilities by the trans-state business. He said:

"The trans-state traffic merely passes through the State and uses but a part of the facilities provided by the railway for handling its business. This trans-state traffic does not require or use the station organization, the agents, cashiers, collectors, bill clerks, check clerks, and the numerous other classes of station labor, except yard clerks, who record car numbers and make out car reports; and the callers, who call the men that man the trains.

"It makes no use of station buildings, except the portion assigned for telegraph purposes; nor of house tracks, where cars are loaded and unloaded; nor of team and public tracks, where car-load freight is received and delivered; nor of tracks to elevators and industries, such as mills, warehouses, coal and lumber yards, storage yards and manufacturing establishments; nor of many buildings and other facilities which are provided to care for traffic, either originating in or destined to points within the State.

"The trans-state traffic could be handled with equal dispatch without the facilities I have mentioned. It is attended with very small terminal cost. The traffic is gathered, weighed, loaded, and billed in another state through to destination and requires no accounting nor station labor in Arkansas, except yard and car record clerks, as previously explained. In the orderly handling of business there are no reasons for trans-state freight which simply passes through the State to incur but a minor expense at division yards and junctions; but in practical operation, both intrastate and interstate cars are added to trains in which this traffic is moved, to secure the full efficiency, as far as possible, of the locomotives.

"The making up of trains is but a part of the yard work, the engines engaged in such service in classification yards handling cars in large cuts, and without extended movements, while in the other yard work, that of switching to the house and team tracks, and the delivery of cars to and taking them from industries, mills and warehouses widely scattered, with but a few cars to a trip (sometimes only one)

consumes time in both the gathering and distributing of this traffic, which is wholly intrastate and interstate, and none of it trans-state.

"Assuming that such physical handling as is given in these yards to trans-state traffic should be a charge against such traffic (which is not, in my opinion, equitable or proper), 15 per cent of the yard service in Arkansas would be a liberal allowance therefor.

"That is to say, not more than 15 per cent of the entire cost for yard service and general yard expenses would attach to 51.16 per cent of the freight traffic.

"Eighty-five per cent of the entire yard cost and expense would attach to 48.84 per cent, which comprised the intrastate and interstate freight traffic.

"The yard expense amounts to 13 per cent of the total expense of operation in Arkansas, or $398,806 for the six months, July to December, 1907.

"Of the station expense, which forms 5 per cent of the entire expense of operation in Arkansas, or $165,258, in the six months, this 51.16 per cent of traffic would make use of only the yard clerks and car record clerks to the points where records of trans-state traffic were taken.

"The total expense for these clerks at such points amounts to 8.5 per cent of station expense, and but a part of these clerks perform duties incident to such traffic.

"The trans-state freight traffic forming more than one-half of the entire traffic of the State, as measured by ton miles, could, on the most liberal construction, make use of but 15 per cent of yard service, as against 48.84 per cent constituting the intra and interstate traffic making use of 85 per cent of yard service, and but a part of 8½ per cent of station expenses.

"Measured by ton miles, the freight traffic touching Arkansas in the month of October, 1907, the month analyzed, was: Trans-state, 51.16 per cent; interstate, 40.69 per cent; intrastate, 8.15 per cent.

"Eliminating the trans-state from consideration, the relation between the interstate and the intrastate traffic becomes 83.3 per cent interstate and 16.7 per cent intrastate. As 48.84 per cent of the traffic uses all of these facilities, the relation of the intrastate traffic to the 48.84 per cent (the interstate and intrastate combined) is 16.7 per cent. Let me explain here that the term or expression 'terminal expense' or 'terminal cost' is used in a broad sense, and means the station and yard expense not only at district and division terminals, but at all stations; it also embraces the cost of maintenance of switch engines and sidetracks other than passing tracks, as every station is a terminal for the traffic that it originates or receives.

"Every shipment of freight, big and little, regardless of the length of haul, must have two terminal expenses. Trans-state freight has no terminal expense within the State. The expense at the starting point and at the destination is a part of the expense of operation of other states, and in the exhibits of cost filed in this State none of those expenses are contained for trans-state freight.

"Strictly interstate freight, that which originates or terminates in the State of Arkansas, has but one of these terminal expenses. The other terminal expense is a charge to the operation of some other state.

"Every intrastate shipment in Arkansas has two terminal expenses within the State." (R. 321-3.)

The witness then (R. 324) illustrated the difference between the long and short haul represented in state and interstate traffic by examples which show that it will require eight cars to handle the same amount of freight in state traffic as would be handled by one car in interstate traffic, and proceeds:

"Exhibit 5 shows that for the six months ending December 31, 1907, the average length of haul of all intrastate freight was 70 miles; while the average length of haul of all interstate freight in Arkansas was 224 miles.

"This means that each shipment of interstate freight moves on an average of 224 miles with but one terminal expense, either that of forwarding or delivering. Each intrastate shipment moves on an average of but 70 miles and incurs two terminal costs for that distance. It follows that to attain the same average length of haul as the interstate that eight terminal costs must be incurred by intrastate freight. That is, eight times the use of the terminal facilities must be made by intrastate freight as compared with one use of the facilities by interstate freight.

"The interstate shipment goes 224 miles for one terminal expense. The intrastate shipment goes but 70 miles and has two terminal expenses.

"Therefore, say for example, ten tons of interstate freight is moved 224 miles with but one gathering or distributing cost; and ten tons of intrastate freight go but 70 miles with both the gathering and distributing expenses.

"The intrastate ten tons shipment goes 70 miles, with two terminal expenses, another ten tons goes 70 miles further, with two more terminal expenses; a third ten tons goes another 70 miles more with two more terminal expenses; and a fourth ten tons the balance of the distance with two more terminal costs to equal a single interstate shipment.

"Ten tons of freight had been loaded four times and unloaded four times, making eight handlings of the intrastate movement of ten tons, while it is going 224 miles; while ten tons of interstate freight has been loaded or unloaded but once in moving this same distance.

"For the purpose of further illustration, we will take the exact distance that we used before, as that represents the average length of haul of the interstate and the intrastate freight.

"The distance from Texarkana to Nuckles, Ark., is 224 miles, the same distance as the average miles moved by every interstate shipment, in Arkansas. (R. 323-4.)

"A car loaded with twenty tons of freight in Texas for Nuckles passes Texarkana and comes through to Nuckles,

where it is put on a sidetrack, unloaded, and charges collected by the agent and remitted, and the other accounting work incident to the transaction is completed. The car makes 4480 ton miles, that is 20 tons multiplied by the distance, 224 miles.

"The distance from Corning to Nuckles is 70 miles, the same distance as the average number of miles made by every intrastate shipment in Arkansas.

"Three cars containing 20 tons are loaded at Corning and moved to Nuckles, making 4200 ton miles. One car, containing 20 tons, is loaded at Tuckerman and moved to Nuckles (a distance of 14 miles, which, added to the mileage of the three cars, is equivalent to the interstate haul of 224 miles), making 280 ton miles. The four cars making 4480 ton miles, the equivalent in that respect to the interstate shipment of one car 224 miles. Four cars are required to take care of the average intrastate shipment as against one car for the average interstate shipment. Three cars must be set at Corning and one at Tuckerman, or a total of four cars for loading.

"These must be loaded, weighed, billed, and all of the accounting features observed at the loading station; and the same four cars must be set for unloading at Nuckles; unloaded, charges collected and remitted and all accounting features incident to the transaction at that end of the journey completed. Each of these four cars has borne a terminal expense at origin and at destination, making eight terminal expenses, as compared with a single terminal expense of the interstate shipment at Nuckles. The other terminal expenses on that shipment, the setting the car for loading, its billing, weighing, and the other steps incident to its preparation for movement, are borne by the station at which the car was loaded in Texas.

"The cost of handling business is dependent upon the number of times the terminal is used.

"The four intrastate shipments referred to require the services of the station and yard forces, and the use of facilities eight times, to move the twenty tons the same number of ton miles as the single interstate shipment which

made the use of station and yard forces and other facilities in the State but once.

"The terminal cost of a shipment five miles is as great as on a shipment of 50 miles or 150 miles or, in fact, any distance; and the terminal cost to the St. Louis, Iron Mountain & Southern Railway in Arkansas for the six months, July to December, 1907, inclusive, was 18 per cent of the entire cost of operation, or $564,064.

"In intrastate traffic a greater number of cars is required and a larger investment required in freight car equipment than is required in interstate traffic.

"Even assuming that the average tons loading per car in interstate and intrastate traffic is equal; that is, that each car loaded in each class of traffic contains the same number of tons, four cars to one are necessary to be employed in handling the intrastate over interstate traffic, to secure the same number of ton miles.

"This, however, as I have explained before, is not the true ratio. Under the railway practice, and under the laws of Arkansas, forty-eight hours are allowed the shipper for loading and forty-eight hours are allowed the consignee for unloading every car.

"This means, in going back to the illustration just made, that the interstate shipment to Nuckles would result in the company being deprived of the use of one car for forty-eight hours, while in the four intrastate shipments the company would be deprived of four cars ninety-six hours each, or 384 hours.

"Reducing this to days the railway company would lose the use of the car containing the interstate shipment two days; while it would be deprived of the use of the four cars in the intrastate shipment sixteen days. This makes the ratio eight to one.

"Eight cars for the use of intrastate freight as against one car in interstate freight.

"As I have explained before, even though the full forty-eight hours were not used in every case, that is to say if the average were lower, if it were one and one-half days or one and one-quarter days or one day, the ratio would remain the same, eight to one.

"The standard freight car of today costs $900, and the relative investment in freight cars in the illustration used for the intrastate and interstate traffic would be $7,200 for the intrastate cars and $900 for the interstate car. This investment is a part of the cost of road and equipment, and the larger investment places additional burdens upon the railway company to earn the interest necessary to carry it, in the ratio of eight to one for intrastate over interstate traffic.

"The cost of maintenance of cars is greater in the intrastate than in the interstate traffic. As I have illustrated it heretofore, eight cars must be provided to handle the same tonnage of intrastate traffic as can be handled with one car in interstate traffic. This naturally increases the proportion of cost of freight car maintenance in intrastate traffic over interstate traffic.

"Depreciation is also going on with eight cars as against one car equivalent in interstate traffic. The ratio would be eight to one. The maintenance of cars is a large item in the expense of operation, amounting to 12 per cent of the entire freight cost in Arkansas during the six months, July to December, 1907, inclusive.

"The depreciation would be eight times as great in the intrastate traffic as in the interstate traffic. And this depreciation on all cars for the purpose of complying with the requirements of classification prescribed by the Interstate Commerce Commission was established at three per cent per annum, or $27.00 per car per annum, on the standard car of today. The relative depreciation therefore would be $216 per annum for the eight cars in the intrastate traffic as against $27 per annum for the single car in the interstate traffic. The ratio would be eight to one. The repairs to freight cars averaged $63.20 each in 1907, and this is fairly representative. As the use of freight cars in intrastate traffic to reach the same ton mile equivalent is eight times

that of interstate traffic, the maintenance would be at the ratio of $505.84 for eight cars per annum, as against $63.23 for one car per annum for interstate traffic, in the ratio of eight to one.

"From my practical experience in railway operation and for the reasons I have given, and for other reasons, in my opinion, the cost of handling intrastate traffic is at least five times as great as that of handling interstate traffic, on the basis of quantity, or more than double the cost on the basis of revenue, as shown in these exhibits." (R. 323-327.)

Mr. Gray, referring to the ton mile division, said:

"It is very unsatisfactory because it does not satisfactorily take into account the increased elements of cost as between the handling of intrastate on one hand and inter or trans-state freight on the other hand. One of which, and a very potent one, is on account of the difference in haul and the difference in the expense of handling.

"My judgment for a long time, as the result of giving such study to this mooted question as I could, such intelligent study as I was capable of, has been that the cost of handling intrastate freight business as against the cost of handling interstate and trans-state freight business, under the conditions which prevail in the Southwest, in practically any of the states in the Southwest with which I am familiar, will run from three to five times as much. In the subsequent study I have given the matter I would be inclined, if I changed at all, to raise the range of that cost."

Referring to exhibit K, after pointing out other objections, he said: "But above all, remains the fact that a proper allowance has not been made for the relative cost of the two classes of business." (R. 1907, 1908, 1909.)

See the evidence of Mr. Nay, R. 1838; Mr. Doddridge, R. 454.

The State's accountants, in preparing exhibit K, seemed to labor under the impression that the question at issue in this case was not so much the cost of state and interstate freight, but rather the cost of operating local and through trains.

## THE FINDINGS OF THE COURT IN REGARD TO EXTRA COST OF INTRASTATE FREIGHT TRAFFIC.

The court found (page 69) that the actual difference between the expense of local and through trains per ton mile, as shown by the State's accountants in their exhibits and testified to by Mr. Hamilton, was 162.67 per cent. (R. 1591.) The extra cost of the intrastate freight, however, was greatly reduced by reason of the large amount of inter and trans-state freight placed upon the local trains as the result of the State's method of compiling exhibit "I," showing the tonnage carried upon each class of trains, the net result being that the cost of the intrastate freight carried on both classes of trains was 87 per cent more per ton per mile than the interstate freight.

After making various changes in the basis adopted by the State the court furnished the formula upon which the accountants for both sides were requested to compile the final statement, which appears as exhibit A to the court's opinion found at pages 106-116. The result of the compilation based upon these modified formulas shows that the average cost of intrastate freight per ton per mile was

201.5 per cent more than the cost per ton per mile of handling interstate freight.

Upon a careful investigation of the difference in the rates charged for intrastate and interstate freight the court found (pages 58-68) that the intrastate rates in force at the time of the institution of these actions and in 1907 were 50 per cent higher than the inter and trans-state rates per ton per mile. The result of this investigation made by the court would tend to reduce the proportion of the various items of operating expense chargeable to intrastate freight only on such accounts as the court instructed should be divided upon the revenue basis. This excess of 50 per cent in the intrastate rates would not affect the entire division of the operating expenses, as but a small proportion of the total expense was divided between state and interstate freight upon the gross revenue basis under the formulas adopted by the court. They cover the following items. Maintenance of way and structures, traffic expense, and miscellaneous or other train expense, and only those items are affected by the increase in the intrastate rates as compared with interstate rates.

The court also found from the evidence that in preparing the formulas or bases of division the accountants for the State disregarded elements of expense which add materially to the cost of the local as compared with the trough traffic, and which should be taken into consideration in determining the difference in cost. While it was impossible to express the result of these omissions in percentages, the court finds

that they were of enough importance to be considered. The omissions referred to include such items as the difference in dead weight on local and through trains, demurrage charged on cars in other states, which was not represented in the figures submitted in the case and which has a very important bearing upon the relative cost of the two classes of traffic, especially when the entire length of haul is taken into consideration. The percentage of freight in less than carload lots on local and through trains was an item of extra expense that could not be provided for by the formulas adopted. The reciprocal tonnage based upon the movement of interstate freight, such as the movement of lumber to the North being counterbalanced by the movement of grain to the South, was another item. After considering the various items mentioned above, and others, the court found that, taking into consideration the differences between the intrastate and interstate rates for like commodities and like hauls on the one hand, and the various items that were omitted as mentioned above on the other, there should be an additional charge of 8½ per cent added to the percentage of extra cost found by the accountants as the result of their calculations based upon the formulas submitted by the court, the result being that the extra cost of handling intrastate freight on the St. Louis, Iron Mountain & Southern Railway was found to be 210 per cent. (Opinion 90-92.)

The court found from the evidence that the conditions on the St. Louis Southwestern Railway Company were somewhat different from those existing upon the lines of the

St. Louis, Iron Mountain & Southern Railway; that the trans-state freight was almost 65 per cent of the total freight moved as compared with only 51 per cent on the St. Louis, Iron Mountain & Southern. It was also found that the average length of haul is shorter for the intrastate freight than it was upon the St. Louis, Iron Mountain & Southern, and the difference between the length of the intrastate and interstate haul was greater. There were other matters which added to the increased cost of local business, and taking into consideration all of these differences in conditions upon the two roads, the court found that an additional allowance of 40 per cent should be added to the percentage of extra cost, making that percentage 250 per cent. This was done after making necessary allowance for a reduction on account of a like difference of 50 per cent in the rates charged for the two classes of traffic. (Opinion 93-94.)

## THE STATE'S DIVISION IS BASED UPON A FALSE ASSUMPTION AS TO THE TON MILES OF INTRA AND INTER-STATE FREIGHT HANDLED ON THROUGH AND LOCAL TRAINS.

Every operating man who testified stated that much the larger part of the intrastate freight is carried on local trains.

C. J. Lincoln, a witness introduced by the State, testified that—

"The interstate traffic is very largely handled on through trains, state traffic is handled on local trains very largely." (R. 967.)

W. B. Doddridge:

"The great bulk of intrastate freight is carried on local or way trains, in common with such interstate freight as there may be for distribution or collection." (R. 457.)

I. G. Rawn:

"I would think that the local train would carry a great preponderance of state freight." (R. 680.)

F. E. Ward:

"State freight being short haul freight is usually carried on the way freights. Interstate freight being long haul is ordinarily handled on through freight trains that run through from one terminal to another. The way freight or local train is one which carries the short haul freight going to towns intermediate between the terminals, either carload or less than carload, and those trains 'peddle' as we call it; that is, load and unload the small lots of less than carload freight, and they spot the cars for the local station, do all the station switching, and are practically traveling

switching trains to do the miscellaneous work that has to be done between terminals. The through freights are trains which are made up as nearly as possible of a unit of size, based upon the cars on the line over which they run and the power that is used there, and on those trains freight destined to distant points is carried, so that in handling that freight is not disturbed. There is no switching or other expense put on to it. It is carried through from one terminal to another terminal ordinarily." (R. 723-5; also 734-5.)

W. M. Whittenton:

"The state business is largely a short haul business and for that reason it is naturally handled on the local freight trains. (R. 758.)

The test made on the St. Louis Southwestern Railway in October, 1908, showed from actual observation and count that 22 per cent of intrastate freight was carried on through trains and 78 per cent on local trains. The nature of the business itself would indicate that that is the case. Local trains are operated largely for the purpose of distributing local intrastate freights. The long haul traffic, which is composed almost entirely of interstate and trans-state freight, is most economically handled on the through trains to avoid the numerous stops made by local trains for switching at junction and terminal points and for distribution at all way stations. It is for that reason the local trains do a large amount of switching at way stations while through trains do scarcely any. Pretty much all the freight that originates in and is destined to points within the State is moved on local trains. It would naturally follow that a very large proportion of that class of freight would be carried on local trains, and yet it is assumed in exhibit "K"

that 61 per cent of intrastate ton mileage was moved on through trains and 39 per cent on local trains. Such a showing is so contrary to natural conditions that it requires explanation, and it is explained in the record by the peculiar abnormal condition in regard to the handling and movement of freights in the month of October, 1907, growing out of the congestion that existed at that time. We will use the language of the witnesses who handled or superintended the handling and movements of freights, in describing the condition that existed and its effect.

John Cannon, Superintendent of the Arkansas Division, testified:

"During the fall of 1907, on account of the very heavy movement of business, we departed from our usual practice in loading our local trains. The local trains during normal times handled nothing but less than carload freight and what we call 'short loads;' that is, loads destined to stations on the local train territory. During the fall of 1907, in addition to that class of loading the locals were filled up to nearly the maximum tonnage with through loads, loads that went an entire distance over the district the local was run on. That excess tonnage ran all the way from 300 to 800 tons per day.

"Most of it was interstate traffic. Of course, there was a lot of state traffic handled also. But the major part of it was interstate freight, through loads that were ordinarily handled in our through trains going to St. Louis or Memphis and to points in Texas or Louisiana." (R. 1797-8.)

H. V. Brown, the terminal clerk, testified that he handled the waybills every day, went over them and checked up the local condition in the yard and made detailed reports as to the movement of freight in and out of the yard. It gave

him a pretty good idea as to what they were handling. The congestion in October, 1907, increased the tonnage on the local freights. I think the local in normal times handled at least 70 per cent of the state freight and not to exceed 30 per cent of the interstate freight. The proportion of interstate freight carried on local trains was increased considerably at the time on account of the through loads that were being put on the locals in order to facilitate the movement of cars. I should estimate that upwards of 60 per cent of the freight carried on local trains was interstate. (R. 1805-6.)

B. W. Moore, the night yardmaster, testified that usually the through trains are loaded to the rated capacity of the engine, but that the local trains are not loaded to the full capacity; that in October, 1907, there was a congestion of freight in the yards of the railroads; that that condition was not peculiar to the Iron Mountain road, but existed on all the roads and in other states; that on account of the congested condition they utilized the power to all the advantage they could by adding to the local movement an added tonnage of probably 500 to 600 tons a day. The added tonnage came from trains from St. Louis, Kansas City, New Orleans, Alexandria and Memphis, going to local points in the local territory or division. Superintendent Cannon issued instructions to utilize the local power to the best advantage in the movement of business, and not to exceed on the local trains, which had light engines of 1,200 tons capacity, 1,000 tons on each local division. Those instructions were carried out to the letter, as I remember it. Ordinarily the local

train would handle only such local cars, less than carload, as originated on the local division. There was a large addition to the loading of local trains during the month of October, 1907, on account of the congested condition of the traffic. A great part of the additional loading came from trains from St. Louis, Memphis, New Orleans, and other points outside of the State of Arkansas. The local train would go in to the terminal with its full capacity of engine tonnage in nearly every case, both north and south; accumulated that tonnage from the White River Division at Newport and Memphis Division at Bald Knob. What they picked up at Newport came from Springfield, Mo., and Missouri Pacific territory. That from the Memphis Division would move from Memphis to Bald Knob on the Memphis territory. (R. 1777-8-9.)

The court found that the evidence was practically conclusive that from 500 to 800 tons gross of freight were added to each local train in order to relieve the congestion.

"When conditions are normal the evidence shows that practically the only through freight carried on local trains is that intended for or carried from points intermediate between division yards. The interstate business carried on local trains averages about 40 per cent of the entire freight carried, and the calculation should be made on that basis." (Opinion, p. 87.)

The correctness of the court's finding can not be questioned by appellants without doing violence to the evidence. Indeed the evidence would have better warranted the court in finding that the intrastate freight carried on local trains

when conditions are normal is 75 per cent and the interstate freight 25 per cent.

If the error as to the local and through freight carried on local trains is corrected, and the ratios of state and interstate freight carried on that class of trains made to conform to the evidence and findings of the court, that tonnage alone would reverse the result and show grossly inadequate earnings even under the method pursued by the State in dividing train and transportation cost.

Again, if the method pursued by the State in ascertaining the amount of interstate freight handled in the State of Arkansas in the month of October, 1907, by deducting the actual movement as ascertained from waybills and wheel reports from the revenue account kept by the auditor and reflected in exhibit 26 is erroneous, as we have heretofore endeavored to show, that error would utterly destroy and defeat the State's method of division.

## THE BASIS USED BY THE STATE IN ASCERTAINING THE COST OF TRANSPORTING INTRASTATE AND INTERSTATE PASSENGER, AND MAIL AND EXPRESS BUSINESS.

The basis of division of passenger expenses is contained in exhibits M and T filed by the State. The division is between "coach and Pullman service, and intrastate, interstate, mail and express business. In general the expenses are divided on a car mile basis, the mileage used being that of October, 1907."

The division is made in detail, following the same divisions of expense as are contained in exhibit K relating to freight. The bases used are wholly different. Maintenance of way and structures, maintenance of locomotives, yard and train expenses, are apportioned between coach, Pullman, mail and express service on a car mile basis. Maintenance of passenger train cars is divided between coach, mail and express service on a car mile basis; traffic expenses between intrastate, interstate, mail and express business on the basis of the gross earnings; station expenses between intrastate and interstate business on the basis of the number of passengers of each class, making an allowance of "about 10 cents per day" for the handling of mails at certain stations and assuming that each intrastate passenger makes use of two terminals and an interstate passenger of one; loss and damage to baggage between intrastate and interstate according to the gross earnings of each; supervision and

general and general expense are divided on the basis of the direct charges as apportioned to each class. The cost of coach and Pullman service is divided between intrastate and interstate business in proportion to the total passenger miles of each class of traffic and added to the other cost of intrastate and interstate business. Miscellaneous revenue and dining car deficit are divided between intrastate and interstate business in proportion to the gross earnings; taxes, rentals, hire of equipment and value of property are divided between intrastate, interstate, mail and express in proportion to the total earnings of each class.

It will be observed that the State did not pursue the same method in dividing the expense of passenger service as it did in the division of freight expense. It abandoned the division as between local and through trains. The reason is given in an explanatory statement on the first sheet of the exhibit, where it is stated that it was not considered necessary to make a division as between local and through service, as nearly all passenger trains on the St. Louis, Iron Mountain & Southern Railway do a local business, meaning that through trains carry local passengers. The same condition existed with reference to the freight traffic, and the reason given presents no distinction in the two cases.

The St. Louis, Iron Mountain & Southern Railway operated 48 local trains and eight through trains in the latter half of 1907. The average stop of the local trains was every 5.2 miles; of the through trains every 36 miles in the State. The average run of the local trains was 114 miles; of the

through trains 275 miles in the State. The average length of the local passenger haul was 30 miles; of the through passenger haul 118 miles. (Exhibits 5 and 46.)

If the method of dividing freight expense was practicable it was equally so with regard to passenger expense, as there is approximately the same relation between the local passenger train and the through passenger train as there is between the local and through freight trains. The local passenger train is used for doing short haul business just as the local freight train is with regard to freight. The incidents of each class of service are similar in many respects. For instance, the through passenger trains like the through freight trains run day and night; the local passenger, like a local freight train, only in daytime. The length of train run is very much shorter in the local passenger service than in the through, and, as in the case of the division of freight expense, they have overlooked many of the elements of increased expense of local passenger business in dividing on the car mile and other bases used by them and, while claiming to have reached a result that reflects the actual cost of each class of traffic, they have in reality assigned to mail and express traffic items of expense that are not in any way connected with either class of business.

## MAINTENANCE OF WAY AND STRUCTURES.

The same objection that has been urged to the division of maintenance of way and structures on the basis of locomotive mileage in exhibit K applies to the division on the basis of car miles in the passenger service. A very large proportion of that expense is not incident to and does not result from operation of either freight or passenger cars.

## MAINTENANCE OF EQUIPMFNT.

### Locomotive Expense:

The division of locomotive expense is made on the basis of the car miles of one month, without any allowance for the difference in the cars on different trains and the expense caused thereby, or for the additional strain put upon the engines by the more frequent stops and starts of the local train. A number of witnesses testified that the repairs to passenger locomotives should be proportioned to the work done by them, and unless all cars are exactly alike the division can not be made on a mileage basis. It is in evidence that an express car weighs 35 tons, coach 45 tons, chair car 50 tons, sleeper 60 to 70 tons, baggage car 35 tons. It would seem obvious that the cost of repairs to locomotives should be in proportion to the weight and mileage of the cars handled by them. This mode of dividing locomotive repairs assumes that the repairs of a locomotive hauling a train consisting of three cars are one-third those of a locomotive hauling a train of nine cars, which is manifestly incorrect, as shown by the testimony.

### Passenger Train Cars:

Mr. Rosing testified that a mail car costs from 15 to 20 per cent more to repair than an express car, and a coach 100 per cent more; that the cost of cleaning cars on a mileage basis is not correct; coaches and chair cars are cleaned at passenger terminals whenever a train arrives, without regard to where it came from or what its mileage

may have been, and the amount of work is not measured by the mileage the car has made. There is also a great difference in the expense of cleaning express and mail cars, it costing from 10 to 12 per cent more to clean the latter than the former. The average cost of cleaning a coach is $1.45. car 65 cents, express and baggage cars 55 cents. (R. 1733-4.)

Mr. Nay testified that the division on a car mile basis is not proper because the expense has little or no relation to the car miles. The car miles of local trains which carry no Pullman cars are treated in the exhibit the same as those in through trains which carry Pullmans, and the method of division is inaccurate because it does not assign a sufficient proportion of the expense of the traffic carried on local trains. (R. 1842.)

Mr. Ward testified that the local train is used for doing a short haul business, and there is a lot of expense attached to the handling of local passenger service which can not be measured by the car mile. The local train has in service for a given number of train miles a much larger number of cars, as local trains run practically in daylight only and tie up at night. (R. 1867.)

**Traffic Expense:**

This expense is divided on the basis of the gross earnings, and 19.33 per cent of the entire expense is charged to mail and express, viz: 11.63 to mail and 7.70 per cent to express. This item covers advertising and agencies main-

tained for the purpose of soliciting and building up business. None of that expense should be charged to those accounts. The mail is carried under contracts with the United States Government, and the railroad company has nothing to do in connection with the business conducted by the express companies. Their only function in connection with that class of business is to provide space in the cars and at stations for the business of the express company. There is no soliciting of either mail or express. The compensation that accrues to the railroads is by contract with the Government or the express company. Mr. Johnson testified that there is no official whose salary or expenses is charged to the traffic account who has anything to do with the making of these contracts. There is a cost incurred in the handling of the mail business, such as the manager of mail traffic and his office force, but it is charged to general expense in the accounts of the railroad company and also in exhibit M.

Mr. Wharton, on being asked why he charged mail and express with any part of traffic expense, stated that he did so because he had no other way to divide it; that it would have been necessary for him to have gone into the offices of the railroad company to see how mail and express were handled in the traffic department, that he could not answer the question without making such an examination, and that the division was made without investigation, and yet, when they come to divide the expense of loss and damage to baggage, miscellaneous revenue and dining car expenses between the various classes of traffic, on the same basis, they

experience no apparent difficulty in eliminating mail and express.

**Train Auditors:**

Under the heading, "5—General Expenses," items amounting to $160,767.19 are divided between coach, Pullman, intrastate, interstate, mail and express on the basis of the direct charges to each class. $44,872 of the amount represents expense of train auditors, $14,893.46 of which is charged to mail and express. The expense of train auditors is incurred in connection with the handling of passengers upon the train. They perform no duties in connection with operation, their only service being in connection with passengers for the purpose of collecting tickets and cash fares; that item of expense should be divided between intrastate and interstate on the basis of the number of passengers handled. Divided on that basis $38,074.03 would be chargeable to intrastate business and $6,798.13 to interstate business. (Exhibit 56, subdivision "B," Expense of Train Auditors, etc.) See also evidence of F. P. Johnson, R. 2008-9.)

**Station Expense:**

This expense is divided without regard to trans-state passengers, who make no use of local terminals, and on the assumption that a state passenger is only twice as expensive as an interstate passenger; that one traveling 118 miles, the average haul of the interstate passenger, has only twice the use of station facilities as four state passengers, each travel-

ing 30 miles, the average state passenger haul on the Iron Mountain Road and on the St. Louis Southwestern Road 23 miles as compared to 121 miles. Trans-state passengers make no appreciable use of station facilities. Interstate passengers use but one terminal, and that once in 118 miles, while the intrastate passenger uses two terminals on an average journey of 30 miles. A passenger going five miles will use every portion of the depot facilities—baggage, trucks, platform and scales—that a passenger going 300 miles will. The greatest part of the station expense is in connection with the short haul.

**Yard and Train Service:**

This item of expense includes among others—

| | |
|---|---|
| Yard service | $ 15,124 |
| Train and engine men | 182,772 |
| Fuel and train supplies | 135,712 |
| Care of passenger cars | 50,600 |
| Engine house expenses | 46,499 |
| Wrecks | 17,879 |
| Injuries to persons | 56,128 |
| Damage to stock | 39,264 |

The same expense is charged to all passengers on different classes of cars on local and through trains. It includes wages of crews and engine men, assuming that the wages of a train crew which runs a train of nine cars is as much as the wages of a crew on a train with three cars, while the evidence shows that the wages of the crew are not based on the cars handled but on the train mileage, and the wages of the local crew are greater per train mile than the through train crew. The cost of fuel and supplies is different, as a larger expense is incurred for ice, water and

lighting coaches than for mail and express cars. The consumption of fuel is affected by the stopping and starting and weight of trains. No account is taken of the difference between local and through trains in that respect.

Injuries to persons could probably have been actually divided between local and through trains and between state and interstate passengers. The attempt to divide it on a car mileage basis including all kinds of cars is erroneous, and charges too much of this account to through service and not enough to local service. The division is erroneous as affecting yard service, because one local train of four cars often receives more attention at the terminals in the way of switching than a through train of nine cars. The car mile is not a proper unit for dividing the expense occasioned by wrecks. The testimony shows that by far the greater per cent of derailments, the principal cause of wrecks, is due to the tender, which is a part of the locomotive, and is not taken into account in this division.

Under the head of "Supervision and General," $40,476.06 is divided between coach, Pullman, intrastate, interstate, mail and express business on the basis of the direct charges as apportioned in the preceding divisions. The correctness of this method of apportionment depends upon whether the direct charges upon which it is based are properly apportioned. If they are not, as we have endeavored to show, then the division of this item of expense would be affected to the extent that the different classes of expense are erroneously divided.

## DIVISION OF COST OF COACH AND PULLMAN SERVICE BETWEEN INTRASTATE AND INTERSTATE BUSINESS.

This large item is divided between intrastate and interstate business in proportion to the total passenger miles of each class of traffic during the six months. The intrastate miles were 43,355,000, the interstate 30,486,624; 58.71 per cent of the total charge of $896,378.78 is charged to intrastate and 41.29 per cent to interstate. Included in the above passenger mileage was the mileage of passengers carried in Pullman cars, representing $302,126.66 of the total cost of passenger service. This account is again divided separately as "Cost of Pullman Service" between intrastate and interstate business on the basis of 25 per cent intrastate and 75 per cent interstate. The result of this method is to charge the expense of Pullman service twice, once in the division of coach expense, where the expense is divided ratably on the basis of passnger miles of coach and Pullman passengers in the proportions stated above, and again in the division of Pullman service, on the arbitrary basis of 25 per cent intrastate and 75 per cent interstate, resulting in a large increase in the expense of interstate business by reason of their having practically used the Pullman passenger mileage twice. Or, if it was proper to divide and apportion the cost of coach and Pullman service separately, it is not right that the Pullman passenger miles should be used as a factor in dividing the coach expense, because to do so would effect a very large reduction in the cost of intrastate passenger service. Upon

that point Mr. F. P. Johnson testified that if not more than 25 per cent of the Pullman passengers are state passengers, that fact would indicate that 75 per cent of them were of much longer haul than the state business, "or, to put it differently, the interstate passengers are of much longer haul than the state passengers, and the result would be that by reducing the total passenger miles to the extent of the Pullman passengers the change in these percentages (of coach cost) would be very substantial, because you would reduce the interstate passenger miles in larger proportion that you would the state passenger miles. The elimination of the Pullman passenger miles from the general division would increase the cost of handling state business in coaches about 8 per cent."

(See evidence of Ward, R. 1867 to 1870; Gray, R. 1911-1917; Nay, R. 1849-1851; Johnson, R. 1995-2000; Rosing, R. 1733-4, and others.)

It is apparent that the State has wholly ignored the difference in conditions pointed out in the evidence we have reviewed in connection with the division of the cost of passenger service. Many of the differences are obvious and can not be disregarded, and to the extent that they have been ignored the conclusions are misleading.

The result of the division of expense of the passenger service on the various bases used in exhibit M is shown in net earnings on exhibit O, and is as follows: Intrastate earnings, 5.21 per cent; interstate loss, 3.44 per cent; mail,

.04 per cent earnings; express, 9.61 per cent loss. The result would seem remarkable in view of the evidence. It would be difficult to account for the fact that there should be a profit of 5.21 per cent on intrastate passenger business and a loss on interstate business, in view of the well-established fact that the rates are practically the same and that it costs more to transport an intrastate passenger than an interstate passenger per mile. A more remarkable result, however, is the loss on express and the small gain on mail business. It is a well known fact that the express business involves a minimum of expense to the railroad company. It has nothing to do with reference to express business but to assign space in the cars and in the station; the express company does all the rest. It renders no service in connection with the mail except to deliver it from the train to the post-office, where it is within 80 rods of the station. Mr. Gray's attention was called to the deficit in express earnings at the conclusion of his testimony in chief. In commenting on it he said:

"If there is any department of the railroad's income that represents the least expense to the dollar received it is the express business. The railroad determines the amount of space to be allotted to express; space at a station is allotted only when it can be spared. No railroad employee is required to handle a pound of express; yet the result of the State's basis indicates that it costs $172,475.77 to earn $133,-910.82 in express service." (R. 1916-17.)

Truly a most remarkable showing!

We have had the State's figures revised by dividing all of the traffic expenses and the expenses of Train Auditors

between intrastate and interstate traffic and dividing the cost of coach and Pullman service between intrastate and interstate traffic, separately, thereby avoiding the duplication of the Pullman passenger miles, also correcting errors in the mileage of each class of cars as reported in the State's exhibit, and conceded; with these changes, the result of the State's formula would be to show the returns upon the value of the property of the St. Louis, Iron Mountain and Southern Railway Company from each class of traffic, as follows:

Intrastate Passenger—A return of 1.39 per cent.
Interstate Passenger—A deficit of 1.34 per cent.
Mail Traffic—A return of 3.45 per cent.
Express—A return of 0.56 per cent.

On the St. Louis Southwestern Railway Company, the return upon each class of traffic would be as follows:

Intrastate Passenger—A return of 3.85 per cent.
Interstate Passenger—A return of 1.10 per cent.
Mail Traffic—A deficit of 9.03 per cent.
Express—A return of 3.81 per cent.

This does not include any other changes than the four mentioned above, nor does it make any provision for increase expense of intrastate traffic or for any increase in the cost of passenger traffic as compared with mail and express traffic not provided for by the State's basis.

Right here, it is well to call attention to the fact that the return upon the value of the property employed in the entire passenger service (including intrastate and interstate

passengers, mail and express) is .67 per cent on the St. Louis, Iron Mountain & Southern Railway and 2.01 per cent on the St. Louis Southwestern Railway. This is the result of the figures submitted by both sides and there is, consequently, no dispute as to the correctness of those returns.

It would seem incredible to assume such a difference in the cost of handling any one of the classes of service as to overcome the fact that the entire passenger traffic is non-compensatory and confiscatory, as shown by the result of the figures compiled by both sides. This is especially true from the fact that the average revenue per passenger per mile in both intrastate and interstate traffic is practically the same, by reason of the fact that the railroads are compelled to reduce the through rate to a parity with the local rates in all cases.

The difference in cost being in favor of the interstate traffic, by reason of the much longer haul and the fact that intrastate passengers incur two terminal handlings in the State as compared with one for the interstate, and none for the trans-state part, would also tend to show that the intrastate traffic will not yield any greater return than the total business as shown above.

## EXTRA EXPENSE OF PASSENGER TRAFFIC.

No allowance was made in exhibit M for the increased cost of transporting intrastate over interstate passengers. That there is a very material difference is abundantly established by the evidence. The causes contributing to the difference in expense are very clearly stated by Mr. McPherson. (See his testimony, R. 327-331.)

A number of operating men were examined as to the difference in expense of transporting the two classes of passengers, and gave their views as to the elements of difference and as to the per cent of extra cost. Mr. McPherson estimated it at 35 per cent increase; Mr. Doddridge from 20 per cent to 30 per cent; Mr. Sewall at 50 per cent; Mr. Ward at 40 per cent; Mr. Whittenton at 25 per cent.

The court divided the expense of the passenger service on the revenue basis, charging the intrastate passenger service on the St. Louis, Iron Mountain & Southern Railway with 10 per cent greater net cost than through, but made no allowance on the St. Louis Southwestern for extra cost, on the ground that the difference in fares between local and through passengers is greater than on the Iron Mountain Railway, and that the difference in cost between the two classes of passenger service was no greater than the higher fares that had been collected. (See opinion, 92, 94.)

## THE EFFECT OF THE COURT'S FINDINGS OF FACT.

The court adopted the method presented by the appellants for apportioning the expense of operation and transportation between intrastate and interstate freight.

Their method consisted of a great number of details requiring minute investigation and analysis of all the various elements of expense incident to the operation of through and local trains, and the transportation of state and interstate freight. The court followed their formulas in many of the details, and only departed from them when they were unsupported by evidence, or, if there was conflicting evidence, where it found that the weight of the evidence supported a different conclusion. In such cases it made such changes in the formulas as to make them conform to the evidence. After the court had determined what the basis of apportionment of expense should be, it referred it to the accountants of each side to figure out the result. This was done by T. A. Hamilton, the expert accountant for the State, and F. P. Johnson for the railroad companies. They agreed in the result and certified it to the court, and the court adopted it as the final result of the formulas adopted by it. (See exhibit A at the end of the opinion, page 106.)

Where the lower court has considered conflicting evidence and made its finding and decree thereon, all presumptions are in favor of the correctness of the finding, and it will not be disturbed unless clearly in conflict with the weight of the evidence.

Kimberley v. Arms, 129 U. S. 512, 525.

Snyder v. Dobson, 74 Fed. 757-8.

McKinley v. Williams, *Ib.* 94, 102.

Idaho Mining & Mill Company v. Davis, 123 Fed. 255.

## RETURN ON THE INVESTMENT.

Only the actual value of the property as agreed by the parties to the proceeding and free from any question of capitalization or bonded indebtedness or interest charges was considered. The court determined that six per cent upon the value of the property devoted to intrastate traffic would be just compensation, with an additional allowance of one and one-half per cent for a surplus fund to cover depreciation charges and provide against contingencies.

The views of the court on this question are stated at pages 96 to 105 of the opinion, and we do not feel that we can add anything to what is there said in support of its conclusions. The earnings as found by the court fall so far below any rate of compensation that would be considered reasonable that the question is not of any great practical importance at this time.

Respectfully submitted,

MARTIN L. CLARDY,

SAMUEL H. WEST.

JOHN M. MOORE,

*Solicitors for Appellees.*

## APPENDIX.

RESULTS obtained under the various bases submitted at the hearing, covering the period from July 1 to December 31, 1907.

.....

Basis submitted by the railroad companies, using the estimate of extra cost for intrastate traffic—freight, 50 per cent; passenger, 15 per cent. See exhibits 3 and 3-A and 33 and 34.

| | *St. L., I. M. & S. Ry.* | *St. L. S. W. Ry.* |
|---|---|---|
| Gross revenue from intrastate freight and passenger traffic | $1,476,790.37 | $ 419,165.78 |
| Operating expenses, taxes and rentals | 1,500,713.75 | 371,103.77 |
| Net earnings..... Def. | 23,923.38 | 48,062.01 |
| One-half the estimated value of the property..... | 4,424,048.46 | 1,285,157.97 |
| Estimated returns based on the per cent of net earnings to valuation.. Def. | 0.54% | 3.74% |

Freight, 100 per cent; passenger, 15 per cent.

## SUPPLEMENTAL BRIEF IN BEHALF OF APPELLEE.

## DIVISION OF COMMON EXPENSE BETWEEN FREIGHT AND PASSENGER TRAFFIC.

Statement 5 to exhibit 3 (R. 2310) contains the bases used in dividing operating expenses between states and common expense, incapable of allocation, between freight and passenger service. Wherever the expense was of such a

nature that it could be allocated to the one or the other it was done. Mr. Johnson testified that this method of keeping the accounts had been in use a great while on the Iron Mountain railroad, and it was a common method in use on most roads. The following classes of common expenses are divided between freight and passenger in the statement referred to on the basis of the number of train miles in each class of service, viz: Maintenance of Way and Structures; Repairs of Locomotives; Other items under Maintenance of Equipment not including Repairs, Renewals, Depreciation of freight and passenger cars and Cars Borrowed and Loaned; Roundhouse Expense; Water and other supplies for Locomotives, not including Fuel; Miscellaneous Employees of Transportation Department, such as Crossing Watchmen, Signalmen and Superintendence; Common items under General Expenses.

Paragraph B of exhibit 3 (R. 2293) contains the result of the division of expense made by the railroad company as between freight and passenger service, using the train mile as a factor for dividing the classes of common expense above enumerated. $3,253,034.86 is charged to freight service, and $1,678,189.89 to passenger service.

Counsel comment at some length in their brief on the use of the train mileage as a factor in dividing common expense. They single out the item of maintenance of way and attempt to show that dividing that particular item on the train mileage results in a large increase in the expense

of passenger service, although it would seem to be obviously fair that whatever basis of division is adopted should be applied to all of the common expense; and certainly there can be no merit, from an accounting standpoint, in dividing Maintenance of Way and Structures on the revenue basis and such items as General Expenses on the train mile basis. They have inserted a table on page 265 of the State's brief showing the effect of the apportionment of maintenance of way expense on the train mile basis as compared with the division of that class of expense on the revenue basis. This table is misleading as an illustration. The common expense, that is that portion of the expense of conducting freight and passenger service that can not be allocated to the two branches of service, consists of many other items than those embraced in maintenance of way, as we have shown.

Paragraph B of exhibit 3 (R. 2293) shows the division of expense made by the railroad company as between freight and passenger service, using the train mile as a factor for dividing the common expense, with the result as stated above.

The following table shows that if all of the common expense were treated uniformly and divided on the revenue basis, it would very materially increase the expense chargeable to the freight service, and would have resulted in a large deficit in the earnings accruing from that class of business.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY.

ARKANSAS RATE MATTER.

If the common expenses that have been divided between freight and passenger on the train mileage basis had been divided on the basis of gross earnings, the results as shown in the St. Louis, Iron Mountain & Southern Railway Company's Exhibit No. 3 would have been as follows:

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Maintenance of Way and Structures | $ 773,605.22 | $ 281,071,29 | $1,054,676.51 |
| Maintenance of Equipment | 824,835.60 | 210,730.47 | 1,035,566.07 |
| Traffic Expenses | 88,734.42 | 53,276.08 | 142,010.50 |
| Transportation Expenses | 1,663,207.01 | 563,437.86 | 2,226,644.87 |
| General Expenses | 182,364.40 | 110,621.03 | 292,985.43 |
| Hire of Equipment, Balance | 175,400.21 | 2,757.26 | 178,157.47 |
| Dining Car Service, Balance | ..... | 1,183.90 | 1,183.90 |
| | $3,708,146.86 | $1,223,077.89 | $4,931,224.75 |
| Taxes | 162,945.69 | 59,202.49 | 222,148.18 |
| Rentals | 16,084.56 | 5,843.95 | 21,928.51 |
| Grand Total | $3,887,177.11 | $1,288,124.33 | $5,175,301.44 |

*Recapitulation.*

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Gross Revenues | $4,896,272.91 | $1,778,803.88 | $6,675,076.79 |
| Operating Expenses | 3,708,146.86 | 1,223,077.89 | 4,931,224.75 |
| Net Operating Revenue | $1,188,126.05 | $ 555,725.99 | $1,743,852.04 |
| Less Taxes and Rentals | 179,030.25 | 65,046.44 | 244,076.69 |
| Balance | $1,009,095.80 | $ 490,679.55 | $1,499,775.35 |
| Assessed Value of Property (Ex. 3-A) | $14,665,072.35 | $5,328,209.65 | $19,993,282.00 |
| Percentage of Net Earnings to Valuation | 6.88% | 9.21% | 7.50% |

The Intrastate gross freight and passenger revenue, as shown in statement 1 of exhibit 3 is as follows:

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Gross Revenues | $ 640,248.17 | $ 836,542.20 | $1,476,790.37 |

The intrastate proportion of the total operating expenses, taxes and rentals divided on percents based on the gross earnings of each class, as shown in Exhibit 3 (Freight 13.08%, Passenger 47.03%), is as follows:

| | | | |
|---|---|---|---|
| Expenses, including Taxes and Rentals | $ 508,442.77 | $ 605,804.87 | $1,114,247.64 |
| Leaving | $ 131,805.40 | $ 230,737.33 | $ 362,542.73 |

The extra cost of handling intrastate freight, as shown under various percentages in statements Nos. 6 and 7 of Exhibit 3, is as follows:

| | Freight. | | Passenger. |
|---|---|---|---|
| Net earnings after dividing operating expenses, taxes and rentals on the straight revenue basis | $131,805.40 | | $230,737.33 |
| Extra cost at 50% | 197,644.23 | Extra cost 15% | 42,685.42 |
| Deficit | 65,838.83 | Surplus | 188,051.91 |
| Extra cost at 100% | 372,668.76 | Extra cost 25% | 68,125.44 |
| Deficit | 240,863.36 | Surplus | 162,611.89 |
| Extra cost at 150% | 528,781.74 | Extra cost 35% | 91,608.53 |
| Deficit | 396,976.34 | Surplus | 139,128.80 |
| Extra cost at 200% | 668,208.06 | Extra cost 50% | 123,286.25 |
| Deficit | 536,402.66 | Surplus | 107,451.08 |

PAGE BOUND VE

| | Freight. | Passenger. | Total. |
|---|---|---|---|
| Assessed value of the property employed in Intrastate Traffic as shown by Exhibit 3-A | $1,918,191.46 | $2,505,857.00 | $4,424,048.46 |
| Percentage of Net Earnings to valuation, at 50% extra cost of freight.. 15% extra cost of passenger. | Deficit 3.43% | 7.50% | 2.76% |
| Percentage of Net Earnings to valuation, at 100% extra cost of freight ..... 25% extra cost of passenger. | Deficit 12.56% | 6.49% | Deficit 1.77% |

If the basis outlined by Judge Trieber is applied to the figures as adjusted by dividing the common expenses between freight and passenger on the revenue basis, the result would be as follows:

| | | |
|---|---|---|
| Earnings from Intrastate Traffic..... | Freight | $ 656,717.58 |
| | Passenger | 1,069,861.28 |
| | Total | $1,726,578.86 |

| | | |
|---|---|---|
| Freight Operating Expenses divided on basis of 210% additional cost calculated on ton mile bases and taxes, rentals and hire of equipment on the revenue basis | $736,414.72 | |
| Passenger Operating Expenses divided on basis of 10% additional cost calculated on the revenue basis and taxes and rentals on the straight revenue basis | 794,713.09 | 1,531,127.81 |
| Net earnings | | $ 195,451.05 |
| Assessed value of the property | | 5,158,266.56 |
| Per cent of Net Earnings to valuation | | 3.79% |

No good reason can be possibly shown why any particular class of expense, such as maintenance of way, should be selected and treated differently from other classes of common expense in the matter of apportionment as between freight and passenger service, and a comparison of the results in the foregoing table with paragraphs B, D and E of Exhibit 3, demonstrates that the use of the revenue as a factor of division would have made no material difference in the results shown in the exhibits filed by the railroads. The reason for using the train miles is clearly shown by the evidence of the operating men, many of whom testified that while it was not by any means perfect it was the best factor that could be used for that purpose.

This objection was not raised during the taking of the testimony. Mr. Ludlam, a member of the firm of Haskins & Sells, public accountants, who prepared the accounts on the part of the State, testified on this point as follows:

"My firm has prepared a statement in this case that we think reflects pretty closely the two classes of business in the State of Arkansas."

Q. I believe you began this division by first taking the division between freight and passenger?

A. *We accepted the company's figures on the freight and passenger.* We have not gone back of the statements submitted by them in this case.

Q. Upon what basis did they divide that?

A. I understand they divided upon the revenue train mileage basis. (R. 1320-1.)

Mr. Wharton, who was in direct charge of the work of Haskins & Sells in connection with these cases, was asked:

Q. Statement No. 2 to Exhibit 5 filed by the plaintiffs in this case contains a statement of the basis upon which the division is made between freight and passenger traffic expenses. Is that the basis upon which you acted in dividing expense as between freight and passenger traffic?

A. We made no division between freight and passenger of our own, simply taking the division made by the railroad company itself.

Q. You simply adopted the division they had made?

A. We took their division.

Q. Why did you take that, Mr. Wharton?

A. We considered it was good enough for the purpose we cared to use it for.

Q. Both as to state assignment and as to division between freight and passenger?

A. Yes, sir.

After stating that the division was made largely on the train mile basis he was asked:

Q. Did you think that was a proper basis to divide it upon?

A. *As between freight and passenger it was probably good enough for the purpose of this case.* I would not care to pass a personal opinion on that, because I haven't studied it sufficiently to form an opinion as between freight and passenger. Having accepted the railroad company's division between the freight and passenger, the only study that was necessary was as to division of freight expense between local and through and the passenger expense of the various classes. (R. 1030-2.)

Mr. Hamilton, another representative of Haskins & Sells, who had a great deal to do with the statistics that were compiled by the State, testified:

"The expenses shown in statement 4 of Exhibit 3 for the Iron Mountain and State of Arkansas were verified by us to this extent, we had recourse to the company's expense distribution books, on which the department, at that time under Mr. Johnson's charge, distributed the various vouchers and expense reports, the superintendent's expense reports throughout the various accounts. In dividing these expenses between freight and passenger, or rather in checking and taking off the company's division of them from that record, we necessarily verified the total as set forth by Mr. Johnson; we didn't go back of his record; that is, we didn't go to the individual vouchers or to the superintendent's reports, except in a few minor instances, and I saw no objection to that as a basis, for the reason that it is made the basis of all the company's statistics."

Q. And you regard it as a correct and proper basis?

A. Yes, sir; we applied some broad tests to it also, to see whether this period averaged up with charges of like character on other periods; on track maintenance, for instance, we took the average cost per mile for several years back, and saw that they averaged up, and that this was fairly normal.

Q. You found, though, no objection to that as a proper basis, or as to the manner in which it had been worked up, as far as your verification went?

A. We have no doubt as to the accuracy of these figures; I don't think there is anything wrong with them.

Q. What was your view as to the revenue train mile as a basis for dividing common expenses between freight and passenger traffic?

A. My opinion on that subject, of course, must be based on just what thought I have been able to give it, and what I have heard people say; I have nothing to do with the operation of trains in an executive capacity. If you want that, I would be glad to give it to you.

Q. Yes; I would like to have that.

A. I should think it was a very fair basis, basing my opinion on what I have just stated, that the extra weight of the freight train would be offset by the extra speed of the passenger train, and that might make it a fair division.

Q. If that was a proper division between freight and passenger, why did you depart from it in dividing the expense of operating local and through trains?

A. It seems to me that where you are considering the freight train as one unit, and the passenger train as another unit, usual divisions between the two classes of service, and you have lumped all your freight trains, that that might be some justification in itself for the first division; that is, you have light local freights and heavy through trains, and they might average up with passenger trains, but when you come to the division between two freight trains, you have a common unit there, both hauling freight cars, and the number of car miles would be the better division.

Q. In making your divisions on the car mile basis, did you take into consideration the weight of the contents of the cars?

A. No, sir; a car mile was a car mile with us.

Q. You have treated an empty car in the same manner you did a loaded car?

A. Yes, sir. (R. 1525-6.)

Mr. Henry Wilmering, a witness for the State, who prepared a formula dividing expenses, testified:

Q. In looking over the paper you handed me in response to my request, where you prepared a formula showing your method of dividing operating expenses between state and interstate, I notice the first item is "Maintenance of Way."

A. That is the first general account; yes, sir.

Q. That you divided on the basis of car miles, straight?

A. Yes, sir; as between local and through trains?

Q. How are they divided between passenger and freight?

A. On the basis of the revenue train miles, it should be, except account No. 17, Docks and Wharves, which would be assigned to freight.

He further stated that the car mile ought to be accepted as the basis of division as between local and through trains, and was asked:

Q. If this is true, why should it not also be used as a basis of division between passenger and freight trains?

A. Well, we have made a concession to the railroad companies in that respect, and have accepted the theory advanced by the railroad officials themselves. One of the principal reasons why we have accepted the revenue train mileage basis for division between freight and passenger where the expenses can not be located is just a concession to the majority of the accounting officials. It is accepting the railroad's own theory.

Q. Who made that concession? You say "we." whom do you mean by "we?"

A. I mean we who represent the States in this litigation, especially in Oklahoma. (R. 1138-39.)

Mr. Hillman, who was introduced as an expert accountant, and who had no connection with the case otherwise than as an expert witness, gave it as his view that the expense of maintenance of way and structures should be divided on the basis of train weights instead of train mileage, both between passenger and freight service and local and through trains; and in that connection the State's accountants admitted that they disregarded the weight and put an empty car on the same basis as a loaded car, in preparing their formulas. (R. 1509-10.) He further testified that if he could not get the data upon which to make the division on the basis of weights, he would adopt the train mile as the next best method of division. (R. 1521.)

The above is practically all the testimony on the part of the State on this subject. It is plain that it does not develop any objection to the basis of dividing common expense on the train mileage adopted by the railroads in their exhibits.

The State's exhibit K used the car mile for the purpose of dividing the expense of maintenance of way between local and through trains. Mr. M. L. Byers, the chief engineer of maintenance of way of the Missouri Pacific System, and other operating men criticized and condemned its use, and counsel in cross examining them on that point endeavored to show that the objections urged by them against the car mile as a unit for dividing maintenance of way expense between

through and local trains would apply to the train mile as a factor for dividing between freight and passenger service.

Mr. Byers was asked on cross examination if all the reasons he had given in his testimony in chief against the car mile as a factor in dividing the expense of maintenance of way as between local and through trains would not be equally applicable to the train mile as a factor of dividing maintenance of way expense between freight and passenger service. He said it would not.

"I think the train mile as a general condition in making a division between freight and passenger of the maintenance of way expense is somewhat less in error than the use of the car mile statistics would be for the same purpose." (R. 1706.)

Mr. Nay was asked what factor the railroads used to divide maintenance of way expense between passenger and freight. He stated in answer:

"We have been using (I am speaking now of the formula we used for operating statistics which we furnished the Interstate Commerce Commission) we have been using the passenger and freight train mileage."

Q. You think that a fair approximation of maintenance of way expense as between freight and passenger?

A. It was as fair as we have been able to find at the time we compiled these operating figures. Our operating

men say that the greater speed of the passenger trains offsets the greater weight of the freight trains. So that it is fair to assume the passenger train mile may be considered the same as the freight train mile.

Q. Would a division of maintenance of way expense between freight and passenger on a train mileage basis be fairly accurate?

A. From the testimony I have heard from operating men I think it would be as accurate as anything that was available at the time these statements were compiled.

Q. Did you make your statement to the Interstate Commerce Commission in these various exhibits based on that formula?

A. Yes, sir. (R. 2034-35.)

Mr. F. P. Johnson testified that the railroad company kept regular statistics separating freight and passenger service and expense for the benefit of the operating department; that the division between freight and passenger on common accounts is made on the train mileage basis in those statistics. (R. 149-50.)

Mr. Carl Gray testified that he thought the use of the train mile in making the division between passenger and freight was fair on account of the fact that while one (freight service) subjects the right of way to much greater use, it does not require as high a degree of maintenance, and they come more nearly compensating. He was asked if that applied to the single track where both classes of traf-

fic are using it constantly, and stated that it did, because it means that while perhaps one uses it harder on account of the greater number of vehicles and the greater axle load, the other requires a higher degree of refinement. He was then asked if the train mile would be a satisfactory basis for dividing between State and interstate business, which is manifestly a wholly different proposition, and stated that it would not, because "in the one case the trains are entities and are representative of themselves, and in the other case not even the carriages themselves are representative." He further stated that for dividing maintenance of way expense as between passenger and freight the train mile presented the least objection, and was about the only method where the relation between the two branches of service had anything in common and was the only basis where the two departments came nearest to each other. (R. 1939-40.)

Mr. McPherson testified:

"The train mile measure being divided between freight and passenger service, may be followed in dividing the common expense as between freight and passenger traffic. But it must be discarded in any consideration and division between intrastate and interstate traffic for various reasons, among which are that it represents trains carrying both classes of traffic, also empty cars the ultimate assignment of which can not be determined and which in themselves yield no revenue." (R. 305.)

The train mile unit is used by most railroads in dividing common expense between freight and passenger for operating statements used in railroad operations; it was the basis authorized by the Interstate Commerce Commission and used by all railroads in compiling information called for by the Interstate Commerce Commission in the form of annual reports until recently. Common expenses such as maintenance of way and structures, repairs of locomotives, and other common joint service should not be divided between freight and passenger service on the revenue basis, as the revenue earned by the trains of each class of srvice has no bearing on the proportion of common expense chargeable to each train. Railroads are maintained in a higher state of efficiency for the benefit of the passenger traffic than they would be if they were exclusive freight roads. Many passenger trains are not run at a profit to the railroad companies, but under regulations of State commissions calling for a certain number of trains in certain localities daily. Many of these trains are operated at a heavy loss, some of them not even paying the cost of wages of the crew and supplies used by the train, and if the common expense incurred in the operation of a railroad, such as maintenance of way and structures, general expenses and other like items, were divided between the freight and passenger service in proportion to the gross earnings, when the earnings from passenger traffic are the result of operating such trains as those mentioned above, the result would not represent the actual cost or even a reasonable approximation, as it makes but little difference in the cost of oper-

ating a train whether that train is carrying ten or fifty passengers. On the other hand, being compelled to operate the train, frequently by State regulation, the only reasonable method by which to arrive at the cost of handling the passengers in the train, they being both State and interstate, is to use the revenue received from each.

In this connection the learned counsel refer to a statement contained in the opinion of Judge Trieber, that any attempt to apportion maintenance of way expense on a ton, car or train mileage would be an injustice to the railroads, and that the court was of the opinion that the straight revenue basis would get more accurate results.

Judge Trieber was not referring to the division of expense between freight and passenger service, but was discussing the division made by the State in exhibit K as between local and through trains. The State had made the division on the basis of car and engine mileage, and what the court intended to say was that neither the car nor the train mile was a proper unit of division between the local and through trains, both of which carry State and interstate traffic. The question as to the proper method of division as between passenger and freight traffic was not before the court, because, as we have heretofore shown, the question was not raised or insisted upon by counsel at the hearing before the lower court.

## RELATION OF REVENUE AND RATES.

They say that the railroad company statistics show that freight intrastate revenue is 98.18 per cent higher than interstate, and passenger 3.48 per cent higher; but that Judge Trieber, taking into account all the various elements of extra cost of intrastate freight, concluded that for the reasons given by him 50 per cent was the proper allowance to be made for the difference in intrastate freight revenues or rates. These figures were developed in two exhibits filed by Mr. Kimbell at the request of the State (Exhibits G and A). We have dealt with that subject and called attention to the testimony of Mr. Kimbell and Mr. Johnson to the effect that the revenue, while to a certain extent affected by the rates, does not reflect changes in rates alone, but is the result of many conditions, including among them the rates, the character of commodities handled, the length of haul, and various elements of that character. Appellee's brief, pp. 108-111.

This matter was fully explained by Mr. Kimbell in his testimony (R. 2078) and by Mr. Johnson (R. 2000-1 and 2011-12), and the fallacy of the State's position is demonstrated by exhibits 54 and 58 filed by those witnesses. (R. 2447-2476.)

The attention of Mr. J. D. Watson, the general freight agent of the St. Louis Southwestern Railway, one of the most efficient railroad officials in his line of work—

that is, rate making—in the country, was called to this exhibit. He was asked:

"One of the exhibits introduced in this case (filed, I think, by Mr. Kimbell) indicates an increase as between the last one-half of the year 1907 and January, 1909, of 96 per cent in the revenue per ton per mile. I wish you would state if, in your judgment, there was that increase in the revenues as compared with the business done in those two periods?"

"A. I don't believe it could possibly be. I might explain why I think that. The revenue per ton per mile does not necessarily indicate anything as to the rate one way or the other. The higher class of traffic that you handle the more your revenue per ton per mile would be, but if you can increase your tonnage and reduce the character of it—that is make it a lower character, your revenue per ton per mile would necessarily decrease, while the volume that you would handle at the decreased revenue per ton per mile would still increase your revenue very materially.

"Now, I don't believe it would be possible, on the Cotton Belt, for a difference of 96 per cent in the revenue to occur between any two months or between one month and the average for any period, because I don't believe it changes or shifts that much." (R. 1676.)

The fact that the statistics of the railroad company show that the intrastate freight revenue is 98 per cent greater than the interstate freight revenue does not mean

that the rates charged on State traffic are twice as high per ton per mile as on interstate traffic. The statistics of the St. Louis, Iron Mountain & Southern Railway show that the average revenue per ton per mile of the total interstate traffic is 6.901 mills and of insetstate traffic 12.826 mills. But when the trans-state traffic is shown separately the result is as follows:

| | | |
|---|---|---|
| Trans-state | average haul | 285 miles |
| | average revenue | 5.799 mills |
| Interstate | average haul | 168 miles |
| | average revenue | 8.286 mills |
| Intrastate | average haul | 72 miles |
| | average revenue | 12.826 mills |

In this case the State revenue is but 50 per cent greater than the interstate revenue, and that does not mean that the rate is 50 per cent greater, but rather that the average haul of interstate freight is more than twice as much as the average haul of State freight, and consequently the average revenue per ton mile is much lighter. If it were possible to separate the interstate traffic into blocks so as to gather together all of the freight the length of haul of which would approximate 72 miles, it is quite likely that the average revenue on that class of business would be as great or greater than the average revenue from State traffic. This is especially true of the results shown by the passenger statistics, wherein the average revenue per passenger per mile of intrastate passenger traffic is 3.48 per cent greater than the average revenue per passenger per mile from interstate passenger traffic. These rates, both

State and interstate, are made upon practically the same unit (two cents or three cents per mile), the lower revenue received from the interstate traffic being due entirely to the greater distance over which the passenger travels. A passenger moving thirty miles between the State of Missouri and Arkansas would pay practically the same rate as a passenger moving thirty miles wholly within the State of Arkansas, and the average revenue per passenger per mile upon each of these passengers would be exactly the same.

## FORT SMITH TERMINAL EXPENSE.

In discussing the propriety of charging the expense of Memphis and Fort Smith terminals to the State of Arkansas the counsel say at page 287 of their brief:

"Judge Trieber held it was proper to charge Memphis expense to Arkansas, but says:

" 'This also applies to Fort Smith terminals in so far as Arkansas business is concerned, Oklahoma business being charged to that State with its proportion of expense.' "

This statement is based on a misunderstanding of Judge Trieber's ruling. Mr. F. P. Johnson had testified that the expense of the Fort Smith terminals "was charged to the State of Arkansas. The train service that passes through Fort Smith and Van Buren is divided on a mileage basis, but the station and yard service is charged to the State of Arkansas at Fort Smith." (R. 858.)

Q. What disposition did you make of the Fort Smith terminals in the Oklahoma Rate Case?

A. We did not make any disposition of that in the Oklahoma case. They are not included there at all.

Q. What did you do with this expense growing out of the trackage between Van Buren and Fort Smith in the Oklahoma case?

A. Any expense that is incurred on the line that enters into the State of Oklahoma is charged to the State of Oklahoma, but the terminal expense at Fort Smith—this station and yard service—is all charged to the State of Arkansas. (R. 1611-12.)

What the court stated in full is as follows:

"Objections are also made to the expenses of the Memphis and Fort Smith terminals charged entirely to the Arkansas business, although all of the Memphis business being in the State of Tennessee is interstate, and a very considerable part of the Fort Smith traffic is of that nature and all the earnings are credited to interstate business. The uncontradicted evidence shows that the Memphis terminal, which is the terminal point of that branch of the Iron Mountain, is used exclusively for the Arkansas business and differs in no respect from what would be incurred if it were in this State on the west side of the Mississippi River instead of being in Memphis on the east side of that river. This also applies to the Fort Smith terminals in so far as the Arkansas business is concerned, the Okla-

homa business being charged to that State with its proportion of expense. These matters will be considered and allowance made therefor when considering the apportionment of the expenses betweeen the State and interstate businesss, and thus the injustice to the intrastate business rectified." (Opinion, p. 40-1.)

The court evidently intended to charge the station and yard expense at Memphis and Van Buren to the State of Arkansas, the former on the ground that the yards in Memphis are for all practical purposes the same as if situated in the State of Arkansas, and those at Fort Smith are in fact situated in that State; hence it was proper that the expense should be charged to that State; but that the train service at Van Buren should be divided on a mileage basis between Arkansas and Oklahoma, as was done. The reason for treating these station and yard expenses as was done by the court is fully explained in the evidence cited in our former brief at pages 78-82.

EXHIBIT 26.

Appellees contend in their brief that the statistics contained in this exhibit showing the proportions of intrastate freight carried on local and through trains in the month of October, 1907, should be used as the basis of dividing expenses between the two classes of freight without regard to whether they were correct or incorrect. They say at page 297 that the plaintiffs are morally and equitably estopped to question the force of the test month's statistics. They attempt to prove by one of appellee's witnesses, Mr.

Carl Gray, that the plaintiffs should be held to the statistics contained in that exhibit because it was filed by the plaintiff, and two of the plaintiff's witnesses, viz.: Mr. Doddridge and Mr. Kimbell, testified that for some purposes October was a fairly representative month. The circumstances under which the exhibit was filed have been explained, and it is not necessary to dwell upon that further than to say that it was filed after a request had been made for a direction by the court to have the statistics prepared for three months.

They say at page 308 the statistics contained in this exhibit were used and quoted by the plaintiff in dividing the different classes of traffic, such as trans-state, interstate and State, and in connection with the long and short haul. The length of haul of State and interstate freight and passengers on the Iron Mountain railroad is contained in exhibit 5 (R. 2327), and on the St. Louis Southwestern Railway in exhibit 14 (R. 2361.) The proportions of trans-state, interstate and State traffic were taken from exhibit 26, but the conditions which affected the loading of local and through trains did not affect the relation of the volume of trans-state freight to other classes of traffic, or impair the usefulness of the exhibit for that purpose; nor would the separation of carload and less than carload freight be affected. It was only the method of handling the freight in the local trains that was effected by the congestion.

The statistics contained in exhibits 5 and 26, the former covering a six months' period and the latter the month

of October, 1907, were compiled upon exactly the same basis as to these matters, the only difference being that exhibit 26 divides the freight between carload and less than carload and the interstate freight between that which is trans-state and that which is purely interstate. No attempt was made or could be made to show just what proportion of each class of traffic was handled upon through and local trains from the data which was used in compiling this exhibit, and our contention is that when the State undertook in exhibit I to determine the amount of freight actually handled on the local trains, and then subtracted that amount from the total traffic shown in exhibit 26, to arrive at the amount of freight carried upon through trains, their basis was wrong and the results obtained were entirely misleading. And this is especially true by reason of the fact that owing to the large amount of business and consequent congestion in that particular month the local train was used for the purpose of moving freight from division point to division point, regardless of the usual functions of the local train, and thereby loaded very largely with trans-state and interstate freights, which was contrary to the usual practice. Mr. Roth testified that he investigated sixteen of the local trains for the purpose of ascertaining whether there was any freight handled on those trains that was not included in the auditor's accounts and in the statements contained in exhibit 26, and found that 30.5 per cent of trans-state freight, 15.5 per cent of other interstate freight and

6 per cent of State freight carried on those trains was not included in the October account. These percentages showed that practically one-third of the trans-state freight carried on the sixteen local trains was not included in the October accounts, as shown by exhibit 26, and showed further that any attempt to determine the relative amount of tonnage carried on both classes of trains by taking the actual movement on the local train and the difference between that and the total amount of traffic taken into account as representing the movement on through trains, does not by any means represent the actual facts. But it does not impair the usefulness of exhibit 26 for the purpose of showing the percentage of trans-state freight that moved in the State of Arkansas during that period; nor does it conflict with the correctness of the statistics contained in exhibit 26 showing the relation of carload and less than carload.

Counsel in their brief make a comparison of the revenue per ton per mile as shown on exhibit 5 and exhibit 26, for the purpose of demonstrating that there could have been no abnormal handling of through freights on local trains in October, 1907. We are unable to see any possible relation between the revenue per ton per mile as shown in the accounts of the railroad company, and the question as to whether the freight that produced the revenue was handled on a local or a through train, but a comparison of the two exhibits does disclose a relation between the tons handled in the State of Arkansas in the month of October

as compared with the six months' period that is instructive, and which bears out our statement that the statistics contained in exhibit 26 correctly show the relation of the volume of the different classes of traffic handled in the State during the month of October. It of course could have no bearing as to the train upon which the freight moved, but it does, we submit, demonstrate very fully and conclusively that the volume and proportions of the freight handled are correctly stated in the exhibit.

Exhibit No. 26, covering the month of October, shows that 21.15 per cent of all tons handled in the State of Arkansas was intrastate traffic, that 14.16 per cent of all freight revenue was intrastate revenue, that 8.15 per cent of all ton miles handled was intrastate traffic; while exhibit No. 5, covering the six months ending December 31, 1907, shows that 19.98 per cent of all tons handled was intrastate traffic, 13.41 per cent of all freight revenue was intrastate, and 7.25 per cent of all ton miles was intrastate ton miles, the percentages being such as to show that there is but little difference between the month of October, 1907, and the entire six months' period.

These comparisons support the statement of Mr. Doddridge and Mr. Kimbell, that one month would be representative as to the relative proportions of the different kind of business, and useful for the purpose of determining the average relation that one class of business bore to the other, and demonstrate that while the statistics contained in exhibit 26 could not be used in any way for the purpose

of determining the distribution of State and interstate freight in loading local and through trains, those statistics were properly used for the purpose of showing the relative volume of trans-state, interstate and State, and the carload and less than carload business.

They seek to impeach the testimony of Cannon, Moore and Brown as to the effect of the congestion upon the loading of local trains. They say exhibit I shows the local trains average 16.6 cars and through trains 33.2 cars, and then assume that if 600 tons had been added to the local trains it would represent 17 cars. This is a very extraordinary view to take of the testimony. B. W. Moore testified that during the congested period the superintendent issued orders to utilize the local train power to the best advantage and load up to 1,000 tons on light engines of 1,200 tons capacity, "and we added to our local movements an added tonnage of probably 500 or 600 tons to the train." The superintendent, Mr. Cannon, testified that during the fall of 1907, on account of the heavy movement of business, the usual practice of loading local trains was changed. Local trains during normal times handle nothing but less than car load freight, and what is called short loads—loads destined to stations in the local train territory. During the fall of 1907 the locals were filled up to nearly the maximum tonnage with through loads, loads that went through the entire district that the local ran over. The excess tonnage ran from 300 to 800 gross tons per day. All the testimony shows that the average loading of merchandise

freight is five tons to the car at the starting point, which is reduced as the tonnage is distributed from station to station, and that the cars in local trains are loaded very much below the maximum capacity of the engine under ordinary conditions. The evidence of Superintendent Cannon and the other witnesses who testified on the subject is simply that the local trains were loaded up to their full capacity, and that the effect of the additional loading was to very materially increase the tonnage of the local trains.

Mr. Cannon testified that ordinarily the local train handles 75 per cent of the State freight, but that during the congestion the conditions were reversed and it did not carry over 25 per cent. Mr. Brown stated practically the same. It can be readily seen, in view of the make-up of local trains and the manner in which they are loaded and handled, that the tonnage might easily have been increased in the manner testified by these witnesses. We can perceive no inconsistency whatever between the conditions referred to by counsel and the testimony of these witnesses.

Respectfully submitted,

MARTIN L. CLARDY,

SAMUEL H. WEST,

JOHN M. MOORE,

*Solicitors for Appellees.*

# ALLEN ET AL., RAILROAD COMMISSIONERS OF THE STATE OF ARKANSAS, *v.* ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY.

# SAME *v.* ST. LOUIS SOUTHWESTERN RAILWAY COMPANY.

APPEALS FROM THE CIRCUIT COURT OF THE UNITED STATES FOR THE EASTERN DISTRICT OF ARKANSAS.

Nos. 440, 441. Argued April 12, 15, 1912.—Decided June 16, 1913.

*Minnesota Rate Cases, ante,* p. 352, followed to effect that an intrastate rate fixed by State Railroad Commission is not an unconstitutional interference with interstate commerce.

A carrier has the right to contest the validity of rates prescribed by a body clothed by the legislature with power to establish rates on the ground they are confiscatory, and this right is not impaired by putting the rates into effect if they prove to be confiscatory.

*Minnesota Rate Cases, ante,* p. 352, also followed to effect that where the proofs submitted by a carrier attacking rates as confiscatory are

not sufficient to justify a finding that the rates are confiscatory, the bill should be dismissed.
187 Fed. Rep. 290, reversed.

THESE two suits were brought to restrain the enforcement of the act of the legislature passed February 9, 1907, fixing the maximum fare for passengers at two cents a mile, and also the orders of the Railroad Commission made June 4, 1908, prescribing maximum freight and passenger rates. The facts involved in both cases are stated in the opinion.

*Mr. Joseph M. Hill* for appellants.

*Mr. John M. Moore*, with whom *Mr. Martin S. Clardy* and *Mr. Samuel H. West* were on the brief, for appellees.

MR. JUSTICE HUGHES delivered the opinion of the court.

The legislature of Arkansas, on February 9, 1907, passed an act fixing the maximum passenger fare within the State, on railroads over eighty-five miles in length, at two cents a mile. On June 4, 1908, the Railroad Commission of the State adopted Standard Distance Tariff No. 3, which superseded the former freight tariff and established maximum intrastate freight rates for all classes and commodities. The requirement with respect to maximum passenger fares as provided by the legislature was also promulgated by the commission.

In July, 1908, the appellees, the St. Louis, Iron Mountain & Southern Railway Company and the St. Louis Southwestern Railway Company, respectively, filed their bills in the Circuit Court, alleging that the action of the legislature and the commission, in fixing these rates, was unreasonable and confiscatory, and also that it amounted

to an unconstitutional interference with interstate commerce. Answers were filed by the defendants, the members of the railroad commission, and voluminous evidence was taken. The court found the rates to be confiscatory and a decree was entered enjoining their enforcement. 187 Fed. Rep. 290. The railroad commissioners appeal.

The contention of the complainants based upon the asserted interference with interstate commerce was rightly overruled by the court below (*Minnesota Rate Cases*, *ante*, p. 352), and the only question which remains for our consideration is whether the proof was sufficient to sustain the finding of confiscation.

It is said on the part of the commissioners, that the freight tariff No. 3, adopted in 1908, was substantially similar to that which had been prescribed in 1904, and that the latter was in substance a repetition of the first tariff of the commission which had been put into effect in 1900; that is to say, that, while changes had been made from time to time to provide suitable adjustments, there were no substantial differences in the rates imposed by the last tariff, of which complaint was made, as compared with those of the earlier years when considered with respect to the effect upon the freight revenue in its entirety. It is urged, however, by the companies that there were reductions in fact and that, apart from this, there had been a continuous increase in the expenses incident to operation in the State and in the burdens imposed upon the companies; and also that the passenger fare act of 1907 (February 9, 1907, Acts 1907, Act No. 8, p. 9) had largely reduced the revenues of the roads. We deem it to be clear that the right of the complainants to contest the validity of the rates, if, as applied to changed conditions, they were found to be confiscatory, was not impaired by their action in putting them into effect. When these suits were brought, the passenger fare act had been in force for more than a year, but this gave opportunity to

ascertain the actual results, and, even if it were assumed that the new freight tariff of 1908 did not greatly reduce the former rates, the complainants were certainly not barred from presenting to the court their contention that the operation of the rates as a whole deprived them of a fair return from their entire intrastate business.

No question is presented as to the value of the properties within the State which were used by the companies in the public service. This was the subject of a formal stipulation by which it was conceded that the assessments made by the state tax commission, multiplied by two, should represent the value of these properties, respectively, for the purpose of these suits. Upon this basis, the value of the property of the St. Louis, Iron Mountain & Southern Railway Company was found to be $39,986,564; and that of the St. Louis Southwestern Railway Company, $14,029,634.

In the case of the Iron Mountain road, the period taken for the purpose of calculation was the six months ending December 31, 1907. According to the statement of the company, the total earnings from the business in Arkansas, interstate and intrastate, for this period, were $6,675,076.79. The total operating expenses, together with taxes and rentals, amounted, for the same period, to $5,175,301.44. The net earnings for the six months were thus $1,499,775.35; and this amount was equivalent to a return at the annual rate of 7.5 per cent upon the entire value of the property.

The statement submitted by the St. Louis Southwestern company for the six months ending December 31, 1907, showed operating revenues within the State, from both interstate and intrastate business, amounting to $2,288,173.40; and operating expenses, taxes and rentals, aggregating $1,388,075.94, leaving as net earnings for the six months, $900,097,46. We have also, in the case of this company, its statement for the entire fiscal year ending

June 30, 1908, which gives the total operating revenues within the State, interstate and intrastate, as $4,130,011.45, and operating expenses, together with taxes and rentals, amounting to $2,691,287.44, thus leaving net earnings of $1,438,724.01, or more than 10 per cent. upon the value of the property.

The showing thus made, of the returns from the combined business, makes it entirely clear that the ultimate conclusion must depend upon the certainty of the proof with respect to the segregation of the results of the intrastate operations. That is, the controlling questions concern the division of the expenses between interstate and intrastate transportation, and the determination of the share of the total value of the property which is assignable to the latter and upon which the rate of net return is to be computed.

As to the apportionment of value, it appears that the method adopted below was to divide the value of the entire property, as found, between the interstate and intrastate business according to the relation of gross revenue. In view of the fundamental objections to this method, which were considered in *Minnesota Rate Cases*, *ante*, p. 352, the results that have been obtained by resort to it in these cases cannot be accepted as affording a sufficient basis for the conclusion that the State has confiscated the property of the company.

In dividing the expenses of operation, the defendants undertook definitely to establish the cost of intrastate traffic as compared with that which was interstate. For this purpose, it was endeavored to attribute to the local and through train services, respectively, their proper shares of expense and in each case to divide the amount of the ascertained share according to the traffic carried. In the case of the Iron Mountain company, traffic statistics were taken for the month of October, 1907; these were analyzed and a division of expenses was made in accordance with

a plan devised by expert accountants. The computations, with respect to the St. Louis Southwestern company, were based upon the operations of October, 1908, as the company had compiled data for that month in making a test of comparative cost. According to these calculations of the defendants, the net return from the entire intrastate business was at the annual rate of 7.09 per cent. for the Iron Mountain road, and 9.16 per cent. for that of the St. Louis Southwestern.

It was objected, however, that the periods selected for these tests were not representative; that the month of October, 1907, in particular, was abnormal because of an unusual congestion of traffic, and that the use of the statistics for October, 1908, was also open to objection as they did not show such a fair average of the business as would enable the court to reach a correct conclusion. The court below took this view, but it was of the opinion that proper allowances might be made which would equalize these conditions. In this view, and for the purpose of correcting assumptions deemed to be erroneous, the court defined the basis of apportionment of the various items of outlay in accordance with which new computations were made. The effect of these calculations was to charge the intrastate freight traffic on the Iron Mountain road with an extra cost of 201.5 per cent. per ton mile. The court, concluding that certain items of the extra cost of local traffic had been omitted, decided that an additional charge of 8.5 per cent. would be reasonable, and that the total extra cost of the intrastate traffic should be placed at 210 per cent. In the case of the St Louis Southwestern company, the extra cost of the intrastate freight traffic was fixed at 250 per cent., this being, it is understood, per ton-mile. With respect to the passenger traffic, the court was of the opinion that the intrastate service should be charged with ten per cent. additional cost in the case of the Iron Mountain company, but that no allowance for extra cost was

necessary in that of the St. Louis Southwestern Company. From the computations on these bases the conclusion was derived that the net return from the entire intrastate business of the Iron Mountain company was at the annual rate of less than one per cent., and from that of the St. Louis Southwestern company, 2.6 per cent., upon the shares of the total property value assigned respectively to the intrastate business.

We shall not attempt to review in detail these calculations upon which the decree is based. While they represent a most serious effort to effect a reasonable apportionment, we are convinced, from our examination of the evidence, that they have the same infirmity which was found to exist in the computations in the *Minnesota* and *Missouri rate cases*. *Minnesota Rate Cases*, *ante*, p. 352; *Missouri Rate Cases*, *ante*, p. 474, decided this day, *ante*, p. 474. On finding, in the present cases, that the periods selected for the purposes of test could not be regarded as fairly representative, the court was left without sufficient data upon which to compute the extra cost of intrastate transportation with such a degree of certainty as would justify the annullment of the State's requirements. Controlling factors, used in the computations, represent general estimates of the conditions of transportation, which may or may not be accurate, and there was an absence of satisfactory evidence, to take the place of the rejected tests, giving with requisite particularity the actual movement of traffic at the times in question and affording a proper basis for the determination of relative cost. The wide variation in results obtained on the different hypotheses, each of which is earnestly supported in argument, illustrates the necessity for the keeping of suitable accounts, at least during typical periods, which will furnish correct statistical information bearing upon the cost of intrastate transportation as compared with interstate, instead of leaving a matter of such in-

tricacy to general expressions of judgment. It was not sufficient for the complainants to criticise the tests relied upon by the defendants, but in seeking to override the action of the State upon constitutional grounds it was incumbent upon them to establish the invalidating facts by definite and convincing proof.

We are of the opinion that the evidence failed to show confiscation.

*The decrees are reversed and the cases remanded with directions to dismiss the bills, respectively, without prejudice.*
